      end subroutine write_matrix

  end subroutine bloch_vectors_7
```

15.3 Polarization

Using generalized Bloch vectors and the $su(N)$ algebra (see above) for the internal representation, we can define various modes of polarization. For spin-1/2, and analogously for massless spin-s particles, we introduce

1. Trivial polarization: $\vec{\alpha} = 0$. [This is unpolarized, but distinct from the particular undefined polarization matrix which has the same meaning.]

2. Circular polarization: $\vec{\alpha}$ points in $\pm z$ direction.

3. Transversal polarization: $\vec{\alpha}$ points orthogonal to the z direction, with a phase ϕ that is 0 for the x axis, and $\pi/2 = 90°$ for the y axis. For antiparticles, the phase switches sign, corresponding to complex conjugation.

4. Axis polarization, where we explicitly give $\vec{\alpha}$.

For higher spin, we retain this definition, but apply it to the two components with maximum and minimum weight. In effect, we concentrate on the first three entries in the α^a array. For massless particles, this is sufficient. For massive particles, we then add the possibilities:

5. Longitudinal polarization: Only the 0-component is set. This is possible only for bosons.

6. Diagonal polarization: Explicitly specify all components in the helicity basis. The $su(N)$ representation consists of diagonal generators only, the Cartan subalgebra.

Obviously, this does not exhaust the possible density matrices for higher spin, but it should cover practical applications.

15.3.1 The polarization type

Polarization is active whenever the coefficient array is allocated. For convenience, we store the spin type ($2s$) and the multiplicity (N) together with the coefficient array (α). We have to allow for the massless case where s is arbitrary > 0 but $N = 2$, and furthermore the chiral massless case where $N = 1$. In the latter case, the array remains deallocated but the chirality is set to ± 1.

There is a convention that an antiparticle transforms according to the complex conjugate representation. We apply this only when transforming from/to polarization defined by a three-vector. For antiparticles, the two-component flips sign in that case. When transforming from/to a state matrix or `pmatrix` representation, we do not apply this sign flip.

⟨*Polarizations: public*⟩≡

```
⟨*Polarizations: polarization: TBP*⟩
```
    end type polarization_t
```

15.3.2 Basic initializer and finalizer

We need the particle flavor for determining the allowed helicity values. The Bloch vector is left undefined, so this initializer (in two versions) creates an unpolarized particle. Exception: a chiral particle is always polarized with definite helicity, it doesn't need a Bloch vector.

This is private.

⟨*Polarizations: polarization: TBP*⟩≡
```
    generic, private :: init => polarization_init, polarization_init_flv
    procedure, private :: polarization_init
    procedure, private :: polarization_init_flv
```

⟨*Polarizations: procedures*⟩≡

    subroutine polarization_init (pol, spin_type, multiplicity, &
        anti, left_handed, right_handed)
      class(polarization_t), intent(out) :: pol
      integer, intent(in) :: spin_type
      integer, intent(in) :: multiplicity
```

```fortran
      logical, intent(in) :: anti
      logical, intent(in) :: left_handed
      logical, intent(in) :: right_handed
      pol%spin_type = spin_type
      pol%multiplicity = multiplicity
      pol%anti = anti
      select case (pol%multiplicity)
      case (1)
         if (left_handed) then
            pol%chirality = -1
         else if (right_handed) then
            pol%chirality = 1
         end if
      end select
      select case (pol%chirality)
      case (0)
         call pol%bv%init_unpolarized (spin_type)
      end select
    end subroutine polarization_init

    subroutine polarization_init_flv (pol, flv)
      class(polarization_t), intent(out) :: pol
      type(flavor_t), intent(in) :: flv
      call pol%init ( &
           spin_type = flv%get_spin_type (), &
           multiplicity = flv%get_multiplicity (), &
           anti = flv%is_antiparticle (), &
           left_handed = flv%is_left_handed (), &
           right_handed = flv%is_right_handed ())
    end subroutine polarization_init_flv
```

Generic polarization: as before, but create a polarized particle (Bloch vector defined) with initial polarization zero.

⟨*Polarizations: polarization: TBP*⟩+≡

```fortran
    generic :: init_generic => &
         polarization_init_generic, &
         polarization_init_generic_flv
    procedure, private :: polarization_init_generic
    procedure, private :: polarization_init_generic_flv
```

⟨*Polarizations: procedures*⟩+≡

```fortran
    subroutine polarization_init_generic (pol, spin_type, multiplicity, &
         anti, left_handed, right_handed)
      class(polarization_t), intent(out) :: pol
      integer, intent(in) :: spin_type
      integer, intent(in) :: multiplicity
      logical, intent(in) :: anti
      logical, intent(in) :: left_handed
      logical, intent(in) :: right_handed
      call pol%init (spin_type, multiplicity, &
           anti, left_handed, right_handed)
      select case (pol%chirality)
      case (0)
         if (pol%multiplicity == pol%bv%get_n_states ()) then
```

```
              call pol%bv%init (spin_type)
         else
              call pol%bv%init_max_weight (spin_type)
         end if
      end select
   end subroutine polarization_init_generic

   subroutine polarization_init_generic_flv (pol, flv)
     class(polarization_t), intent(out) :: pol
     type(flavor_t), intent(in) :: flv
     call pol%init_generic ( &
           spin_type = flv%get_spin_type (), &
           multiplicity = flv%get_multiplicity (), &
           anti = flv%is_antiparticle (), &
           left_handed = flv%is_left_handed (), &
           right_handed = flv%is_right_handed ())
   end subroutine polarization_init_generic_flv
```

A finalizer is no longer necessary.

15.3.3 I/O

The default setting produces a tabular output of the polarization vector entries. Optionally, we can create a state matrix and write its contents, emulating the obsolete original implementation.

If `all_states` is true (default), we generate all helity combinations regardless of the matrix-element value. Otherwise, skip helicities with zero entry, or absolute value less than `tolerance`, if also given.

⟨*Polarizations: polarization: TBP*⟩+≡
```
   procedure :: write => polarization_write
```

⟨*Polarizations: procedures*⟩+≡
```
   subroutine polarization_write (pol, unit, state_matrix, all_states, tolerance)
     class(polarization_t), intent(in) :: pol

      read (u, iostat=iostat) pol%anti
      call pol%bv%read_raw (u, iostat)
    end subroutine polarization_read_raw
```

15.3.4   Accessing contents

Return true if the particle is technically polarized. The particle is either chiral,
or its Bloch vector has been defined. The function returns true even if the Bloch
vector is zero or the particle is scalar.

⟨*Polarizations: polarization: TBP*⟩+≡
```
    procedure :: is_polarized => polarization_is_polarized
```

⟨*Polarizations: procedures*⟩+≡
```
function polarization_is_polarized (pol) result (polarized)
  class(polarization_t), intent(in) :: pol
  logical :: polarized
  polarized = pol%chirality /= 0 .or. pol%bv%is_polarized ()
end function polarization_is_polarized
```

Return true if the polarization is diagonal, i.e., all entries in the density matrix are diagonal. For an unpolarized particle, we also return `.true.` since the density matrix is proportional to the unit matrix.

⟨*Polarizations: polarization: TBP*⟩+≡
```
procedure :: is_diagonal => polarization_is_diagonal
```

⟨*Polarizations: procedures*⟩+≡
```
function polarization_is_diagonal (pol) result (diagonal)
  class(polarization_t), intent(in) :: pol
  logical :: diagonal
  select case (pol%chirality)
  case (0)
     diagonal = pol%bv%is_diagonal ()
  case default
     diagonal = .true.
  end select
end function polarization_is_diagonal
```

15.3.5 Mapping between polarization and state matrix

Create the polarization object that corresponds to a state matrix. The state matrix is not necessarily normalized. The result will be either unpolarized, or a generalized Bloch vector that we compute in terms of the appropriate spin generator basis. To this end, we first construct the complete density matrix, then set the Bloch vector with this input.

For a naturally chiral particle (i.e., neutrino), we do not set the polarization vector, it is implied.

Therefore, we cannot account for any sign flip and transform as-is.

⟨*Polarizations: polarization: TBP*⟩+≡
```
procedure :: init_state_matrix => polarization_init_state_matrix
```

⟨*Polarizations: procedures*⟩+≡
```
subroutine polarization_init_state_matrix (pol, state)
  class(polarization_t), intent(out) :: pol
  type(state_matrix_t), intent(in), target :: state
  type(state_iterator_t) :: it
  type(flavor_t) :: flv
  type(helicity_t) :: hel
  integer :: d, h1, h2, i, j
  complex(default), dimension(:,:), allocatable :: r
  complex(default) :: me
  real(default) :: trace
  call it%init (state)
  flv = it%get_flavor (1)
  hel = it%get_helicity (1)
```

```
      if (hel%is_defined ()) then
         call pol%init_generic (flv)
         select case (pol%chirality)
         case (0)
            trace = 0
            d = pol%bv%get_n_states ()
            allocate (r (d, d), source = (0._default, 0._default))
            do while (it%is_valid ())
               hel = it%get_helicity (1)
               call hel%get_indices (h1, h2)
               i = pol%bv%hel_index (h1)
               j = pol%bv%hel_index (h2)
               me = it%get_matrix_element ()
               r(i,j) = me
               if (i == j)  trace = trace + real (me)
               call it%advance ()
            end do
            if (trace /= 0)  call pol%bv%set (r / trace)
         end select
      else
         call pol%init (flv)
      end if
   end subroutine polarization_init_state_matrix
```

Create the state matrix that corresponds to a given polarization. We make use of the polarization iterator as defined below, which should iterate according to the canonical helicity ordering.

⟨*Polarizations: polarization: TBP*⟩+≡
```
   procedure :: to_state => polarization_to_state_matrix
```

⟨*Polarizations: procedures*⟩+≡
```
   subroutine polarization_to_state_matrix (pol, state, all_states, tolerance)
     class(polarization_t), intent(in), target :: pol
     type(state_matrix_t), intent(out) :: state
     logical, intent(in), optional :: all_states
     real(default), intent(in), optional :: tolerance
     type(polarization_iterator_t) :: it
     type(quantum_numbers_t), dimension(1) :: qn
     complex(default) :: value
     call it%init (pol, all_states, tolerance)
     call state%init (store_values = .true.)
     do while (it%is_valid ())
        value = it%get_value ()
        qn(1) = it%get_quantum_numbers ()
        call state%add_state (qn, value = value)
        call it%advance ()
     end do
     call state%freeze ()
   end subroutine polarization_to_state_matrix
```

15.3.6 Specific initializers

Unpolarized particle, no nontrivial entries in the density matrix. This is the default initialization mode.

⟨*Polarizations: polarization: TBP*⟩+≡
```
    procedure :: init_unpolarized => polarization_init_unpolarized
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_init_unpolarized (pol, flv)
      class(polarization_t), intent(out) :: pol
      type(flavor_t), intent(in) :: flv
      call pol%init (flv)
    end subroutine polarization_init_unpolarized
```

The following three modes are useful mainly for spin-1/2 particle and massless particles of any nonzero spin. Only the highest-weight components are filled.

Circular polarization: The density matrix of the two highest-weight states is

$$\rho(f) = \frac{1 - |f|}{2}\mathbf{1} + |f| \times \begin{cases} \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}, & f > 0; \\ \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}, & f < 0, \end{cases}$$

In the generalized Bloch representation, this is an entry for the T^3 generator only, regardless of the spin representation.

A chiral particle is not affected.

⟨*Polarizations: polarization: TBP*⟩+≡
```
    procedure :: init_circular => polarization_init_circular
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_init_circular (pol, flv, f)
      class(polarization_t), intent(out) :: pol
      type(flavor_t), intent(in) :: flv
      real(default), intent(in) :: f
      call pol%init (flv)
      select case (pol%chirality)
      case (0)
         call pol%bv%init_vector (pol%spin_type, &
              [0._default, 0._default, f])
      end select
    end subroutine polarization_init_circular
```

Transversal polarization is analogous to circular, but we get a density matrix

$$\rho(f, \phi) = \frac{1 - |f|}{2}\mathbf{1} + \frac{|f|}{2}\begin{pmatrix} 1 & e^{-i\phi} \\ e^{i\phi} & 1 \end{pmatrix}.$$

for the highest-weight subspace. The lower weights are unaffected. The phase is $\phi = 0$ for the x-axis, $\phi = 90°$ for the y axis as polarization vector.

For an antiparticle, the phase switches sign, and for $f < 0$, the off-diagonal elements switch sign.

A chiral particle is not affected.

⟨*Polarizations: polarization: TBP*⟩+≡
```
    procedure :: init_transversal => polarization_init_transversal
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_init_transversal (pol, flv, phi, f)
      class(polarization_t), intent(out) :: pol
      type(flavor_t), intent(in) :: flv
      real(default), intent(in) :: phi, f
      call pol%init (flv)
      select case (pol%chirality)
      case (0)
         if (pol%anti) then
            call pol%bv%init_vector (pol%spin_type, &
                  [f * cos (phi), f * sin (phi), 0._default])
         else
            call pol%bv%init_vector (pol%spin_type, &
                  [f * cos (phi),-f * sin (phi), 0._default])
         end if
      end select
    end subroutine polarization_init_transversal
```

For axis polarization, we again set only the entries with maximum weight, which for spin 1/2 means

$$\rho(f, \phi) = \frac{1}{2} \begin{pmatrix} 1 + \alpha_3 & \alpha_1 - i\alpha_2 \\ \alpha_1 + i\alpha_2 & 1 - \alpha_3 \end{pmatrix}.$$

For an antiparticle, the imaginary part proportional to α_2 switches sign (complex conjugate). A chiral particle is not affected.

In the generalized Bloch representation, this translates into coefficients for $T^{1,2,3}$, all others stay zero.

⟨*Polarizations: polarization: TBP*⟩+≡
```
    procedure :: init_axis => polarization_init_axis
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_init_axis (pol, flv, alpha)
      class(polarization_t), intent(out) :: pol
      type(flavor_t), intent(in) :: flv
      real(default), dimension(3), intent(in) :: alpha
      call pol%init (flv)
      select case (pol%chirality)
      case (0)
         if (pol%anti) then
            call pol%bv%init_vector (pol%spin_type, &
                  [alpha(1), alpha(2), alpha(3)])
         else
            call pol%bv%init_vector (pol%spin_type, &
                  [alpha(1),-alpha(2), alpha(3)])
         end if
      end select
    end subroutine polarization_init_axis
```

This version specifies the polarization axis in terms of r (polarization degree) and θ, ϕ (polar and azimuthal angles).

If one of the angles is a nonzero multiple of π, roundoff errors typically will result in tiny contributions to unwanted components. Therefore, include a catch

for small numbers.

⟨*Polarizations: polarization: TBP*⟩+≡
```
    procedure :: init_angles => polarization_init_angles
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_init_angles (pol, flv, r, theta, phi)
      class(polarization_t), intent(out) :: pol
      type(flavor_t), intent(in) :: flv
      real(default), intent(in) :: r, theta, phi
      real(default), dimension(3) :: alpha
      real(default), parameter :: eps = 10 * epsilon (1._default)

      alpha(1) = r * sin (theta) * cos (phi)
      alpha(2) = r * sin (theta) * sin (phi)
      alpha(3) = r * cos (theta)
      where (abs (alpha) < eps)  alpha = 0
      call pol%init_axis (flv, alpha)
    end subroutine polarization_init_angles
```

Longitudinal polarization is defined only for massive bosons. Only the zero
component is filled. Otherwise, unpolarized.

In the generalized Bloch representation, the zero component corresponds to
a linear combination of all diagonal (Cartan) generators.

⟨*Polarizations: polarization: TBP*⟩+≡
```
    procedure :: init_longitudinal => polarization_init_longitudinal
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_init_longitudinal (pol, flv, f)
      class(polarization_t), intent(out) :: pol
      type(flavor_t), intent(in) :: flv
      real(default), intent(in) :: f
      real(default), dimension(:), allocatable :: rd
      integer :: s, d
      s = flv%get_spin_type ()
      select case (s)
      case (VECTOR, TENSOR)
         call pol%init_generic (flv)
         if (pol%bv%is_polarized ()) then
            d = pol%bv%get_n_states ()
            allocate (rd (d), source = 0._default)
            rd(pol%bv%hel_index (0)) = f
            call pol%bv%set (rd)
         end if
      case default
         call pol%init_unpolarized (flv)
      end select
    end subroutine polarization_init_longitudinal
```

This is diagonal polarization: we specify all components explicitly. `rd` is the
array of diagonal elements of the density matrix. We assume that the length of
`rd` is equal to the particle multiplicity.

⟨*Polarizations: polarization: TBP*⟩+≡
```
    procedure :: init_diagonal => polarization_init_diagonal
```

⟨*Polarizations: procedures*⟩+≡

```
subroutine polarization_init_diagonal (pol, flv, rd)
  class(polarization_t), intent(out) :: pol
  type(flavor_t), intent(in) :: flv
  real(default), dimension(:), intent(in) :: rd
  real(default) :: trace
  call pol%init_generic (flv)
  if (pol%bv%is_polarized ()) then
     trace = sum (rd)
     if (trace /= 0)  call pol%bv%set (rd / trace)
  end if
end subroutine polarization_init_diagonal
```

15.3.7   Operations

Combine polarization states by computing the outer product of the state matrices.

⟨*Polarizations: public*⟩+≡

```
public :: combine_polarization_states
```

⟨*Polarizations: procedures*⟩+≡

```
subroutine combine_polarization_states (pol, state)
  type(polarization_t), dimension(:), intent(in), target :: pol
  type(state_matrix_t), intent(out) :: state
  type(state_matrix_t), dimension(size(pol)), target :: pol_state
  integer :: i
  do i = 1, size (pol)
     call pol(i)%to_state (pol_state(i))
  end do
  call outer_multiply (pol_state, state)
  do i = 1, size (pol)
     call pol_state(i)%final ()
  end do
end subroutine combine_polarization_states
```

Transform a polarization density matrix into a polarization vector. This is possible without information loss only for spin-1/2 and for massless particles. To get a unique answer in all cases, we consider only the components with highest weight. Obviously, this loses the longitudinal component of a massive vector, for instance. The norm of the returned axis is the polarization fraction for the highest-weight subspace. For a scalar particle, we return a zero vector. The same result applies if the highest-weight component vanishes.

This is the inverse operation of `polarization_init_axis` above, where the polarization fraction is set to unity.

For an antiparticle, the `alpha(2)` coefficient flips sign.

⟨*Polarizations: polarization: TBP*⟩+≡

```
procedure :: get_axis => polarization_get_axis
```

⟨*Polarizations: procedures*⟩+≡

```
function polarization_get_axis (pol) result (alpha)
  class(polarization_t), intent(in), target :: pol
  real(default), dimension(3) :: alpha
```

```
      select case (pol%chirality)
      case (0)
         call pol%bv%to_vector (alpha)
         if (.not. pol%anti)  alpha(2) = - alpha(2)
      case (-1)
         alpha = [0._default, 0._default, -1._default]
      case (1)
         alpha = [0._default, 0._default, 1._default]
      end select
   end function polarization_get_axis
```

This function returns polarization degree and polar and azimuthal angles (θ, ϕ) of the polarization axis. The same restrictions apply as above.

Since we call the `get_axis` method, the phase flips sign for an antiparticle.

⟨*Polarizations: polarization: TBP*⟩+≡
```
   procedure :: to_angles => polarization_to_angles
```

⟨*Polarizations: procedures*⟩+≡
```
   subroutine polarization_to_angles (pol, r, theta, phi)
     class(polarization_t), intent(in) :: pol
     real(default), intent(out) :: r, theta, phi
     real(default), dimension(3) :: alpha
     real(default) :: norm, r12
     alpha = pol%get_axis ()
     norm = sum (alpha**2)
     r = sqrt (norm)
     if (norm > 0) then
        r12 = sqrt (alpha(1)**2 + alpha(2)**2)
        theta = atan2 (r12, alpha(3))
        if (any (alpha(1:2) /= 0)) then
           phi = atan2 (alpha(2), alpha(1))
        else
           phi = 0
        end if
     else
        theta = 0
        phi = 0
     end if
   end subroutine polarization_to_angles
```

15.3.8 Polarization Iterator

The iterator acts like a state matrix iterator, i.e., it points to one helicity combination at a time and can return the corresponding helicity object and matrix-element value.

Since the polarization is stored as a Bloch vector, we recover the whole density matrix explicitly upon initialization, store it inside the iterator object, and then just return its elements one at a time.

For an unpolarized particle, the iterator returns a single state with undefined helicity. The value is the value of any diagonal density matrix element, $1/n$ where n is the multiplicity.

⟨*Polarizations: public*⟩+≡

```
      public :: polarization_iterator_t
```

⟨*Polarizations: types*⟩+≡
```
    type :: polarization_iterator_t
      private
      type(polarization_t), pointer :: pol => null ()
      logical :: polarized = .false.
      integer :: h1 = 0
      integer :: h2 = 0
      integer :: i = 0
      integer :: j = 0
      complex(default), dimension(:,:), allocatable :: r
      complex(default) :: value = 1._default
      real(default) :: tolerance = -1._default
      logical :: valid = .false.
     contains
     ⟨Polarizations: polarization iterator: TBP⟩
    end type polarization_iterator_t
```

Output for debugging purposes only, therefore no format for real/complex.

⟨*Polarizations: polarization iterator: TBP*⟩≡
```
    procedure :: write => polarization_iterator_write
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_iterator_write (it, unit)
      class(polarization_iterator_t), intent(in) :: it
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit)
      write (u, "(1X,A)")  "Polarization iterator:"
      write (u, "(3X,A,L1)")  "assigned = ", associated (it%pol)
      write (u, "(3X,A,L1)")  "valid   = ", it%valid
      if (it%valid) then
         write (u, "(3X,A,2(1X,I2))")  "i, j     = ", it%i, it%j
         write (u, "(3X,A,2(1X,I2))")  "h1, h2   = ", it%h1, it%h2
         write (u, "(3X,A)", advance="no")  "value    = "
         write (u, *)  it%value
         if (allocated (it%r)) then
            do i = 1, size (it%r, 2)
               write (u, *)  it%r(i,:)
            end do
         end if
      end if
    end subroutine polarization_iterator_write
```

Initialize, i.e., (virtually) point to the first helicity state supported by the polarization object. If the density matrix is nontrivial, we calculate it here.

Following the older state-matrix conventions, the iterator sequence starts at the lowest helicity value. In the current internal representation, this corresponds to the highest index value.

If the current matrix-element value is zero, advance the iterator. Advancing will stop at a nonzero value or if the iterator becomes invalid.

If `tolerance` is given, any state matrix entry less or equal will be treated as zero, causing the iterator to skip an entry. By default, the value is negative, so no entry is skipped.

⟨*Polarizations: polarization iterator: TBP*⟩+≡
```
    procedure :: init => polarization_iterator_init
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine polarization_iterator_init (it, pol, all_states, tolerance)
      class(polarization_iterator_t), intent(out) :: it
      type(polarization_t), intent(in), target :: pol
      logical, intent(in), optional :: all_states
      real(default), intent(in), optional :: tolerance
      integer :: d
      logical :: only_max_weight
      it%pol => pol
      if (present (all_states)) then
         if (.not. all_states) then
            if (present (tolerance)) then
               it%tolerance = tolerance
            else
               it%tolerance = 0
            end if
         end if
      end if
      select case (pol%chirality)
      case (0)
         d = pol%bv%get_n_states ()
         only_max_weight = pol%multiplicity < d
         it%polarized = pol%bv%is_polarized ()
         if (it%polarized) then
            it%i = d
            it%j = it%i
            it%h1 = pol%bv%hel_value (it%i)
            it%h2 = it%h1
            call pol%bv%to_matrix (it%r, only_max_weight)
            it%value = it%r(it%i, it%j)
         else
            it%value = 1._default / d
         end if
         it%valid = .true.
      case (1,-1)
         it%polarized = .true.
         select case (pol%spin_type)
         case (SPINOR)
            it%h1 = pol%chirality
         case (VECTORSPINOR)

         end select
         it%h2 = it%h1
         it%valid = .true.
      end select
      if (it%valid .and. abs (it%value) <= it%tolerance)  call it%advance ()
    end subroutine polarization_iterator_init
```

1143

Advance to the next valid helicity state. Repeat if the returned value is zero.

For an unpolarized object, we iterate through the diagonal helicity states with a constant value.

⟨Polarizations: polarization iterator: TBP⟩+≡
```
    procedure :: advance => polarization_iterator_advance
```

⟨Polarizations: procedures⟩+≡
```
    recursive subroutine polarization_iterator_advance (it)
      class(polarization_iterator_t), intent(inout) :: it
      if (it%valid) then
         select case (it%pol%chirality)
         case (0)
            if (it%polarized) then
               if (it%j > 1) then
                  it%j = it%j - 1
                  it%h2 = it%pol%bv%hel_value (it%j)
                  it%value = it%r(it%i, it%j)
               else if (it%i > 1) then
                  it%j = it%pol%bv%get_n_states ()
                  it%h2 = it%pol%bv%hel_value (it%j)
                  it%i = it%i - 1
                  it%h1 = it%pol%bv%hel_value (it%i)
                  it%value = it%r(it%i, it%j)
               else
                  it%valid = .false.
               end if
            else
               it%valid = .false.
            end if
         case default
            it%valid = .false.
         end select
         if (it%valid .and. abs (it%value) <= it%tolerance)  call it%advance ()
      end if
    end subroutine polarization_iterator_advance
```

This is true as long as the iterator points to a valid helicity state.

⟨Polarizations: polarization iterator: TBP⟩+≡
```
    procedure :: is_valid => polarization_iterator_is_valid
```

⟨Polarizations: procedures⟩+≡
```
    function polarization_iterator_is_valid (it) result (is_valid)
      logical :: is_valid
      class(polarization_iterator_t), intent(in) :: it
      is_valid = it%valid
    end function polarization_iterator_is_valid
```

Return the matrix element value for the helicity that we are currently pointing at.

⟨Polarizations: polarization iterator: TBP⟩+≡
```
    procedure :: get_value => polarization_iterator_get_value
```

⟨*Polarizations: procedures*⟩+≡
```
    function polarization_iterator_get_value (it) result (value)
      complex(default) :: value
      class(polarization_iterator_t), intent(in) :: it
      if (it%valid) then
         value = it%value
      else
         value = 0
      end if
    end function polarization_iterator_get_value
```

Return a quantum number object for the helicity that we are currently pointing at. This is a single quantum number object, not an array.

Note that the `init` method of the helicity object has the order reversed.

⟨*Polarizations: polarization iterator: TBP*⟩+≡
```
    procedure :: get_quantum_numbers => polarization_iterator_get_quantum_numbers
```

⟨*Polarizations: procedures*⟩+≡
```
    function polarization_iterator_get_quantum_numbers (it) result (qn)
      class(polarization_iterator_t), intent(in) :: it
      type(helicity_t) :: hel
      type(quantum_numbers_t) :: qn
      if (it%polarized) then
         call hel%init (it%h2, it%h1)
      end if
      call qn%init (hel)
    end function polarization_iterator_get_quantum_numbers
```

15.3.9 Sparse Matrix

We introduce a simple implementation of a sparse matrix that can represent polarization (or similar concepts) for transfer to I/O within the program. It consists of an integer array that represents the index values, and a complex array that represents the nonvanishing entries. The number of nonvanishing entries must be known for initialization, but the entries are filled one at a time.

Here is a base type without the special properties of a spin-density matrix.

⟨*Polarizations: public*⟩+≡
```
    public :: smatrix_t
```

⟨*Polarizations: types*⟩+≡
```
    type :: smatrix_t
       private
       integer :: dim = 0
       integer :: n_entry = 0
       integer, dimension(:,:), allocatable :: index
       complex(default), dimension(:), allocatable :: value
     contains
     ⟨Polarizations: smatrix: TBP⟩
    end type smatrix_t
```

Output.

⟨*Polarizations: smatrix: TBP*⟩≡
```
    procedure :: write => smatrix_write
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine smatrix_write (object, unit, indent)
      class(smatrix_t), intent(in) :: object
      integer, intent(in), optional :: unit, indent
      integer :: u, i, ind
      u = given_output_unit (unit)
      ind = 0;  if (present (indent))  ind = indent
      if (allocated (object%value)) then
         if (size (object%value) > 0) then
            do i = 1, object%n_entry
               write (u, "(1x,A,'@(')", advance="no")  repeat ("  ", ind)
               write (u, "(SP,9999(I2.1,':',1x))", advance="no") &
                  object%index(:,i)
               write (u, "('(',"  // FMT_19 // ",',',"  // FMT_19 // &
                  ",'))')")  object%value(i)
            end do
         else
            write (u, "(1x,A)", advance="no")  repeat ("  ", ind)
            write (u, "(A)")  "[empty matrix]"
         end if
      else
         write (u, "(1x,A)", advance="no")  repeat ("  ", ind)
         write (u, "(A)")  "[undefined matrix]"
      end if
    end subroutine smatrix_write
```

Initialization: allocate arrays to the correct size. We specify both the dimension
of the matrix (if different from two, this is rather a generic tensor) and the
number of nonvanishing entries.

⟨*Polarizations: smatrix: TBP*⟩+≡
```
    procedure :: init => smatrix_init
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine smatrix_init (smatrix, dim, n_entry)
      class(smatrix_t), intent(out) :: smatrix
      integer, intent(in) :: dim
      integer, intent(in) :: n_entry
      smatrix%dim = dim
      smatrix%n_entry = n_entry
      allocate (smatrix%index (dim, n_entry))
      allocate (smatrix%value (n_entry))
    end subroutine smatrix_init
```

Fill: one entry at a time.

⟨*Polarizations: smatrix: TBP*⟩+≡
```
    procedure :: set_entry => smatrix_set_entry
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine smatrix_set_entry (smatrix, i, index, value)
      class(smatrix_t), intent(inout) :: smatrix
```

```
      integer, intent(in) :: i
      integer, dimension(:), intent(in) :: index
      complex(default), intent(in) :: value
      smatrix%index(:,i) = index
      smatrix%value(i) = value
    end subroutine smatrix_set_entry
```

⟨*Polarizations: smatrix: TBP*⟩+≡
```
    procedure :: exists => smatrix_exists
```

⟨*Polarizations: procedures*⟩+≡
```
    elemental function smatrix_exists (smatrix) result (exist)
      logical :: exist
      class(smatrix_t), intent(in) :: smatrix
      exist = .not. all (smatrix%value == 0)
    end function smatrix_exists
```

15.3.10   Polarization Matrix

As an extension of the more generic `smatrix` type, we implement a proper spin-density matrix. After the matrix has been filled, we can fix spin type and multiplicity for a particle, check the matrix for consistency, and normalize it if necessary.

This implementation does not have an antiparticle flag, just like the state matrix object. We therefore cannot account for sign flips when using this object.

TODO: The `pure` flag is for informational purposes only, and it only represents a necessary condition if spin is greater than $1/2$. We may either check purity for all spins or drop this.

⟨*Polarizations: public*⟩+≡
```
    public :: pmatrix_t
```

⟨*Polarizations: types*⟩+≡
```
    type, extends (smatrix_t) :: pmatrix_t
      private
      integer :: spin_type = 0
      integer :: multiplicity = 0
      logical :: massive = .true.
      integer :: chirality = 0
      real(default) :: degree = 1
      logical :: pure = .false.
    contains
    ⟨Polarizations: pmatrix: TBP⟩
    end type pmatrix_t
```

Output, including extra data. (The `indent` argument is ignored.)

⟨*Polarizations: pmatrix: TBP*⟩≡
```
    procedure :: write => pmatrix_write
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine pmatrix_write (object, unit, indent)
      class(pmatrix_t), intent(in) :: object
      integer, intent(in), optional :: unit, indent
```

```
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A)")   "Polarization: spin density matrix"
      write (u, "(3x,A,I0)")  "spin type     = ", object%spin_type
      write (u, "(3x,A,I0)")  "multiplicity  = ", object%multiplicity
      write (u, "(3x,A,L1)")  "massive       = ", object%massive
      write (u, "(3x,A,I0)")  "chirality     = ", object%chirality
      write (u, "(3x,A,F10.7)")  "pol.degree    =", object%degree
      write (u, "(3x,A,L1)")  "pure state    = ", object%pure
      call object%smatrix_t%write (u, 1)
   end subroutine pmatrix_write
```

This assignment is trivial, but must be coded explicitly.

⟨*Polarizations: pmatrix: TBP*⟩+≡
```
    generic :: assignment(=) => pmatrix_assign_from_smatrix
    procedure, private :: pmatrix_assign_from_smatrix
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine pmatrix_assign_from_smatrix (pmatrix, smatrix)
      class(pmatrix_t), intent(out) :: pmatrix
      type(smatrix_t), intent(in) :: smatrix
      pmatrix%smatrix_t = smatrix
    end subroutine pmatrix_assign_from_smatrix
```

Declare spin, multiplicity, and polarization degree. Check whether all entries fit, and whether this is a valid matrix.

The required properties are:

1. all entries apply to the given spin and mass type

2. the diagonal is real

3. only the upper of corresponding off-diagonal elements is specified, i.e., the row index is less than the column index

4. the trace is nonnegative and equal to the polarization degree (the remainder, proportional to the unit matrix, is understood to be present)

5. the trace of the matrix square is positive and less or equal to the trace of the matrix itself, which is the polarization degree.

6. If the trace of the matrix square and the trace of the matrix are unity, we may have a pure state. (For spin up to 1/2, this is actually sufficient.)

⟨*Polarizations: pmatrix: TBP*⟩+≡
```
    procedure :: normalize => pmatrix_normalize
```

⟨*Polarizations: procedures*⟩+≡
```
    subroutine pmatrix_normalize (pmatrix, flv, degree, tolerance)
      class(pmatrix_t), intent(inout) :: pmatrix
      type(flavor_t), intent(in) :: flv
      real(default), intent(in), optional :: degree
      real(default), intent(in), optional :: tolerance
      integer :: i, hmax
      logical :: fermion, ok
```

1148

```fortran
real(default) :: trace, trace_sq

15.3.11 Data Transformation

Create a `polarization_t` object from the contents of a normalized `pmatrix_t` object. We scan the entries as present in `pmatrix` and transform them into a density matrix, if necessary. The density matrix then initializes the Bloch vector. This is analogous to `polarization_init_state_matrix`.

There is a subtlety associated with massless particles. Since the `pmatrix` doesn't contain the full density matrix but just the nontrivial part, we have to initialize the polarization object with the massless equipartion, which contains nonzero entries for the Cartan generators. The `set` method therefore should not erase those initial contents. This is a constraint for the implementation of `set`, as applied to the Bloch vector.

As mentioned above, `pmatrix_t` does not support an antiparticle flag.

⟨*Polarizations: polarization: TBP*⟩+≡
```

15.4.1 The particle type

Particle status codes

The overall status codes (incoming/outgoing etc.) are inherited from the module `subevents`.

Polarization status:

⟨*Particles: parameters*⟩≡
```
    integer, parameter, public :: PRT_UNPOLARIZED = 0
    integer, parameter, public :: PRT_DEFINITE_HELICITY = 1
    integer, parameter, public :: PRT_GENERIC_POLARIZATION = 2
```

Definition

The quantum numbers are flavor (from which invariant particle properties can be derived), color, and polarization. The particle may be unpolarized. In this case, `hel` and `pol` are unspecified. If it has a definite helicity, the `hel` component is defined. If it has a generic polarization, the `pol` component is defined. For each particle we store the four-momentum and the invariant mass squared, i.e., the squared norm of the four-momentum. There is also an optional list of parent and child particles, for bookkeeping in physical events. The `vertex` is an optional component that consists of a Lorentz 4-vector, denoting the position and time of the vertex (displaced vertex/time). `lifetime` is an optional component that accounts for the finite lifetime τ of a decaying particle. In case there is no magnetic field etc., the true decay vertex of a particle in the detector would be $\vec{v}' = \vec{v} + \tau \times \vec{p}/p^0$, where p^0 and $\vec{p}$ are the energy and 3-momentum of the particle.

⟨*Particles: public*⟩≡
```
    public :: particle_t

      type(flavor_t) :: flavor
      type(color_t) :: color
      call flavor%init (pdg, model)
      call particle%set_flavor (flavor)
      call color%init_col_acl (col, anti_col)
      call particle%set_color (color)
      call particle%set_status (status)
      call particle%set_momentum (mom)
    end subroutine particle_init_external
```

Initialize a particle using a single-particle state matrix which determines flavor,
color, and polarization. The state matrix must have unique flavor and color. The
factorization mode determines whether the particle is unpolarized, has definite
helicity, or generic polarization. This mode is translated into the polarization
status.

⟨*Particles: particle: TBP*⟩+≡
```
    generic :: init => init_state
    procedure :: init_state => particle_init_state

15.4.2 Particle sets

A particle set is what is usually called an event: an array of particles. The individual particle entries carry momentum, quantum numbers, polarization, and optionally connections. There is (also optionally) a correlated state-density matrix that maintains spin correlations that are lost in the individual particle entries.

⟨*Particles: public*⟩+≡
```
    public :: particle_set_t
```

⟨*Particles: types*⟩+≡
```
    type :: particle_set_t
       ! private !!!
       integer :: n_beam = 0
       integer :: n_in  = 0
       integer :: n_vir = 0
       integer :: n_out = 0
       integer :: n_tot = 0
       integer :: factorization_mode = FM_IGNORE_HELICITY
       type(particle_t), dimension(:), allocatable :: prt
       type(state_matrix_t) :: correlated_state
     contains
     ⟨Particles: particle set: TBP⟩
    end type particle_set_t
```

A particle set can be initialized from an interaction or from a HepMC event record.

⟨*Particles: particle set: TBP*⟩≡
```
    generic :: init => init_interaction
    procedure :: init_interaction => particle_set_init_interaction
```

When a particle set is initialized from a given interaction, we have to determine the branch within the original state matrix that fixes the particle quantum numbers. This is done with the appropriate probabilities, based on a random number x. The `mode` determines whether the individual particles become unpolarized,
```

or take a definite (diagonal) helicity, or acquire single-particle polarization matrices. The flag `keep_correlations` tells whether the spin-correlation matrix is to be calculated and stored in addition to the particles. The flag `keep_virtual` tells whether virtual particles should be dropped. Note that if virtual particles are dropped, the spin-correlation matrix makes no sense, and parent-child relations are not set.

For a correct disentangling of color and flavor (in the presence of helicity), we consider two interactions. `int` has no color information, and is used to select a flavor state. Consequently, we trace over helicities here. `int_flows` contains color-flow and potentially helicity information, but is useful only after the flavor combination has been chosen. So this interaction is used to select helicity and color, but restricted to the selected flavor combination.

`int` and `int_flows` may be identical if there is only a single (or no) color flow. If there is just a single flavor combination, `x(1)` can be set to zero.

The current algorithm of evaluator convolution requires that the beam particles are assumed outgoing (in the beam interaction) and become virtual in all derived interactions. In the particle set they should be re-identified as incoming. The optional integer `n_incoming` can be used to perform this correction.

The flag `is_valid` is false if factorization of the state is not possible, in particular if the squared matrix element is zero.

⟨*Particles: procedures*⟩+≡

15.4.3   Manual build

Basic initialization.   Just allocate with a given number of beam, incoming, virtual, and outgoing particles.

⟨*Particles: particle set: TBP*⟩+≡
```
    procedure :: basic_init => particle_set_basic_init
```

⟨*Particles: procedures*⟩+≡
```
    subroutine particle_set_basic_init (particle_set, n_beam, n_in, n_vir, n_out)
      class(particle_set_t), intent(out) :: particle_set
      integer, intent(in) :: n_beam, n_in, n_vir, n_out
      particle_set%n_beam = n_beam
      particle_set%n_in = n_in
      particle_set%n_vir = n_vir
      particle_set%n_out = n_out
      particle_set%n_tot = n_beam + n_in + n_vir + n_out
      allocate (particle_set%prt (particle_set%n_tot))
    end subroutine particle_set_basic_init
```

Build a particle set from scratch. This is used for testing purposes. The ordering of particles in the result is beam-incoming-remnant-virtual-outgoing.
    Parent-child relations:

- Beams are parents of incoming and beam remnants. The assignment is alternating (first beam, second beam).

- Incoming are parents of virtual and outgoing, collectively.

More specific settings, such as resonance histories, cannot be set this way.
    Beam-remnant particles are counted as virtual, but have a different status code.
    We assume that the pdg array has the correct size.

⟨*Particles: particle set: TBP*⟩+≡

        call pset%prt(map(i))%set_flavor (source%prt(i)%get_flv ())
        call pset%prt(map(i))%set_color (source%prt(i)%get_col ())
        call pset%prt(map(i))%set_parents (map (source%prt(i)%get_parents ()))
        call pset%prt(map(i))%set_children (map (source%prt(i)%get_children ()))
     end do
   end subroutine particle_set_transfer
```

Insert a new particle as an intermediate into a previously empty position.

Flavor and status are just set. Color is not set (but see below). The complicated part is reassigning parent-child relations. The inserted particle comes with an array `child` of its children which are supposed to be existing particles.

We first scan all particles that come before the new insertion. Whenever a particle has children that coincide with the children of the new particle, those child entries are removed. (a) If the new particle has no parent entry yet, those child entries are replaced by the index of the new particle and simultaneously, the particle is registered as a parent of the new particle. (b) If the current particle already has a parent entry, those child entries are removed.

When this is done, the new particle is registered as the (only) parent of its children.

⟨*Particles: particle set: TBP*⟩+≡
```
   procedure :: insert => particle_set_insert
```

⟨*Particles: procedures*⟩+≡
```
   subroutine particle_set_insert (pset, i, status, flv, child)
     class(particle_set_t), intent(inout) :: pset

```

Assigning particles manually may result in color mismatches. This is checked here for all particles in the set. The color object is compared against the color type that belongs to the flavor object. The return value is an allocatable array which consists of the particles with invalid color assignments. If the array size is zero, all is fine.

15.4.5 I/O formats

Here, we define input/output of particle sets in various formats. This is the right place since particle sets contain most of the event information.

All write/read routines take as first argument the object, as second argument the I/O unit which in this case is a mandatory argument. Then follow further event data.

Internal binary format

This format is supposed to contain the complete information, so the particle data set can be fully reconstructed. The exception is the model part of the particle flavors; this is unassigned for the flavor values read from file.

⟨*Particles: particle set: TBP*⟩+≡
```
procedure :: write_raw => particle_set_write_raw
procedure :: read_raw => particle_set_read_raw
```

⟨*Particles: procedures*⟩+≡
```
subroutine particle_set_write_raw (particle_set, u)
  class(particle_set_t), intent(in) :: particle_set
  integer, intent(in) :: u
  integer :: i
  write (u) &
       particle_set%n_beam, particle_set%n_in, &
       particle_set%n_vir, particle_set%n_out
  write (u) particle_set%factorization_mode

Transform a particle set into HEPEVT-compatible form. In this form, for each particle, the parents and the children are contiguous in the particle array. Usually, this requires to clone some particles.

We do not know in advance how many particles the canonical form will have. To be on the safe side, allocate four times the original size.

This procedure reconstructs an array of vertex indices from the parent-child information in the particle entries, according to the HepMC scheme. For each particle, we determine which vertex it comes from and which vertex it goes to. We return the two arrays and the maximum vertex index.

For each particle in the list, we first check its parents. If for any parent the vertex where it goes to is already known, this vertex index is assigned as the current 'from' vertex. Otherwise, a new index is created, assigned as the current 'from' vertex, and as the 'to' vertex for all parents.

Then, the analogous procedure is done for the children.

Furthermore, we assign to each vertex the vertex position from the parent(s). We check that these vertex positions coincide, and if not return a null vector.

15.4.6 Expression interface

This converts a `particle_set` object as defined here to a more concise `subevt` object that can be used as the event root of an expression. In particular, the latter lacks virtual particles, spin correlations and parent-child relations.

We keep beam particles, incoming partons, and outgoing partons. Furthermore, we keep radiated particles (a.k.a. beam remnants) if they have no children in the current particle set, and mark them as outgoing particles.

If `colorize` is set and true, mark all particles in the subevent as colorized, and set color/anticolor flow indices where they are defined. Colorless particles do not get indices but are still marked as colorized, for consistency.

```

This routines orders the outgoing particles into clusters of colorless particles and such of particles ordered corresponding to the indices of the color lines. All outgoing particles in the ordered set appear as child of the corresponding outgoing particle in the unordered set, including colored beam remnants. We always start continue via the anti-color line, such that color flows within each Lund string system is always continued from the anticolor of one particle to the identical color index of another particle.

Chapter 16

Beams

These modules implement beam configuration and beam structure, the latter in abstract terms.

beam_structures The `beam_structure_t` type is a messenger type that communicates the user settings to the `WHIZARD` core.

beams Beam configuration.

sf_aux Tools for handling structure functions and splitting

sf_mappings Mapping functions, useful for structure function implementation

sf_base The abstract structure-function interaction and structure-function chain types.

These are the implementation modules, the concrete counterparts of `sf_base`:

sf_isr ISR structure function (photon radiation inclusive and resummed in collinear and IR regions).

sf_epa Effective Photon Approximation.

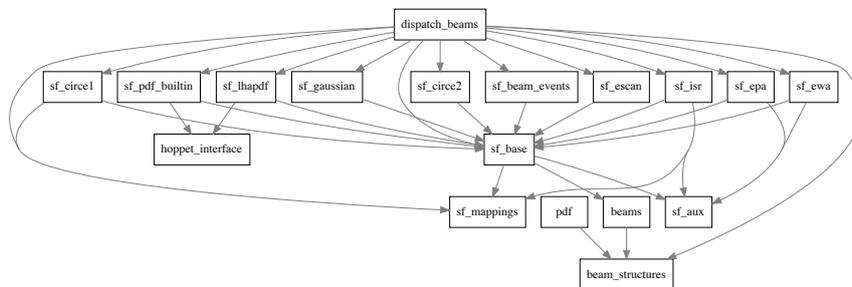
sf_ewa Effective W (and Z) approximation.


Figure 16.1: Module dependencies in `src/beams`.

sf_escan Energy spectrum that emulates a uniform energy scan.

sf_gaussian Gaussian beam spread

sf_beam_events Beam-event generator that reads its input from an external file.

sf_circe1 CIRCE1 beam spectra for electrons and photons.

sf_circe2 CIRCE2 beam spectra for electrons and photons.

hoppet_interface Support for b-quark matching, addon to PDF modules.

sf_pdf_builtin Direct support for selected hadron PDFs.

sf_lhapdf LHAPDF library support.

16.1 Beam structure

This module stores the beam structure definition as it is declared in the SIN-DARIN script. The structure definition is not analyzed, just recorded for later use.

We do not capture any numerical parameters, just names of particles and structure functions.

    use diagnostics
    use lorentz
    use polarizations

  ⟨*Standard module head*⟩

  ⟨*Beam structures: public*⟩

  ⟨*Beam structures: types*⟩

  ⟨*Beam structures: interfaces*⟩

  contains

  ⟨*Beam structures: procedures*⟩

  end module beam_structures

16.1.1 Beam structure elements

An entry in a beam-structure record consists of a string that denotes a type of structure function.

⟨*Beam structures: types*⟩≡
    type :: beam_structure_entry_t
      logical :: is_valid = .false.
      type(string_t) :: name
    contains
    ⟨*Beam structures: beam structure entry: TBP*⟩
    end type beam_structure_entry_t

Output.

⟨*Beam structures: beam structure entry: TBP*⟩≡
    procedure :: to_string => beam_structure_entry_to_string

⟨*Beam structures: procedures*⟩≡
    function beam_structure_entry_to_string (object) result (string)
      class(beam_structure_entry_t), intent(in) :: object

```
    type(string_t) :: string
    if (object%is_valid) then
        string = object%name
    else
        string = "none"
    end if
end function beam_structure_entry_to_string
```

A record in the beam-structure sequence denotes either a structure-function entry, a pair of such entries, or a pair spectrum.

⟨*Beam structures: types*⟩+≡
```
type :: beam_structure_record_t
    type(beam_structure_entry_t), dimension(:), allocatable :: entry
end type beam_structure_record_t
```

16.1.2   Beam structure type

The beam-structure object contains the beam particle(s) as simple strings. The sequence of records indicates the structure functions by name. No numerical parameters are stored.

⟨*Beam structures: public*⟩≡
```
public :: beam_structure_t
```

⟨*Beam structures: types*⟩+≡
```
type :: beam_structure_t
    private
    integer :: n_beam = 0
    type(string_t), dimension(:), allocatable :: prt
    type(beam_structure_record_t), dimension(:), allocatable :: record
    type(smatrix_t), dimension(:), allocatable :: smatrix
    real(default), dimension(:), allocatable :: pol_f
    real(default), dimension(:), allocatable :: p
    real(default), dimension(:), allocatable :: theta
    real(default), dimension(:), allocatable :: phi
  contains
  ⟨Beam structures: beam structure: TBP⟩
end type beam_structure_t
```

The finalizer deletes all contents explicitly, so we can continue with an empty beam record. (It is not needed for deallocation.) We have distinct finalizers for the independent parts of the beam structure.

⟨*Beam structures: beam structure: TBP*⟩≡
```
procedure :: final_sf => beam_structure_final_sf
```

⟨*Beam structures: procedures*⟩+≡
```
subroutine beam_structure_final_sf (object)
    class(beam_structure_t), intent(inout) :: object
    if (allocated (object%prt))  deallocate (object%prt)
    if (allocated (object%record))  deallocate (object%record)
    object%n_beam = 0
end subroutine beam_structure_final_sf
```

Output. The actual information fits in a single line, therefore we can provide a
`to_string` method. The `show` method also lists the current values of relevant
global variables.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: write => beam_structure_write
    procedure :: to_string => beam_structure_to_string
```

⟨*Beam structures: procedures*⟩+≡

            if (size (object%record) > 0) then
               if (with_beams)  string = string // " => "
               do i = 1, size (object%record)
                  if (i > 1)  string = string // " => "
                  do j = 1, size (object%record(i)%entry)
                     if (j > 1)  string = string // ", "
                     string = string // object%record(i)%entry(j)%to_string ()
                  end do
               end do
            end if
         end if
      case default
         string = "[any particles]"
      end select
    end function beam_structure_to_string
```

Initializer: dimension the beam structure record. Each array element denotes
the number of entries for a record within the beam-structure sequence. The
number of entries is either one or two, while the number of records is unlimited.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: init_sf => beam_structure_init_sf
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_init_sf (beam_structure, prt, dim_array)
      class(beam_structure_t), intent(inout) :: beam_structure
      type(string_t), dimension(:), intent(in) :: prt
      integer, dimension(:), intent(in), optional :: dim_array
      integer :: i
      call beam_structure%final_sf ()
      beam_structure%n_beam = size (prt)
      allocate (beam_structure%prt (size (prt)))
      beam_structure%prt = prt
      if (present (dim_array)) then
         allocate (beam_structure%record (size (dim_array)))
         do i = 1, size (dim_array)
            allocate (beam_structure%record(i)%entry (dim_array(i)))
         end do
      else
         allocate (beam_structure%record (0))
      end if
    end subroutine beam_structure_init_sf
```

Set an entry, specified by record number and entry number.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: set_sf => beam_structure_set_sf
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_set_sf (beam_structure, i, j, name)
      class(beam_structure_t), intent(inout) :: beam_structure
```

```
      integer, intent(in) :: i, j
      type(string_t), intent(in) :: name
      associate (entry => beam_structure%record(i)%entry(j))
        entry%name = name
        entry%is_valid = .true.
      end associate
    end subroutine beam_structure_set_sf
```

Expand the beam-structure object. (i) For a pair spectrum, keep the entry. (ii) For a single-particle structure function written as a single entry, replace this by a record with two entries. (ii) For a record with two nontrivial entries, separate this into two records with one trivial entry each.

To achieve this, we need a function that tells us whether an entry is a spectrum or a structure function. It returns 0 for a trivial entry, 1 for a single-particle structure function, and 2 for a two-particle spectrum.

⟨*Beam structures: interfaces*⟩≡
```
    abstract interface
       function strfun_mode_fun (name) result (n)
         import
         type(string_t), intent(in) :: name
         integer :: n
       end function strfun_mode_fun
    end interface
```

Algorithm: (1) Mark entries as invalid where necessary. (2) Count the number of entries that we will need. (3) Expand and copy entries to a new record array. (4) Replace the old array by the new one.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: expand => beam_structure_expand
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_expand (beam_structure, strfun_mode)
      class(beam_structure_t), intent(inout) :: beam_structure
      procedure(strfun_mode_fun) :: strfun_mode
      type(beam_structure_record_t), dimension(:), allocatable :: new
      integer :: n_record, i, j
      if (.not. allocated (beam_structure%record))  return
      do i = 1, size (beam_structure%record)

       end select
     end associate
  end do
  call move_alloc (from = new, to = beam_structure%record)
end subroutine beam_structure_expand
```

16.1.3 Polarization

To record polarization, we provide an allocatable array of `smatrix` objects, sparse matrices. The polarization structure is independent of the structure-function setup, they are combined only when an actual beam object is constructed.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: final_pol => beam_structure_final_pol
    procedure :: init_pol => beam_structure_init_pol
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_final_pol (beam_structure)
      class(beam_structure_t), intent(inout) :: beam_structure
      if (allocated (beam_structure%smatrix))  deallocate (beam_structure%smatrix)
      if (allocated (beam_structure%pol_f))  deallocate (beam_structure%pol_f)
    end subroutine beam_structure_final_pol

    subroutine beam_structure_init_pol (beam_structure, n)
      class(beam_structure_t), intent(inout) :: beam_structure
      integer, intent(in) :: n
      if (allocated (beam_structure%smatrix))  deallocate (beam_structure%smatrix)
      allocate (beam_structure%smatrix (n))
      if (.not. allocated (beam_structure%pol_f)) &
           allocate (beam_structure%pol_f (n), source = 1._default)
    end subroutine beam_structure_init_pol
```

Check if polarized beams are used.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: has_polarized_beams => beam_structure_has_polarized_beams
```

⟨*Beam structures: procedures*⟩+≡
```
    elemental function beam_structure_has_polarized_beams (beam_structure) result (pol)
      logical :: pol
      class(beam_structure_t), intent(in) :: beam_structure
      if (allocated (beam_structure%pol_f)) then
         pol = any (beam_structure%pol_f /= 0)
      else
         pol = .false.
      end if
    end function beam_structure_has_polarized_beams
```

Directly copy the spin density matrices.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: set_smatrix => beam_structure_set_smatrix
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_set_smatrix (beam_structure, i, smatrix)
      class(beam_structure_t), intent(inout) :: beam_structure
      integer, intent(in) :: i
      type(smatrix_t), intent(in) :: smatrix
      beam_structure%smatrix(i) = smatrix
    end subroutine beam_structure_set_smatrix
```

Initialize one of the spin density matrices manually.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: init_smatrix => beam_structure_init_smatrix
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_init_smatrix (beam_structure, i, n_entry)
      class(beam_structure_t), intent(inout) :: beam_structure
      integer, intent(in) :: i
      integer, intent(in) :: n_entry
      call beam_structure%smatrix(i)%init (2, n_entry)
    end subroutine beam_structure_init_smatrix
```

Set a polarization entry.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: set_sentry => beam_structure_set_sentry
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_set_sentry &
        (beam_structure, i, i_entry, index, value)
      class(beam_structure_t), intent(inout) :: beam_structure
      integer, intent(in) :: i
      integer, intent(in) :: i_entry
      integer, dimension(:), intent(in) :: index
      complex(default), intent(in) :: value
      call beam_structure%smatrix(i)%set_entry (i_entry, index, value)
    end subroutine beam_structure_set_sentry
```

Set the array of polarization fractions.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: set_pol_f => beam_structure_set_pol_f
```

⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_set_pol_f (beam_structure, f)
      class(beam_structure_t), intent(inout) :: beam_structure
      real(default), dimension(:), intent(in) :: f
      if (allocated (beam_structure%pol_f))  deallocate (beam_structure%pol_f)
      allocate (beam_structure%pol_f (size (f)), source = f)
    end subroutine beam_structure_set_pol_f
```

16.1.4 Beam momenta

By default, beam momenta are deduced from the `sqrts` value or from the mass of the decaying particle, assuming a c.m. setup. Here we set them explicitly.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: final_mom => beam_structure_final_mom
```

⟨*Beam structures: procedures*⟩+≡
```
  subroutine beam_structure_final_mom (beam_structure)
    class(beam_structure_t), intent(inout) :: beam_structure
    if (allocated (beam_structure%p))  deallocate (beam_structure%p)
    if (allocated (beam_structure%theta))  deallocate (beam_structure%theta)
    if (allocated (beam_structure%phi))  deallocate (beam_structure%phi)
  end subroutine beam_structure_final_mom
```

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: set_momentum => beam_structure_set_momentum
    procedure :: set_theta => beam_structure_set_theta
    procedure :: set_phi => beam_structure_set_phi
```
⟨*Beam structures: procedures*⟩+≡
```
    subroutine beam_structure_set_momentum (beam_structure, p)
      class(beam_structure_t), intent(inout) :: beam_structure
      real(default), dimension(:), intent(in) :: p
      if (allocated (beam_structure%p))  deallocate (beam_structure%p)
      allocate (beam_structure%p (size (p)), source = p)
    end subroutine beam_structure_set_momentum

    subroutine beam_structure_set_theta (beam_structure, theta)
      class(beam_structure_t), intent(inout) :: beam_structure
      real(default), dimension(:), intent(in) :: theta
      if (allocated (beam_structure%theta))  deallocate (beam_structure%theta)
      allocate (beam_structure%theta (size (theta)), source = theta)
    end subroutine beam_structure_set_theta

    subroutine beam_structure_set_phi (beam_structure, phi)
      class(beam_structure_t), intent(inout) :: beam_structure
      real(default), dimension(:), intent(in) :: phi
      if (allocated (beam_structure%phi))  deallocate (beam_structure%phi)
      allocate (beam_structure%phi (size (phi)), source = phi)
    end subroutine beam_structure_set_phi
```

16.1.5   Get contents

Look at the incoming particles. We may also have the case that beam particles
are not specified, but polarization.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: is_set => beam_structure_is_set
    procedure :: get_n_beam => beam_structure_get_n_beam
    procedure :: get_prt => beam_structure_get_prt
```
⟨*Beam structures: procedures*⟩+≡
```
    function beam_structure_is_set (beam_structure) result (flag)
      class(beam_structure_t), intent(in) :: beam_structure
      logical :: flag
      flag = beam_structure%n_beam > 0 .or. beam_structure%asymmetric ()
    end function beam_structure_is_set

    function beam_structure_get_n_beam (beam_structure) result (n)
      class(beam_structure_t), intent(in) :: beam_structure
      integer :: n
      n = beam_structure%n_beam
    end function beam_structure_get_n_beam

    function beam_structure_get_prt (beam_structure) result (prt)
      class(beam_structure_t), intent(in) :: beam_structure
      type(string_t), dimension(:), allocatable :: prt
      allocate (prt (size (beam_structure%prt)))
```

```
      prt = beam_structure%prt
    end function beam_structure_get_prt
```

Return the number of records.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: get_n_record => beam_structure_get_n_record
```

⟨*Beam structures: procedures*⟩+≡
```
    function beam_structure_get_n_record (beam_structure) result (n)
      class(beam_structure_t), intent(in) :: beam_structure
      integer :: n
      if (allocated (beam_structure%record)) then
         n = size (beam_structure%record)
      else
         n = 0
      end if
    end function beam_structure_get_n_record
```

Return an array consisting of the beam indices affected by the valid entries
within a record. After expansion, there should be exactly one valid entry per
record.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: get_i_entry => beam_structure_get_i_entry
```

⟨*Beam structures: procedures*⟩+≡
```
    function beam_structure_get_i_entry (beam_structure, i) result (i_entry)
      class(beam_structure_t), intent(in) :: beam_structure
      integer, intent(in) :: i
      integer, dimension(:), allocatable :: i_entry
      associate (record => beam_structure%record(i))
        select case (size (record%entry))
        case (1)
           if (record%entry(1)%is_valid) then
              allocate (i_entry (2), source = [1, 2])
           else
              allocate (i_entry (0))
           end if
        case (2)
           if (all (record%entry%is_valid)) then
              allocate (i_entry (2), source = [1, 2])
           else if (record%entry(1)%is_valid) then
              allocate (i_entry (1), source = [1])
           else if (record%entry(2)%is_valid) then
              allocate (i_entry (1), source = [2])
           else
              allocate (i_entry (0))
           end if
        end select
      end associate
    end function beam_structure_get_i_entry
```

Return the name of the first valid entry within a record. After expansion, there
should be exactly one valid entry per record.

⟨*Beam structures: beam structure: TBP*⟩+≡

```
    procedure :: get_name => beam_structure_get_name
```

⟨*Beam structures: procedures*⟩+≡
```
    function beam_structure_get_name (beam_structure, i) result (name)
      type(string_t) :: name
      class(beam_structure_t), intent(in) :: beam_structure
      integer, intent(in) :: i
      associate (record => beam_structure%record(i))
        if (record%entry(1)%is_valid) then
           name = record%entry(1)%name
        else if (size (record%entry) == 2) then
           name = record%entry(2)%name
        end if
      end associate
    end function beam_structure_get_name
```

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: has_pdf => beam_structure_has_pdf
```

⟨*Beam structures: procedures*⟩+≡
```
    function beam_structure_has_pdf (beam_structure) result (has_pdf)
      logical :: has_pdf
      class(beam_structure_t), intent(in) :: beam_structure
      integer :: i
      type(string_t) :: name
      has_pdf = .false.
      do i = 1, beam_structure%get_n_record ()
        name = beam_structure%get_name (i)
        has_pdf = has_pdf .or. name == var_str ("pdf_builtin") .or. name == var_str ("lhapdf")
      end do
    end function beam_structure_has_pdf
```

Return true if the beam structure contains a particular structure function identifier (such as `lhapdf`, `isr`, etc.)

⟨*Beam structures: beam structure: TBP*⟩+≡
```
    procedure :: contains => beam_structure_contains
```

⟨*Beam structures: procedures*⟩+≡
```
    function beam_structure_contains (beam_structure, name) result (flag)
      class(beam_structure_t), intent(in) :: beam_structure
      character(*), intent(in) :: name
      logical :: flag
      integer :: i, j
      flag = .false.
      if (allocated (beam_structure%record)) then
         do i = 1, size (beam_structure%record)
            do j = 1, size (beam_structure%record(i)%entry)
               flag = beam_structure%record(i)%entry(j)%name == name
               if (flag)  return
            end do
         end do
      end if
    end function beam_structure_contains
```

Return polarization data.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
procedure :: polarized => beam_structure_polarized
procedure :: get_smatrix => beam_structure_get_smatrix
procedure :: get_pol_f => beam_structure_get_pol_f
procedure :: asymmetric => beam_structure_asymmetric
```
⟨*Beam structures: procedures*⟩+≡
```
function beam_structure_polarized (beam_structure) result (flag)
  class(beam_structure_t), intent(in) :: beam_structure
  logical :: flag

               &momentum/a p undefined")
      end if
   end function beam_structure_get_momenta
```

Check for a complete beam structure. The `applies` flag tells if the beam structure should actually be used for a process with the given `n_in` number of incoming particles.

It set if the beam structure matches the process as either decay or scattering. It is unset if beam structure references a scattering setup but the process is a decay. It is also unset if the beam structure itself is empty.

If the beam structure cannot be used, terminate with fatal error.

⟨*Beam structures: beam structure: TBP*⟩+≡
```
      procedure :: check_against_n_in => beam_structure_check_against_n_in
```

⟨*Beam structures: procedures*⟩+≡
```

16.2.1 Beam data

The beam data type contains beam data for one or two beams, depending on whether we are dealing with beam collisions or particle decay. In addition, it holds the c.m. energy sqrts, the Lorentz transformation L that transforms the c.m. system into the lab system, and the pair of c.m. momenta.

⟨Beams: public⟩≡
```
    public :: beam_data_t
```

⟨*Beams: types*⟩≡
```
type :: beam_data_t
  logical :: initialized = .false.
  integer :: n = 0
  type(flavor_t), dimension(:), allocatable :: flv
  real(default), dimension(:), allocatable :: mass
  type(pmatrix_t), dimension(:), allocatable :: pmatrix
  logical :: lab_is_cm_frame = .true.
  type(vector4_t), dimension(:), allocatable :: p_cm
  type(vector4_t), dimension(:), allocatable :: p
  type(lorentz_transformation_t), allocatable  :: L_cm_to_lab
  real(default) :: sqrts = 0
  character(32) :: md5sum = ""
 contains
 ⟨Beams: beam data: TBP⟩
end type beam_data_t
```

Generic initializer. This is called by the specific initializers below. Initialize either for decay or for collision.

⟨*Beams: procedures*⟩≡
```
subroutine beam_data_init (beam_data, n)
  type(beam_data_t), intent(out) :: beam_data
  integer, intent(in) :: n
  beam_data%n = n
  allocate (beam_data%flv (n))
  allocate (beam_data%mass (n))
  allocate (beam_data%pmatrix (n))
  allocate (beam_data%p_cm (n))
  allocate (beam_data%p (n))
  beam_data%initialized = .true.
end subroutine beam_data_init
```

Finalizer: needed for the polarization components of the beams.

⟨*Beams: beam data: TBP*⟩≡
```
procedure :: final => beam_data_final
```

⟨*Beams: procedures*⟩+≡
```
subroutine beam_data_final (beam_data)
  class(beam_data_t), intent(inout) :: beam_data
  beam_data%initialized = .false.
end subroutine beam_data_final
```

The verbose (default) version is for debugging. The short version is for screen output in the UI.

⟨*Beams: beam data: TBP*⟩+≡
```
procedure :: write => beam_data_write
```

⟨*Beams: procedures*⟩+≡
```

16.2.2   Initializers: beam structure

Initialize the beam data object from a beam structure object, given energy and model.

⟨*Beams: beam data: TBP*⟩+≡
```
procedure :: init_structure => beam_data_init_structure
```

⟨*Beams: procedures*⟩+≡
```
subroutine beam_data_init_structure &
     (beam_data, structure, sqrts, model, decay_rest_frame)
  class(beam_data_t), intent(out) :: beam_data
  type(beam_structure_t), intent(in) :: structure
  integer :: n_beam
  real(default), intent(in) :: sqrts
  class(model_data_t), intent(in), target :: model
  logical, intent(in), optional :: decay_rest_frame
  type(flavor_t), dimension(:), allocatable :: flv
  n_beam = structure%get_n_beam ()
  allocate (flv (n_beam))
  call flv%init (structure%get_prt (), model)
  if (structure%asymmetric ()) then
     if (structure%polarized ()) then
        call beam_data%init_momenta (structure%get_momenta (), flv, &
             structure%get_smatrix (), structure%get_pol_f ())
     else
        call beam_data%init_momenta (structure%get_momenta (), flv)
     end if
  else
     select case (n_beam)
     case (1)
        if (structure%polarized ()) then
           call beam_data%init_decay (flv, &
                structure%get_smatrix (), structure%get_pol_f (), &
                rest_frame = decay_rest_frame)
        else
           call beam_data%init_decay (flv, &
                rest_frame = decay_rest_frame)
        end if
     case (2)
```

```
            if (structure%polarized ()) then
               call beam_data%init_sqrts (sqrts, flv, &
                     structure%get_smatrix (), structure%get_pol_f ())
            else
               call beam_data%init_sqrts (sqrts, flv)
            end if
         case default
            call msg_bug ("Beam data: invalid beam structure object")
         end select
      end if
   end subroutine beam_data_init_structure
```

16.2.3 Initializers: collisions

This is the simplest one: just the two flavors, c.m. energy, polarization. Color
is inferred from flavor. Beam momenta and c.m. momenta coincide.

⟨*Beams: beam data: TBP*⟩+≡
```
      procedure :: init_sqrts => beam_data_init_sqrts
```

⟨*Beams: procedures*⟩+≡
```
      subroutine beam_data_init_sqrts (beam_data, sqrts, flv, smatrix, pol_f)
        class(beam_data_t), intent(out) :: beam_data
        real(default), intent(in) :: sqrts
        type(flavor_t), dimension(:), intent(in) :: flv
        type(smatrix_t), dimension(:), intent(in), optional :: smatrix
        real(default), dimension(:), intent(in), optional :: pol_f
        real(default), dimension(size(flv)) :: E, p
        call beam_data_init (beam_data, size (flv))
        beam_data%sqrts = sqrts
        beam_data%lab_is_cm_frame = .true.
        select case (beam_data%n)
        case (1)
           E = sqrts;  p = 0
           beam_data%p_cm = vector4_moving (E, p, 3)
           beam_data%p = beam_data%p_cm
        case (2)
           beam_data%p_cm = colliding_momenta (sqrts, flv%get_mass ())
           beam_data%p = colliding_momenta (sqrts, flv%get_mass ())
        end select
        call beam_data_finish_initialization (beam_data, flv, smatrix, pol_f)
      end subroutine beam_data_init_sqrts
```

This version sets beam momenta directly, assuming that they are asymmetric,
i.e., lab frame and c.m. frame do not coincide. Polarization info is deferred to a
common initializer.

The Lorentz transformation that we compute here is not actually used in
the calculation; instead, it will be recomputed for each event in the subroutine
`phs_set_incoming_momenta`. We compute it here for the nominal beam setup
nevertheless, so we can print it and, in particular, include it in the MD5 sum.

⟨*Beams: beam data: TBP*⟩+≡
```

      rewind (unit)
      beam_data%md5sum = md5sum (unit)
      close (unit)
    end subroutine beam_data_compute_md5sum
```

16.2.4   Initializers: decays

This is the simplest one: decay in rest frame. We need just flavor and polar-
ization. Color is inferred from flavor. Beam momentum and c.m. momentum
coincide.

⟨*Beams: beam data: TBP*⟩+≡
```
    procedure :: init_decay => beam_data_init_decay
```

⟨*Beams: procedures*⟩+≡
```
    subroutine beam_data_init_decay (beam_data, flv, smatrix, pol_f, rest_frame)
      class(beam_data_t), intent(out) :: beam_data
      type(flavor_t), dimension(1), intent(in) :: flv
      type(smatrix_t), dimension(1), intent(in), optional :: smatrix
      real(default), dimension(:), intent(in), optional :: pol_f
      logical, intent(in), optional :: rest_frame
      real(default), dimension(1) :: m
```

```
      m = flv%get_mass ()
      if (present (smatrix)) then
         call beam_data%init_sqrts (m(1), flv, smatrix, pol_f)
      else
         call beam_data%init_sqrts (m(1), flv, smatrix, pol_f)
      end if
      if (present (rest_frame))  beam_data%lab_is_cm_frame = rest_frame
   end subroutine beam_data_init_decay
```

16.2.5   The beams type

Beam objects are interaction objects that contain the actual beam data including polarization and density matrix. For collisions, the beam object actually contains two beams.

⟨*Beams: public*⟩+≡
```
   public :: beam_t
```

⟨*Beams: types*⟩+≡
```
   type :: beam_t
      private
      type(interaction_t) :: int
   end type beam_t
```

The constructor contains code that converts beam data into the (entangled) particle-pair quantum state. First, we set the number of particles and polarization mask. (The polarization mask is handed over to all later interactions, so if helicity is diagonal or absent, this fact is used when constructing the hard-interaction events.) Then, we construct the entangled state that combines helicity, flavor and color of the two particles (where flavor and color are unique, while several helicity states are possible). Then, we transfer this state together with the associated values from the spin density matrix into the **interaction_t** object.

Calling the **add_state** method of the interaction object, we keep the entries of the helicity density matrix without adding them up. This ensures that for unpolarized states, we do not normalize but end up with an $1/N$ entry, where N is the initial-state multiplicity.

⟨*Beams: public*⟩+≡
```
   public :: beam_init
```

⟨*Beams: procedures*⟩+≡
```
   subroutine beam_init (beam, beam_data)
     type(beam_t), intent(out) :: beam
     type(beam_data_t), intent(in), target :: beam_data
     logical, dimension(beam_data%n) :: polarized, diagonal
     type(quantum_numbers_mask_t), dimension(beam_data%n) :: mask, mask_d
     type(state_matrix_t), target :: state_hel, state_fc, state_tmp
     type(state_iterator_t) :: it_hel, it_tmp
     type(quantum_numbers_t), dimension(:), allocatable :: qn
     complex(default) :: value
     real(default), parameter :: tolerance = 100 * epsilon (1._default)
     polarized = beam_data%pmatrix%is_polarized ()
```

```
          diagonal = beam_data%pmatrix%is_diagonal ()

16.3.1   Momentum splitting

Let us consider first an incoming parton with momentum k and invariant mass squared $s = k^2$ that splits into two partons with momenta q, p and invariant masses $t = q^2$ and $u = p^2$. (This is an abuse of the Mandelstam notation. t is actually the momentum transfer, assuming that p is radiated and q initiates the hard process.) The energy is split among the partons such that if $E = k^0$, we have $q^0 = xE$ and $p^0 = \bar{x}E$, where $\bar{x} \equiv 1 - x$.

We define the angle θ as the polar angle of p w.r.t. the momentum axis of the incoming momentum k. Ignoring azimuthal angle, we can write the four-momenta in the basis (E, p_T, p_L) as

$$k = \begin{pmatrix} E \\ 0 \\ p \end{pmatrix}, \qquad p = \begin{pmatrix} \bar{x}E \\ \bar{x}\bar{p}\sin\theta \\ \bar{x}\bar{p}\cos\theta \end{pmatrix}, \qquad q = \begin{pmatrix} xE \\ -\bar{x}\bar{p}\sin\theta \\ p - \bar{x}\bar{p}\cos\theta \end{pmatrix}, \qquad (16.1)$$

where the first two mass-shell conditions are

$$p^2 = E^2 - s, \qquad \bar{p}^2 = E^2 - \frac{u}{\bar{x}^2}. \qquad (16.2)$$

The second condition implies that, for positive u, $\bar{x}^2 > u/E^2$, or equivalently

$$x < 1 - \sqrt{u}/E. \qquad (16.3)$$

We are interested in the third mass-shell conditions: s and u are fixed, so we need t as a function of $\cos\theta$:

$$t = -2\bar{x}\left(E^2 - p\bar{p}\cos\theta\right) + s + u. \qquad (16.4)$$

Solving for $\cos\theta$, we get

$$\cos\theta = \frac{2\bar{x}E^2 + t - s - u}{2\bar{x}p\bar{p}}. \qquad (16.5)$$

We can compute $\sin\theta$ numerically as $\sin^2\theta = 1 - \cos^2\theta$, but it is important to reexpress this in view of numerical stability. To this end, we first determine the bounds for t. The cosine must be between -1 and 1, so the bounds are

$$t_0 = -2\bar{x}\left(E^2 + p\bar{p}\right) + s + u, \qquad (16.6)$$
$$t_1 = -2\bar{x}\left(E^2 - p\bar{p}\right) + s + u. \qquad (16.7)$$

Computing $\sin^2\theta$ from $\cos\theta$ above, we observe that the numerator is a quadratic polynomial in t which has the zeros t_0 and t_1, while the common denominator is given by $(2\bar{x}p\bar{p})^2$. Hence, we can write

$$\sin^2\theta = -\frac{(t - t_0)(t - t_1)}{(2\bar{x}p\bar{p})^2} \qquad \text{and} \qquad \cos\theta = \frac{(t - t_0) + (t - t_1)}{4\bar{x}p\bar{p}}, \qquad (16.8)$$

which is free of large cancellations near $t = t_0$ or $t = t_1$.

If all is massless, i.e., $s = u = 0$, this simplifies to

$$t_0 = -4\bar{x}E^2, \qquad\qquad\qquad t_1 = 0, \qquad\qquad (16.9)$$

$$\sin^2\theta = -\frac{t}{\bar{x}E^2}\left(1 + \frac{t}{4\bar{x}E^2}\right), \qquad \cos\theta = 1 + \frac{t}{2\bar{x}E^2}. \qquad (16.10)$$

Here is the implementation. First, we define a container for the kinematical integration limits and some further data.

Note: contents are public only for easy access in unit test.

        write (u, 1) "m2    =", d%m2
      end subroutine splitting_data_write
```

16.3.2 Constant data

This is the initializer for the data. The input consists of the incoming momentum, its invariant mass squared, and the invariant mass squared of the radiated particle. $m2$ is the *physical* mass squared of the outgoing particle. The t bounds depend on the chosen x value and cannot be determined yet.

⟨*SF aux: splitting data: TBP*⟩+≡
```
      procedure :: init => splitting_data_init
```

⟨*SF aux: procedures*⟩+≡
```
      subroutine splitting_data_init (d, k, mk2, mr2, mo2, collinear)
        class(splitting_data_t), intent(out) :: d
        type(vector4_t), intent(in) :: k
        real(default), intent(in) :: mk2, mr2, mo2
        logical, intent(in), optional :: collinear
        if (present (collinear))  d%collinear = collinear
        d%E = energy (k)
        d%x1 = 1 - sqrt (max (mr2, 0._default)) / d%E
        d%p = sqrt (d%E**2 - mk2)
        d%s = mk2
        d%u = mr2
        d%m2 = mo2
      end subroutine splitting_data_init
```

Retrieve the x bounds, if needed for x sampling. Generating an x value is done by the caller, since this is the part that depends on the nature of the structure function.

⟨*SF aux: splitting data: TBP*⟩+≡
```
      procedure :: get_x_bounds => splitting_get_x_bounds
```

⟨*SF aux: procedures*⟩+≡
```
      function splitting_get_x_bounds (d) result (x)
        class(splitting_data_t), intent(in) :: d
        real(default), dimension(2) :: x
        x = [ d%x0, d%x1 ]
      end function splitting_get_x_bounds
```

Now set the momentum fraction and compute t_0 and t_1.

[The calculation of t_1 is subject to numerical problems. The exact formula is ($s = m_i^2$, $u = m_r^2$)

$$ t_1 = -2\bar{x}E^2 + m_i^2 + m_r^2 + 2\bar{x}\sqrt{E^2 - m_i^2}\,\sqrt{E^2 - m_r^2/\bar{x}^2}. \qquad (16.11) $$

The structure-function paradigm is useful only if $E \gg m_i, m_r$. In a Taylor expansion for large E, the leading term cancels. The expansion of the square roots (to subleading order) yields

$$t_1 = xm_i^2 - \frac{x}{\bar{x}}m_r^2. \tag{16.12}$$

There are two cases of interest: $m_i = m_o$ and $m_r = 0$,

$$t_1 = xm_o^2 \tag{16.13}$$

and $m_i = m_r$ and $m_o = 0$,

$$t_1 = -\frac{x^2}{\bar{x}}m_i^2. \tag{16.14}$$

In both cases, $t_1 \leq m_o^2$.]

That said, it turns out that taking the t_1 evaluation at face value leads to less problems than the approximation. We express the angles in terms of $t - t_0$ and $t - t_1$. Numerical noise in t_1 can then be tolerated.

⟨*SF aux: splitting data: TBP*⟩+≡
```
procedure :: set_t_bounds => splitting_set_t_bounds
```

⟨*SF aux: procedures*⟩+≡
```
elemental subroutine splitting_set_t_bounds (d, x, xb)
  class(splitting_data_t), intent(inout) :: d
  real(default), intent(in), optional :: x, xb
  real(default) :: tp, tm
  if (present (x))  d%x = x
  if (present (xb)) d%xb = xb
  if (vanishes (d%u)) then
     d%pb = d%E
  else
     if (.not. vanishes (d%xb)) then
        d%pb = sqrt (max (d%E**2 - d%u / d%xb**2, 0._default))
     else
        d%pb = 0
     end if
  end if
  tp = -2 * d%xb * d%E**2 + d%s + d%u
  tm = -2 * d%xb * d%p * d%pb
  d%t0 = tp + tm
  d%t1 = tp - tm
  d%t = d%t1
end subroutine splitting_set_t_bounds
```

16.3.3 Sampling recoil

Compute a value for the momentum transfer t, using a random number r. We assume a logarithmic distribution for $t - m^2$, corresponding to the propagator $1/(t - m^2)$ with the physical mass m for the outgoing particle. Optionally, we can narrow the kinematical bounds.

If all three masses in the splitting vanish, the upper limit for t is zero. In that case, the t value is set to zero and the splitting will be collinear.

⟨*SF aux: splitting data: TBP*⟩+≡
```
procedure :: sample_t => splitting_sample_t
```

⟨*SF aux: procedures*⟩+≡
```
    subroutine splitting_sample_t (d, r, t0, t1)
      class(splitting_data_t), intent(inout) :: d
      real(default), intent(in) :: r
      real(default), intent(in), optional :: t0, t1
      real(default) :: tt0, tt1, tt0m, tt1m
      if (d%collinear) then
         d%t = d%t1
      else
         tt0 = d%t0;  if (present (t0))  tt0 = max (t0, tt0)
         tt1 = d%t1;  if (present (t1))  tt1 = min (t1, tt1)
         tt0m = tt0 - d%m2
         tt1m = tt1 - d%m2
         if (tt0m < 0 .and. tt1m < 0 .and. abs(tt0m) > &
              epsilon(tt0m) .and. abs(tt1m) > epsilon(tt0m)) then
            d%t = d%m2 + tt0m * exp (r * log (tt1m / tt0m))
         else
            d%t = tt1
         end if
      end if
    end subroutine splitting_sample_t
```

The inverse operation: Given t, we recover the value of r that would have produced this value.

⟨*SF aux: splitting data: TBP*⟩+≡
```
    procedure :: inverse_t => splitting_inverse_t
```

⟨*SF aux: procedures*⟩+≡
```
    subroutine splitting_inverse_t (d, r, t0, t1)
      class(splitting_data_t), intent(in) :: d
      real(default), intent(out) :: r
      real(default), intent(in), optional :: t0, t1
      real(default) :: tt0, tt1, tt0m, tt1m
      if (d%collinear) then
         r = 0
      else
         tt0 = d%t0;  if (present (t0))  tt0 = max (t0, tt0)
         tt1 = d%t1;  if (present (t1))  tt1 = min (t1, tt1)
         tt0m = tt0 - d%m2
         tt1m = tt1 - d%m2
         if (tt0m < 0 .and. tt1m < 0) then
            r = log ((d%t - d%m2) / tt0m) / log (tt1m / tt0m)
         else
            r = 0
         end if
      end if
    end subroutine splitting_inverse_t
```

This is trivial, but provided for convenience:

⟨*SF aux: splitting data: TBP*⟩+≡
```
    procedure :: sample_phi => splitting_sample_phi
```

⟨*SF aux: procedures*⟩+≡
```
    subroutine splitting_sample_phi (d, r)
```

1296

```
      class(splitting_data_t), intent(inout) :: d
      real(default), intent(in) :: r
      if (d%collinear) then
          d%phi = 0
      else
          d%phi = (1-r) * d%phi0 + r * d%phi1
      end if
  end subroutine splitting_sample_phi
```

Inverse:

⟨*SF aux: splitting data: TBP*⟩+≡
```
    procedure :: inverse_phi => splitting_inverse_phi
```

⟨*SF aux: procedures*⟩+≡
```
    subroutine splitting_inverse_phi (d, r)
      class(splitting_data_t), intent(in) :: d

16.3.4 Splitting

In this function, we actually perform the splitting. The incoming momentum k is split into (if no recoil) $q_1 = (1 - x)k$ and $q_2 = xk$.

Apart from the splitting data, we need the incoming momentum k, the momentum transfer t, and the azimuthal angle ϕ. The momentum fraction x is already known here.

Alternatively, we can split without recoil. The azimuthal angle is irrelevant, and the momentum transfer is always equal to the upper limit t_1, so the polar angle is zero. Obviously, if there are nonzero masses it is not possible to keep both energy-momentum conservation and at the same time all particles on shell. We choose for dropping the on-shell condition here.

             end if
          end function splitting_split_momentum
```

Momenta generated by splitting will in general be off-shell. They are on-shell
only if they are collinear and massless. This subroutine puts them on shell by
brute force, violating either momentum or energy conservation. The direction
of three-momentum is always retained.

If the energy is below mass shell, we return a zero momentum.

      p = vector4_moving (E, space_part (p))
   end select
 end subroutine on_shell
```

16.3.5   Recovering the splitting

This is the inverse problem. We have on-shell momenta and want to deduce the splitting parameters x, t, and ϕ.

Update 2018-08-22: As a true inverse to `splitting_split_momentum`, we now use not just a single momentum `q2` as before, but the momentum pair `q1`, `q2` for recovering x and $\bar{x}$ separately. If x happens to be close to 1, we would completely lose the tiny $\bar{x}$ value, otherwise, and thus get a meaningless result.

Momentum splitting: massless radiation

Compute momentum splitting for generic kinematics. It turns out that for $x = 0.5$, where $t - m^2$ is the geometric mean between its upper and lower bounds (this can be directly seen from the logarithmic distribution in the function `sample_t` for $r \equiv x = 1 - x = 0.5$), we arrive at an exact number $t = -0.15$ for the given input values.

Momentum splitting: massless parton

Compute momentum splitting for generic kinematics. It turns out that for $x = 0.5$, where $t - m^2$ is the geometric mean between its upper and lower

bounds, we arrive at an exact number $t = -0.36$ for the given input values.

Endpoint stability

Compute momentum splitting for collinear kinematics close to both endpoints.
In particular, check both directions $x \to$ momenta and momenta $\to x$.

For purely massless collinear splitting, the KEEP_XXX flag is irrelevant. We choose KEEP_ENERGY here.

16.4 Mappings for structure functions

In this module, we provide a wrapper for useful mappings of the unit (hyper-)square that we can apply to a set of structure functions.

In some cases it is useful, or even mandatory, to map the MC input parameters nontrivially onto a set of structure functions for the two beams. In all cases considered here, instead of $x_1, x_2, \ldots$ as parameters for the beams, we generate one parameter that is equal, or related to, the product $x_1 x_2 \cdots$ (so it directly corresponds to $\sqrt{s}$). The other parameters describe the distribution of energy (loss) between beams and radiations.

⟨sf_mappings.f90⟩≡
  ⟨*File header*⟩

```
  module sf_mappings
```

⟨Use kinds⟩
```
  use kinds, only: double
  use io_units
  use constants, only: pi, zero, one
  use numeric_utils
  use diagnostics
```

⟨Standard module head⟩

⟨SF mappings: public⟩

⟨SF mappings: parameters⟩

⟨SF mappings: types⟩

⟨SF mappings: interfaces⟩

```
contains
```

⟨SF mappings: procedures⟩

```
end module sf_mappings
```

16.4.1 Base type

First, we define an abstract base type for the mapping. In all cases we need to store the indices of the parameters on which the mapping applies. Additional parameters can be stored in the extensions of this type.

⟨SF mappings: public⟩≡
```
    public :: sf_mapping_t
```

⟨SF mappings: types⟩≡
```
    type, abstract :: sf_mapping_t
      integer, dimension(:), allocatable :: i
     contains
     ⟨SF mappings: sf mapping: TBP⟩
    end type sf_mapping_t
```

The output routine is deferred:

⟨SF mappings: sf mapping: TBP⟩≡
```
    procedure (sf_mapping_write), deferred :: write
```

⟨SF mappings: interfaces⟩≡
```
    abstract interface
      subroutine sf_mapping_write (object, unit)
        import
        class(sf_mapping_t), intent(in) :: object
        integer, intent(in), optional :: unit
      end subroutine sf_mapping_write
    end interface
```

Initializer for the base type. The array of parameter indices is allocated but initialized to zero.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
    procedure :: base_init => sf_mapping_base_init
```

⟨*SF mappings: procedures*⟩≡
```
    subroutine sf_mapping_base_init (mapping, n_par)
      class(sf_mapping_t), intent(out) :: mapping
      integer, intent(in) :: n_par
      allocate (mapping%i (n_par))
      mapping%i = 0
    end subroutine sf_mapping_base_init
```

Set an index value.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
    procedure :: set_index => sf_mapping_set_index
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_mapping_set_index (mapping, j, i)
      class(sf_mapping_t), intent(inout) :: mapping
      integer, intent(in) :: j, i
      mapping%i(j) = i
    end subroutine sf_mapping_set_index
```

Retrieve an index value.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
    procedure :: get_index => sf_mapping_get_index
```

⟨*SF mappings: procedures*⟩+≡
```
    function sf_mapping_get_index (mapping, j) result (i)
      class(sf_mapping_t), intent(inout) :: mapping
      integer, intent(in) :: j
      integer :: i
      i = mapping%i(j)
    end function sf_mapping_get_index
```

Return the dimensionality, i.e., the number of parameters.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
    procedure :: get_n_dim => sf_mapping_get_n_dim
```

⟨*SF mappings: procedures*⟩+≡
```
    function sf_mapping_get_n_dim (mapping) result (n)
      class(sf_mapping_t), intent(in) :: mapping
      integer :: n
      n = size (mapping%i)
    end function sf_mapping_get_n_dim
```

Computation: the values `p` are the input parameters, the values `r` are the output parameters. The values `rb` are defined as $\bar{r} = 1 - r$, but provided explicitly. They allow us to avoid numerical problems near $r = 1$.

The extra parameter `x_free` indicates that the total energy has already been renormalized by this factor. We have to take such a factor into account in a resonance or on-shell mapping.

The Jacobian is `f`. We modify only the two parameters indicated by the indices `i`.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
procedure (sf_mapping_compute), deferred :: compute
```

⟨*SF mappings: interfaces*⟩+≡
```
abstract interface
   subroutine sf_mapping_compute (mapping, r, rb, f, p, pb, x_free)
     import
     class(sf_mapping_t), intent(inout) :: mapping
     real(default), dimension(:), intent(out) :: r, rb
     real(default), intent(out) :: f
     real(default), dimension(:), intent(in) :: p, pb
     real(default), intent(inout), optional :: x_free
   end subroutine sf_mapping_compute
end interface
```

The inverse mapping. Use `r` and/or `rb` to reconstruct `p` and also compute `f`.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
procedure (sf_mapping_inverse), deferred :: inverse
```

⟨*SF mappings: interfaces*⟩+≡
```
abstract interface
   subroutine sf_mapping_inverse (mapping, r, rb, f, p, pb, x_free)
     import
     class(sf_mapping_t), intent(inout) :: mapping
     real(default), dimension(:), intent(in) :: r, rb
     real(default), intent(out) :: f
     real(default), dimension(:), intent(out) :: p, pb
     real(default), intent(inout), optional :: x_free
   end subroutine sf_mapping_inverse
end interface
```

16.4.2 Methods for self-tests

This is a shorthand for: inject parameters, compute the mapping, display results, compute the inverse, display again. We provide an output format for the parameters and, optionally, a different output format for the Jacobians.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
procedure :: check => sf_mapping_check
```

⟨*SF mappings: procedures*⟩+≡
```
subroutine sf_mapping_check (mapping, u, p_in, pb_in, fmt_p, fmt_f)
  class(sf_mapping_t), intent(inout) :: mapping
  integer, intent(in) :: u
  real(default), dimension(:), intent(in) :: p_in, pb_in
  character(*), intent(in) :: fmt_p
  character(*), intent(in), optional :: fmt_f
  real(default), dimension(size(p_in)) :: p, pb, r, rb
  real(default) :: f, tolerance
  tolerance = 1.5E-17
  p = p_in
  pb= pb_in
```

```
      call mapping%compute (r, rb, f, p, pb)
      call pacify (p, tolerance)
      call pacify (pb, tolerance)
      call pacify (r, tolerance)
      call pacify (rb, tolerance)
      write (u, "(3x,A,9(1x," // fmt_p // "))")  "p =", p
      write (u, "(3x,A,9(1x," // fmt_p // "))")  "pb=", pb

         write (u, "(3x,A,9(1x," // fmt_f // "))")  "f =", f
      else
         write (u, "(3x,A,9(1x," // fmt_p // "))")  "f =", f
      end if
      write (u, *)
      write (u, "(3x,A,9(1x," // fmt_p // "))")  "*r=", product (r)
    end subroutine sf_mapping_check
```

This is a consistency check for the self-tests: the integral over the unit square should be unity. We estimate this by a simple binning and adding up the values; this should be sufficient for a self-test.

The argument is the requested number of sampling points. We take the square root for binning in both dimensions, so the precise number might be different.

⟨*SF mappings: sf mapping: TBP*⟩+≡
```
    procedure :: integral => sf_mapping_integral
```

⟨*SF mappings: procedures*⟩+≡
```

```

16.4.4 Implementation: resonance pair mapping

This maps the unit square (r_1, r_2) such that p_1 is the product $r_1 r_2$, while p_2 is related to the ratio, then it maps p_1 to itself according to a Breit-Wigner shape, i.e., a flat prior distribution in p_1 results in a Breit-Wigner distribution. Mass and width of the BW are rescaled by the energy, thus dimensionless fractions.

16.4.5 Implementation: resonance single mapping

While simpler, this is needed for structure-function setups only in exceptional cases.

This maps the unit interval (r_1) to itself according to a Breit-Wigner shape, i.e., a flat prior distribution in r_1 results in a Breit-Wigner distribution. Mass and width of the BW are rescaled by the energy, thus dimensionless fractions.

```

16.4.6 Implementation: on-shell mapping

This is a degenerate version of the unit-square mapping where the product $r_1 r_2$ is constant. This product is given by the rescaled squared mass. We introduce an artificial first parameter p_1 to keep the counting, but nothing depends on it. The second parameter is the same p_2 as for the standard unit-square mapping for $\alpha = 1$, it parameterizes the ratio of r_1 and r_2.

⟨*SF mappings: public*⟩+≡
```
   public :: sf_os_mapping_t
```

⟨*SF mappings: types*⟩+≡
```
   type, extends (sf_mapping_t) :: sf_os_mapping_t
     real(default) :: m = 0
     real(default) :: lm2 = 0
    contains
    ⟨SF mappings: sf on-shell mapping: TBP⟩
   end type sf_os_mapping_t
```

Output.
⟨*SF mappings: sf on-shell mapping: TBP*⟩≡
```
   procedure :: write => sf_os_mapping_write
```

⟨*SF mappings: procedures*⟩+≡
```
   subroutine sf_os_mapping_write (object, unit)
     class(sf_os_mapping_t), intent(in) :: object
     integer, intent(in), optional :: unit
     integer :: u
     u = given_output_unit (unit)
     write (u, "(1x,A)", advance="no")  "map"
     if (any (object%i /= 0)) then
        write (u, "('(',I0,',',I0,')')", advance="no")  object%i
     end if
     write (u, "(A,F7.5,A)")  ": on-shell (", object%m, ")"
   end subroutine sf_os_mapping_write
```

Initialize: index pair and dimensionless mass parameter.
⟨*SF mappings: sf on-shell mapping: TBP*⟩+≡
```
   procedure :: init => sf_os_mapping_init
```

⟨*SF mappings: procedures*⟩+≡
```
   subroutine sf_os_mapping_init (mapping, m)
     class(sf_os_mapping_t), intent(out) :: mapping
     real(default), intent(in) :: m
     call mapping%base_init (2)
     mapping%m = m
     mapping%lm2 = abs (2 * log (mapping%m))
   end subroutine sf_os_mapping_init

    end subroutine sf_os_mapping_single_inverse
```

16.4.8   Implementation: endpoint mapping

This maps the unit square (r_1, r_2) such that p_1 is the product $r_1 r_2$, while p_2 is related to the ratio. Furthermore, we enhance the region at $r_1 = 1$ and $r_2 = 1$, which translates into $p_1 = 1$ and $p_2 = 0, 1$. The enhancement is such that any power-like singularity is caught. This is useful for beamstrahlung spectra.

In addition, we allow for a delta-function singularity in r_1 and/or r_2. The singularity is smeared to an interval of width ϵ. If nonzero, we distinguish the kinematical momentum fractions r_i from effective values x_i, which should go into the structure-function evaluation. A bin of width ϵ in r is mapped to $x = 1$ exactly, while the interval $(0, 1 - \epsilon)$ is mapped to $(0, 1)$ in x. The Jacobian reflects this distinction, and the logical **in_peak** allows for an unambiguous distinction.

The delta-peak fraction is used only for the integration self-test.

     pb(mapping%i(j)) = 1 - p2(j)
  end do
end subroutine sf_ep_mapping_inverse
```

16.4.9 Implementation: endpoint mapping with resonance

Like the endpoint mapping for p_2, but replace the endpoint mapping by a Breit-Wigner mapping for p_1. This covers resonance production in the presence of beamstrahlung.

If the flag `resonance` is unset, we skip the resonance mapping, so the parameter p_1 remains equal to $r_1 r_2$, as in the standard s-channel mapping.

⟨*SF mappings: public*⟩+≡
```
public :: sf_epr_mapping_t
```

⟨*SF mappings: types*⟩+≡
```
type, extends (sf_mapping_t) :: sf_epr_mapping_t
  real(default) :: a = 1
  real(default) :: m = 0
  real(default) :: w = 0
  logical :: resonance = .true.
 contains
 ⟨SF mappings: sf endpoint/res mapping: TBP⟩
end type sf_epr_mapping_t
```

Output.

⟨*SF mappings: sf endpoint/res mapping: TBP*⟩≡
```
procedure :: write => sf_epr_mapping_write
```

⟨*SF mappings: procedures*⟩+≡

```
subroutine sf_epr_mapping_write (object, unit)
  class(sf_epr_mapping_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)", advance="no")  "map"
  if (any (object%i /= 0)) then
      write (u, "('(',I0,',',I0,')')", advance="no")  object%i
  end if
  if (object%resonance) then
      write (u, "(A,F7.5,A,F7.5,', ',F7.5,A)")  ": ep/res (a = ", object%a, &
            " | ", object%m, object%w, ")"
  else
      write (u, "(A,F7.5,A)")  ": ep/nores (a = ", object%a, ")"
  end if
end subroutine sf_epr_mapping_write
```

Initialize: if mass and width are not given, we initialize a non-resonant version of the mapping.

16.4.15   Implementation: Endpoint + ISR + resonance

This is a combination of endpoint (i.e., beamstrahlung) and ISR power mapping, adapted for an s-channel resonance. The first two internal parameters

apply to the beamstrahlung spectrum, the last two to the ISR function for the first and second beam, respectively. The first and third parameters are the result of an overall resonance mapping, so on the outside, the first parameter is the total momentum fraction, the third one describes the distribution between beamstrahlung and ISR.

16.4.17 Basic formulas

Standard mapping of the unit square

This mapping of the unit square is appropriate in particular for structure functions which are concentrated at the lower end. Instead of a rectangular grid, one set of grid lines corresponds to constant parton c.m. energy. The other set is chosen such that the jacobian is only mildly singular ($\ln x$ which is zero at $x = 1$), corresponding to an initial concentration of sampling points at the maximum energy. If power is greater than one (the default), points are also concentrated at the lower end.

The formula is (power=α):

$$r_1 = (p_1^{p_2})^\alpha \tag{16.15}$$

$$r_2 = (p_1^{1-p_2})^\alpha \tag{16.16}$$

$$f = \alpha^2 p_1^{\alpha-1} |\log p_1| \tag{16.17}$$

and for the default case $\alpha = 1$:

$$r_1 = p_1^{p_2} \tag{16.18}$$

$$r_2 = p_1^{1-p_2} \tag{16.19}$$

$$f = |\log p_1| \tag{16.20}$$

⟨*SF mappings: procedures*⟩+≡
```
    subroutine map_unit_square (r, factor, p, power)
      real(default), dimension(2), intent(out) :: r
      real(default), intent(out) :: factor
      real(default), dimension(2), intent(in) :: p
      real(default), intent(in), optional :: power
      real(default) :: xx, yy
      factor = 1
      xx = p(1)
      yy = p(2)
      if (present(power)) then
         if (p(1) > 0 .and. power > 1) then
            xx = p(1)**power
            factor = factor * power * xx / p(1)
         end if
      end if
      if (.not. vanishes (xx)) then
         r(1) = xx ** yy
         r(2) = xx / r(1)
```

```
            factor = factor * abs (log (xx))
         else
            r = 0
         end if
       end subroutine map_unit_square
```

This is the inverse mapping.

⟨*SF mappings: procedures*⟩+≡
```
       subroutine map_unit_square_inverse (r, factor, p, power)
         real(kind=default), dimension(2), intent(in) :: r
         real(kind=default), intent(out) :: factor
         real(kind=default), dimension(2), intent(out) :: p
         real(kind=default), intent(in), optional :: power
         real(kind=default) :: lg, xx, yy
         factor = 1
         xx = r(1) * r(2)
         if (.not. vanishes (xx)) then
            lg = log (xx)
            if (.not. vanishes (lg)) then
               yy = log (r(1)) / lg
            else
               yy = 0
            end if
            p(2) = yy
            factor = factor * abs (lg)
            if (present(power)) then
               p(1) = xx**(1._default/power)
               factor = factor * power * xx / p(1)
            else
               p(1) = xx
            end if
         else
            p = 0
         end if
       end subroutine map_unit_square_inverse
```

Precise mapping of the unit square

A more precise version (with unit power parameter). This version should be
numerically stable near $x = 1$ and $y = 0, 1$. The formulas are again

$$r_1 = p_1^{p_2}, \qquad r_2 = p_1^{\bar{p}_2}, \qquad f = -\log p_1 \qquad (16.21)$$

but we compute both r_i and $\bar{r}_i$ simultaneously and make direct use of both p_i
and $\bar{p}_i$ as appropriate.

⟨*SF mappings: procedures*⟩+≡
```
       subroutine map_unit_square_prec (r, rb, factor, p, pb)
         real(default), dimension(2), intent(out) :: r
         real(default), dimension(2), intent(out) :: rb
         real(default), intent(out) :: factor
         real(default), dimension(2), intent(in) :: p
         real(default), dimension(2), intent(in) :: pb
```

```
      if (p(1) > 0.5_default) then
         call compute_prec_xy_1 (r(1), rb(1), p(1), pb(1), p (2))
         call compute_prec_xy_1 (r(2), rb(2), p(1), pb(1), pb(2))
         factor = - log_prec (p(1), pb(1))
      else if (.not. vanishes (p(1))) then
         call compute_prec_xy_0 (r(1), rb(1), p(1), pb(1), p (2))
         call compute_prec_xy_0 (r(2), rb(2), p(1), pb(1), pb(2))
         factor = - log_prec (p(1), pb(1))
      else
         r  = 0
         rb = 1
         factor = 0
      end if
   end subroutine map_unit_square_prec
```

This is the inverse mapping.

⟨SF mappings: procedures⟩+≡
```
   subroutine map_unit_square_inverse_prec (r, rb, factor, p, pb)
     real(default), dimension(2), intent(in) :: r
     real(default), dimension(2), intent(in) :: rb
     real(default), intent(out) :: factor
     real(default), dimension(2), intent(out) :: p
     real(default), dimension(2), intent(out) :: pb
     call inverse_prec_x (r, rb, p(1), pb(1))
     if (all (r > 0)) then
        if (rb(1) < rb(2)) then
           call inverse_prec_y (r, rb, p(2), pb(2))
        else
           call inverse_prec_y ([r(2),r(1)], [rb(2),rb(1)], pb(2), p(2))
        end if

     else
        p(1)  = 0
        pb(1) = 1
        p(2)  = 0.5_default
        pb(2) = 0.5_default
        factor = 0
     end if
   end subroutine map_unit_square_inverse_prec
```

This is an auxiliary function: evaluate the expression $\bar{z} = 1 - x^y$ in a numerically stable way. Instabilities occur for $y = 0$ and $x = 1$. The idea is to replace the bracket by the first terms of its Taylor expansion around $x = 1$ (read $\bar{x} \equiv 1 - x$)

$$1 - x^y = y\bar{x}\left(1 + \frac{1}{2}(1-y)\bar{x} + \frac{1}{6}(2-y)(1-y)\bar{x}^2\right) \qquad (16.22)$$

whenever this is the better approximation. Actually, the relative numerical error of the exact formula is about $\eta/(y\bar{x})$ where η is given by `epsilon(KIND)` in Fortran. The relative error of the approximation is better than the last included term divided by $(y\bar{x})$.

The first subroutine computes z and $\bar{z}$ near $x = 1$ where $\log x$ should be expanded, the second one near $x = 0$ where $\log x$ can be kept.

⟨*SF mappings: procedures*⟩+≡

```fortran
    subroutine compute_prec_xy_1 (z, zb, x, xb, y)
      real(default), intent(out) :: z, zb
      real(default), intent(in) :: x, xb, y
      real(default) :: a1, a2, a3
      a1 = y * xb
      a2 = a1 * (1 - y) * xb / 2
      a3 = a2 * (2 - y) * xb / 3
      if (abs (a3) < epsilon (a3)) then
         zb = a1 + a2 + a3
         z = 1 - zb
      else
         z = x ** y
         zb = 1 - z
      end if
    end subroutine compute_prec_xy_1

    subroutine compute_prec_xy_0 (z, zb, x, xb, y)
      real(default), intent(out) :: z, zb
      real(default), intent(in) :: x, xb, y
      real(default) :: a1, a2, a3, lx
      lx = -log (x)
      a1 = y * lx
      a2 = a1 * y * lx / 2
      a3 = a2 * y * lx / 3
      if (abs (a3) < epsilon (a3)) then
         zb = a1 + a2 + a3
         z = 1 - zb
      else
         z = x ** y
         zb = 1 - z
      end if
    end subroutine compute_prec_xy_0
```

For the inverse calculation, we evaluate $x = r_1 r_2$ in a stable way. Since it is just a polynomial, the expansion near $x = 1$ is analytically exact, and we don't need to choose based on precision.

⟨*SF mappings: procedures*⟩+≡

```fortran
    subroutine inverse_prec_x (r, rb, x, xb)
      real(default), dimension(2), intent(in) :: r, rb
      real(default), intent(out) :: x, xb
      real(default) :: a0, a1
      a0 = rb(1) + rb(2)
      a1 = rb(1) * rb(2)
      if (a0 > 0.5_default) then
         xb = a0 - a1
         x = 1 - xb
      else
         x = r(1) * r(2)
         xb = 1 - x
      end if
    end subroutine inverse_prec_x
```

The inverse calculation for the relative momentum fraction

$$y = \frac{1}{1 + \frac{\log r_2}{\log r_1}} \qquad (16.23)$$

is slightly more complicated. We should take the precise form of the logarithm, so we are safe near $r_i = 1$. A series expansion is required if $r_1 \ll r_2$, since then y becomes small. (We assume $r_1 < r_2$ here; for the opposite case, the arguments can be exchanged.)

⟨*SF mappings: procedures*⟩+≡

```
subroutine inverse_prec_y (r, rb, y, yb)
  real(default), dimension(2), intent(in) :: r, rb
  real(default), intent(out) :: y, yb
  real(default) :: log1, log2, a1, a2, a3
  log1 = log_prec (r(1), rb(1))
  log2 = log_prec (r(2), rb(2))
  if (abs (log2**3) < epsilon (one)) then
     if (abs(log1) < epsilon (one)) then
        y = zero
     else
        y = one / (one + log2 / log1)
     end if
     if (abs(log2) < epsilon (one)) then
        yb = zero
     else
        yb = one / (one + log1 / log2)
     end if
     return
  end if
  a1 = - rb(1) / log2
  a2 = - rb(1) ** 2 * (one / log2**2 + one / (2 * log2))
  a3 = - rb(1) ** 3 * (one / log2**3 + one / log2**2 + one/(3 * log2))
  if (abs (a3) < epsilon (a3)) then
     y  = a1 + a2 + a3
     yb = one - y
  else
     y  = one / (one + log2 / log1)
     yb = one / (one + log1 / log2)
  end if
end subroutine inverse_prec_y
```

Mapping for on-shell s-channel

The limiting case, if the product $r_1 r_2$ is fixed for on-shell production. The parameter p_1 is ignored. In the inverse mapping, it is returned zero.

The parameter x_free, if present, rescales the total energy. If it is less than one, the rescaled mass parameter m^2 should be increased accordingly.

Public for access in unit test.

⟨*SF mappings: public*⟩+≡

```
public :: map_on_shell
public :: map_on_shell_inverse
```

⟨*SF mappings: procedures*⟩+≡

```fortran
  subroutine map_on_shell (r, factor, p, lm2, x_free)
    real(default), dimension(2), intent(out) :: r
    real(default), intent(out) :: factor
    real(default), dimension(2), intent(in) :: p
    real(default), intent(in) :: lm2
    real(default), intent(in), optional :: x_free
    real(default) :: lx
    lx = lm2;  if (present (x_free))  lx = lx + log (x_free)
    r(1) = exp (- p(2) * lx)
    r(2) = exp (- (1 - p(2)) * lx)
    factor = lx
  end subroutine map_on_shell

  subroutine map_on_shell_inverse (r, factor, p, lm2, x_free)

    real(default), intent(in) :: lm2
    real(default), intent(in), optional :: x_free
    real(default) :: lx
    lx = lm2;  if (present (x_free))  lx = lx + log (x_free)
    p(1) = 0
    factor = 1
  end subroutine map_on_shell_single_inverse
```

Mapping for a Breit-Wigner resonance

This is the standard Breit-Wigner mapping. We apply it to a single variable,
independently of or in addition to a unit-square mapping. We assume here that
the limits for the variable are 0 and 1, and that the mass m and width w are
rescaled appropriately, so they are dimensionless and usually between 0 and 1.

If x_free is set, it rescales the total energy and thus mass and width, since
these are defined with respect to the total energy.

⟨*SF mappings: procedures*⟩+≡
```
    subroutine map_breit_wigner (r, factor, p, m, w, x_free)
      real(default), intent(out) :: r
      real(default), intent(out) :: factor
      real(default), intent(in) :: p
      real(default), intent(in) :: m
      real(default), intent(in) :: w
      real(default), intent(in), optional :: x_free
      real(default) :: m2, mw, a1, a2, a3, z, tmp
      m2 = m ** 2
      mw = m * w
      if (present (x_free)) then
         m2 = m2 / x_free
         mw = mw / x_free
      end if
      a1 = atan (- m2 / mw)
      a2 = atan ((1 - m2) / mw)
      a3 = (a2 - a1) * mw
      z = (1-p) * a1 + p * a2
      if (-pi/2 < z .and. z < pi/2) then
         tmp = tan (z)
         r = max (m2 + mw * tmp, 0._default)
         factor = a3 * (1 + tmp ** 2)
      else
         r = 0
         factor = 0
      end if
    end subroutine map_breit_wigner

    subroutine map_breit_wigner_inverse (r, factor, p, m, w, x_free)
      real(default), intent(in) :: r
      real(default), intent(out) :: factor
      real(default), intent(out) :: p
```

```
   real(default), intent(in) :: m
   real(default), intent(in) :: w
   real(default) :: m2, mw, a1, a2, a3, tmp
   real(default), intent(in), optional :: x_free
   m2 = m ** 2
   mw = m * w
   if (present (x_free)) then
      m2 = m2 / x_free
      mw = mw / x_free
   end if
   a1 = atan (- m2 / mw)
   a2 = atan ((1 - m2) / mw)
   a3 = (a2 - a1) * mw
   tmp = (r - m2) / mw
   p = (atan (tmp) - a1) / (a2 - a1)
   factor = a3 * (1 + tmp ** 2)
 end subroutine map_breit_wigner_inverse
```

Mapping with endpoint enhancement

This is a mapping which is close to the unit mapping, except that at the endpoint(s), the output values are exponentially enhanced.

$$y = \tanh(a \tan(\frac{\pi}{2} x)) \tag{16.24}$$

We have two variants: one covers endpoints at 0 and 1 symmetrically, while the other one (which essentially maps one-half of the range), covers only the endpoint at 1.

⟨*SF mappings: procedures*⟩+≡

```
   subroutine map_endpoint_1 (x3, factor, x1, a)
     real(default), intent(out) :: x3, factor
     real(default), intent(in) :: x1
     real(default), intent(in) :: a
     real(default) :: x2
     if (abs (x1) < 1) then
        x2 = tan (x1 * pi / 2)
        x3 = tanh (a * x2)
        factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
     else
        x3 = x1
        factor = 0
     end if
   end subroutine map_endpoint_1

   subroutine map_endpoint_inverse_1 (x3, factor, x1, a)
     real(default), intent(in) :: x3
     real(default), intent(out) :: x1, factor
     real(default), intent(in) :: a
     real(default) :: x2
     if (abs (x3) < 1) then
        x2 = atanh (x3) / a
        x1 = 2 / pi * atan (x2)
```

```
        factor = a * pi/2 * (1 + x2 ** 2) * (1 - x3 ** 2)
      else
         x1 = x3
         factor = 0
      end if
   end subroutine map_endpoint_inverse_1

   subroutine map_endpoint_01 (x4, factor, x0, a)
     real(default), intent(out) :: x4, factor
     real(default), intent(in) :: x0
     real(default), intent(in) :: a
     real(default) :: x1, x3
     x1 = 2 * x0 - 1
     call map_endpoint_1 (x3, factor, x1, a)
     x4 = (x3 + 1) / 2
   end subroutine map_endpoint_01

   subroutine map_endpoint_inverse_01 (x4, factor, x0, a)
     real(default), intent(in) :: x4
     real(default), intent(out) :: x0, factor
     real(default), intent(in) :: a
     real(default) :: x1, x3
     x3 = 2 * x4 - 1
     call map_endpoint_inverse_1 (x3, factor, x1, a)
     x0 = (x1 + 1) / 2
   end subroutine map_endpoint_inverse_01
```

Mapping with endpoint enhancement (ISR)

This is another endpoint mapping. It is designed to flatten the ISR singularity which is of power type at $x = 1$, i.e., if

$$\sigma = \int_0^1 dx\, f(x)\, G(x) = \int_0^1 dx\, \epsilon (1-x)^{-1+\epsilon} G(x), \qquad (16.25)$$

we replace this by

$$r = x^\epsilon \quad \Longrightarrow \quad \sigma = \int_0^1 dr\, G(1 - (1-r)^{1/\epsilon}). \qquad (16.26)$$

We expect that ϵ is small.

The actual mapping is $r \to x$ (so x emerges closer to 1). The Jacobian that we return is thus $1/f(x)$. We compute the mapping in terms of $\bar{x} \equiv 1 - x$, so we can achieve the required precision. Because some compilers show quite wild numeric fluctuations, we internally convert numeric types to explicit `double` precision.

⟨*SF mappings: public*⟩+≡
```
    public :: map_power_1
    public :: map_power_inverse_1
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine map_power_1 (xb, factor, rb, eps)
      real(default), intent(out) :: xb, factor
```

```fortran
      real(default), intent(in) :: rb
      real(double) :: rb_db, factor_db, eps_db, xb_db
      real(default), intent(in) :: eps
      rb_db = real (rb, kind=double)
      eps_db = real (eps, kind=double)
      xb_db = rb_db ** (1 / eps_db)
      if (rb_db > 0) then
         factor_db = xb_db / rb_db / eps_db
         factor = real (factor_db, kind=default)
      else
         factor = 0
      end if
      xb = real (xb_db, kind=default)
    end subroutine map_power_1

    subroutine map_power_inverse_1 (xb, factor, rb, eps)
      real(default), intent(in) :: xb
      real(default), intent(out) :: rb, factor
      real(double) :: xb_db, factor_db, eps_db, rb_db
      real(default), intent(in) :: eps
      xb_db = real (xb, kind=double)
      eps_db = real (eps, kind=double)
      rb_db = xb_db ** eps_db
      if (xb_db > 0) then
         factor_db = xb_db / rb_db / eps_db
         factor = real (factor_db, kind=default)
      else
         factor = 0
      end if
      rb = real (rb_db, kind=default)
    end subroutine map_power_inverse_1
```

Here we apply a power mapping to both endpoints. We divide the interval in two equal halves and apply the power mapping for the nearest endpoint, either 0 or 1.

⟨*SF mappings: procedures*⟩+≡

```fortran
    subroutine map_power_01 (y, yb, factor, r, eps)
      real(default), intent(out) :: y, yb, factor
      real(default), intent(in) :: r
      real(default), intent(in) :: eps
      real(default) :: u, ub, zp, zm
      u = 2 * r - 1
      if (u > 0) then
         ub = 2 * (1 - r)
         call map_power_1 (zm, factor, ub, eps)
         zp = 2 - zm
      else if (u < 0) then
         ub = 2 * r
         call map_power_1 (zp, factor, ub, eps)
         zm = 2 - zp
      else
         factor = 1 / eps
         zp = 1
```

```
       zm = 1
    end if
    y  = zp / 2
    yb = zm / 2
  end subroutine map_power_01

  subroutine map_power_inverse_01 (y, yb, factor, r, eps)
    real(default), intent(in) :: y, yb
    real(default), intent(out) :: r, factor
    real(default), intent(in) :: eps
    real(default) :: ub, zp, zm
    zp = 2 * y
    zm = 2 * yb
    if (zm < zp) then
       call map_power_inverse_1 (zm, factor, ub, eps)
       r = 1 - ub / 2
    else if (zp < zm) then
       call map_power_inverse_1 (zp, factor, ub, eps)
       r = ub / 2
    else
       factor = 1 / eps
       ub = 1
       r = ub / 2
    end if
  end subroutine map_power_inverse_01
```

Structure-function channels

A structure-function chain parameterization (channel) may contain a mapping that applies to multiple structure functions. This is described by an extension of the **sf_mapping_t** type. In addition, it may contain mappings that apply to (other) individual structure functions. The details of these mappings are implementation-specific.

The **sf_channel_t** type combines this information. It contains an array of map codes, one for each structure-function entry. The code values are:

none MC input parameters r directly become energy fractions x

single default mapping for a single structure-function entry

multi/s map $r \rightarrow x$ such that one MC input parameter is $\hat{s}/s$

multi/resonance as before, adapted to s-channel resonance

multi/on-shell as before, adapted to an on-shell particle in the s channel

multi/endpoint like multi/s, but enhance the region near $r_i = 1$

multi/endpoint/res endpoint mapping with resonance

multi/endpoint/os endpoint mapping for on-shell

multi/power/os like multi/endpoint, regulating a power singularity

⟨*SF mappings: parameters*⟩≡
```
integer, parameter :: SFMAP_NONE = 0
integer, parameter :: SFMAP_SINGLE = 1
integer, parameter :: SFMAP_MULTI_S = 2
integer, parameter :: SFMAP_MULTI_RES = 3
integer, parameter :: SFMAP_MULTI_ONS = 4
integer, parameter :: SFMAP_MULTI_EP = 5
integer, parameter :: SFMAP_MULTI_EPR = 6
integer, parameter :: SFMAP_MULTI_EPO = 7
integer, parameter :: SFMAP_MULTI_IP = 8
integer, parameter :: SFMAP_MULTI_IPR = 9
integer, parameter :: SFMAP_MULTI_IPO = 10
integer, parameter :: SFMAP_MULTI_EI = 11
integer, parameter :: SFMAP_MULTI_SRS = 13
integer, parameter :: SFMAP_MULTI_SON = 14
```

Then, it contains an allocatable entry for the multi mapping. This entry holds the MC-parameter indices on which the mapping applies (there may be more than one MC parameter per structure-function entry) and any parameters associated with the mapping.

There can be only one multi-mapping per channel.

⟨*SF mappings: public*⟩+≡
```
public :: sf_channel_t
```

⟨*SF mappings: types*⟩+≡
```
type :: sf_channel_t
   integer, dimension(:), allocatable :: map_code
   class(sf_mapping_t), allocatable :: multi_mapping
 contains
 ⟨SF mappings: sf channel: TBP⟩
end type sf_channel_t
```

The output format prints a single character for each structure-function entry and, if applicable, an account of the mapping parameters.

          case default
              write (u, "(1x,A)", advance="no") "?"
          end select
       end do
    else
       write (u, "(1x,A)", advance="no") "-"
    end if
    if (allocated (object%multi_mapping)) then
       write (u, "(1x,'/')", advance="no")
       call object%multi_mapping%write (u)
    else
       write (u, *)
    end if
  end subroutine sf_channel_write
```

Initializer for a single **sf_channel** object.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: init => sf_channel_init
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_init (channel, n_strfun)
      class(sf_channel_t), intent(out) :: channel
      integer, intent(in) :: n_strfun
      allocate (channel%map_code (n_strfun))
      channel%map_code = SFMAP_NONE
    end subroutine sf_channel_init
```

Assignment. This merely copies intrinsic assignment, but apparently the latter is bugged in gfortran 4.6.3, causing memory corruption.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    generic :: assignment (=) => sf_channel_assign
    procedure :: sf_channel_assign
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_assign (copy, original)
      class(sf_channel_t), intent(out) :: copy
      type(sf_channel_t), intent(in) :: original
```

```
        allocate (copy%map_code (size (original%map_code)))
        copy%map_code = original%map_code
        if (allocated (original%multi_mapping)) then
            allocate (copy%multi_mapping, source = original%multi_mapping)
        end if
    end subroutine sf_channel_assign
```

This initializer allocates an array of channels with common number of structure-
function entries, therefore it is not a type-bound procedure.

⟨*SF mappings: public*⟩+≡
```
    public :: allocate_sf_channels
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine allocate_sf_channels (channel, n_channel, n_strfun)
      type(sf_channel_t), dimension(:), intent(out), allocatable :: channel
      integer, intent(in) :: n_channel
      integer, intent(in) :: n_strfun
      integer :: c
      allocate (channel (n_channel))
      do c = 1, n_channel
          call channel(c)%init (n_strfun)
      end do
    end subroutine allocate_sf_channels
```

This marks a given subset of indices as single-mapping.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: activate_mapping => sf_channel_activate_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_activate_mapping (channel, i_sf)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      channel%map_code(i_sf) = SFMAP_SINGLE
    end subroutine sf_channel_activate_mapping
```

This sets an s-channel multichannel mapping. The parameter indices are not
yet set.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_s_mapping => sf_channel_set_s_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_s_mapping (channel, i_sf, power)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: power
      channel%map_code(i_sf) = SFMAP_MULTI_S
      allocate (sf_s_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_s_mapping_t)
          call mapping%init (power)
      end select
    end subroutine sf_channel_set_s_mapping
```

This sets an s-channel resonance multichannel mapping.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
procedure :: set_res_mapping => sf_channel_set_res_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
subroutine sf_channel_set_res_mapping (channel, i_sf, m, w, single)
  class(sf_channel_t), intent(inout) :: channel
  integer, dimension(:), intent(in) :: i_sf
  real(default), intent(in) :: m, w
  logical, intent(in) :: single
  if (single) then
     channel%map_code(i_sf) = SFMAP_MULTI_SRS
     allocate (sf_res_mapping_single_t :: channel%multi_mapping)
     select type (mapping => channel%multi_mapping)
     type is (sf_res_mapping_single_t)
        call mapping%init (m, w)
     end select
  else
     channel%map_code(i_sf) = SFMAP_MULTI_RES
     allocate (sf_res_mapping_t :: channel%multi_mapping)
     select type (mapping => channel%multi_mapping)
     type is (sf_res_mapping_t)
        call mapping%init (m, w)
     end select
  end if
end subroutine sf_channel_set_res_mapping
```

This sets an s-channel on-shell multichannel mapping. The length of the i_sf array must be 2. (The first parameter actually becomes an irrelevant dummy.)

⟨*SF mappings: sf channel: TBP*⟩+≡
```
procedure :: set_os_mapping => sf_channel_set_os_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
subroutine sf_channel_set_os_mapping (channel, i_sf, m, single)
  class(sf_channel_t), intent(inout) :: channel
  integer, dimension(:), intent(in) :: i_sf
  real(default), intent(in) :: m
  logical, intent(in) :: single
  if (single) then
     channel%map_code(i_sf) = SFMAP_MULTI_SON
     allocate (sf_os_mapping_single_t :: channel%multi_mapping)
     select type (mapping => channel%multi_mapping)
     type is (sf_os_mapping_single_t)
        call mapping%init (m)
     end select
  else
     channel%map_code(i_sf) = SFMAP_MULTI_ONS
     allocate (sf_os_mapping_t :: channel%multi_mapping)
     select type (mapping => channel%multi_mapping)
     type is (sf_os_mapping_t)
        call mapping%init (m)
     end select
  end if
end subroutine sf_channel_set_os_mapping
```

This sets an s-channel endpoint mapping. The parameter a is the slope parameter (default 1); increasing it moves the endpoint region (at $x = 1$ to lower values in the input parameter. region even more.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_ep_mapping => sf_channel_set_ep_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_ep_mapping (channel, i_sf, a)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: a
      channel%map_code(i_sf) = SFMAP_MULTI_EP
      allocate (sf_ep_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_ep_mapping_t)
         call mapping%init (a = a)
      end select
    end subroutine sf_channel_set_ep_mapping
```

This sets a resonant endpoint mapping.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_epr_mapping => sf_channel_set_epr_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_epr_mapping (channel, i_sf, a, m, w)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in) :: a, m, w
      channel%map_code(i_sf) = SFMAP_MULTI_EPR
      allocate (sf_epr_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_epr_mapping_t)
         call mapping%init (a, m, w)
      end select
    end subroutine sf_channel_set_epr_mapping
```

This sets an on-shell endpoint mapping.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_epo_mapping => sf_channel_set_epo_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_epo_mapping (channel, i_sf, a, m)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in) :: a, m
      channel%map_code(i_sf) = SFMAP_MULTI_EPO
      allocate (sf_epo_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_epo_mapping_t)
         call mapping%init (a, m)
      end select
    end subroutine sf_channel_set_epo_mapping
```

This sets an s-channel power mapping, regulating a singularity of type $(1 - x)^{-1+\epsilon}$. The parameter ϵ depends on the structure function.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_ip_mapping => sf_channel_set_ip_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_ip_mapping (channel, i_sf, eps)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: eps
      channel%map_code(i_sf) = SFMAP_MULTI_IP
      allocate (sf_ip_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_ip_mapping_t)
         call mapping%init (eps)
      end select
    end subroutine sf_channel_set_ip_mapping
```

This sets an s-channel resonant power mapping, regulating a singularity of type $(1-x)^{-1+\epsilon}$ in the presence of an s-channel resonance. The parameter ϵ depends on the structure function.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_ipr_mapping => sf_channel_set_ipr_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_ipr_mapping (channel, i_sf, eps, m, w)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: eps, m, w
      channel%map_code(i_sf) = SFMAP_MULTI_IPR
      allocate (sf_ipr_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_ipr_mapping_t)
         call mapping%init (eps, m, w)
      end select
    end subroutine sf_channel_set_ipr_mapping
```

This sets an on-shell power mapping, regulating a singularity of type $(1-x)^{-1+\epsilon}$ for the production of a single on-shell particle.. The parameter ϵ depends on the structure function.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_ipo_mapping => sf_channel_set_ipo_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_ipo_mapping (channel, i_sf, eps, m)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: eps, m
      channel%map_code(i_sf) = SFMAP_MULTI_IPO
      allocate (sf_ipo_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_ipo_mapping_t)
         call mapping%init (eps, m)
      end select
```

```
    end subroutine sf_channel_set_ipo_mapping
```

This sets a combined endpoint/ISR mapping.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_ei_mapping => sf_channel_set_ei_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_ei_mapping (channel, i_sf, a, eps)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: a, eps
      channel%map_code(i_sf) = SFMAP_MULTI_EI
      allocate (sf_ei_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_ei_mapping_t)
         call mapping%init (a, eps)
      end select
    end subroutine sf_channel_set_ei_mapping
```

This sets a combined endpoint/ISR mapping with resonance.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_eir_mapping => sf_channel_set_eir_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_eir_mapping (channel, i_sf, a, eps, m, w)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: a, eps, m, w
      channel%map_code(i_sf) = SFMAP_MULTI_EI
      allocate (sf_eir_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_eir_mapping_t)
         call mapping%init (a, eps, m, w)
      end select
    end subroutine sf_channel_set_eir_mapping
```

This sets a combined endpoint/ISR mapping, on-shell.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: set_eio_mapping => sf_channel_set_eio_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    subroutine sf_channel_set_eio_mapping (channel, i_sf, a, eps, m)
      class(sf_channel_t), intent(inout) :: channel
      integer, dimension(:), intent(in) :: i_sf
      real(default), intent(in), optional :: a, eps, m
      channel%map_code(i_sf) = SFMAP_MULTI_EI
      allocate (sf_eio_mapping_t :: channel%multi_mapping)
      select type (mapping => channel%multi_mapping)
      type is (sf_eio_mapping_t)
         call mapping%init (a, eps, m)
      end select
    end subroutine sf_channel_set_eio_mapping
```

Return true if the mapping code at position i␣sf is SFMAP␣SINGLE.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: is_single_mapping => sf_channel_is_single_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    function sf_channel_is_single_mapping (channel, i_sf) result (flag)
      class(sf_channel_t), intent(in) :: channel
      integer, intent(in) :: i_sf
      logical :: flag
      flag = channel%map_code(i_sf) == SFMAP_SINGLE
    end function sf_channel_is_single_mapping
```

Return true if the mapping code at position i␣sf is any of the SFMAP␣MULTI mappings.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: is_multi_mapping => sf_channel_is_multi_mapping
```

⟨*SF mappings: procedures*⟩+≡
```
    function sf_channel_is_multi_mapping (channel, i_sf) result (flag)
      class(sf_channel_t), intent(in) :: channel
      integer, intent(in) :: i_sf
      logical :: flag
      select case (channel%map_code(i_sf))
      case (SFMAP_NONE, SFMAP_SINGLE)
         flag = .false.
      case default
         flag = .true.
      end select
    end function sf_channel_is_multi_mapping
```

Return the number of parameters that the multi-mapping requires. The mapping object must be allocated.

⟨*SF mappings: sf channel: TBP*⟩+≡
```
    procedure :: get_multi_mapping_n_par => sf_channel_get_multi_mapping_n_par
```

⟨*SF mappings: procedures*⟩+≡
```
    function sf_channel_get_multi_mapping_n_par (channel) result (n_par)
      class(sf_channel_t), intent(in) :: channel
      integer :: n_par
      if (allocated (channel%multi_mapping)) then
         n_par = channel%multi_mapping%get_n_dim ()
      else
         n_par = 0
      end if
    end function sf_channel_get_multi_mapping_n_par
```

Return true if there is any nontrivial mapping in any of the channels.

Note: we provide an explicit public function. gfortran 4.6.3 has problems with the alternative implementation as a type-bound procedure for an array base object.

⟨*SF mappings: public*⟩+≡
```
    public :: any_sf_channel_has_mapping
```

1374

⟨*SF mappings: procedures*⟩+≡

```
function any_sf_channel_has_mapping (channel) result (flag)
  type(sf_channel_t), dimension(:), intent(in) :: channel
  logical :: flag
  integer :: c
  flag = .false.
  do c = 1, size (channel)
     flag = flag .or. any (channel(c)%map_code /= SFMAP_NONE)
  end do
end function any_sf_channel_has_mapping
```

Set a parameter index for an active multi mapping. We assume that the index array is allocated properly.

⟨*SF mappings: sf channel: TBP*⟩+≡

```
procedure :: set_par_index => sf_channel_set_par_index
```

⟨*SF mappings: procedures*⟩+≡

```
subroutine sf_channel_set_par_index (channel, j, i_par)
  class(sf_channel_t), intent(inout) :: channel

```

Check resonance mapping

Probe the resonance mapping of the unit square for different parameter values.
Also calculates integrals. For a finite number of bins, they differ slightly from
1, but the result is well-defined because we are not using random points.

   The resonance mass is at $1/2$ the energy, the width is $1/10$.

⟨*SF mappings: execute tests*⟩+≡
```
    call test (sf_mappings_3, "sf_mappings_3", &

   write (u, "(A)")  "* Test output end: sf_mappings_3"

 end subroutine sf_mappings_3
```

Check on-shell mapping

Probe the on-shell mapping of the unit square for different parameter values. Also calculates integrals. In this case, the Jacobian is constant and given by $|\log m^2|$, so this is also the value of the integral. The factor results from the variable change in the δ function $\delta(m^2 - x_1 x_2)$ which multiplies the cross section for the case at hand.

For the test, the (rescaled) resonance mass is set at $1/2$ the energy.

⟨*SF mappings: execute tests*⟩+≡

16.5.1   Abstract rescale data-type

NLO calculations require the treatment of initial state parton radiation. The
radiation of a parton rescales the energy fraction which enters the hard process.
We allow for different rescale settings by extending the abstract. sf_rescale_t
data type.

⟨*SF base: public*⟩≡
```
    public :: sf_rescale_t
```

⟨*SF base: types*⟩≡
```

    contains
```
⟨*SF base: rescale collinear: TBP*⟩
```
    end type sf_rescale_collinear_t
```

For the subtraction terms we need to rescale the Born x of both beams in the collinear limit. This leaves one beam unaffected and rescales the other according to

$$x = \frac{\overline{x}}{1 - \xi} \tag{16.27}$$

which is the collinear limit of sf_rescale_real_apply.

⟨*SF base: rescale collinear: TBP*⟩≡

       real(default) :: xi, y
    contains
```
⟨*SF base: rescale real: TBP*⟩
```
    end type sf_rescale_real_t
```

In case of IS Splittings, the beam x changes from Born to real and thus needs to be rescaled according to

$$x_\oplus = \frac{\overline{x}_\oplus}{\sqrt{1 - \xi}} \sqrt{\frac{2 - \xi(1 - y)}{2 - \xi(1 + y)}}, \qquad x_\ominus = \frac{\overline{x}_\ominus}{\sqrt{1 - \xi}} \sqrt{\frac{2 - \xi(1 + y)}{2 - \xi(1 - y)}} \qquad (16.28)$$

16.5.2   Abstract structure-function data type

This type should hold all configuration data for a specific type of structure function. The base object is empty; the implementations will fill it.

⟨*SF base: public*⟩+≡
```
    public :: sf_data_t
```

⟨*SF base: types*⟩+≡
```
    type, abstract :: sf_data_t
     contains
```
     ⟨*SF base: sf data: TBP*⟩
```
    end type sf_data_t
```

Output.
⟨*SF base: sf data: TBP*⟩≡
```
    procedure (sf_data_write), deferred :: write
```

⟨*SF base: interfaces*⟩+≡
```
abstract interface
   subroutine sf_data_write (data, unit, verbose)
     import
     class(sf_data_t), intent(in) :: data
     integer, intent(in), optional :: unit
     logical, intent(in), optional :: verbose
   end subroutine sf_data_write
end interface
```

Return true if this structure function is in generator mode. In that case, all parameters are free, otherwise bound. (We do not support mixed cases.) Default is: no generator.

⟨*SF base: sf data: TBP*⟩+≡
```
procedure :: is_generator => sf_data_is_generator
```

⟨*SF base: procedures*⟩+≡
```
function sf_data_is_generator (data) result (flag)
  class(sf_data_t), intent(in) :: data
  logical :: flag
  flag = .false.
end function sf_data_is_generator
```

Return the number of input parameters that determine the structure function.

⟨*SF base: sf data: TBP*⟩+≡
```
procedure (sf_data_get_int), deferred :: get_n_par
```

⟨*SF base: interfaces*⟩+≡
```
abstract interface
   function sf_data_get_int (data) result (n)
     import
     class(sf_data_t), intent(in) :: data
     integer :: n
   end function sf_data_get_int
end interface
```

Return the outgoing particle PDG codes for the current setup. The codes can be an array of particles, for each beam.

⟨*SF base: sf data: TBP*⟩+≡
```
procedure (sf_data_get_pdg_out), deferred :: get_pdg_out
```

⟨*SF base: interfaces*⟩+≡
```
abstract interface
   subroutine sf_data_get_pdg_out (data, pdg_out)
     import
     class(sf_data_t), intent(in) :: data
     type(pdg_array_t), dimension(:), intent(inout) :: pdg_out
   end subroutine sf_data_get_pdg_out
end interface
```

Allocate a matching structure function interaction object and properly initialize it.

⟨*SF base: sf data: TBP*⟩+≡
```
procedure (sf_data_allocate_sf_int), deferred :: allocate_sf_int
```

1403

⟨*SF base: interfaces*⟩+≡
```
    abstract interface
       subroutine sf_data_allocate_sf_int (data, sf_int)
         import
         class(sf_data_t), intent(in) :: data
         class(sf_int_t), intent(inout), allocatable :: sf_int
       end subroutine sf_data_allocate_sf_int
    end interface
```

Return the PDF set index, if applicable. We implement a default method which returns zero. The PDF (builtin and LHA) implementations will override this.

⟨*SF base: sf data: TBP*⟩+≡
```
    procedure :: get_pdf_set => sf_data_get_pdf_set
```

⟨*SF base: procedures*⟩+≡
```
    elemental function sf_data_get_pdf_set (data) result (pdf_set)
      class(sf_data_t), intent(in) :: data
      integer :: pdf_set
      pdf_set = 0
    end function sf_data_get_pdf_set
```

Return the spectrum file, if applicable. We implement a default method which returns zero. CIRCE1, CIRCE2 and the beam spectrum will override this.

⟨*SF base: sf data: TBP*⟩+≡
```
    procedure :: get_beam_file => sf_data_get_beam_file
```

⟨*SF base: procedures*⟩+≡
```
    function sf_data_get_beam_file (data) result (file)
      class(sf_data_t), intent(in) :: data
      type(string_t) :: file
      file = ""
    end function sf_data_get_beam_file
```

16.5.3   Structure-function chain configuration

This is the data type that the `process` module uses for setting up its structure-function chain. For each structure function described by the beam data, there is an entry. The `i` array indicates the beam(s) to which this structure function applies, and the `data` object contains the actual configuration data.

⟨*SF base: public*⟩+≡
```
    public :: sf_config_t
```

⟨*SF base: types*⟩+≡
```
    type :: sf_config_t
       integer, dimension(:), allocatable :: i
       class(sf_data_t), allocatable :: data
     contains
     ⟨SF base: sf config: TBP⟩
    end type sf_config_t
```

1404

Output:

⟨*SF base: sf config: TBP*⟩≡
```
    procedure :: write => sf_config_write
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_config_write (object, unit)
      class(sf_config_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      if (allocated (object%i)) then
         write (u, "(1x,A,2(1x,I0))")  "Structure-function configuration: &
              &beam(s)", object%i
         if (allocated (object%data))  call object%data%write (u)
      else
         write (u, "(1x,A)")  "Structure-function configuration: [undefined]"
      end if
    end subroutine sf_config_write
```

Initialize.

⟨*SF base: sf config: TBP*⟩+≡
```
    procedure :: init => sf_config_init
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_config_init (sf_config, i_beam, sf_data)
      class(sf_config_t), intent(out) :: sf_config
      integer, dimension(:), intent(in) :: i_beam
      class(sf_data_t), intent(in) :: sf_data
      allocate (sf_config%i (size (i_beam)), source = i_beam)
      allocate (sf_config%data, source = sf_data)
    end subroutine sf_config_init
```

Return the PDF set, if any.

⟨*SF base: sf config: TBP*⟩+≡
```
    procedure :: get_pdf_set => sf_config_get_pdf_set
```

⟨*SF base: procedures*⟩+≡
```
    elemental function sf_config_get_pdf_set (sf_config) result (pdf_set)
      class(sf_config_t), intent(in) :: sf_config
      integer :: pdf_set
      pdf_set = sf_config%data%get_pdf_set ()
    end function sf_config_get_pdf_set
```

Return the beam spectrum file, if any.

⟨*SF base: sf config: TBP*⟩+≡
```
    procedure :: get_beam_file => sf_config_get_beam_file
```

⟨*SF base: procedures*⟩+≡
```
    function sf_config_get_beam_file (sf_config) result (file)
      class(sf_config_t), intent(in) :: sf_config
      type(string_t) :: file
      file = sf_config%data%get_beam_file ()
    end function sf_config_get_beam_file
```

16.5.4 Structure-function instance

The `sf_int_t` data type contains an `interaction_t` object (it is an extension of this type) and a pointer to the `sf_data_t` configuration data. This interaction, or copies of it, is used to implement structure-function kinematics and dynamics in the context of process evaluation.

The status code `status` tells whether the interaction is undefined, has defined kinematics (but matrix elements invalid), or is completely defined. There is also a status code for failure. The implementation is responsible for updating the status.

The entries `mi2`, `mr2`, and `mo2` hold the squared invariant masses of the incoming, radiated, and outgoing particle, respectively. They are supposed to be set upon initialization, but could also be varied event by event.

If the radiated or outgoing mass is nonzero, we may need to apply an on-shell projection. The projection mode is stored as `on_shell_mode`.

The array `beam_index` is the list of beams on which this structure function applies (1, 2, or both). The arrays `incoming`, `radiated`, and `outgoing` contain the indices of the respective particle sets within the interaction, for convenient lookup. The array `par_index` indicates the MC input parameters that this entry will use up in the structure-function chain. The first parameter (or the first two, for a spectrum) in this array determines the momentum fraction and is thus subject to global mappings.

In the abstract base type, we do not implement the data pointer. This allows us to restrict its type in the implementations.

⟨*SF base: public*⟩+≡
```
    public :: sf_int_t
```

⟨*SF base: types*⟩+≡
```
    type, abstract, extends (interaction_t) :: sf_int_t
      integer :: status = SF_UNDEFINED
      real(default), dimension(:), allocatable :: mi2
      real(default), dimension(:), allocatable :: mr2
      real(default), dimension(:), allocatable :: mo2
      integer :: on_shell_mode = KEEP_ENERGY
      logical :: qmin_defined = .false.
      logical :: qmax_defined = .false.
      real(default), dimension(:), allocatable :: qmin
      real(default), dimension(:), allocatable :: qmax
      integer, dimension(:), allocatable :: beam_index
      integer, dimension(:), allocatable :: incoming
      integer, dimension(:), allocatable :: radiated
      integer, dimension(:), allocatable :: outgoing
      integer, dimension(:), allocatable :: par_index
      integer, dimension(:), allocatable :: par_primary
    contains
    ⟨SF base: sf int: TBP⟩
    end type sf_int_t
```

Status codes. The codes that refer to links, masks, and connections, apply to structure-function chains only.

The status codes are public.

⟨*SF base: parameters*⟩≡

```
integer, parameter, public :: SF_UNDEFINED = 0
integer, parameter, public :: SF_INITIAL = 1
integer, parameter, public :: SF_DONE_LINKS = 2
integer, parameter, public :: SF_FAILED_MASK = 3
integer, parameter, public :: SF_DONE_MASK = 4
integer, parameter, public :: SF_FAILED_CONNECTIONS = 5
integer, parameter, public :: SF_DONE_CONNECTIONS = 6
integer, parameter, public :: SF_SEED_KINEMATICS = 10
integer, parameter, public :: SF_FAILED_KINEMATICS = 11
integer, parameter, public :: SF_DONE_KINEMATICS = 12
integer, parameter, public :: SF_FAILED_EVALUATION = 13
integer, parameter, public :: SF_EVALUATED = 20
```

Write a string version of the status code:

⟨*SF base: procedures*⟩+≡
```
subroutine write_sf_status (status, u)
  integer, intent(in) :: status
  integer, intent(in) :: u
  select case (status)
  case (SF_UNDEFINED)
     write (u, "(1x,'[',A,']')")  "undefined"
  case (SF_INITIAL)
     write (u, "(1x,'[',A,']')")  "initialized"
  case (SF_DONE_LINKS)
     write (u, "(1x,'[',A,']')")  "links set"
  case (SF_FAILED_MASK)
     write (u, "(1x,'[',A,']')")  "mask mismatch"
  case (SF_DONE_MASK)
     write (u, "(1x,'[',A,']')")  "mask set"
  case (SF_FAILED_CONNECTIONS)
     write (u, "(1x,'[',A,']')")  "connections failed"
  case (SF_DONE_CONNECTIONS)
     write (u, "(1x,'[',A,']')")  "connections set"
  case (SF_SEED_KINEMATICS)
     write (u, "(1x,'[',A,']')")  "incoming momenta set"
  case (SF_FAILED_KINEMATICS)
     write (u, "(1x,'[',A,']')")  "kinematics failed"
  case (SF_DONE_KINEMATICS)
     write (u, "(1x,'[',A,']')")  "kinematics set"
  case (SF_FAILED_EVALUATION)
     write (u, "(1x,'[',A,']')")  "evaluation failed"
  case (SF_EVALUATED)
     write (u, "(1x,'[',A,']')")  "evaluated"
  end select
end subroutine write_sf_status
```

This is the basic output routine. Display status and interaction.

⟨*SF base: sf int: TBP*⟩≡
```
procedure :: base_write => sf_int_base_write
```

⟨*SF base: procedures*⟩+≡
```
subroutine sf_int_base_write (object, unit, testflag)
  class(sf_int_t), intent(in) :: object
  integer, intent(in), optional :: unit
```

```
          logical, intent(in), optional :: testflag
          integer :: u
          u = given_output_unit (unit)
          write (u, "(1x,A)", advance="no")  "SF instance:"

```

Basic initialization: set the invariant masses for the particles and initialize the interaction. The caller should then add states to the interaction and freeze it.

1408

The dimension of the mask should be equal to the sum of the dimensions of the mass-squared arrays, which determine incoming, radiated, and outgoing particles, respectively.

Optionally, we can define minimum and maximum values for the momentum transfer to the outgoing particle(s). If all masses are zero, this is actually required for non-collinear splitting.

```

Initialization. This proceeds via an abstract data object, which for the actual
implementation should have the matching concrete type. Since all implementa-
tions have the same signature, we can prepare a deferred procedure. The data
object will become the target of a corresponding pointer within the sf_int_t
implementation.

This should call the previous procedure.

⟨*SF base: sf int: TBP*⟩+≡
```
    procedure (sf_int_init), deferred :: init
```

⟨*SF base: interfaces*⟩+≡
```
    abstract interface
      subroutine sf_int_init (sf_int, data)
        import
        class(sf_int_t), intent(out) :: sf_int
        class(sf_data_t), intent(in), target :: data
      end subroutine sf_int_init
    end interface
```

Complete initialization. This routine contains initializations that can only be
performed after the interaction object got its final shape, i.e., redundant helici-
ties have been eliminated by matching with beams and process.

The default implementation does nothing.

The target attribute is formally required since some overriding implemen-
tations use a temporary pointer (iterator) to the state-matrix component. It
doesn't appear to make a real difference, though.

      allocate (sf_int%par_index (size (par_index)))
      sf_int%par_index = par_index
    end subroutine sf_int_set_par_index
```

Initialize the structure-function kinematics, setting incoming momenta. We assume that array shapes match.

Three versions. The first version relies on the momenta being linked to another interaction. The second version sets the momenta explicitly. In the third version, we first compute momenta for the specified energies and store those.

⟨*SF base: sf int: TBP*⟩+≡

                 k(j) = vector4_moving (E(j), &
                       (3-2*j) * sqrt (E(j)**2 - sf_int%mi2(j)), 3)
              end do
              call sf_int%seed_kinematics (k)
           end if
        end if
     end subroutine sf_int_seed_energies
```

Tell if in generator mode. By default, this is false. To be overridden where appropriate; we may refer to the `is_generator` method of the `data` component in the concrete type.

⟨*SF base: sf int: TBP*⟩+≡
```
     procedure :: is_generator => sf_int_is_generator
```

⟨*SF base: procedures*⟩+≡
```
     function sf_int_is_generator (sf_int) result (flag)
       class(sf_int_t), intent(in) :: sf_int
       logical :: flag
       flag = .false.
     end function sf_int_is_generator
```

Generate free parameters **r**. Parameters are free if they do not correspond to integration parameters (i.e., are bound), but are generated by the structure function object itself. By default, all parameters are bound, and the output values of this procedure will be discarded. With free parameters, we have to override this procedure.

The value **x_free** is the renormalization factor of the total energy that corresponds to the free parameters. If there are no free parameters, the procedure will not change its value, which starts as unity. Otherwise, the fraction is typically decreased, but may also be increased in some cases.

⟨*SF base: sf int: TBP*⟩+≡
```
     procedure :: generate_free => sf_int_generate_free
```

⟨*SF base: procedures*⟩+≡
```
     subroutine sf_int_generate_free (sf_int, r, rb,  x_free)
       class(sf_int_t), intent(inout) :: sf_int
       real(default), dimension(:), intent(out) :: r, rb
       real(default), intent(inout) :: x_free
       r = 0
       rb= 1
     end subroutine sf_int_generate_free
```

Complete the structure-function kinematics, derived from an input parameter (array) r between 0 and 1. The interaction momenta are calculated, and we return x (the momentum fraction), and f (the Jacobian factor for the map $r \rightarrow x$), if `map` is set.

If the `map` flag is unset, r and x values will coincide, and f will become unity. If it is set, the structure-function implementation chooses a convenient mapping from r to x with Jacobian f.

In the `inverse_kinematics` variant, we exchange the intent of `x` and `r`. The momenta are calculated only if the optional flag `set_momenta` is present and set. Internal parameters of `sf_int` are calculated only if the optional flag `set_x` is present and set.

Update 2018-08-22: Throughout this algorithm, we now carry `xb`$=1-x$ together with `x` values, as we did for `r` before. This allows us to handle unstable endpoint numerics wherever necessary. The only place where the changes actually did matter was for inverse kinematics in the ISR setup, with a very soft photon, but it might be most sensible to apply the extension with `xb` everywhere.

Single splitting: compute momenta, given x input parameters. We assume that the incoming momentum is set. The status code is set to **SF_FAILED_KINEMATICS** if the x array does not correspond to a valid momentum configuration. Otherwise, it is updated to **SF_DONE_KINEMATICS**.

We force the outgoing particle on-shell. The on-shell projection is determined by the **on_shell_mode**. The radiated particle should already be on shell.

```

The inverse procedure: we compute the x array from the momentum configuration. In an overriding TBP, we may also set internal data that depend on this, for convenience.

NOTE: Here and above, the single-particle case is treated in detail, allowing for non-collinearity and non-vanishing masses and nontrivial momentum-transfer bounds. For the pair case, we currently implement only collinear splitting and assume massless particles. This should be improved.

Update 2017-08-22: recover also xb, using the updated recover method of the splitting-data object. Th

Apply the structure function, i.e., evaluate the interaction. For the calculation, we may use the stored momenta, any further information stored inside the sf_int implementation during kinematics setup, and the given energy scale. It may happen that for the given kinematics the value is not defined. This should be indicated by the status code.

⟨*SF base: sf int: TBP*⟩+≡
```
    procedure (sf_int_apply), deferred :: apply
```

⟨*SF base: interfaces*⟩+≡
```
    abstract interface
       subroutine sf_int_apply (sf_int, scale, rescale, i_sub)
         import
         class(sf_int_t), intent(inout) :: sf_int
         real(default), intent(in) :: scale

           value(i) = real (sf_int%get_matrix_element (i))
        end do
     else
        value = 0
     end if
```

```
      end subroutine sf_int_get_values
```

16.5.6 Direct calculations

Compute a structure function value (array) directly, given an array of x values
and a scale. If the energy is also given, we initialize the kinematics for that
energy, otherwise take it from a previous run.

We assume that the E array has dimension n_in, and the x array has n_par.

Note: the output x values (xx and xxb) are unused in this use case.

⟨*SF base: sf int: TBP*⟩+≡
```
    procedure :: compute_values => sf_int_compute_values
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_int_compute_values (sf_int, value, x, xb, scale, E)
      class(sf_int_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: value
      real(default), dimension(:), intent(in) :: x
      real(default), dimension(:), intent(in) :: xb
      real(default), intent(in) :: scale
      real(default), dimension(:), intent(in), optional :: E
      real(default), dimension(size (x)) :: xx, xxb
      real(default) :: f
      if (present (E))  call sf_int%seed_kinematics (E)
      if (sf_int%status >= SF_SEED_KINEMATICS) then
         call sf_int%complete_kinematics (xx, xxb, f, x, xb, map=.false.)
         call sf_int%apply (scale)

         value = value * f
      else
         value = 0
      end if
    end subroutine sf_int_compute_values
```

Compute just a single value for one of the states, i.e., throw the others away.

⟨*SF base: sf int: TBP*⟩+≡
```
    procedure :: compute_value => sf_int_compute_value
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_int_compute_value &
         (sf_int, i_state, value, x, xb, scale, E)
      class(sf_int_t), intent(inout) :: sf_int
      integer, intent(in) :: i_state
      real(default), intent(out) :: value
      real(default), dimension(:), intent(in) :: x
      real(default), dimension(:), intent(in) :: xb
      real(default), intent(in) :: scale
      real(default), dimension(:), intent(in), optional :: E
      real(default), dimension(:), allocatable :: value_array
      if (sf_int%status >= SF_INITIAL) then
         allocate (value_array (sf_int%get_n_states ()))
         call sf_int%compute_values (value_array, x, xb, scale, E)
         value = value_array(i_state)
```

```
        else
            value = 0
        end if
    end subroutine sf_int_compute_value
```

16.5.7   Structure-function instance

This is a wrapper for sf_int_t objects, such that we can build an array with
different structure-function types. The structure-function contains an array (a
sequence) of sf_int_t objects.

   The object, it holds the evaluator that connects the preceding part of the
structure-function chain to the current interaction.

   It also stores the input and output parameter values for the contained struc-
ture function. The r array has a second dimension, corresponding to the map-
ping channels in a multi-channel configuration. There is a Jacobian entry f for
each channel. The corresponding logical array mapping tells whether we apply
the mapping appropriate for the current structure function in this channel. The
x parameter values (energy fractions) are common to all channels.

⟨*SF base: types*⟩+≡
```
    type :: sf_instance_t
       class(sf_int_t), allocatable :: int
       type(evaluator_t) :: eval
       real(default), dimension(:,:), allocatable :: r
       real(default), dimension(:,:), allocatable :: rb
       real(default), dimension(:), allocatable :: f
       logical, dimension(:), allocatable :: m
       real(default), dimension(:), allocatable :: x
       real(default), dimension(:), allocatable :: xb
    end type sf_instance_t
```

16.5.8   Structure-function chain

A chain is an array of structure functions sf, initiated by a beam setup. We
do not use this directly for evaluation, but create instances with copies of the
contained interactions.

   n_par is the total number of parameters that is necessary for completely
determining the structure-function chain. n_bound is the number of MC input
parameters that are requested from the integrator. The difference of n_par and
n_bound is the number of free parameters, which are generated by a structure-
function object in generator mode.

⟨*SF base: public*⟩+≡
```
    public :: sf_chain_t
```

⟨*SF base: types*⟩+≡
```
    type, extends (beam_t) :: sf_chain_t

16.5.9 Chain instances

A structure-function chain instance contains copies of the interactions in the configuration chain, suitably linked to each other and connected by evaluators.

After initialization, out_sf should point, for each beam, to the last structure function that affects this beam. out_sf_i should indicate the index of the

corresponding outgoing particle within that structure-function interaction.

Analogously, out_eval is the last evaluator in the structure-function chain, which contains the complete set of outgoing particles. out_eval_i should indicate the index of the outgoing particles, within that evaluator, which will initiate the collision.

When calculating actual kinematics, we fill the p, r, and x arrays and the f factor. The p array denotes the MC input parameters as they come from the random-number generator. The r array results from applying global mappings. The x array results from applying structure-function local mappings. The x values can be interpreted directly as momentum fractions (or angle fractions, where recoil is involved). The f factor is the Jacobian that results from applying all mappings.

Update 2017-08-22: carry and output all complements (pb, rb, xb). Previously, xb was not included in the record, and the output did not contain either. It does become more verbose, however.

The mapping entry may store a global mapping that is applied to a combination of x values and structure functions, as opposed to mappings that affect only a single structure function. It is applied before the latter mappings, in the transformation from the p array to the r array. For parameters affected by this mapping, we should ensure that they are not involved in a local mapping.

Initialize. This creates a copy of the interactions in the configuration chain, assumed to be properly initialized. In the copy, we allocate the p etc. arrays.

The brute-force assignment of the **sf** component would be straightforward, but at least gfortran 4.6.3 would like a more fine-grained copy. In any case, the copy is deep as far as allocatables are concerned, but for the contained

`interaction_t` objects the copy is shallow, as long as we do not bind defined assignment to the type. Therefore, we have to re-assign the `interaction_t` components explicitly, this time calling the proper defined assignment. Furthermore, we allocate the parameter arrays for each structure function.

Copy a channel-mapping object to the structure-function chain instance. We assume that assignment is sufficient, i.e., any non-static components of the `channel` object are allocatable und thus recursively copied.

After the copy, we extract the single-entry mappings and activate them for the individual structure functions. If there is a multi-entry mapping, we obtain the corresponding MC parameter indices and set them in the copy of the channel object.

Link the interactions in the chain. First, link the beam instance to its template
in the configuration chain, which should have the appropriate momenta fixed.

Then, we follow the chain via the arrays **out_sf** and **out_sf_i**. The arrays
are (up to) two-dimensional, the entries correspond to the beam particle(s).
For each beam, the entry **out_sf** points to the last interaction that affected this
beam, and **out_sf_i** is the out-particle index within that interaction. For the
initial beam, **out_sf** is zero by definition.

For each entry in the chain, we scan the affected beams (one or two). We
look for **out_sf** and link the out-particle there to the corresponding in-particle
in the current interaction. Then, we update the entry in **out_sf** and **out_sf_i**
to point to the current interaction.

Exchange the quantum-number masks between the interactions in the chain, so
we can combine redundant entries and detect any obvious mismatch.

We proceed first in the forward direction and then backwards again.

After this is finished, we finalize initialization by calling the setup_constants
method, which prepares constant data that depend on the matrix element structure.

This is an internal subroutine of the previous one: After evaluators are set, trace the outgoing particles to the last evaluator. We only need the first channel, all channels are equivalent for this purpose.

For each beam, the outgoing particle is located by **out_sf** (the structure-function object where it originates) and **out_sf_i** (the index within that object). This particle is referenced by the corresponding evaluator, which in turn is referenced by the next evaluator, until we are at the end of the chain. We can trace back references by `interaction_find_link`. Knowing that **out_eval** is the index of the last evaluator, we thus determine **out_eval_i**, the index of the outgoing particle within that evaluator.

⟨*SF base: init evaluators: find outgoing particles*⟩≡
```
subroutine find_outgoing_particles ()
  type(interaction_t), pointer :: int, int_next
  integer :: i, j, out_sf, out_i
  chain%out_eval = size (chain%sf)
  do j = 1, size (chain%out_eval_i)

```

```
            out_i = interaction_find_link (int_next, int, out_i)
            int => int_next
         end do
         chain%out_eval_i(j) = out_i
      end do
      call int%tag_hard_process (chain%out_eval_i)
   end subroutine find_outgoing_particles
```

Compute the kinematics in the chain instance. We can assume that the seed momenta are set in the configuration beams. Scanning the chain, we first transfer the incoming momenta. Then, the use up the MC input parameter array `p` to compute the radiated and outgoing momenta.

In the multi-channel case, `c_sel` is the channel which we use for computing the kinematics and the `x` values. In the other channels, we invert the kinematics in order to recover the corresponding rows in the `r` array, and the Jacobian `f`.

We first apply any global mapping to transform the input `p` into the array `r`. This is then given to the structure functions which compute the final array `x` and Jacobian factors `f`, which we multiply to obtain the overall Jacobian.

This is a variant of the previous procedure. We know the x parameters and reconstruct the momenta and the MC input parameters p. We do not need to select a channel.

Note: this is probably redundant, since the method we actually want starts from the momenta, recovers all x parameters, and then inverts mappings. See below recover_kinematics.

Recover the kinematics: assuming that the last evaluator has been filled with
a valid set of momenta, we travel the momentum links backwards and fill the
preceding evaluators and, as a side effect, interactions. We stop at the beam
interaction.

After all momenta are set, apply the inverse_kinematics procedure above,
suitably modified, to recover the x and p parameters and the Jacobian factors.

The c_sel (channel) argument is just used to mark a selected channel for
the records, otherwise the recovery procedure is independent of this.

                  else
                     chain%p (:,c) = chain%r (:,c)
                     chain%pb(:,c) = chain%rb(:,c)
                  end if
               end do
            end if
         end if
         chain%status = SF_DONE_KINEMATICS
      end if
   end subroutine sf_chain_instance_recover_kinematics
```

Return the initial beam momenta to their source, thus completing kinematics recovery. Obviously, this works as a side effect.

⟨*SF base: sf chain instance: TBP*⟩+≡

```
   procedure :: return_beam_momenta => sf_chain_instance_return_beam_momenta
```

⟨*SF base: procedures*⟩+≡

```
subroutine sf_chain_instance_return_beam_momenta (chain)
  class(sf_chain_instance_t), intent(in), target :: chain
  type(interaction_t), pointer :: int
  if (chain%status >= SF_DONE_KINEMATICS) then
     int => beam_get_int_ptr (chain%beam_t)
     call interaction_send_momenta (int)
  end if
end subroutine sf_chain_instance_return_beam_momenta
```

Evaluate all interactions in the chain and the product evaluators. We provide a `scale` argument that is given to all structure functions in the chain.

Hadronic NLO calculations involve rescaled fractions of the original beam momentum. In particular, we have to handle the following cases:

- normal evaluation (where `i_sub = 0`) for all terms except the real non-subtracted,

- rescaled momentum fraction for both beams in the case of the real non-subtracted term (`i_sub = 0`),

- and rescaled momentum fraction for one of both beams in the case of the subtraction and DGLAP component (`i_sub = 1,2`).

For the collinear final or intial state counter terms, we apply a rescaling to one beam, and keep the other beam as is. We redo it then vice versa having now two subtractions.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
procedure :: evaluate => sf_chain_instance_evaluate
```

⟨*SF base: procedures*⟩+≡
```
subroutine sf_chain_instance_evaluate (chain, scale, sf_rescale)

      end if
    end if
    chain%status = SF_EVALUATED
  end if
end subroutine sf_chain_instance_evaluate
```

16.5.10 Access to the chain instance

Transfer the outgoing momenta to the array **p**. We assume that array sizes match.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
    procedure :: get_out_momenta => sf_chain_instance_get_out_momenta
```

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_chain_instance_get_out_momenta (chain, p)
      class(sf_chain_instance_t), intent(in), target :: chain
      type(vector4_t), dimension(:), intent(out) :: p
      type(interaction_t), pointer :: int
      integer :: i, j
      if (chain%status >= SF_DONE_KINEMATICS) then
        do j = 1, size (chain%out_sf)
            i = chain%out_sf(j)
            select case (i)
            case (0)
                int => beam_get_int_ptr (chain%beam_t)
            case default
                int => chain%sf(i)%int%interaction_t
```

```
         end select
         p(j) = int%get_momentum (chain%out_sf_i(j))
       end do
     end if
   end subroutine sf_chain_instance_get_out_momenta
```

Return a pointer to the last evaluator in the chain (to the interaction).

⟨*SF base: sf chain instance: TBP*⟩+≡
```
   procedure :: get_out_int_ptr => sf_chain_instance_get_out_int_ptr
```

⟨*SF base: procedures*⟩+≡
```
   function sf_chain_instance_get_out_int_ptr (chain) result (int)
     class(sf_chain_instance_t), intent(in), target :: chain
     type(interaction_t), pointer :: int
     if (chain%out_eval == 0) then
        int => beam_get_int_ptr (chain%beam_t)
     else
        int => chain%sf(chain%out_eval)%eval%interaction_t
     end if
   end function sf_chain_instance_get_out_int_ptr
```

Return the index of the j-th outgoing particle, within the last evaluator.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
   procedure :: get_out_i => sf_chain_instance_get_out_i
```

⟨*SF base: procedures*⟩+≡
```
   function sf_chain_instance_get_out_i (chain, j) result (i)
     class(sf_chain_instance_t), intent(in) :: chain
     integer, intent(in) :: j
     integer :: i
     i = chain%out_eval_i(j)
   end function sf_chain_instance_get_out_i
```

Return the mask for the outgoing particle(s), within the last evaluator.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
   procedure :: get_out_mask => sf_chain_instance_get_out_mask
```

⟨*SF base: procedures*⟩+≡
```
   function sf_chain_instance_get_out_mask (chain) result (mask)
     class(sf_chain_instance_t), intent(in), target :: chain
     type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
     type(interaction_t), pointer :: int
     allocate (mask (chain%config%n_in))
     int => chain%get_out_int_ptr ()
     mask = int%get_mask (chain%out_eval_i)
   end function sf_chain_instance_get_out_mask
```

Return the array of MC input parameters that corresponds to channel `c`. This is the `p` array, the parameters before all mappings.

The `p` array may be deallocated. This should correspond to a zero-size `r` argument, so nothing to do then.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
   procedure :: get_mcpar => sf_chain_instance_get_mcpar
```

1443

⟨*SF base: procedures*⟩+≡
```
    subroutine sf_chain_instance_get_mcpar (chain, c, r)
      class(sf_chain_instance_t), intent(in) :: chain
      integer, intent(in) :: c
      real(default), dimension(:), intent(out) :: r
      if (allocated (chain%p))  r = pack (chain%p(:,c), chain%bound)
    end subroutine sf_chain_instance_get_mcpar
```

Return the Jacobian factor that corresponds to channel `c`.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
    procedure :: get_f => sf_chain_instance_get_f
```

⟨*SF base: procedures*⟩+≡
```
    function sf_chain_instance_get_f (chain, c) result (f)
      class(sf_chain_instance_t), intent(in) :: chain
      integer, intent(in) :: c
      real(default) :: f
      if (allocated (chain%f)) then
         f = chain%f(c)
      else
         f = 1
      end if
    end function sf_chain_instance_get_f
```

Return the evaluation status.

⟨*SF base: sf chain instance: TBP*⟩+≡
```
    procedure :: get_status => sf_chain_instance_get_status
```

⟨*SF base: procedures*⟩+≡
```

16.5.12   Test implementation: structure function

This is a template for the actual structure-function implementation which will
be defined in separate modules.

Configuration data

The test structure function uses the `Test` model. It describes a scalar within
an arbitrary initial particle, which is given in the initialization. The radiated
particle is also a scalar, the same one, but we set its mass artificially to zero.

⟨*SF base: public test auxiliary*⟩≡
```
      public :: sf_test_data_t
```

⟨SF base: test types⟩≡

```
type, extends (sf_data_t) :: sf_test_data_t
   class(model_data_t), pointer :: model => null ()
   integer :: mode = 0
   type(flavor_t) :: flv_in
   type(flavor_t) :: flv_out
   type(flavor_t) :: flv_rad
   real(default) :: m = 0
   logical :: collinear = .true.
   real(default), dimension(:), allocatable :: qbounds
 contains
```
⟨SF base: sf test data: TBP⟩
```
end type sf_test_data_t
```

Output.

⟨SF base: sf test data: TBP⟩≡
```
procedure :: write => sf_test_data_write
```

⟨SF base: test auxiliary⟩≡
```
subroutine sf_test_data_write (data, unit, verbose)
  class(sf_test_data_t), intent(in) :: data
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: verbose
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)")  "SF test data:"
  write (u, "(3x,A,A)") "model    = ", char (data%model%get_name ())
  write (u, "(3x,A)", advance="no") "incoming  = "

      class(sf_int_t), intent(inout), allocatable :: sf_int
      if (allocated (sf_int)) deallocate (sf_int)
      allocate (sf_test_t :: sf_int)
    end subroutine sf_test_data_allocate_sf_int
```

Interaction

⟨*SF base: test types*⟩+≡
```
    type, extends (sf_int_t) :: sf_test_t
       type(sf_test_data_t), pointer :: data => null ()
       real(default) :: x = 0
     contains
     ⟨SF base: sf test int: TBP⟩
     end type sf_test_t
```

Type string: constant

⟨*SF base: sf test int: TBP*⟩≡
```
    procedure :: type_string => sf_test_type_string
```

⟨*SF base: test auxiliary*⟩+≡
```
    function sf_test_type_string (object) result (string)
      class(sf_test_t), intent(in) :: object
      type(string_t) :: string
      string = "Test"
    end function sf_test_type_string
```

Output. Call the interaction routine after displaying the configuration.

⟨*SF base: sf test int: TBP*⟩+≡
```
    procedure :: write => sf_test_write
```

⟨*SF base: test auxiliary*⟩+≡
```
    subroutine sf_test_write (object, unit, testflag)
      class(sf_test_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag
      integer :: u
      u = given_output_unit (unit)
      if (associated (object%data)) then
         call object%data%write (u)
         call object%base_write (u, testflag)
      else
         write (u, "(1x,A)")  "SF test data: [undefined]"
      end if
    end subroutine sf_test_write
```

Initialize. We know that `data` will be of concrete type `sf_test_data_t`, but we have to cast this explicitly.

For this implementation, we set the incoming and outgoing masses equal to the physical particle mass, but keep the radiated mass zero.

Optionally, we can provide minimum and maximum values for the momentum transfer.

⟨*SF base: sf test int: TBP*⟩+≡

16.5.13   Test implementation: pair spectrum

Another template, this time for a incoming particle pair, splitting into two
radiated and two outgoing particles.

Configuration data

For simplicity, the spectrum contains two mirror images of the previous structure-
function configuration: the incoming and all outgoing particles are test scalars.
    We have two versions, one with radiated particles, one without.

⟨*SF base: test types*⟩+≡
```
    type, extends (sf_data_t) :: sf_test_spectrum_data_t
      class(model_data_t), pointer :: model => null ()
      type(flavor_t) :: flv_in
      type(flavor_t) :: flv_out
      type(flavor_t) :: flv_rad
      logical :: with_radiation = .true.
      real(default) :: m = 0
     contains
     ⟨SF base: sf test spectrum data: TBP⟩
    end type sf_test_spectrum_data_t
```

Output.

⟨*SF base: sf test spectrum data: TBP*⟩≡
```
    procedure :: write => sf_test_spectrum_data_write
```

⟨*SF base: test auxiliary*⟩+≡
```
    subroutine sf_test_spectrum_data_write (data, unit, verbose)
      class(sf_test_spectrum_data_t), intent(in) :: data
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A)")  "SF test spectrum data:"
      write (u, "(3x,A,A)") "model     = ", char (data%model%get_name ())
```

```
      write (u, "(3x,A)", advance="no") "incoming  = "
      call data%flv_in%write (u);  write (u, *)
      write (u, "(3x,A)", advance="no") "outgoing  = "
      call data%flv_out%write (u);  write (u, *)
      write (u, "(3x,A)", advance="no") "radiated  = "
      call data%flv_rad%write (u);  write (u, *)
      write (u, "(3x,A," // FMT_19 // ")")  "mass      = ", data%m
    end subroutine sf_test_spectrum_data_write
```

Initialization.

⟨*SF base: sf test spectrum data: TBP*⟩+≡
```
    procedure :: init => sf_test_spectrum_data_init
```

⟨*SF base: test auxiliary*⟩+≡
```
    subroutine sf_test_spectrum_data_init (data, model, pdg_in, with_radiation)
      class(sf_test_spectrum_data_t), intent(out) :: data
      class(model_data_t), intent(in), target :: model
      type(pdg_array_t), intent(in) :: pdg_in
      logical, intent(in) :: with_radiation
      data%model => model
      data%with_radiation = with_radiation
      if (pdg_array_get (pdg_in, 1) /= 25) then
         call msg_fatal ("Test structure function: input flavor must be 's'")
      end if

```

1454

Initialize. We know that `data` will be of concrete type `sf_test_spectrum_data_t`, but we have to cast this explicitly.

For this implementation, we set the incoming and outgoing masses equal to the physical particle mass, but keep the radiated mass zero.

Optionally, we can provide minimum and maximum values for the momentum transfer.

16.5.14   Test implementation: generator spectrum

A generator for two beams, no radiation (for simplicity).

Configuration data

For simplicity, the spectrum contains two mirror images of the previous structure-function configuration: the incoming and all outgoing particles are test scalars.

We have two versions, one with radiated particles, one without.

⟨*SF base: test types*⟩+≡
```
type, extends (sf_data_t) :: sf_test_generator_data_t
  class(model_data_t), pointer :: model => null ()
  type(flavor_t) :: flv_in
  type(flavor_t) :: flv_out
  type(flavor_t) :: flv_rad
  real(default) :: m = 0
 contains
 ⟨SF base: sf test generator data: TBP⟩
end type sf_test_generator_data_t
```

Output.

⟨*SF base: sf test generator data: TBP*⟩≡
```
procedure :: write => sf_test_generator_data_write
```

⟨*SF base: test auxiliary*⟩+≡
```
subroutine sf_test_generator_data_write (data, unit, verbose)
  class(sf_test_generator_data_t), intent(in) :: data
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: verbose
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)")  "SF test generator data:"
  write (u, "(3x,A,A)") "model    = ", char (data%model%get_name ())
  write (u, "(3x,A)", advance="no") "incoming  = "
  call data%flv_in%write (u);  write (u, *)
  write (u, "(3x,A)", advance="no") "outgoing  = "
  call data%flv_out%write (u);  write (u, *)
  write (u, "(3x,A," // FMT_19 // ")")  "mass      = ", data%m
end subroutine sf_test_generator_data_write
```

Initialization.

⟨*SF base: sf test generator data: TBP*⟩+≡
```
procedure :: init => sf_test_generator_data_init
```

⟨*SF base: test auxiliary*⟩+≡
```
subroutine sf_test_generator_data_init (data, model, pdg_in)

      allocate (sf_test_generator_t :: sf_int)
    end subroutine sf_test_generator_data_allocate_sf_int
```

Interaction

⟨*SF base: test types*⟩+≡
```
    type, extends (sf_int_t) :: sf_test_generator_t
      type(sf_test_generator_data_t), pointer :: data => null ()
     contains
     ⟨SF base: sf test generator: TBP⟩
    end type sf_test_generator_t
```

⟨*SF base: sf test generator: TBP*⟩≡
```
procedure :: type_string => sf_test_generator_type_string
```

⟨*SF base: test auxiliary*⟩+≡
```
function sf_test_generator_type_string (object) result (string)
  class(sf_test_generator_t), intent(in) :: object
  type(string_t) :: string
  string = "Test Generator"
end function sf_test_generator_type_string
```

Output. Call the interaction routine after displaying the configuration.

⟨*SF base: sf test generator: TBP*⟩+≡
```
procedure :: write => sf_test_generator_write
```

⟨*SF base: test auxiliary*⟩+≡
```
subroutine sf_test_generator_write (object, unit, testflag)
  class(sf_test_generator_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: testflag
  integer :: u
  u = given_output_unit (unit)
  if (associated (object%data)) then
     call object%data%write (u)
     call object%base_write (u, testflag)
  else
     write (u, "(1x,A)")  "SF test generator data: [undefined]"
  end if
end subroutine sf_test_generator_write
```

Initialize. We know that `data` will be of concrete type **sf_test_generator_data_t**, but we have to cast this explicitly.

For this implementation, we set the incoming and outgoing masses equal to the physical particle mass. No radiation.

⟨*SF base: sf test generator: TBP*⟩+≡
```
procedure :: init => sf_test_generator_init
```

⟨*SF base: test auxiliary*⟩+≡
```
subroutine sf_test_generator_init (sf_int, data)
  class(sf_test_generator_t), intent(out) :: sf_int
  class(sf_data_t), intent(in), target :: data
  type(quantum_numbers_mask_t), dimension(4) :: mask

      call sf_int%freeze ()
    end select
    sf_int%status = SF_INITIAL
  end subroutine sf_test_generator_init
```

This structure function is a generator.

⟨*SF base: sf test generator: TBP*⟩+≡
```
    procedure :: is_generator => sf_test_generator_is_generator
```

⟨*SF base: test auxiliary*⟩+≡
```
    function sf_test_generator_is_generator (sf_int) result (flag)
      class(sf_test_generator_t), intent(in) :: sf_int
      logical :: flag
      flag = sf_int%data%is_generator ()
    end function sf_test_generator_is_generator
```

Generate free parameters. This mock generator always produces the nubmers 0.8 and 0.5.

⟨*SF base: sf test generator: TBP*⟩+≡
```
    procedure :: generate_free => sf_test_generator_generate_free
```

⟨*SF base: test auxiliary*⟩+≡
```
    subroutine sf_test_generator_generate_free (sf_int, r, rb,  x_free)
      class(sf_test_generator_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: r, rb
      real(default), intent(inout) :: x_free
      r = [0.8, 0.5]
      rb= 1 - r
      x_free = x_free * product (r)
    end subroutine sf_test_generator_generate_free
```

Recover momentum fractions. Since the x values are free, we also set the x_free parameter.

⟨*SF base: sf test generator: TBP*⟩+≡
```
    procedure :: recover_x => sf_test_generator_recover_x
```

⟨*SF base: test auxiliary*⟩+≡
```
    subroutine sf_test_generator_recover_x (sf_int, x, xb, x_free)
      class(sf_test_generator_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: x
      real(default), dimension(:), intent(out) :: xb
      real(default), intent(inout), optional :: x_free

      if (present (x_free))  x_free = x_free * product (x)
    end subroutine sf_test_generator_recover_x
```

Set kinematics. Since this is a generator, just transfer input to output.

⟨SF base: sf test generator: TBP⟩+≡
```
procedure :: complete_kinematics => sf_test_generator_complete_kinematics
```

⟨SF base: test auxiliary⟩+≡
```
subroutine sf_test_generator_complete_kinematics (sf_int, x, xb, f, r, rb, map)
  class(sf_test_generator_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(out) :: x
  real(default), dimension(:), intent(out) :: xb
  real(default), intent(out) :: f
  real(default), dimension(:), intent(in) :: r
  real(default), dimension(:), intent(in) :: rb
  logical, intent(in) :: map
  x = r
  xb= rb
  f = 1
  call sf_int%reduce_momenta (x)
end subroutine sf_test_generator_complete_kinematics
```

Compute inverse kinematics. Here, we start with the x array and compute the "input" r values and the Jacobian f. After this, we can set momenta by the same formula as for normal kinematics.

⟨SF base: sf test generator: TBP⟩+≡
```
procedure :: inverse_kinematics => sf_test_generator_inverse_kinematics
```

⟨SF base: test auxiliary⟩+≡
```
subroutine sf_test_generator_inverse_kinematics &
    (sf_int, x, xb, f, r, rb, map, set_momenta)
  class(sf_test_generator_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(in) :: x
  real(default), dimension(:), intent(in) :: xb
  real(default), intent(out) :: f
  real(default), dimension(:), intent(out) :: r
  real(default), dimension(:), intent(out) :: rb
  logical, intent(in) :: map
  logical, intent(in), optional :: set_momenta
  logical :: set_mom
  set_mom = .false.;  if (present (set_momenta))  set_mom = set_momenta
  r = x
  rb= xb
  f = 1
  if (set_mom)  call sf_int%reduce_momenta (x)
end subroutine sf_test_generator_inverse_kinematics
```

Apply the structure function. The matrix element becomes unity and the application always succeeds.

⟨SF base: sf test generator: TBP⟩+≡
```
procedure :: apply => sf_test_generator_apply
```

⟨SF base: test auxiliary⟩+≡
```
subroutine sf_test_generator_apply (sf_int, scale, rescale, i_sub)
  class(sf_test_generator_t), intent(inout) :: sf_int

Structure function instance configuration

We create a structure-function chain instance which implements a configured
structure-function chain. We link the momentum entries in the interactions and
compute kinematics.

   We do not actually connect the interactions and create evaluators. We skip
this step and manually advance the status of the chain instead.

16.6.1 Physics

The ISR structure function is in the most crude approximation (LLA without α corrections, i.e. ϵ^0)

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \qquad \text{with} \qquad \epsilon = \frac{\alpha}{\pi}q_e^2 \ln \frac{s}{m^2}, \qquad (16.29)$$

where m is the mass of the incoming (and outgoing) particle, which is initially assumed on-shell.

In $f_0(x)$, there is an integrable singularity at $x = 1$ which does not spoil the integration, but would lead to an unbounded $f_{\max}$. Therefore, we map this singularity like

$$x = 1 - (1-x')^{1/\epsilon} \qquad (16.30)$$

such that

$$\int dx \, f_0(x) = \int dx' \qquad (16.31)$$

For the detailed form of the QED ISR structure function cf. Chap. 10.

16.6.2 Implementation

In the concrete implementation, the zeroth order mapping (16.30) is implemented, and the Jacobian is equal to $f_i(x)/f_0(x)$. This can be written as

$$\frac{f_0(x)}{f_0(x)} = 1 \tag{16.32}$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon - \frac{1 - x^2}{2(1 - x')} \tag{16.33}$$

$$\frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 - \frac{1 - x^2}{2(1 - x')}$$
$$- \frac{(1 + 3x^2)\ln x + (1 - x)\left(4(1 + x)\ln(1 - x) + 5 + x\right)}{8(1 - x')}\epsilon \tag{16.34}$$

For $x = 1$ (i.e., numerically indistinguishable from 1), this reduces to

$$\frac{f_0(x)}{f_0(x)} = 1 \tag{16.35}$$

$$\frac{f_1(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon \tag{16.36}$$

$$\frac{f_2(x)}{f_0(x)} = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 \tag{16.37}$$

The last line in (16.34) is zero for

$$x_{\min} = 0.0071405332973459283954987977 2019 \tag{16.38}$$

(Mathematica result), independent of ϵ. For x values less than this we ignore this correction because of the logarithmic singularity which should in principle be resummed.

16.6.3 The ISR data block

```

16.6.4 The ISR object

The `isr_t` data type is a $1 \to 2$ interaction, i.e., we allow for single-photon emission only (but use the multi-photon resummed radiator function). The particles are ordered as (incoming, photon, outgoing).

There is no need to handle several flavors (and data blocks) in parallel, since ISR is always applied immediately after beam collision. (ISR for partons is accounted for by the PDFs themselves.) Polarization is carried through, i.e., we retain the polarization of the incoming particle and treat the emitted photon as unpolarized. Color is trivially carried through. This implies that particles 1 and 3 should be locked together. For ISR we don't need the q variable.

⟨*SF isr: public*⟩+≡
```
public :: isr_t
```

⟨*SF isr: types*⟩+≡
```
type, extends (sf_int_t) :: isr_t
  private
  type(isr_data_t), pointer :: data => null ()

⟨*SF isr: isr: TBP*⟩+≡
```
    procedure :: set_order => isr_set_order
```

⟨*SF isr: procedures*⟩+≡
```
    subroutine isr_set_order (object, order)
      class(isr_t), intent(inout) :: object
      integer, intent(in) :: order
      call object%data%set_order (order)
      call object%data%pdf%set_order (order)
    end subroutine isr_set_order
```

16.6.5   Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ were trivial. The ISR structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the x value is transformed. Higher orders affect the function value.

The structure function implementation applies the above mapping to the input (random) number `r` to generate the momentum fraction `x` and the function value `f`. For numerical stability reasons, we also output `xb`, which is $\bar{x} = 1 - x$.

For the ISR structure function, the mapping Jacobian cancels the structure function (to order zero). We apply the cancellation explicitly, therefore both the Jacobian `f` and the zeroth-order value (see the `apply` method) are unity if mapping is turned on. If mapping is turned off, the Jacobian `f` includes the value of the (zeroth-order) structure function, and strongly peaked.

⟨*SF isr: isr: TBP*⟩+≡
```
    procedure :: complete_kinematics => isr_complete_kinematics
```

⟨*SF isr: procedures*⟩+≡
```
    subroutine isr_complete_kinematics (sf_int, x, xb, f, r, rb, map)
      class(isr_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: x
      real(default), dimension(:), intent(out) :: xb
      real(default), intent(out) :: f
      real(default), dimension(:), intent(in) :: r
      real(default), dimension(:), intent(in) :: rb
      logical, intent(in) :: map
      real(default) :: eps
      eps = sf_int%data%eps
      if (map) then
         call map_power_1 (sf_int%xb, f, rb(1), eps)
```

```
      else
         sf_int%xb = rb(1)
         if (rb(1) > 0) then
            f = 1
         else
            f = 0
         end if
      end if
      sf_int%x = 1 - sf_int%xb
      x(1) = sf_int%x
      xb(1) = sf_int%xb
      if (size (x) == 3) then
         x(2:3) = r(2:3)
         xb(2:3) = rb(2:3)
      end if
      call sf_int%split_momentum (x, xb)
      select case (sf_int%status)
      case (SF_FAILED_KINEMATICS)
         sf_int%x = 0
         sf_int%xb= 0
         f = 0
      end select
   end subroutine isr_complete_kinematics
```

Overriding the default method: we compute the `x` array from the momentum configuration. In the specific case of ISR, we also set the internally stored x and $\bar{x}$ values, so they can be used in the following routine.

⟨*SF isr: isr: TBP*⟩+≡
```
   procedure :: recover_x => sf_isr_recover_x
```

⟨*SF isr: procedures*⟩+≡
```
   subroutine sf_isr_recover_x (sf_int, x, xb, x_free)
     class(isr_t), intent(inout) :: sf_int
     real(default), dimension(:), intent(out) :: x
     real(default), dimension(:), intent(out) :: xb
     real(default), intent(inout), optional :: x_free
     call sf_int%base_recover_x (x, xb, x_free)
     sf_int%x  = x(1)
     sf_int%xb = xb(1)
   end subroutine sf_isr_recover_x
```

Compute inverse kinematics. Here, we start with the x array and compute the "input" r values and the Jacobian f. After this, we can set momenta by the same formula as for normal kinematics.

For extracting x, we rely on the stored $\bar{x}$ value, since the x value in the argument is likely imprecise. This means that either complete_kinematics or recover_x must be called first, for the current sampling point (but maybe another channel).

⟨*SF isr: isr: TBP*⟩+≡
```
   procedure :: inverse_kinematics => isr_inverse_kinematics
```

⟨*SF isr: procedures*⟩+≡
```
   subroutine isr_inverse_kinematics (sf_int, x, xb, f, r, rb, map, set_momenta)
```

16.6.6 ISR application

For ISR, we could in principle compute kinematics and function value in a
single step. In order to be able to reweight matrix elements including structure
functions we split kinematics and structure function calculation. The structure
function works on a single beam, assuming that the input momentum has been
set.

For the structure-function evaluation, we rely on the fact that the power
mapping, which we apply in the kinematics method (if the `map` flag is set),
has a Jacobian which is just the inverse lowest-order structure function. With
mapping active, the two should cancel exactly.

After splitting momenta, we set the outgoing momenta on-shell. We choose to conserve momentum, so energy conservation may be violated.

⟨*SF isr: isr: TBP*⟩+≡

16.7.1 Physics

The EPA structure function for a photon inside an (elementary) particle p with
energy E, mass m and charge q_p (e.g., electron) is given by ($\bar{x} \equiv 1 - x$)

$$
f(x) = \frac{\alpha}{\pi}\, q_p^2\, \frac{1}{x} \left[\left(\bar{x} + \frac{x^2}{2} \right) \ln \frac{Q_{\max}^2}{Q_{\min}^2} \right.
$$
$$
\left. - \left(1 - \frac{x}{2} \right)^2 \ln \frac{x^2 + \frac{Q_{\max}^2}{E^2}}{x^2 + \frac{Q_{\min}^2}{E^2}} - x^2 \frac{m^2}{Q_{\min}^2} \left(1 - \frac{Q_{\min}^2}{Q_{\max}^2} \right) \right]. \quad (16.39)
$$

If no explicit Q bounds are provided, the kinematical bounds are

$$-Q^2_{\max} = t_0 = -2\bar{x}(E^2 + p\bar{p}) + 2m^2 \approx -4\bar{x}E^2, \tag{16.40}$$

$$-Q^2_{\min} = t_1 = -2\bar{x}(E^2 - p\bar{p}) + 2m^2 \approx -\frac{x^2}{\bar{x}}m^2. \tag{16.41}$$

The second and third terms in (16.39) are negative definite (and subleading). Noting that $\bar{x}+x^2/2$ is bounded between $1/2$ and 1, we derive that $f(x)$ is always smaller than

$$\bar{f}(x) = \frac{\alpha}{\pi}\,q_p^2\,\frac{L - 2\ln x}{x} \qquad \text{where} \qquad L = \ln\frac{\min(4E^2_{\max}, Q^2_{\max})}{\max(m^2, Q^2_{\min})}, \tag{16.42}$$

where we allow for explicit Q bounds that narrow the kinematical range. Therefore, we generate this distribution:

$$\int_{x_0}^{x_1} dx\,\bar{f}(x) = C(x_0, x_1)\int_0^1 dx' \tag{16.43}$$

We set

$$\ln x = \frac{1}{2}\left\{L - \sqrt{L^2 - 4\left[x'\ln x_1(L - \ln x_1) + \bar{x}'\ln x_0(L - \ln x_0)\right]}\right\} \tag{16.44}$$

such that $x(0) = x_0$ and $x(1) = x_1$ and

$$\frac{dx}{dx'} = \left(\frac{\alpha}{\pi}q_p^2\right)^{-1} x\frac{C(x_0, x_1)}{L - 2\ln x} \tag{16.45}$$

with

$$C(x_0, x_1) = \frac{\alpha}{\pi}q_p^2\left[\ln x_1(L - \ln x_1) - \ln x_0(L - \ln x_0)\right] \tag{16.46}$$

such that (16.43) is satisfied. Finally, we have

$$\int_{x_0}^{x_1} dx\,f(x) = C(x_0, x_1)\int_0^1 dx'\,\frac{f(x(x'))}{\bar{f}(x(x'))} \tag{16.47}$$

where x' is calculated from x via (16.44).

The structure of the mapping is most obvious from:

$$x'(x) = \frac{\log x(L - \log x) - \log x_0(L - \log x_0)}{\log x_1(L - \log x_1) - \log x_0(L - \log x_0)}\ . \tag{16.48}$$

16.7.2 The EPA data block

The EPA parameters are: α, $E_{\max}$, m, $Q_{\min}$, and $x_{\min}$. Instead of m we can use the incoming particle PDG code as input; from this we can deduce the mass and charge.

Internally we store in addition $C_{0/1} = \frac{\alpha}{\pi}q_e^2 \ln x_{0/1}(L - \ln x_{0/1})$, the c.m. energy squared and the incoming particle mass.

16.7.3 The EPA object

The epa_t data type is a $1 \rightarrow 2$ interaction. We should be able to handle several flavors in parallel, since EPA is not necessarily applied immediately after beam collision: Photons may be radiated from quarks. In that case, the partons are massless and $q_{\min}$ applies instead, so we do not need to generate several kinematical configurations in parallel.

The squared charge values multiply the matrix elements, depending on the flavour. We scan the interaction after building it, so we have the correct assignments.

The particles are ordered as (incoming, radiated, photon), where the photon initiates the hard interaction.

We generate an unpolarized photon and transfer initial polarization to the radiated parton. Color is transferred in the same way.

⟨*SF epa: types*⟩+≡
```
   type, extends (sf_int_t) :: epa_t
      type(epa_data_t), pointer :: data => null ()
      real(default) :: x  = 0
      real(default) :: xb = 0
      real(default) :: E  = 0
      real(default), dimension(:), allocatable :: charge2
    contains
    ⟨SF epa: epa: TBP⟩
   end type epa_t
```

Type string: has to be here, but there is no string variable on which EPA
depends. Hence, a dummy routine.

⟨*SF epa: epa: TBP*⟩≡
```
procedure :: type_string => epa_type_string
```

⟨*SF epa: procedures*⟩+≡
```
function epa_type_string (object) result (string)
  class(epa_t), intent(in) :: object
  type(string_t) :: string
  if (associated (object%data)) then
     string = "EPA: equivalent photon approx."
  else
     string = "EPA: [undefined]"
  end if
end function epa_type_string
```

Output. Call the interaction routine after displaying the configuration.

⟨*SF epa: epa: TBP*⟩+≡
```
procedure :: write => epa_write
```

⟨*SF epa: procedures*⟩+≡
```
subroutine epa_write (object, unit, testflag)
  class(epa_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: testflag
  integer :: u
  u = given_output_unit (unit)
  if (associated (object%data)) then
     call object%data%write (u)
     if (object%status >= SF_DONE_KINEMATICS) then
        write (u, "(1x,A)")  "SF parameters:"
        write (u, "(3x,A," // FMT_17 // ")")  "x =", object%x
        if (object%status >= SF_FAILED_EVALUATION) then
           write (u, "(3x,A," // FMT_17 // ")")  "E =", object%E
        end if
     end if
     call object%base_write (u, testflag)
  else
     write (u, "(1x,A)")  "EPA data: [undefined]"
  end if
end subroutine epa_write
```

Prepare the interaction object. We have to construct transition matrix elements
for all flavor and helicity combinations.

    end do
    sf_int%status = SF_INITIAL
  end subroutine epa_setup_constants
```

16.7.4 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

The EPA structure function allows for a straightforward mapping of the unit interval. The x value is transformed, and the mapped structure function becomes unity at its upper boundary.

The structure function implementation applies the above mapping to the input (random) number `r` to generate the momentum fraction `x` and the function value `f`. For numerical stability reasons, we also output `xb`, which is $\bar{x} = 1 - x$.

⟨*SF epa: epa: TBP*⟩+≡
```fortran
    procedure :: complete_kinematics => epa_complete_kinematics
```

⟨*SF epa: procedures*⟩+≡
```fortran
  subroutine epa_complete_kinematics (sf_int, x, xb, f, r, rb, map)
    class(epa_t), intent(inout) :: sf_int
    real(default), dimension(:), intent(out) :: x
    real(default), dimension(:), intent(out) :: xb
    real(default), intent(out) :: f
    real(default), dimension(:), intent(in) :: r
    real(default), dimension(:), intent(in) :: rb
    logical, intent(in) :: map
    real(default) :: delta, sqrt_delta, lx
    if (map) then
       associate (data => sf_int%data)
         delta = data%log ** 2 -  4 * (r(1) * data%c1 + rb(1) * data%c0)
         if (delta > 0) then
            sqrt_delta = sqrt (delta)
            lx = (data%log - sqrt_delta) / 2
         else
            sf_int%status = SF_FAILED_KINEMATICS
            f = 0
            return
         end if
         x(1) = exp (lx)
         f = x(1) * data%dc / sqrt_delta
       end associate
    else
```

```
        x(1) = r(1)
        if (sf_int%data%x_min < x(1) .and. x(1) < sf_int%data%x_max) then
           f = 1
        else
           sf_int%status = SF_FAILED_KINEMATICS
           f = 0
           return
        end if
     end if
     xb(1) = 1 - x(1)
     if (size(x) == 3) then
        x(2:3) = r(2:3)
        xb(2:3) = rb(2:3)
     end if
     call sf_int%split_momentum (x, xb)
     select case (sf_int%status)
     case (SF_DONE_KINEMATICS)
        sf_int%x = x(1)
        sf_int%xb= xb(1)
        sf_int%E  = energy (sf_int%get_momentum (1))
     case (SF_FAILED_KINEMATICS)
        sf_int%x = 0
        sf_int%xb= 0
        f = 0
     end select
  end subroutine epa_complete_kinematics
```

Overriding the default method: we compute the x array from the momentum
configuration. In the specific case of EPA, we also set the internally stored x
and $\bar{x}$ values, so they can be used in the following routine.

Note: the extraction of $\bar{x}$ is not numerically safe, but it cannot be as long
as the base recover_x is not.

⟨*SF epa: epa: TBP*⟩+≡
```
     procedure :: recover_x => sf_epa_recover_x
```

⟨*SF epa: procedures*⟩+≡
```
     subroutine sf_epa_recover_x (sf_int, x, xb, x_free)
       class(epa_t), intent(inout) :: sf_int
       real(default), dimension(:), intent(out) :: x
       real(default), dimension(:), intent(out) :: xb
       real(default), intent(inout), optional :: x_free
       call sf_int%base_recover_x (x, xb, x_free)
       sf_int%x  = x(1)
       sf_int%xb = xb(1)
     end subroutine sf_epa_recover_x
```

Compute inverse kinematics. Here, we start with the x array and compute the
"input" r values and the Jacobian f. After this, we can set momenta by the
same formula as for normal kinematics.

⟨*SF epa: epa: TBP*⟩+≡
```
     procedure :: inverse_kinematics => epa_inverse_kinematics
```

⟨SF epa: procedures⟩+≡

```
subroutine epa_inverse_kinematics (sf_int, x, xb, f, r, rb, map, set_momenta)
  class(epa_t), intent(inout) :: sf_int
  real(default), dimension(:), intent(in) :: x
  real(default), dimension(:), intent(in) :: xb
  real(default), intent(out) :: f
  real(default), dimension(:), intent(out) :: r
  real(default), dimension(:), intent(out) :: rb
  logical, intent(in) :: map
  logical, intent(in), optional :: set_momenta
  real(default) :: lx, delta, sqrt_delta, c
  logical :: set_mom
  set_mom = .false.;  if (present (set_momenta))  set_mom = set_momenta
  if (map) then
     associate (data => sf_int%data)
       lx = log (x(1))
       sqrt_delta = data%log - 2 * lx
       delta = sqrt_delta ** 2
       c = (data%log ** 2 - delta) / 4
       r (1) = (c - data%c0) / data%dc
       rb(1) = (data%c1 - c) / data%dc
       f = x(1) * data%dc / sqrt_delta
     end associate
  else
     r (1) = x(1)
     rb(1) = xb(1)
     if (sf_int%data%x_min < x(1) .and. x(1) < sf_int%data%x_max) then
        f = 1
     else
        f = 0
     end if
  end if
  if (size(r) == 3) then
     r (2:3) = x(2:3)
     rb(2:3) = xb(2:3)
  end if
  if (set_mom) then
     call sf_int%split_momentum (x, xb)
     select case (sf_int%status)
     case (SF_FAILED_KINEMATICS);  f = 0
     end select
  end if
  sf_int%E  = energy (sf_int%get_momentum (1))
end subroutine epa_inverse_kinematics
```

16.7.5   EPA application

For EPA, we can in principle compute kinematics and function value in a single step. In order to be able to reweight events, kinematics and structure function application are separated. This function works on a single beam, assuming that the input momentum has been set. We need three random numbers as input: one for x, and two for the polar and azimuthal angles. Alternatively, for the

no-recoil case, we can skip p_T generation; in this case, we only need one.

For obtaining splitting kinematics, we rely on the assumption that all in-particles are mass-degenerate (or there is only one), so the generated x values are identical.

⟨*SF epa: epa: TBP*⟩+≡
```
procedure :: apply => epa_apply
```

⟨*SF epa: procedures*⟩+≡
```
subroutine epa_apply (sf_int, scale, rescale, i_sub)
  class(epa_t), intent(inout) :: sf_int
  real(default), intent(in) :: scale
  class(sf_rescale_t), intent(in), optional :: rescale
  integer, intent(in), optional :: i_sub
  real(default) :: x, xb, qminsq, qmaxsq, f, E
  associate (data => sf_int%data)
    x = sf_int%x
    xb= sf_int%xb
    E = sf_int%E
    qminsq = max (x ** 2 / xb * data%mass ** 2, data%q_min ** 2)
    qmaxsq = min (4 * xb * E ** 2, data%q_max ** 2)
    if (qminsq < qmaxsq) then
       f = data%a / x &
            * ((xb + x ** 2 / 2) * log (qmaxsq / qminsq) &
            - (1 - x / 2) ** 2 &
            * log ((x**2 + qmaxsq / E ** 2) / (x**2 + qminsq / E ** 2)) &
            - x ** 2 * data%mass ** 2 / qminsq * (1 - qminsq / qmaxsq))
    else
       f = 0
    end if
    call sf_int%set_matrix_element &
         (cmplx (f, kind=default) * sf_int%charge2)
  end associate
  sf_int%status = SF_EVALUATED
end subroutine epa_apply
```

16.8.1 Physics

The EWA structure function for a Z or W inside a fermion (lepton or quark) depends on the vector-boson polarization. We distinguish transversal ($\pm$) and

longitudinal (0) polarization.

$$F_+(x) = \frac{1}{16\pi^2} \frac{(v-a)^2 + (v+a)^2 \bar{x}^2}{x} \left[\ln\left(\frac{p_{\perp,\text{max}}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\text{max}}^2}{p_{\perp,\text{max}}^2 + \bar{x}M^2} \right]$$
(16.49)

$$F_-(x) = \frac{1}{16\pi^2} \frac{(v+a)^2 + (v-a)^2 \bar{x}^2}{x} \left[\ln\left(\frac{p_{\perp,\text{max}}^2 + \bar{x}M^2}{\bar{x}M^2} \right) - \frac{p_{\perp,\text{max}}^2}{p_{\perp,\text{max}}^2 + \bar{x}M^2} \right]$$
(16.50)

$$F_0(x) = \frac{v^2 + a^2}{8\pi^2} \frac{2\bar{x}}{x} \frac{p_{\perp,\text{max}}^2}{p_{\perp,\text{max}}^2 + \bar{x}M^2}$$
(16.51)

where $p_{\perp,\text{max}}$ is the cutoff in transversal momentum, M is the vector-boson mass, v and a are the vector and axial-vector couplings, and $\bar{x} \equiv 1-x$. Note that the longitudinal structure function is finite for large cutoff, while the transversal structure function is logarithmically divergent.

The maximal transverse momentum is given by the kinematical limit, it is

$$p_{\perp,\text{max}} = \bar{x}\sqrt{s}/2.$$
(16.52)

The vector and axial couplings for a fermion branching into a W are

$$v_W = \frac{g}{2\sqrt{2}}, \qquad\qquad a_W = \frac{g}{2\sqrt{2}}.$$
(16.53)

For Z emission, this is replaced by

$$v_Z = \frac{g}{2\cos\theta_w} \left(t_3 - 2q\sin^2\theta_w \right), \qquad a_Z = \frac{g}{2\cos\theta_w} t_3,$$
(16.54)

where $t_3 = \pm\frac{1}{2}$ is the fermion isospin, and q its charge.

For an initial antifermion, the signs of the axial couplings are inverted. Note that a common sign change of v and a is irrelevant.

The EWA depends on the parameters g, $\sin^2\theta_w$, M_W, and M_Z. These can all be taken from the SM input, and the prefactors are calculated from those and the incoming particle type.

Since these structure functions have a $1/x$ singularity (which is not really relevant in practice, however, since the vector boson mass is finite), we map this singularity allowing for nontrivial x bounds:

$$x = \exp(\bar{r}\ln x_0 + r\ln x_1)$$
(16.55)

such that

$$\int_{x_0}^{x_1} \frac{dx}{x} = (\ln x_1 - \ln x_0) \int_0^1 dr.$$
(16.56)

As a user parameter, we have the cutoff $p_{\perp,\text{max}}$. The divergence $1/x$ also requires a x_0 cutoff; and for completeness we introduce a corresponding x_1. Physically, the minimal sensible value of x is M^2/s, although the approximation loses its value already at higher x values.

16.8.2 The EWA data block

The EWA parameters are: $p_{T,\max}$, c_V, c_A, and m. Instead of m we can use the incoming particle PDG code as input; from this we can deduce the mass and charges. In the initialization phase it is not yet determined whether a W or a Z is radiated, hence we set the vector and axial-vector couplings equal to the common prefactors $g/2 = e/2/\sin\theta_W$.

In principle, for EWA it would make sense to allow the user to also set the upper bound for x, $x_{\max}$, but we fix it to one here.

```

16.8.3 The EWA object

The ewa_t data type is a $1 \to 2$ interaction. We should be able to handle several flavors in parallel, since EWA is not necessarily applied immediately after beam collision: W/Z bosons may be radiated from quarks. In that case, the partons are massless and q_{min} applies instead, so we do not need to generate several kinematical configurations in parallel.

The particles are ordered as (incoming, radiated, W/Z), where the W/Z initiates the hard interaction.

In the case of EPA, we generated an unpolarized photon and transferred initial polarization to the radiated parton. Color is transferred in the same way. I do not know whether the same can/should be done for EWA, as the structure functions depend on the W/Z polarization. If we are having Z bosons, both up- and down-type fermions can participate. Otherwise, with a W^+ an up-type fermion is transferred to a down-type fermion, and the other way round.

⟨*SF ewa: types*⟩+≡
```
    type, extends (sf_int_t) :: ewa_t
      type(ewa_data_t), pointer :: data => null ()
      real(default) :: x  = 0
      real(default) :: xb = 0
      integer :: n_me = 0
      real(default), dimension(:), allocatable :: cv
      real(default), dimension(:), allocatable :: ca
    contains
    ⟨SF ewa: ewa: TBP⟩
    end type ewa_t
```

Type string: has to be here, but there is no string variable on which EWA depends. Hence, a dummy routine.

⟨*SF ewa: ewa: TBP*⟩≡
```
    procedure :: type_string => ewa_type_string
```

1559

⟨*SF ewa: procedures*⟩+≡
```
    function ewa_type_string (object) result (string)
      class(ewa_t), intent(in) :: object
      type(string_t) :: string

16.8.4   Kinematics

Set kinematics. The EWA structure function allows for a straightforward mapping of the unit interval. So, to leading order, the structure function value is unity, but the x value is transformed. Higher orders affect the function value. If map is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If map is set, the exponential mapping for the $1/x$ singularity discussed above is applied.

16.8.5   EWA application

For EWA, we can compute kinematics and function value in a single step. This
function works on a single beam, assuming that the input momentum has been
set. We need four random numbers as input: one for x, one for Q^2, and two
for the polar and azimuthal angles. Alternatively, we can skip p_T generation;
in this case, we only need one.

   For obtaining splitting kinematics, we rely on the assumption that all in-
particles are mass-degenerate (or there is only one), so the generated x values
are identical.

⟨*SF ewa: ewa: TBP*⟩+≡

16.9 Energy-scan spectrum

This spectrum is actually a trick that allows us to plot the c.m. energy dependence of a cross section without scanning the input energy. We start with the observation that a spectrum $f(x)$, applied to one of the incoming beams only, results in a cross section

$$\sigma = \int dx\, f(x)\, \hat{\sigma}(xs). \tag{16.57}$$

We want to compute the distribution of $E = \sqrt{\hat{s}} = \sqrt{xs}$, i.e.,

$$\frac{d\sigma}{dE} = \frac{2\sqrt{x}}{\sqrt{s}}\frac{d\sigma}{dx} = \frac{2\sqrt{x}}{\sqrt{s}}\, f(x)\, \hat{\sigma}(xs), \tag{16.58}$$

so if we set

$$f(x) = \frac{\sqrt{s}}{2\sqrt{x}}, \tag{16.59}$$

we get the distribution

$$\frac{d\sigma}{dE} = \hat{\sigma}(\hat{s} = E^2). \tag{16.60}$$

We implement this as a spectrum with a single parameter x. The parameters for the individual beams are computed as $x_i = \sqrt{x}$, so they are equal and the kinematics is always symmetric.

16.9.1 Data type

The `norm` is unity if the total cross section should be normalized to one, and $\sqrt{s}$ if it should be normalized to the total energy. In the latter case, the differential distribution $d\sigma/d\sqrt{\hat{s}}$ coincides with the partonic cross section $\hat{\sigma}$ as a function of $\sqrt{\hat{s}}$.

⟨*SF escan: public*⟩≡

    end select
  end subroutine escan_init
```

16.9.3 Kinematics

Set kinematics. We have a single parameter, but reduce both beams. The `map`
flag is ignored.

⟨*SF escan: escan: TBP*⟩+≡
```
    procedure :: complete_kinematics => escan_complete_kinematics
```

⟨*SF escan: procedures*⟩+≡
```
    subroutine escan_complete_kinematics (sf_int, x, xb, f, r, rb, map)
      class(escan_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: x
      real(default), dimension(:), intent(out) :: xb
      real(default), intent(out) :: f
      real(default) :: sqrt_x
      real(default), dimension(:), intent(in) :: r
      real(default), dimension(:), intent(in) :: rb
      logical, intent(in) :: map
      x = r
      xb= rb
      sqrt_x = sqrt (x(1))
      if (sqrt_x > 0) then
         f = 1 / (2 * sqrt_x)
      else
         f = 0
         sf_int%status = SF_FAILED_KINEMATICS
         return
      end if
      call sf_int%reduce_momenta ([sqrt_x, sqrt_x])
    end subroutine escan_complete_kinematics
```

Recover x. The base procedure should return two momentum fractions for
the two beams, while we have only one parameter. This is the product of the
extracted momentum fractions.

16.10   Gaussian beam spread

Instead of an analytic beam description, beam data may be provided in form of
an event file. In its most simple form, the event file contains pairs of x values,
relative to nominal beam energies. More advanced formats may include polar-
ization, etc. The current implementation carries beam polarization through, if
specified.

The code is very similar to the energy scan described above.

However, we must include a file-handle manager for the beam-event files.
Two different processes may access a given beam-event file at the same time
(i.e., serially but alternating). Accessing an open file from two different units is
non-standard and not supported by all compilers. Therefore, we keep a global
registry of open files, associated units, and reference counts. The gaussian_t
objects act as proxies to this registry.

⟨sf_gaussian.f90⟩≡
  ⟨File header⟩

```
  module sf_gaussian
```

  ⟨Use kinds⟩
  ⟨Use strings⟩
```
    use io_units
    use format_defs, only: FMT_12
    use file_registries

    end function gaussian_is_generator
```

Generate free parameters. The x value should be distributed with mean 1 and σ given by the spread. We reject negative x values. (This cut slightly biases the distribution, but for reasonable (small) spreads negative r should not occur.

⟨*SF gaussian: gaussian: TBP*⟩+≡
```
    procedure :: generate_free => gaussian_generate_free
```

⟨*SF gaussian: procedures*⟩+≡
```
    subroutine gaussian_generate_free (sf_int, r, rb, x_free)
      class(gaussian_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: r, rb
      real(default), intent(inout) :: x_free
      real(default), dimension(size(r)) :: z
      associate (data => sf_int%data)
        do
          call sf_int%rng%generate_gaussian (z)
          rb = z * data%spread
          r = 1 - rb
          x_free = x_free * product (r)
          if (all (r > 0))  exit
        end do
      end associate
```

```
            end subroutine gaussian_generate_free
```

Set kinematics. Trivial transfer since this is a pure generator. The `map` flag
doesn't apply.

⟨*SF gaussian: gaussian: TBP*⟩+≡
```
    procedure :: complete_kinematics => gaussian_complete_kinematics
```

⟨*SF gaussian: procedures*⟩+≡
```

16.11 Using beam event data

Instead of an analytic beam description, beam data may be provided in form of an event file. In its most simple form, the event file contains pairs of x values, relative to nominal beam energies. More advanced formats may include polarization, etc. The current implementation carries beam polarization through, if specified.

The code is very similar to the energy scan described above.

However, we must include a file-handle manager for the beam-event files. Two different processes may access a given beam-event file at the same time (i.e., serially but alternating). Accessing an open file from two different units is non-standard and not supported by all compilers. Therefore, we keep a global registry of open files, associated units, and reference counts. The `beam_events_t` objects act as proxies to this registry.

⟨`sf_beam_events.f90`⟩≡
  ⟨*File header*⟩

16.12.1 Physics

Beamstrahlung is applied before ISR. The CIRCE1 implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously). Nevertheless it is factorized:

The functional form in the CIRCE1 parameterization is defined for electrons or photons

$$f(x) = \alpha \, x^\beta \, (1-x)^\gamma \tag{16.61}$$

for $x < 1 - \epsilon$ (resp. $x > \epsilon$ in the photon case). In the remaining interval, the standard form is zero, with a delta singularity at $x = 1$ (resp. $x = 0$). Equivalently, the delta part may be distributed uniformly among this interval. This latter form is implemented in the kirke version of the CIRCE1 subroutines, and is used here.

The parameter `circe1\_eps` sets the peak mapping of the `CIRCE1` structure function. Its default value is 10^{-5}. The other parameters are the parameterization version and revision number, the accelerator type, and the $\sqrt{s}$ value used by `CIRCE1`. The chattiness can also be set.

Since the energy is distributed in a narrow region around unity (for electrons) or zero (for photons), it is advantageous to map the interval first. The mapping is controlled by the parameter `circe1\_epsilon` which is taken from the `CIRCE1` internal data structure.

The $\sqrt{s}$ value, if not explicitly set, is taken from the process data. Note that interpolating $\sqrt{s}$ is not recommended; one should rather choose one of the distinct values known to `CIRCE1`.

16.12.2 The CIRCE1 data block

The CIRCE1 parameters are: The incoming flavors, the flags whether the photon or the lepton is the parton in the hard interaction, the flags for the generation mode (generator/mapping/no mapping), the mapping parameter ϵ, $\sqrt{s}$ and several steering parameters: `ver`, `rev`, `acc`, `chat`.

In generator mode, the x values are actually discarded and a random number generator is used instead.

    end function circe1_data_get_beam_file
```

16.12.3   Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

⟨*SF circe1: types*⟩+≡
```
    type, extends (circe1_rng_t) :: rng_obj_t
      class(rng_t), allocatable :: rng
     contains
      procedure :: generate => rng_obj_generate
    end type rng_obj_t
```

⟨*SF circe1: procedures*⟩+≡
```
    subroutine rng_obj_generate (rng_obj, u)
      class(rng_obj_t), intent(inout) :: rng_obj
      real(double), intent(out) :: u
      real(default) :: x
      call rng_obj%rng%generate (x)
      u = x
    end subroutine rng_obj_generate
```

16.12.4   The CIRCE1 object

This is a $2 \to 4$ interaction, where, depending on the parameters, any two of the four outgoing particles are connected to the hard interactions, the others are radiated. Knowing that all particles are colorless, we do not have to deal with color.

The flavors are sorted such that the first two particles are the incoming leptons, the next two are the radiated particles, and the last two are the partons initiating the hard interaction.

1623

CIRCE1 does not support polarized beams explicitly. For simplicity, we nevertheless carry beam polarization through to the outgoing electrons and make the photons unpolarized.

In the case that no radiated particle is kept (which actually is the default), polarization is always transferred to the electrons, too. If there is a recoil photon in the event, the radiated particles are 3 and 4, respectively, and 5 and 6 are the outgoing ones (triggering the hard scattering process), while in the case of no radiation, the outgoing particles are 3 and 4, respectively. In the case of the electron being the radiated particle, helicity is not kept.

⟨*SF circe1: public*⟩+≡
```
    public :: circe1_t
```

16.12.5   Kinematics

Refer to the `data` component.

⟨*SF circe1: circe1: TBP*⟩+≡
```
   procedure :: is_generator => circe1_is_generator
```

⟨*SF circe1: procedures*⟩+≡
```
   function circe1_is_generator (sf_int) result (flag)
     class(circe1_t), intent(in) :: sf_int
     logical :: flag
     flag = sf_int%data%is_generator ()
   end function circe1_is_generator
```

Generate free parameters, if generator mode is on. Otherwise, the parameters
will be discarded.

⟨*SF circe1: circe1: TBP*⟩+≡
```
   procedure :: generate_free => circe1_generate_free
```

⟨*SF circe1: procedures*⟩+≡
```
   subroutine circe1_generate_free (sf_int, r, rb,  x_free)
     class(circe1_t), intent(inout) :: sf_int
     real(default), dimension(:), intent(out) :: r, rb
     real(default), intent(inout) :: x_free

     if (sf_int%data%generate) then
        call circe_generate (r, sf_int%data%get_pdg_int (), sf_int%rng_obj)
        rb = 1 - r
        x_free = x_free * product (r)
     else
        r = 0
        rb= 1
     end if
   end subroutine circe1_generate_free
```

Generator mode: depending on the particle codes, call one of the available `girce`
generators. Illegal particle code combinations should have been caught during
data initialization.

⟨*SF circe1: procedures*⟩+≡
```
   subroutine circe_generate (x, pdg, rng_obj)
     real(default), dimension(2), intent(out) :: x
     integer, dimension(2), intent(in) :: pdg
     class(rng_obj_t), intent(inout) :: rng_obj
     real(double) :: xc1, xc2
     select case (abs (pdg(1)))
     case (ELECTRON)
        select case (abs (pdg(2)))
        case (ELECTRON)
           call gircee (xc1, xc2, rng_obj = rng_obj)
```

```
      case (PHOTON)
         call girceg (xc1, xc2, rng_obj = rng_obj)
      end select
   case (PHOTON)
      select case (abs (pdg(2)))
      case (ELECTRON)
         call girceg (xc2, xc1, rng_obj = rng_obj)
      case (PHOTON)
         call gircgg (xc1, xc2, rng_obj = rng_obj)
      end select
   end select
   x = [xc1, xc2]
   end subroutine circe_generate
```

Set kinematics. The r values (either from integration or from the generator call above) are copied to x unchanged, and f is unity. We store the x values, so we can use them for the evaluation later.

⟨*SF circe1: circe1: TBP*⟩+≡
```
   procedure :: complete_kinematics => circe1_complete_kinematics
```

⟨*SF circe1: procedures*⟩+≡
```
   subroutine circe1_complete_kinematics (sf_int, x, xb, f, r, rb, map)
     class(circe1_t), intent(inout) :: sf_int
     real(default), dimension(:), intent(out) :: x
     real(default), dimension(:), intent(out) :: xb
     real(default), intent(out) :: f
     real(default), dimension(:), intent(in) :: r
     real(default), dimension(:), intent(in) :: rb
     logical, intent(in) :: map
     x = r
     xb = rb
     sf_int%x = x
     sf_int%xb= xb
     f = 1
     if (sf_int%data%with_radiation) then
        call sf_int%split_momenta (x, xb)
     else

     class(circe1_t), intent(inout) :: sf_int
     real(default), dimension(:), intent(in) :: x
     real(default), dimension(:), intent(in) :: xb
```

```
   real(default), intent(out) :: f
   real(default), dimension(:), intent(out) :: r
   real(default), dimension(:), intent(out) :: rb
   logical, intent(in) :: map
   logical, intent(in), optional :: set_momenta
   logical :: set_mom
   set_mom = .false.;  if (present (set_momenta))  set_mom = set_momenta
   r = x
   rb = xb
   sf_int%x = x
   sf_int%xb= xb
   f = 1
   if (set_mom) then
      call sf_int%split_momenta (x, xb)
      select case (sf_int%status)
      case (SF_FAILED_KINEMATICS);  f = 0
      end select
   end if
end subroutine circe1_inverse_kinematics
```

16.12.6   CIRCE1 application

CIRCE is applied for the two beams at once. We can safely assume that no
structure functions are applied before this, so the incoming particles are on-shell
electrons/positrons.

The scale is ignored.

⟨*SF circe1: circe1: TBP*⟩+≡
```
   procedure :: apply => circe1_apply
```

⟨*SF circe1: procedures*⟩+≡
```
   subroutine circe1_apply (sf_int, scale, rescale, i_sub)
     class(circe1_t), intent(inout) :: sf_int
     real(default), intent(in) :: scale
     class(sf_rescale_t), intent(in), optional :: rescale
     integer, intent(in), optional :: i_sub
     real(default), dimension(2) :: xb
     real(double), dimension(2) :: xc
     real(double), parameter :: one = 1
     associate (data => sf_int%data)
       xc = sf_int%x
       xb = sf_int%xb
       if (data%generate) then
          sf_int%f = 1
       else
          sf_int%f = 0
          if (all (sf_int%continuum)) then
             sf_int%f = circe (xc(1), xc(2), data%pdg_in(1), data%pdg_in(2))
          end if
          if (sf_int%continuum(2) .and. sf_int%peak(1)) then
             sf_int%f = sf_int%f &
                  + circe (one, xc(2), data%pdg_in(1), data%pdg_in(2)) &
                  * peak (xb(1), data%eps)
          end if
```

```
              if (sf_int%continuum(1) .and. sf_int%peak(2)) then
                 sf_int%f = sf_int%f &
                      + circe (xc(1), one, data%pdg_in(1), data%pdg_in(2)) &
                      * peak (xb(2), data%eps)
              end if
              if (all (sf_int%peak)) then
                 sf_int%f = sf_int%f &
                      + circe (one, one, data%pdg_in(1), data%pdg_in(2)) &
                      * peak (xb(1), data%eps) * peak (xb(2), data%eps)
              end if
           end if
        end associate
        call sf_int%set_matrix_element (cmplx (sf_int%f, kind=default))
        sf_int%status = SF_EVALUATED
     end subroutine circe1_apply
```

This is a smeared delta peak at zero, as an endpoint singularity. We choose an exponentially decreasing function, starting at zero, with integral (from 0 to 1) $1 - e^{-1/\epsilon}$. For small ϵ, this reduces to one.

⟨*SF circe1: procedures*⟩+≡

```
     function peak (x, eps) result (f)
       real(default), intent(in) :: x, eps
       real(default) :: f
       f = exp (-x / eps) / eps
     end function peak
```

16.13.1 Physics

`CIRCE2` describes photon spectra Beamstrahlung is applied before ISR. The `CIRCE2` implementation has a single structure function for both beams (which makes sense since it has to be switched on or off for both beams simultaneously).

16.13.2 The CIRCE2 data block

The CIRCE2 parameters are: file and collider specification, incoming (= outgoing) particles. The luminosity is returned by `circe2_luminosity`.

```

16.13.3 Random Number Generator for CIRCE

The CIRCE implementation now supports a generic random-number generator object that allows for a local state as a component. To support this, we must extend the abstract type provided by CIRCE and delegate the generator call to the (also abstract) RNG used by WHIZARD.

⟨*SF circe2: types*⟩+≡
```
    type, extends (circe2_rng_t) :: rng_obj_t
      class(rng_t), allocatable :: rng
     contains
      procedure :: generate => rng_obj_generate
    end type rng_obj_t
```

⟨*SF circe2: procedures*⟩+≡
```
    subroutine rng_obj_generate (rng_obj, u)
      class(rng_obj_t), intent(inout) :: rng_obj
      real(default), intent(out) :: u
      real(default) :: x
      call rng_obj%rng%generate (x)
      u = x
    end subroutine rng_obj_generate
```

16.13.4 The CIRCE2 object

For CIRCE2 spectra it does not make sense to describe the state matrix as a radiation interaction, even if photons originate from laser backscattering. Instead, it is a $2 \to 2$ interaction where the incoming particles are identical to the outgoing ones.

The current implementation of CIRCE2 does support polarization and classical correlations, but no entanglement, so the density matrix of the outgoing

particles is diagonal. The incoming particles are unpolarized (user-defined polarization for beams is meaningless, since polarization is described by the data file). The outgoing particles are polarized or polarization-averaged, depending on user request.

When assigning matrix elements, we scan the previously initialized state matrix. For each entry, we extract helicity and call the structure function. In the unpolarized case, the helicity is undefined and replaced by value zero. In the polarized case, there are four entries. If the generator is used, only one entry is nonzero in each call. Which one, is determined by comparing with a previously (randomly, distributed by relative luminosity) selected pair of helicities.

```

16.15.4 The PDF object

The PDF $1 \to 2$ interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

The PDF application is a $1 \to 2$ splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

⟨*SF pdf builtin: public*⟩+≡
```
    public :: pdf_builtin_t
```

⟨*SF pdf builtin: types*⟩+≡
```
    type, extends (sf_int_t) :: pdf_builtin_t

         call sf_int%set_outgoing ([3])
         sf_int%status = SF_INITIAL
      end select
   end subroutine pdf_builtin_init
```

16.15.5 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

⟨*SF pdf builtin: pdf builtin: TBP*⟩+≡
```
   procedure :: complete_kinematics => pdf_builtin_complete_kinematics
```

⟨*SF pdf builtin: procedures*⟩+≡
```
   subroutine pdf_builtin_complete_kinematics (sf_int, x, xb, f, r, rb, map)
     class(pdf_builtin_t), intent(inout) :: sf_int
     real(default), dimension(:), intent(out) :: x
     real(default), dimension(:), intent(out) :: xb
```

```
    real(default), intent(out) :: f
    real(default), dimension(:), intent(in) :: r
    real(default), dimension(:), intent(in) :: rb
    logical, intent(in) :: map
    if (map) then
       call msg_fatal ("PDF builtin: map flag not supported")
    else
       x(1) = r(1)
       xb(1)= rb(1)
       f = 1
    end if
    call sf_int%split_momentum (x, xb)
    select case (sf_int%status)
    case (SF_DONE_KINEMATICS)
       sf_int%x = x(1)
    case (SF_FAILED_KINEMATICS)
       sf_int%x = 0
       f = 0
    end select
end subroutine pdf_builtin_complete_kinematics
```

Overriding the default method: we compute the x value from the momentum
configuration. In this specific case, we also set the internally stored x value, so
it can be used in the following routine.

⟨*SF pdf builtin: pdf builtin: TBP*⟩+≡

         end select
      end if
    end subroutine pdf_builtin_inverse_kinematics
```

16.15.6 Structure function

Once the scale is also known, we can actually call the PDF and set the values. Contrary to LHAPDF, the wrapper already takes care of adjusting to the x and Q bounds. Account for the Jacobian.

The class `rescale` gives rescaling prescription for NLO convolution of the structure function in combination with `i_sub`.

⟨*SF pdf builtin: pdf builtin: TBP*⟩+≡
```
    procedure :: apply => pdf_builtin_apply
```

⟨*SF pdf builtin: procedures*⟩+≡
```
    subroutine pdf_builtin_apply (sf_int, scale, rescale, i_sub)

      end subroutine pdf_builtin_apply
```

16.15.7 Strong Coupling

Since the PDF codes provide a function for computing the running α_s value, we make this available as an implementation of the abstract `alpha_qcd_t` type, which is used for matrix element evaluation.

⟨*SF pdf builtin: public*⟩+≡
```
    public :: alpha_qcd_pdf_builtin_t
```

⟨*SF pdf builtin: types*⟩+≡
```
    type, extends (alpha_qcd_t) :: alpha_qcd_pdf_builtin_t
       type(string_t) :: pdfset_name
       integer :: pdfset_id = -1
     contains
     ⟨SF pdf builtin: alpha qcd: TBP⟩
    end type alpha_qcd_pdf_builtin_t
```

1668

Output.

⟨*SF pdf builtin: alpha qcd: TBP*⟩≡
```
procedure :: write => alpha_qcd_pdf_builtin_write
```

⟨*SF pdf builtin: procedures*⟩+≡
```
subroutine alpha_qcd_pdf_builtin_write (object, unit)
  class(alpha_qcd_pdf_builtin_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, "(3x,A)")  "QCD parameters (pdf_builtin):"
  write (u, "(5x,A,A)")  "PDF set = ", char (object%pdfset_name)
  write (u, "(5x,A,I0)") "PDF ID  = ", object%pdfset_id
end subroutine alpha_qcd_pdf_builtin_write
```

Calculation: the numeric ID selects the correct PDF set, which must be properly initialized.

⟨*SF pdf builtin: alpha qcd: TBP*⟩+≡
```
procedure :: get => alpha_qcd_pdf_builtin_get
```

⟨*SF pdf builtin: procedures*⟩+≡
```
function alpha_qcd_pdf_builtin_get (alpha_qcd, scale) result (alpha)
  class(alpha_qcd_pdf_builtin_t), intent(in) :: alpha_qcd
  real(default), intent(in) :: scale
  real(default) :: alpha
  alpha = pdf_alphas (alpha_qcd%pdfset_id, scale)
end function alpha_qcd_pdf_builtin_get
```

Initialization. We need to access the global initialization status.

⟨*SF pdf builtin: alpha qcd: TBP*⟩+≡
```
procedure :: init => alpha_qcd_pdf_builtin_init
```

⟨*SF pdf builtin: procedures*⟩+≡
```
subroutine alpha_qcd_pdf_builtin_init (alpha_qcd, name, path)
  class(alpha_qcd_pdf_builtin_t), intent(out) :: alpha_qcd
  type(string_t), intent(in) :: name
  type(string_t), intent(in) :: path
  alpha_qcd%pdfset_name = name
  alpha_qcd%pdfset_id = pdf_get_id (name)
  if (alpha_qcd%pdfset_id < 0) &
       call msg_fatal ("QCD parameter initialization: PDF set " &

16.16.4 The LHAPDF status

This type holds the initialization status of the LHAPDF system. Entry 1 is for
proton PDFs, entry 2 for pion PDFs, entry 3 for photon PDFs.

Since it is connected to the external LHAPDF library, this is a truly global
object. We implement it as a a private module variable. To access it from else-
where, the caller has to create and initialize an object of type lhapdf_status_t,
which acts as a proxy.

⟨*SF lhapdf: types*⟩≡
```
type :: lhapdf_global_status_t
  private
  logical, dimension(3) :: initialized = .false.
end type lhapdf_global_status_t
```

⟨*SF lhapdf: variables*⟩≡
```
type(lhapdf_global_status_t), save :: lhapdf_global_status
```

⟨*SF lhapdf: procedures*⟩≡
```
function lhapdf_global_status_is_initialized (set) result (flag)
  logical :: flag
  integer, intent(in), optional :: set
  if (present (set)) then
     select case (set)
     case (1:3);    flag = lhapdf_global_status%initialized(set)
     case default;  flag = .false.
     end select
  else
     flag = any (lhapdf_global_status%initialized)
  end if
end function lhapdf_global_status_is_initialized
```

⟨*SF lhapdf: procedures*⟩+≡
```
subroutine lhapdf_global_status_set_initialized (set)
  integer, intent(in) :: set
  lhapdf_global_status%initialized(set) = .true.
end subroutine lhapdf_global_status_set_initialized
```

This is the only public procedure, it tells the system to forget about previous
initialization, allowing for changing the chosen PDF set. Note that such a
feature works only if the global program flow is serial, so no two distinct sets
are accessed simultaneously. But this applies to LHAPDF anyway.

⟨*SF lhapdf: public*⟩≡
```
public :: lhapdf_global_reset
```

⟨*SF lhapdf: procedures*⟩+≡
```
subroutine lhapdf_global_reset ()
  lhapdf_global_status%initialized = .false.
end subroutine lhapdf_global_reset
```

16.16.5 LHAPDF initialization

Before using LHAPDF, we have to initialize it with a particular data set and member. This applies not just if we use structure functions, but also if we just use an α_s formula. The integer `set` should be 1 for proton, 2 for pion, and 3 for photon, but this is just convention.

It appears as if LHAPDF does not allow for multiple data sets being used concurrently (?), so multi-threaded usage with different sets (e.g., a scan) is excluded. The current setup with a global flag that indicates initialization is fine as long as Whizard itself is run in serial mode at the Sindarin level. If we introduce multithreading in any form from Sindarin, we have to rethink the implementation of the LHAPDF interface. (The same considerations apply to builtin PDFs.)

If the particular set has already been initialized, do nothing. This implies that whenever we want to change the setup for a particular set, we have to reset the LHAPDF status. `lhapdf_initialize` has an obvious name clash with `lhapdf_init`, the reason it works for `pdf_builtin` is that there things are outsourced to a separate module (inc. `lhapdf_status` etc.).

⟨*SF lhapdf: public*⟩+≡
```
public :: lhapdf_initialize
```

⟨*SF lhapdf: procedures*⟩+≡
```

       exist = member >= 0 .and. member <= n_members
     end function dataset_member_exists
   end subroutine lhapdf_initialize
```

16.16.6 Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

⟨*SF lhapdf: lhapdf: TBP*⟩≡
```
    procedure :: complete_kinematics => lhapdf_complete_kinematics
```

⟨*SF lhapdf: procedures*⟩+≡
```
    subroutine lhapdf_complete_kinematics (sf_int, x, xb, f, r, rb, map)
      class(lhapdf_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: x
      real(default), dimension(:), intent(out) :: xb
      real(default), intent(out) :: f
      real(default), dimension(:), intent(in) :: r
      real(default), dimension(:), intent(in) :: rb
      logical, intent(in) :: map
      if (map) then
         call msg_fatal ("LHAPDF: map flag not supported")
      else
         x(1) = r(1)
         xb(1)= rb(1)
         f = 1
      end if
      call sf_int%split_momentum (x, xb)
      select case (sf_int%status)
      case (SF_DONE_KINEMATICS)
         sf_int%x = x(1)
      case (SF_FAILED_KINEMATICS)
         sf_int%x = 0
         f = 0
      end select
    end subroutine lhapdf_complete_kinematics
```

Overriding the default method: we compute the x value from the momentum
configuration. In this specific case, we also set the internally stored x value, so
it can be used in the following routine.

⟨*SF lhapdf: lhapdf: TBP*⟩+≡
```
    procedure :: recover_x => lhapdf_recover_x
```

⟨*SF lhapdf: procedures*⟩+≡
```
    subroutine lhapdf_recover_x (sf_int, x, xb, x_free)
      class(lhapdf_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: x
      real(default), dimension(:), intent(out) :: xb
      real(default), intent(inout), optional :: x_free
      call sf_int%base_recover_x (x, xb, x_free)
      sf_int%x  = x(1)
    end subroutine lhapdf_recover_x
```

Compute inverse kinematics. Here, we start with the x array and compute the
"input" r values and the Jacobian f. After this, we can set momenta by the
same formula as for normal kinematics.

⟨*SF lhapdf: lhapdf: TBP*⟩+≡
```
    procedure :: inverse_kinematics => lhapdf_inverse_kinematics
```

⟨*SF lhapdf: procedures*⟩+≡
```
    subroutine lhapdf_inverse_kinematics (sf_int, x, xb, f, r, rb, map, set_momenta)
      class(lhapdf_t), intent(inout) :: sf_int
```

```
      real(default), dimension(:), intent(in) :: x
      real(default), dimension(:), intent(in) :: xb
      real(default), intent(out) :: f
      real(default), dimension(:), intent(out) :: r
      real(default), dimension(:), intent(out) :: rb
      logical, intent(in) :: map
      logical, intent(in), optional :: set_momenta
      logical :: set_mom
      set_mom = .false.;  if (present (set_momenta))  set_mom = set_momenta
      if (map) then
         call msg_fatal ("LHAPDF: map flag not supported")
      else
         r(1) = x(1)
         rb(1)= xb(1)
         f = 1
      end if
      if (set_mom) then
         call sf_int%split_momentum (x, xb)
         select case (sf_int%status)
         case (SF_FAILED_KINEMATICS);  f = 0
         end select
      end if
    end subroutine lhapdf_inverse_kinematics
```

16.16.7   The LHAPDF data block

The data block holds the incoming flavor (which has to be proton, pion, or
photon), the corresponding pointer to the global access data (1, 2, or 3), the
flag `invert` which is set for an antiproton, the bounds as returned by LHAPDF
for the specified set, and a mask that determines which partons will be actually
in use.

⟨*SF lhapdf: public*⟩+≡
```
    public :: lhapdf_data_t
```

⟨*SF lhapdf: types*⟩+≡
```
    type, extends (sf_data_t) :: lhapdf_data_t

```

16.16.8   The LHAPDF object

The `lhapdf_t` data type is a $1 \rightarrow 2$ interaction which describes the splitting of an (anti)proton into a parton and a beam remnant. We stay in the strict forward-splitting limit, but allow some invariant mass for the beam remnant such that the outgoing parton is exactly massless. For a real event, we would replace this by a parton cascade, where the outgoing partons have virtuality as dictated by parton-shower kinematics, and transverse momentum is generated.

This is the LHAPDF object which holds input data together with the interaction. We also store the x momentum fraction and the scale, since kinematics and function value are requested at different times.

The PDF application is a $1 \rightarrow 2$ splitting process, where the particles are ordered as (hadron, remnant, parton).

Polarization is ignored completely. The beam particle is colorless, while partons and beam remnant carry color. The remnant gets a special flavor code.

⟨SF lhapdf: public⟩+≡
```
    public :: lhapdf_t
```

⟨SF lhapdf: types⟩+≡
```
    type, extends (sf_int_t) :: lhapdf_t
      type(lhapdf_data_t), pointer :: data => null ()
      real(default) :: x = 0
      real(default) :: q = 0
      real(default) :: s = 0
     contains
     ⟨SF lhapdf: lhapdf: TBP⟩
    end type lhapdf_t
```

Type string: display the chosen PDF set.

⟨SF lhapdf: lhapdf: TBP⟩+≡
```
    procedure :: type_string => lhapdf_type_string
```

⟨SF lhapdf: procedures⟩+≡
```
    function lhapdf_type_string (object) result (string)
      class(lhapdf_t), intent(in) :: object
      type(string_t) :: string

```

16.16.9 Structure function

We have to cast the LHAPDF arguments to/from double precision (possibly
from/to extended/quadruple precision), if necessary. Furthermore, some struc-
ture functions can yield negative results (sea quarks close to $x = 1$). We set
these unphysical values to zero.

16.16.10 Strong Coupling

Since the PDF codes provide a function for computing the running α_s value, we make this available as an implementation of the abstract `alpha_qcd_t` type, which is used for matrix element evaluation.

⟨*SF lhapdf: public*⟩+≡
```
    public :: alpha_qcd_lhapdf_t
```

⟨*SF lhapdf: types*⟩+≡
```
    type, extends (alpha_qcd_t) :: alpha_qcd_lhapdf_t
      type(string_t) :: pdfset_dir
      type(string_t) :: pdfset_file
      integer :: pdfset_member = -1
      type(lhapdf_pdf_t) :: pdf
     contains
     ⟨SF lhapdf: alpha qcd: TBP⟩
    end type alpha_qcd_lhapdf_t
```

Output. As in earlier versions we leave the LHAPDF path out.

⟨*SF lhapdf: alpha qcd: TBP*⟩≡
```
    procedure :: write => alpha_qcd_lhapdf_write
```

⟨*SF lhapdf: procedures*⟩+≡
```
    subroutine alpha_qcd_lhapdf_write (object, unit)
      class(alpha_qcd_lhapdf_t), intent(in) :: object
```

```
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(3x,A)")   "QCD parameters (lhapdf):"
      write (u, "(5x,A,A)") "PDF set   = ", char (object%pdfset_file)
      write (u, "(5x,A,I0)") "PDF member = ", object%pdfset_member
    end subroutine alpha_qcd_lhapdf_write
```

Calculation: the numeric member ID selects the correct PDF set, which must
be properly initialized.

⟨*SF lhapdf: interfaces*⟩+≡
```
    interface
       double precision function alphasPDF (Q)
         double precision, intent(in) :: Q
       end function alphasPDF
    end interface
```

⟨*SF lhapdf: alpha qcd: TBP*⟩+≡
```
    procedure :: get => alpha_qcd_lhapdf_get
```

⟨*SF lhapdf: procedures*⟩+≡
```
    function alpha_qcd_lhapdf_get (alpha_qcd, scale) result (alpha)
      class(alpha_qcd_lhapdf_t), intent(in) :: alpha_qcd
      real(default), intent(in) :: scale
      real(default) :: alpha
      if (LHAPDF5_AVAILABLE) then
         alpha = alphasPDF (dble (scale))
      else if (LHAPDF6_AVAILABLE) then
         alpha = alpha_qcd%pdf%alphas_pdf (dble (scale))
      end if
    end function alpha_qcd_lhapdf_get
```

Initialization. We need to access the (quasi-global) initialization status.

⟨*SF lhapdf: alpha qcd: TBP*⟩+≡
```
    procedure :: init => alpha_qcd_lhapdf_init
```

⟨*SF lhapdf: procedures*⟩+≡
```

16.17   Easy PDF Access

For the shower, subtraction and matching, it is very useful to have direct access
to $f(x, Q)$ independently of the used library.

⟨pdf.f90⟩≡

  ⟨*File header*⟩

```
  module pdf
```

  ⟨*Use kinds with double*⟩
```
    use io_units
    use system_dependencies, only: LHAPDF5_AVAILABLE, LHAPDF6_AVAILABLE
    use diagnostics
    use beam_structures
    use lhapdf !NODEP!
    use pdf_builtin !NODEP!
```

  ⟨*Standard module head*⟩

  ⟨*PDF: public*⟩

  ⟨*PDF: parameters*⟩

  ⟨*PDF: types*⟩

```
  contains
```

  ⟨*PDF: procedures*⟩

```
  end module pdf
```

We support the following implementations:

⟨*PDF: parameters*⟩≡
```
    integer, parameter, public :: STRF_NONE = 0
    integer, parameter, public :: STRF_LHAPDF6 = 1
    integer, parameter, public :: STRF_LHAPDF5 = 2
    integer, parameter, public :: STRF_PDF_BUILTIN = 3
```

A container to bundle all necessary PDF data. Could be moved to a more
central location.

⟨*PDF: public*⟩≡
```
    public :: pdf_data_t
```

⟨*PDF: types*⟩≡
```

  ⟨*Standard module head*⟩

  ⟨*Dispatch beams: public*⟩

  ⟨*Dispatch beams: types*⟩

  ⟨*Dispatch beams: variables*⟩

```
  contains
```

  ⟨*Dispatch beams: procedures*⟩

```
    end module dispatch_beams
```

This data type is a container for transferring structure-function specific data from the `dispatch_sf_data` to the `dispatch_sf_channels` subroutine.

⟨*Dispatch beams: public*⟩≡
```
    public :: sf_prop_t
```

⟨*Dispatch beams: types*⟩≡
```
    type :: sf_prop_t
       real(default), dimension(2) :: isr_eps = 1
    end type sf_prop_t
```

Allocate a structure-function configuration object according to the `sf_method` string.

The `sf_prop` object can be used to transfer structure-function specific data up and to the `dispatch_sf_channels` subroutine below, so they can be used for particular mappings.

The `var_list_global` object is used for the RNG generator seed. It is intent(inout) because the RNG generator seed may change during initialization.

The `pdg_in` array is the array of incoming flavors, corresponding to the upstream structure function or the beam array. This will be checked for the structure function in question and replaced by the outgoing flavors. The `pdg_prc` array is the array of incoming flavors (beam index, component index) for the hard process.

⟨*Dispatch beams: public*⟩+≡

This is a hook that allows us to inject further handlers for structure-function objects, in particular a test structure function.

⟨*Dispatch beams: public*⟩+≡
```
    public :: dispatch_sf_data_extra
```

⟨*Dispatch beams: variables*⟩≡
```
    procedure (dispatch_sf_data), pointer :: &
        dispatch_sf_data_extra => null ()
```

This is an auxiliary procedure, used by the beam-structure expansion: tell for a given structure function name, whether it corresponds to a pair spectrum ($n = 2$), a single-particle structure function ($n = 1$), or nothing ($n = 0$). Though energy_scan can in principle also be a pair spectrum, it always has only one parameter.

⟨*Dispatch beams: public*⟩+≡

         call msg_bug ("Structure function '" // char (name) &
              // "' not supported yet")
      end select
    end function strfun_mode
```

Dispatch a whole structure-function chain, given beam data and beam structure data.

This could be done generically, but we should look at the specific combination of structure functions in order to select appropriate mappings.

The `beam_structure` argument gets copied because we want to expand it to canonical form (one valid structure-function entry per record) before proceeding further.

The `pdg_prc` argument is the array of incoming flavors. The first index is the beam index, the second one the process component index. Each element is itself a PDG array, notrivial if there is a flavor sum for the incoming state of this component.

The dispatcher is divided in two parts. The first part configures the structure function data themselves. After this, we can configure the phase space for the elementary process.

16.18.1   QCD coupling

Allocate the `alpha` (running coupling) component of the `qcd` block with a concrete implementation, depending on the variable settings in the `global` record.

If a fixed α_s is requested, we do not allocate the `qcd%alpha` object. In this case, the matrix element code will just take the model parameter as-is, which implies fixed α_s. If the object is allocated, the α_s value is computed and updated for each matrix-element call.

Also fetch the `alphas_nf` variable from the list and store it in the QCD record. This is not used in the α_s calculation, but the QCD record thus becomes a messenger for this user parameter.

```

Chapter 17

Interface for Matrix Element Objects

These modules manage internal and, in particular, external matrix-element code.

prc_core We define the abstract `prc_core_t` type which handles all specific features of kinematics matrix-element evaluation that depend on a particular class of processes. This abstract type supplements the `prc_core_def_t` type and related types in another module. Together, they provide a complete set of matrix-element handlers that are implemented in the concrete types below.

These are the implementations:

prc_template_me Implements matrix-element code without actual content (trivial value), but full-fledged interface. This can be used for injecting user-defined matrix-element code.

prc_omega Matrix elements calculated by `O'MEGA` are the default for WHIZARD. Here, we provide all necessary support.

prc_external Matrix elements provided or using external (not `O'MEGA`) code or libraries. This is an abstract type, with concrete extensions below:

prc_external_test Concrete implementation of the external-code type, actually using some pre-defined test matrix elements.

prc_gosam Interface for matrix elements computed using `GoSam`.

prc_openloops Interface for matrix elements computed using OpenLoops.

prc_recola Interface for matrix elements computed using Recola.

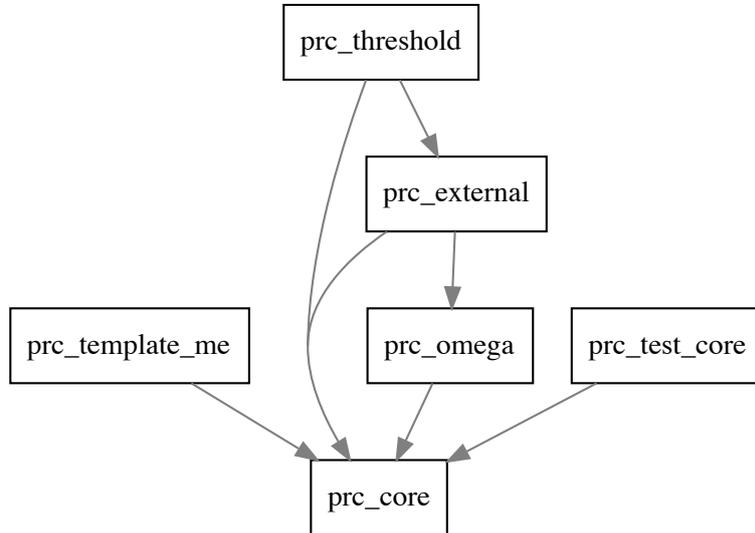
prc_threshold Interface for matrix elements for the top-pair threshold, that use external libraries.


Figure 17.1: Module dependencies in `src/me_methods`.

17.1 Abstract process core

In this module we provide abstract data types for process classes. Each process class represents a set of processes which are handled by a common "method", e.g., by the `O'MEGA` matrix-element generator. The process class is also able to select a particular implementation for the phase-space and integration modules.

For a complete implementation of a process class, we have to provide extensions of the following abstract types:

prc_core_def_t process and matrix-element configuration

prc_writer_t (optional) writing external matrix-element code

prc_driver_t accessing the matrix element (internal or external)

prc_core_t evaluating kinematics and matrix element. The process core also selects phase-space and integrator implementations as appropriate for the process class and configuration.

In the actual process-handling data structures, each process component contains an instance of such a process class as its core. This allows us to keep the `processes` module below, which supervises matrix-element evaluation, integration, and event generation, free of any reference to concrete implementations (for the process class, phase space, and integrator).

There are no unit tests, these are deferred to the `processes` module.

⟨`prc_core.f90`⟩≡

⟨*File header*⟩

```

⟨*Prc core: procedures*⟩

```
end module prc_core
```

17.1.1 The process core

The process core is of abstract data type. Different types of matrix element will be represented by different implementations.

⟨*Prc core: public*⟩≡
```
    public :: prc_core_t
```

⟨*Prc core: types*⟩≡
```
    type, abstract :: prc_core_t
      class(prc_core_def_t), pointer :: def => null ()
      logical :: data_known = .false.
      type(process_constants_t) :: data
      class(prc_core_driver_t), allocatable :: driver
      logical :: use_color_factors = .false.
      integer :: nc = 3
    contains
    ⟨Prc core: process core: TBP⟩
    end type prc_core_t
```

In any case there must be an output routine.

⟨*Prc core: process core: TBP*⟩≡
```
    procedure(prc_core_write), deferred :: write
```

⟨*Prc core: interfaces*⟩≡
```
abstract interface
   subroutine prc_core_write (object, unit)
     import
     class(prc_core_t), intent(in) :: object
     integer, intent(in), optional :: unit
   end subroutine prc_core_write
end interface
```

Just type the name of the actual core method.

⟨*Prc core: process core: TBP*⟩+≡
```
procedure(prc_core_write_name), deferred :: write_name
```

⟨*Prc core: interfaces*⟩+≡
```
abstract interface
   subroutine prc_core_write_name (object, unit)
     import
     class(prc_core_t), intent(in) :: object
     integer, intent(in), optional :: unit
   end subroutine prc_core_write_name
end interface
```

For initialization, we assign a pointer to the process entry in the relevant library. This allows us to access all process functions via the implementation of `prc_core_t`.

We declare the `object` as `intent(inout)`, since just after allocation it may be useful to store some extra data in the object, which we can then use in the actual initialization. This applies to extensions of `prc_core` which override the `init` method.

⟨*Prc core: process core: TBP*⟩+≡
```
procedure :: init => prc_core_init
procedure :: base_init => prc_core_init
```

⟨*Prc core: procedures*⟩≡
```
subroutine prc_core_init (object, def, lib, id, i_component)
  class(prc_core_t), intent(inout) :: object
  class(prc_core_def_t), intent(in), target :: def
  type(process_library_t), intent(in), target :: lib
  type(string_t), intent(in) :: id
  integer, intent(in) :: i_component
  object%def => def
  call lib%connect_process (id, i_component, object%data, object%driver)
  object%data_known = .true.
end subroutine prc_core_init
```

Return true if the matrix element generation was successful. This can be tested by looking at the number of generated flavor states, which should be nonzero.

⟨*Prc core: process core: TBP*⟩+≡
```
procedure :: has_matrix_element => prc_core_has_matrix_element
```

⟨*Prc core: procedures*⟩+≡
```
function prc_core_has_matrix_element (object) result (flag)
  class(prc_core_t), intent(in) :: object
```

```
      logical :: flag
      flag = object%data%n_flv /= 0
    end function prc_core_has_matrix_element
```

Return true if this process-core type needs extra code that has to be compiled
and/or linked, beyond the default O'MEGA framework. This depends only on the
concrete type, and the default is no.

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure, nopass :: needs_external_code => prc_core_needs_external_code
```

⟨*Prc core: procedures*⟩+≡
```
    function prc_core_needs_external_code () result (flag)
      logical :: flag
      flag = .false.
    end function prc_core_needs_external_code
```

The corresponding procedure to create and load extra libraries. The base pro-
cedure must not be called but has to be overridden, if extra code is required.

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure :: prepare_external_code => &
        prc_core_prepare_external_code
```

⟨*Prc core: procedures*⟩+≡
```
    subroutine prc_core_prepare_external_code &
        (core, flv_states, var_list, os_data, libname, model, i_core, is_nlo)
      class(prc_core_t), intent(inout) :: core
      integer, intent(in), dimension(:,:), allocatable :: flv_states
      type(var_list_t), intent(in) :: var_list
      type(os_data_t), intent(in) :: os_data
      type(string_t), intent(in) :: libname
      type(model_data_t), intent(in), target :: model
      integer, intent(in) :: i_core
      logical, intent(in) :: is_nlo
      call core%write ()
      call msg_bug ("prc_core_prepare_external_code called &
          &but not overridden")
    end subroutine prc_core_prepare_external_code
```

Return true if this process-core type uses the BLHA interface. This depends
only on the concrete type, and the default is no.

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure, nopass :: uses_blha => prc_core_uses_blha
```

⟨*Prc core: procedures*⟩+≡
```
    function prc_core_uses_blha () result (flag)
      logical :: flag
      flag = .false.
    end function prc_core_uses_blha
```

Tell whether a particular combination of flavor/helicity/color state is allowed
for the matrix element.

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_is_allowed), deferred :: is_allowed
```

1719

⟨*Prc core: interfaces*⟩+≡
```
abstract interface
   function prc_core_is_allowed (object, i_term, f, h, c) result (flag)
     import
     class(prc_core_t), intent(in) :: object
     integer, intent(in) :: i_term, f, h, c
     logical :: flag
   end function prc_core_is_allowed
end interface
```

Set the constant process data for a specific term. By default, these are the constants stored inside the object, ignoring the term index. Type extensions may override this and provide term-specific data.

⟨*Prc core: process core: TBP*⟩+≡
```
procedure :: get_constants => prc_core_get_constants
```

⟨*Prc core: procedures*⟩+≡
```
subroutine prc_core_get_constants (object, data, i_term)
  class(prc_core_t), intent(in) :: object
  type(process_constants_t), intent(out) :: data
  integer, intent(in) :: i_term
  data = object%data
end subroutine prc_core_get_constants
```

The strong coupling is not among the process constants. The default implementation is to return a negative number, which indicates that α_s is not available. This may be overridden by an implementation that provides an (event-specific) value. The value can be stored in the process-specific workspace.

⟨*Prc core: process core: TBP*⟩+≡
```
procedure :: get_alpha_s => prc_core_get_alpha_s
```

⟨*Prc core: procedures*⟩+≡
```
function prc_core_get_alpha_s (object, core_state) result (alpha)
  class(prc_core_t), intent(in) :: object
  class(prc_core_state_t), intent(in), allocatable :: core_state
  real(default) :: alpha
  alpha = -1
end function prc_core_get_alpha_s
```

Allocate the workspace associated to a process component. The default is that there is no workspace, so we do nothing. A type extension may override this and allocate a workspace object of appropriate type, which can be used in further calculations.

In any case, the `intent(out)` attribute deletes any previously allocated workspace.

⟨*Prc core: process core: TBP*⟩+≡
```
procedure :: allocate_workspace => prc_core_ignore_workspace
```

⟨*Prc core: procedures*⟩+≡
```
subroutine prc_core_ignore_workspace (object, core_state)
  class(prc_core_t), intent(in) :: object
  class(prc_core_state_t), intent(inout), allocatable :: core_state
end subroutine prc_core_ignore_workspace
```

Compute the momenta in the hard interaction, taking the seed kinematics as input. The i_term index tells us which term we want to compute. (The standard method is to just transfer the momenta to the hard interaction.)

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_compute_hard_kinematics), deferred :: &
        compute_hard_kinematics
```

⟨*Prc core: interfaces*⟩+≡
```
    abstract interface
        subroutine prc_core_compute_hard_kinematics &
            (object, p_seed, i_term, int_hard, core_state)
        import
        class(prc_core_t), intent(in) :: object
        type(vector4_t), dimension(:), intent(in) :: p_seed
        integer, intent(in) :: i_term
        type(interaction_t), intent(inout) :: int_hard
        class(prc_core_state_t), intent(inout), allocatable :: core_state
        end subroutine prc_core_compute_hard_kinematics
    end interface
```

Compute the momenta in the effective interaction, taking the hard kinematics as input. (This is called only if parton recombination is to be applied for the process variant.)

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_compute_eff_kinematics), deferred :: &
        compute_eff_kinematics
```

⟨*Prc core: interfaces*⟩+≡
```
    abstract interface
        subroutine prc_core_compute_eff_kinematics &
            (object, i_term, int_hard, int_eff, core_state)
        import
        class(prc_core_t), intent(in) :: object
        integer, intent(in) :: i_term
        type(interaction_t), intent(in) :: int_hard
        type(interaction_t), intent(inout) :: int_eff
        class(prc_core_state_t), intent(inout), allocatable :: core_state
        end subroutine prc_core_compute_eff_kinematics
    end interface
```

The process core must implement this function. Here, j is the index of the particular term we want to compute. The amplitude may depend on the factorization and renormalization scales.

The core_state (workspace) argument may be used if it is provided by the caller. Otherwise, the routine should compute the result directly.

⟨*Prc core: process core: TBP*⟩+≡
```
    procedure(prc_core_compute_amplitude), deferred :: compute_amplitude
```

⟨*Prc core: interfaces*⟩+≡
```
    abstract interface
        function prc_core_compute_amplitude &
            (object, j, p, f, h, c, fac_scale, ren_scale, alpha_qcd_forced, &
            core_state) result (amp)
```

1721

```
          import
          complex(default) :: amp
          class(prc_core_t), intent(in) :: object
          integer, intent(in) :: j
          type(vector4_t), dimension(:), intent(in) :: p
          integer, intent(in) :: f, h, c
          real(default), intent(in) :: fac_scale, ren_scale
          real(default), intent(in), allocatable :: alpha_qcd_forced
          class(prc_core_state_t), intent(inout), allocatable, optional :: &
               core_state
        end function prc_core_compute_amplitude
     end interface
```

17.1.2 Storage for intermediate results

The abstract `prc_core_state_t` type allows process cores to set up temporary workspace. The object is an extra argument for each of the individual calculations between kinematics setup and matrix-element evaluation.

⟨*Prc core: public*⟩+≡
```
     public :: prc_core_state_t
```

⟨*Prc core: types*⟩+≡
```
     type, abstract :: prc_core_state_t
      contains
        procedure(workspace_write), deferred :: write
        procedure(workspace_reset_new_kinematics), deferred :: reset_new_kinematics
     end type prc_core_state_t
```

For debugging, we should at least have an output routine.

⟨*Prc core: interfaces*⟩+≡
```
     abstract interface
        subroutine workspace_write (object, unit)
          import
          class(prc_core_state_t), intent(in) :: object
          integer, intent(in), optional :: unit
        end subroutine workspace_write
     end interface
```

This is used during the NLO calculation, see there for more information.

⟨*Prc core: interfaces*⟩+≡
```
     abstract interface
       subroutine workspace_reset_new_kinematics (object)
         import
         class(prc_core_state_t), intent(inout) :: object
       end subroutine workspace_reset_new_kinematics
     end interface
```

17.1.3 Helicity selection data

This is intended for use with O'MEGA, but may also be made available to other process methods. We set thresholds for counting the times a specific helicity amplitude is zero. When the threshold is reached, we skip this amplitude in subsequent calls.

For initializing the helicity counters, we need an object that holds the two parameters, the threshold (large real number) and the cutoff (integer).

A helicity value suppressed by more than `threshold` (a value which multiplies `epsilon`, to be compared with the average of the current amplitude, default is 10^{10}) is treated as zero. A matrix element is assumed to be zero and not called again if it has been zero `cutoff` times.

⟨*Prc core: public*⟩+≡
```
    public :: helicity_selection_t
```

⟨*Prc core: types*⟩+≡
```
    type :: helicity_selection_t
      logical :: active = .false.
      real(default) :: threshold = 0
      integer :: cutoff = 0
     contains
     ⟨Prc core: helicity selection: TBP⟩
    end type helicity_selection_t
```

Output. If the selection is inactive, print nothing.

⟨*Prc core: helicity selection: TBP*⟩≡
```
    procedure :: write => helicity_selection_write
```

⟨*Prc core: procedures*⟩+≡
```
    subroutine helicity_selection_write (object, unit)
      class(helicity_selection_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      if (object%active) then
         write (u, "(3x,A)")  "Helicity selection data:"
         write (u, "(5x,A,ES17.10)") &
              "threshold =", object%threshold
         write (u, "(5x,A,I0)") &
              "cutoff    = ", object%cutoff
      end if
    end subroutine helicity_selection_write
```

17.2 Test process type

For the following tests, we define a simple implementation of the abstract `prc_core_t`, designed such as to complement the `prc_test_t` process definition type.

Note that it is not given that the actual process is defined as `prc_test_t` type. We enforce this by calling `prc_test_create_library`. The driver component in

the process core will then become of type `prc_test_t`.

⟨`prc_test_core.f90`⟩≡
  ⟨*File header*⟩

  ```
  module prc_test_core
  ```

  ⟨*Use kinds*⟩
  ```
    use io_units
    use lorentz
    use interactions
    use prc_test
    use prc_core
  ```

  ⟨*Standard module head*⟩

  ⟨*Prc test core: public*⟩

  ⟨*Prc test core: types*⟩

  ```
  contains
  ```

  ⟨*Prc test core: procedures*⟩

  ```
  end module prc_test_core
  ```

⟨*Prc test core: public*⟩≡
  ```
    public :: test_t
  ```

⟨*Prc test core: types*⟩≡
  ```
    type, extends (prc_core_t) :: test_t
     contains
  ```
     ⟨*Prc test core: test type: TBP*⟩
  ```
    end type test_t
  ```

⟨*Prc test core: test type: TBP*⟩≡
  ```
    procedure :: write => test_write
  ```

⟨*Prc test core: procedures*⟩≡
  ```
    subroutine test_write (object, unit)
      class(test_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(3x,A)")  "test type implementing prc_test"
    end subroutine test_write
  ```

⟨*Prc test core: test type: TBP*⟩+≡
  ```
    procedure :: write_name => test_write_name
  ```

⟨*Prc test core: procedures*⟩+≡
  ```
    subroutine test_write_name (object, unit)
      class(test_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
  ```

```
       write (u,"(1x,A)")  "Core: prc_test"
    end subroutine test_write_name
```

This process type always needs a MC parameter set and a single term. This only state is always allowed.

⟨*Prc test core: test type: TBP*⟩+≡
```
    procedure :: needs_mcset => test_needs_mcset
    procedure :: get_n_terms => test_get_n_terms
    procedure :: is_allowed => test_is_allowed
```

⟨*Prc test core: procedures*⟩+≡
```
    function test_needs_mcset (object) result (flag)
      class(test_t), intent(in) :: object
      logical :: flag
      flag = .true.
    end function test_needs_mcset

    function test_get_n_terms (object) result (n)
      class(test_t), intent(in) :: object
      integer :: n
      n = 1
    end function test_get_n_terms

    function test_is_allowed (object, i_term, f, h, c) result (flag)
      class(test_t), intent(in) :: object
      integer, intent(in) :: i_term, f, h, c
      logical :: flag
      flag = .true.
    end function test_is_allowed
```

Transfer the generated momenta directly to the hard interaction in the (only) term. We assume that everything has been set up correctly, so the array fits.

⟨*Prc test core: test type: TBP*⟩+≡
```
    procedure :: compute_hard_kinematics => test_compute_hard_kinematics
```

⟨*Prc test core: procedures*⟩+≡
```
    subroutine test_compute_hard_kinematics &
        (object, p_seed, i_term, int_hard, core_state)
      class(test_t), intent(in) :: object
      type(vector4_t), dimension(:), intent(in) :: p_seed
      integer, intent(in) :: i_term
      type(interaction_t), intent(inout) :: int_hard
      class(prc_core_state_t), intent(inout), allocatable :: core_state
      call int_hard%set_momenta (p_seed)
    end subroutine test_compute_hard_kinematics
```

This procedure is not called for test_t, just a placeholder.

⟨*Prc test core: test type: TBP*⟩+≡
```
    procedure :: compute_eff_kinematics => test_compute_eff_kinematics
```

⟨*Prc test core: procedures*⟩+≡
```
    subroutine test_compute_eff_kinematics &
        (object, i_term, int_hard, int_eff, core_state)
```

```
      class(test_t), intent(in) :: object
      integer, intent(in) :: i_term
      type(interaction_t), intent(in) :: int_hard
      type(interaction_t), intent(inout) :: int_eff
      class(prc_core_state_t), intent(inout), allocatable :: core_state
    end subroutine test_compute_eff_kinematics
```

Transfer the incoming momenta of p_seed directly to the effective interaction,
and vice versa for the outgoing momenta.

int_hard is left untouched since int_eff is an alias (via pointer) to it.

⟨*Prc test core: test type: TBP*⟩+≡
```
    procedure :: recover_kinematics => test_recover_kinematics
```

⟨*Prc test core: procedures*⟩+≡
```
    subroutine test_recover_kinematics &
        (object, p_seed, int_hard, int_eff, core_state)
      class(test_t), intent(in) :: object
      type(vector4_t), dimension(:), intent(inout) :: p_seed
      type(interaction_t), intent(inout) :: int_hard
      type(interaction_t), intent(inout) :: int_eff
      class(prc_core_state_t), intent(inout), allocatable :: core_state
      integer :: n_in
      n_in = int_eff%get_n_in ()
      call int_eff%set_momenta (p_seed(1:n_in), outgoing = .false.)
      p_seed(n_in+1:) = int_eff%get_momenta (outgoing = .true.)
    end subroutine test_recover_kinematics
```

Compute the amplitude. The driver ignores all quantum numbers and, in fact,
returns a constant. Nevertheless, we properly transfer the momentum vectors.

⟨*Prc test core: test type: TBP*⟩+≡
```
    procedure :: compute_amplitude => test_compute_amplitude
```

⟨*Prc test core: procedures*⟩+≡
```
    function test_compute_amplitude &
        (object, j, p, f, h, c, fac_scale, ren_scale, alpha_qcd_forced, core_state) &
        result (amp)
      class(test_t), intent(in) :: object
      integer, intent(in) :: j
      type(vector4_t), dimension(:), intent(in) :: p
      integer, intent(in) :: f, h, c
      real(default), intent(in) :: fac_scale, ren_scale
      real(default), intent(in), allocatable :: alpha_qcd_forced
      class(prc_core_state_t), intent(inout), allocatable, optional :: core_state
      complex(default) :: amp
      real(default), dimension(:,:), allocatable :: parray
      integer :: i, n_tot
      select type (driver => object%driver)
      type is (prc_test_t)
        if (driver%scattering) then
          n_tot = 4
        else
          n_tot = 3
        end if
        allocate (parray (0:3,n_tot))
```

```
        forall (i = 1:n_tot)  parray(:,i) = vector4_get_components (p(i))
        amp = driver%get_amplitude (parray)
     end select
  end function test_compute_amplitude
```

17.3   Template matrix elements

Here, we provide template matrix elements that are in structure very similar
to O'MEGA matrix elements, but do not need its infrastructure. Per default, the
matrix elements are flat, i.e. they have the constant value one. Analogous to the
O'MEGA implementation, this section implements the interface to the templates
(via the makefile) and the driver.

⟨prc_template_me.f90⟩≡
  ⟨*File header*⟩

```
  module prc_template_me

    use, intrinsic ::  iso_c_binding !NODEP!

    use kinds
```
  ⟨*Use strings*⟩
```
    use io_units
    use system_defs, only: TAB
    use diagnostics
    use os_interface
    use lorentz
    use flavors
    use interactions
    use model_data

    use particle_specifiers, only: new_prt_spec
    use process_constants
    use prclib_interfaces
    use prc_core_def
    use process_libraries
    use prc_core
```

  ⟨*Standard module head*⟩

  ⟨*Template matrix elements: public*⟩

  ⟨*Template matrix elements: types*⟩

  ⟨*Template matrix elements: interfaces*⟩

```
  contains
```

  ⟨*Template matrix elements: procedures*⟩

```
  end module prc_template_me
```

17.3.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

⟨*Template matrix elements: public*⟩≡
```
public :: template_me_def_t
```

⟨*Template matrix elements: types*⟩≡
```
type, extends (prc_core_def_t) :: template_me_def_t
  contains
  ⟨Template matrix elements: template ME def: TBP⟩
end type template_me_def_t
```

⟨*Template matrix elements: template ME def: TBP*⟩≡
```
procedure, nopass :: type_string => template_me_def_type_string
```

⟨*Template matrix elements: procedures*⟩≡
```
function template_me_def_type_string () result (string)
  type(string_t) :: string
  string = "template"
end function template_me_def_type_string
```

Initialization: allocate the writer for the template matrix element. Also set any data for this process that the writer needs.

⟨*Template matrix elements: template ME def: TBP*⟩+≡
```
procedure :: init => template_me_def_init
```

⟨*Template matrix elements: procedures*⟩+≡
```
subroutine template_me_def_init &
    (object, model, prt_in, prt_out, unity)
  class(template_me_def_t), intent(out) :: object
  class(model_data_t), intent(in), target :: model
  type(string_t), dimension(:), intent(in) :: prt_in
  type(string_t), dimension(:), intent(in) :: prt_out
  logical, intent(in) :: unity
  allocate (template_me_writer_t :: object%writer)
  select type (writer => object%writer)
  type is (template_me_writer_t)
     call writer%init (model, prt_in, prt_out, unity)
  end select
end subroutine template_me_def_init
```

Write/read process- and method-specific data.

⟨*Template matrix elements: template ME def: TBP*⟩+≡
```
procedure :: write => template_me_def_write
```

⟨*Template matrix elements: procedures*⟩+≡
```
subroutine template_me_def_write (object, unit)
  class(template_me_def_t), intent(in) :: object
  integer, intent(in) :: unit
  select type (writer => object%writer)
  type is (template_me_writer_t)
     call writer%write (unit)
  end select
```

```
      end subroutine template_me_def_write
```

⟨Template matrix elements: template ME def: TBP⟩+≡
```
    procedure :: read => template_me_def_read
```

⟨Template matrix elements: procedures⟩+≡
```
    subroutine template_me_def_read (object, unit)
      class(template_me_def_t), intent(out) :: object
      integer, intent(in) :: unit
      call msg_bug &
           ("WHIZARD template process definition: input not supported (yet)")
    end subroutine template_me_def_read
```

Allocate the driver for template matrix elements.

⟨Template matrix elements: template ME def: TBP⟩+≡
```
    procedure :: allocate_driver => template_me_def_allocate_driver
```

⟨Template matrix elements: procedures⟩+≡
```
    subroutine template_me_def_allocate_driver (object, driver, basename)
      class(template_me_def_t), intent(in) :: object
      class(prc_core_driver_t), intent(out), allocatable :: driver
      type(string_t), intent(in) :: basename
      allocate (template_me_driver_t :: driver)
    end subroutine template_me_def_allocate_driver
```

We need code:

⟨Template matrix elements: template ME def: TBP⟩+≡
```
    procedure, nopass :: needs_code => template_me_def_needs_code
```

⟨Template matrix elements: procedures⟩+≡
```
    function template_me_def_needs_code () result (flag)
      logical :: flag
      flag = .true.
    end function template_me_def_needs_code
```

These are the features that a template matrix element provides.

⟨Template matrix elements: template ME def: TBP⟩+≡
```
    procedure, nopass :: get_features => template_me_def_get_features
```

⟨Template matrix elements: procedures⟩+≡
```
    subroutine template_me_def_get_features (features)
      type(string_t), dimension(:), allocatable, intent(out) :: features
      allocate (features (5))
      features = [ &
           var_str ("init"), &
           var_str ("update_alpha_s"), &
           var_str ("is_allowed"), &
           var_str ("new_event"), &
           var_str ("get_amplitude")]
    end subroutine template_me_def_get_features
```

The interface of the specific features.

⟨*Template matrix elements: interfaces*⟩≡
```
   abstract interface
      subroutine init_t (par, scheme) bind(C)
        import
        real(c_default_float), dimension(*), intent(in) :: par
        integer(c_int), intent(in) :: scheme
      end subroutine init_t
   end interface

   abstract interface
      subroutine update_alpha_s_t (alpha_s) bind(C)
        import
        real(c_default_float), intent(in) :: alpha_s
      end subroutine update_alpha_s_t
   end interface

   abstract interface
      subroutine is_allowed_t (flv, hel, col, flag) bind(C)
        import
        integer(c_int), intent(in) :: flv, hel, col
        logical(c_bool), intent(out) :: flag
      end subroutine is_allowed_t
   end interface

   abstract interface
      subroutine new_event_t (p) bind(C)
        import
        real(c_default_float), dimension(0:3,*), intent(in) :: p
      end subroutine new_event_t
   end interface

   abstract interface
      subroutine get_amplitude_t (flv, hel, col, amp) bind(C)
        import
        integer(c_int), intent(in) :: flv, hel, col
        complex(c_default_complex), intent(out):: amp
      end subroutine get_amplitude_t
   end interface
```

Connect the template matrix element features with the process driver.

⟨*Template matrix elements: template ME def: TBP*⟩+≡
```
   procedure :: connect => template_me_def_connect
```

⟨*Template matrix elements: procedures*⟩+≡
```
   subroutine template_me_def_connect (def, lib_driver, i, proc_driver)
     class(template_me_def_t), intent(in) :: def
     class(prclib_driver_t), intent(in) :: lib_driver
     integer, intent(in) :: i
     class(prc_core_driver_t), intent(inout) :: proc_driver
     integer(c_int) :: pid, fid
     type(c_funptr) :: fptr
     select type (proc_driver)
     type is  (template_me_driver_t)
```

1730

```
            pid = i
            fid = 1
            call lib_driver%get_fptr (pid, fid, fptr)
            call c_f_procpointer (fptr, proc_driver%init)
            fid = 2
            call lib_driver%get_fptr (pid, fid, fptr)
            call c_f_procpointer (fptr, proc_driver%update_alpha_s)
            fid = 3
            call lib_driver%get_fptr (pid, fid, fptr)
            call c_f_procpointer (fptr, proc_driver%is_allowed)
            fid = 4
            call lib_driver%get_fptr (pid, fid, fptr)
            call c_f_procpointer (fptr, proc_driver%new_event)
            fid = 5
            call lib_driver%get_fptr (pid, fid, fptr)
            call c_f_procpointer (fptr, proc_driver%get_amplitude)
       end select
    end subroutine template_me_def_connect
```

17.3.2   The Template Matrix element writer

Unlike O'MEGA, the template matrix element is directly written by the main
WHIZARD program, so there will be no entry in the makefile for calling an ex-
ternal program. The template matrix element writer is responsible for writing
interfaces and wrappers.

⟨*Template matrix elements: types*⟩+≡
```
    type, extends (prc_writer_f_module_t) :: template_me_writer_t
       class(model_data_t), pointer :: model => null ()
       type(string_t) :: model_name
       logical :: unity
       type(string_t), dimension(:), allocatable :: prt_in
       type(string_t), dimension(:), allocatable :: prt_out
       integer :: n_in
       integer :: n_out
       integer :: n_tot
     contains
     ⟨Template matrix elements: template ME writer: TBP⟩
     end type template_me_writer_t
```

The reported type is the same as for the template_me_def_t type.

⟨*Template matrix elements: template ME writer: TBP*⟩≡
```
    procedure, nopass :: type_name => template_me_writer_type_name
```

⟨*Template matrix elements: procedures*⟩+≡
```
    function template_me_writer_type_name () result (string)
      type(string_t) :: string
      string = "template"
    end function template_me_writer_type_name
```

Taking into account the prefix for template ME module names.

⟨*Template matrix elements: template ME writer: TBP*⟩+≡
```
    procedure, nopass :: get_module_name => template_me_writer_get_module_name
```

⟨*Template matrix elements: procedures*⟩+≡
```
function template_me_writer_get_module_name (id) result (name)
  type(string_t) :: name
  type(string_t), intent(in) :: id
  name = "tpr_" // id
end function template_me_writer_get_module_name
```

Output. This is called by `template_me_def_write`.

⟨*Template matrix elements: template ME writer: TBP*⟩+≡
```
procedure :: write => template_me_writer_write
```

⟨*Template matrix elements: procedures*⟩+≡
```
subroutine template_me_writer_write (object, unit)
  class(template_me_writer_t), intent(in) :: object
  integer, intent(in) :: unit
  integer :: i, j
  write (unit, "(5x,A,I0)") "# incoming part. = ", object%n_in
  write (unit, "(7x,A)", advance="no") &
                         "   Initial state: "
  do i = 1, object%n_in - 1
     write (unit, "(1x,A)", advance="no") char (object%prt_in(i))
  end do
  write (unit, "(1x,A)") char (object%prt_in(object%n_in))
  write (unit, "(5x,A,I0)") "# outgoing part. = ", object%n_out
  write (unit, "(7x,A)", advance="no") &
                         "   Final state:   "
  do j = 1, object%n_out - 1
     write (unit, "(1x,A)", advance="no") char (object%prt_out(j))
  end do
  write (unit, "(1x,A)") char (object%prt_out(object%n_out))
  write (unit, "(5x,A,I0)") "# part. (total) = ", object%n_tot
end subroutine template_me_writer_write
```

Initialize with process data.

⟨*Template matrix elements: template ME writer: TBP*⟩+≡
```
procedure :: init => template_me_writer_init
```

⟨*Template matrix elements: procedures*⟩+≡
```
subroutine template_me_writer_init (writer, model, &
     prt_in, prt_out, unity)
  class(template_me_writer_t), intent(out) :: writer
  class(model_data_t), intent(in), target :: model
  type(string_t), dimension(:), intent(in) :: prt_in
  type(string_t), dimension(:), intent(in) :: prt_out
  logical, intent(in) :: unity
  writer%model => model
  writer%model_name = model%get_name ()
  writer%n_in = size (prt_in)
  writer%n_out = size (prt_out)
  writer%n_tot = size (prt_in) + size (prt_out)
  allocate (writer%prt_in (size (prt_in)), source = prt_in)
  allocate (writer%prt_out (size (prt_out)), source = prt_out)
  writer%unity = unity
end subroutine template_me_writer_init
```

The makefile is the driver file for the test matrix elements.

⟨*Template matrix elements: template ME writer: TBP*⟩+≡
```
    procedure :: write_makefile_code => template_me_write_makefile_code
```

⟨*Template matrix elements: procedures*⟩+≡

17.3.3   Driver

⟨*Template matrix elements: public*⟩+≡
```
    public :: template_me_driver_t
```

⟨*Template matrix elements: types*⟩+≡
```
    type, extends (prc_core_driver_t) :: template_me_driver_t
      procedure(init_t), nopass, pointer :: &
           init => null ()
      procedure(update_alpha_s_t), nopass, pointer :: &
           update_alpha_s => null ()
      procedure(is_allowed_t), nopass, pointer :: &
           is_allowed => null ()
      procedure(new_event_t), nopass, pointer :: &
           new_event => null ()
      procedure(get_amplitude_t), nopass, pointer :: &
           get_amplitude => null ()
    contains
    ⟨Template matrix elements: template ME driver: TBP⟩
    end type template_me_driver_t
```

The reported type is the same as for the `template_me_def_t` type.

⟨*Template matrix elements: template ME driver: TBP*⟩≡
```
    procedure, nopass :: type_name => template_me_driver_type_name
```

⟨*Template matrix elements: procedures*⟩+≡
```
    function template_me_driver_type_name () result (string)
      type(string_t) :: string
      string = "template"
    end function template_me_driver_type_name
```

17.3.4   High-level process definition

This procedure wraps the details filling a process-component definition entry as
appropriate for an template matrix element.

NOTE: For calling the `import_component` method, we must explicitly address the `process_def_t` parent object. The natural way to call the method of the extended type triggers a bug in gfortran 4.6. The string array arguments `prt_in` and `prt_out` become corrupted and cause a segfault.

⟨*Template matrix elements: public*⟩+≡
```
    public :: template_me_make_process_component
```

⟨*Template matrix elements: procedures*⟩+≡
```
    subroutine template_me_make_process_component (entry, component_index, &
         model, model_name, prt_in, prt_out, unity)
      class(process_def_entry_t), intent(inout) :: entry
      integer, intent(in) :: component_index
      type(string_t), intent(in) :: model_name
```

```
      class(model_data_t), intent(in), target :: model
      type(string_t), dimension(:), intent(in) :: prt_in
      type(string_t), dimension(:), intent(in) :: prt_out
      logical, intent(in) :: unity
      class(prc_core_def_t), allocatable :: def
      allocate (template_me_def_t :: def)
      select type (def)
      type is (template_me_def_t)
         call def%init (model, prt_in, prt_out, unity)
      end select
      call entry%process_def_t%import_component (component_index, &
           n_out = size (prt_out), &
           prt_in  = new_prt_spec (prt_in), &
           prt_out = new_prt_spec (prt_out), &
           method = var_str ("template"), &
           variant = def)
    end subroutine template_me_make_process_component
```

17.3.5 The `prc_template_me_t` wrapper

This is an instance of the generic `prc_core_t` object. It contains a pointer to the process definition (`template_me_def_t`), a data component (`process_constants_t`), and the matrix-element driver (`template_me_driver_t`).

⟨*Template matrix elements: public*⟩+≡
```
    public :: prc_template_me_t
```

⟨*Template matrix elements: types*⟩+≡
```
    type, extends (prc_core_t) :: prc_template_me_t
      real(default), dimension(:), allocatable :: par
      integer :: scheme = 0
     contains
     ⟨Template matrix elements: prc template ME: TBP⟩
    end type prc_template_me_t
```

The workspace associated to a `prc_template_me_t` object contains a single flag. The flag is used to suppress re-evaluating the matrix element for each quantum-number combination, after the first amplitude belonging to a given kinematics has been computed.

   We can also store the value of a running coupling once it has been calculated for an event. The default value is negative, which indicates an undefined value in this context.

⟨*Template matrix elements: types*⟩+≡
```
    type, extends (prc_core_state_t) :: template_me_state_t
      logical :: new_kinematics = .true.
      real(default) :: alpha_qcd = -1
     contains
      procedure :: write => template_me_state_write
      procedure :: reset_new_kinematics => template_me_state_reset_new_kinematics
    end type template_me_state_t
```

1745

⟨*Template matrix elements: procedures*⟩+≡
```
    subroutine template_me_state_write (object, unit)
      class(template_me_state_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(3x,A,L1)")  "Template ME state: new kinematics = ", &
           object%new_kinematics
    end subroutine template_me_state_write
```

⟨*Template matrix elements: procedures*⟩+≡
```
    subroutine template_me_state_reset_new_kinematics (object)
      class(template_me_state_t), intent(inout) :: object
    end subroutine template_me_state_reset_new_kinematics
```

Allocate the workspace with the above specific type.

⟨*Template matrix elements: prc template ME: TBP*⟩≡
```
    procedure :: allocate_workspace => prc_template_me_allocate_workspace
```
⟨*Template matrix elements: procedures*⟩+≡
```
    subroutine prc_template_me_allocate_workspace (object, core_state)
      class(prc_template_me_t), intent(in) :: object
      class(prc_core_state_t), intent(inout), allocatable :: core_state
      allocate (template_me_state_t :: core_state)
    end subroutine prc_template_me_allocate_workspace
```

The following procedures are inherited from the base type as deferred, thus must
be implemented. The corresponding unit tests are skipped here; the procedures
are tested when called from the processes module.

Output: print just the ID of the associated matrix element. Then display
any stored parameters.

⟨*Template matrix elements: prc template ME: TBP*⟩+≡
```
    procedure :: write => prc_template_me_write
```
⟨*Template matrix elements: procedures*⟩+≡
```
    subroutine prc_template_me_write (object, unit)
      class(prc_template_me_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit)
      write (u, "(3x,A)", advance="no")  "Template process core:"
      if (object%data_known) then
         write (u, "(1x,A)")  char (object%data%id)
      else
         write (u, "(1x,A)")  "[undefined]"
      end if
      if (allocated (object%par)) then
         write (u, "(3x,A)")  "Parameter array:"
         do i = 1, size (object%par)
            write (u, "(5x,I0,1x,ES17.10)")  i, object%par(i)
         end do
      end if
    end subroutine prc_template_me_write
```

⟨*Template matrix elements: prc template ME: TBP*⟩+≡
```
    procedure :: write_name => prc_template_me_write_name
```

⟨*Template matrix elements: procedures*⟩+≡
```
    subroutine prc_template_me_write_name (object, unit)
      class(prc_template_me_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u,"(1x,A)") "Core: template"
    end subroutine prc_template_me_write_name
```

Temporarily store the parameter array inside the `prc_template_me` object, so
we can use it later during the actual initialization.

⟨*Template matrix elements: prc template ME: TBP*⟩+≡
```
    procedure :: set_parameters => prc_template_me_set_parameters
```

⟨*Template matrix elements: procedures*⟩+≡
```
    subroutine prc_template_me_set_parameters (prc_template_me, model)
      class(prc_template_me_t), intent(inout) :: prc_template_me
      class(model_data_t), intent(in), target, optional :: model
      if (present (model)) then
         if (.not. allocated (prc_template_me%par)) &
              allocate (prc_template_me%par (model%get_n_real ()))
         call model%real_parameters_to_array (prc_template_me%par)
         prc_template_me%scheme = model%get_scheme_num ()
      end if
    end subroutine prc_template_me_set_parameters
```

To fully initialize the process core, we perform base initialization, then initialize
the external matrix element code.

This procedure overrides the `init` method of the base type, which we never-
theless can access via its binding `base_init`. When done, we have an allocated
driver. The driver will call the `init` procedure for the external matrix element,
and thus transfer the parameter set to where it finally belongs.

⟨*Template matrix elements: prc template ME: TBP*⟩+≡
```
    procedure :: init => prc_template_me_init
```

⟨*Template matrix elements: procedures*⟩+≡
```
    subroutine prc_template_me_init (object, def, lib, id, i_component)
      class(prc_template_me_t), intent(inout) :: object
      class(prc_core_def_t), intent(in), target :: def
      type(process_library_t), intent(in), target :: lib
      type(string_t), intent(in) :: id
      integer, intent(in) :: i_component
      call object%base_init (def, lib, id, i_component)
      call object%activate_parameters ()
    end subroutine prc_template_me_init
```

Activate the stored parameters by transferring them to the external matrix
element.

⟨*Template matrix elements: prc template ME: TBP*⟩+≡
```
    procedure :: activate_parameters => prc_template_me_activate_parameters
```

⟨*Template matrix elements: procedures*⟩+≡
```
    subroutine prc_template_me_activate_parameters (object)
      class (prc_template_me_t), intent(inout) :: object
      if (allocated (object%driver)) then
         if (allocated (object%par)) then
            select type (driver => object%driver)
            type is (template_me_driver_t)
               if (associated (driver%init)) then
                  call driver%init (object%par, object%scheme)
               end if
            end select
         else
            call msg_bug ("prc_template_me_activate: parameter set is not allocated")
         end if
      else
         call msg_bug ("prc_template_me_activate: driver is not allocated")
      end if
    end subroutine prc_template_me_activate_parameters
```

Tell whether a particular combination of flavor, helicity, color is allowed. Here
we have to consult the matrix-element driver.

⟨*Template matrix elements: prc template ME: TBP*⟩+≡
```
    procedure :: is_allowed => prc_template_me_is_allowed
```

⟨*Template matrix elements: procedures*⟩+≡
```
    function prc_template_me_is_allowed (object, i_term, f, h, c) result (flag)
       class(prc_template_me_t), intent(in) :: object
       integer, intent(in) :: i_term, f, h, c
       logical :: flag
       logical(c_bool) :: cflag
       select type (driver => object%driver)
       type is (template_me_driver_t)
          call driver%is_allowed (f, h, c, cflag)
          flag = cflag
       end select
    end function prc_template_me_is_allowed
```

Transfer the generated momenta directly to the hard interaction in the (only)
term. We assume that everything has been set up correctly, so the array fits.

⟨*Template matrix elements: prc template ME: TBP*⟩+≡
```
    procedure :: compute_hard_kinematics => &
        prc_template_me_compute_hard_kinematics
```

⟨*Template matrix elements: procedures*⟩+≡
```

  class(prc_core_state_t), intent(inout), allocatable :: core_state
end subroutine prc_template_me_compute_eff_kinematics
```

Compute the amplitude. For the tree-level process, we can ignore the scale settings. The term index `j` is also irrelevant.

We first call `new_event` for the given momenta (which we must unpack), then retrieve the amplitude value for the given quantum numbers.

If the `core_state` status flag is present, we can make sure that we call `new_event` only once for a given kinematics. After the first call, we unset the `new_kinematics` flag.

  end subroutine prc_template_me_test
```

Generate, compile and load a simple process matrix element

The process is $e^+e^- \rightarrow \mu^+\mu^-$ for vanishing masses and $e = 0.3$. We initialize the process, build the library, and compute a particular matrix element for momenta of unit energy and right-angle scattering. The matrix element, as it happens, is equal to e^2. (Note that are no conversion factors applied, so this result is exact.)

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

⟨*Template matrix elements: execute tests*⟩≡

17.4 O'MEGA Interface

The standard method for process computation with WHIZARD is the O'MEGA
matrix element generator.

This section implements the interface to the code generator (via the makefile) and the driver for the features provided by the O'MEGA matrix element.

There are actually two different methods steered by this interface, the traditional one which delivers compiled Fortran code, while the O'MEGA virtual machine (OVM) produces bytecode with look-up tables.

17.4.3 Driver

⟨*Omega interface: public*⟩+≡
```
    public :: omega_driver_t
```

⟨*Omega interface: types*⟩+≡
```
    type, extends (prc_core_driver_t) :: omega_driver_t
      procedure(init_t), nopass, pointer :: &
           init => null ()
      procedure(update_alpha_s_t), nopass, pointer :: &
           update_alpha_s => null ()
      procedure(reset_helicity_selection_t), nopass, pointer :: &
           reset_helicity_selection => null ()
      procedure(is_allowed_t), nopass, pointer :: &
           is_allowed => null ()
      procedure(new_event_t), nopass, pointer :: &
           new_event => null ()
      procedure(get_amplitude_t), nopass, pointer :: &
           get_amplitude => null ()
     contains
     ⟨Omega interface: omega driver: TBP⟩
    end type omega_driver_t
```

The reported type is the same as for the omega_def_t type.

⟨*Omega interface: omega driver: TBP*⟩≡
```
    procedure, nopass :: type_name => omega_driver_type_name
```

⟨*Omega interface: procedures*⟩+≡
```
    function omega_driver_type_name () result (string)
```

```
      type(string_t) :: string
      string = "omega"
    end function omega_driver_type_name
```

17.4.4 High-level process definition

This procedure wraps the details filling a process-component definition entry as
appropriate for an O'MEGA matrix element.

NOTE: For calling the import_component method, we must explicitly address the process_def_t parent object. The natural way to call the method of the extended type triggers a bug in gfortran 4.6. The string array arguments prt_in and prt_out become corrupted and cause a segfault.

⟨*Omega interface: public*⟩+≡
```
    public :: omega_make_process_component
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine omega_make_process_component (entry, component_index, &
         model_name, prt_in, prt_out, &
         ufo, ufo_path, restrictions, cms_scheme, &
         openmp_support, report_progress, write_omega_output, extra_options, diags, diags_color)
      class(process_def_entry_t), intent(inout) :: entry
      integer, intent(in) :: component_index
      type(string_t), intent(in) :: model_name
      type(string_t), dimension(:), intent(in) :: prt_in
      type(string_t), dimension(:), intent(in) :: prt_out
      logical, intent(in), optional :: ufo
      type(string_t), intent(in), optional :: ufo_path
      type(string_t), intent(in), optional :: restrictions
      logical, intent(in), optional :: cms_scheme
      logical, intent(in), optional :: openmp_support
      logical, intent(in), optional :: report_progress
      logical, intent(in), optional :: write_omega_output
      type(string_t), intent(in), optional :: extra_options
      logical, intent(in), optional :: diags, diags_color
      logical :: ufo_model
      class(prc_core_def_t), allocatable :: def
      ufo_model = .false.;  if (present (ufo))  ufo_model = ufo
      allocate (omega_def_t :: def)
      select type (def)
      class is (omega_def_t)
         call def%init (model_name, prt_in, prt_out, &
              .false., ufo_model, ufo_path, &
              restrictions, cms_scheme, &
              openmp_support, report_progress, write_omega_output, extra_options, diags, diags_color
      end select
      call entry%process_def_t%import_component (component_index, &
           n_out = size (prt_out), &
           prt_in  = new_prt_spec (prt_in), &
           prt_out = new_prt_spec (prt_out), &
           method = var_str ("omega"), &
           variant = def)
    end subroutine omega_make_process_component
```

17.4.5 The `prc_omega_t` wrapper

This is an instance of the generic `prc_core_t` object. It contains a pointer to the process definition (`omega_def_t`), a data component (`process_constants_t`), and the matrix-element driver (`omega_driver_t`).

⟨*Omega interface: public*⟩+≡
```
    public :: prc_omega_t
```

⟨*Omega interface: types*⟩+≡
```
    type, extends (prc_core_t) :: prc_omega_t
      real(default), dimension(:), allocatable :: par
      integer :: scheme = 0
      type(helicity_selection_t) :: helicity_selection
      type(qcd_t) :: qcd
     contains
     ⟨Omega interface: prc omega: TBP⟩
    end type prc_omega_t
```

The workspace associated to a `prc_omega_t` object contains a single flag. The flag is used to suppress re-evaluating the matrix element for each quantum-number combination, after the first amplitude belonging to a given kinematics has been computed.

We can also store the value of a running coupling once it has been calculated for an event. The default value is negative, which indicates an undefined value in this context.

⟨*Omega interface: public*⟩+≡
```
    public :: omega_state_t
```

⟨*Omega interface: types*⟩+≡
```
    type, extends (prc_core_state_t) :: omega_state_t
      logical :: new_kinematics = .true.
      real(default) :: alpha_qcd = -1
     contains
     ⟨Omega interface: omega state: TBP⟩
    end type omega_state_t
```

⟨*Omega interface: omega state: TBP*⟩≡
```
    procedure :: write => omega_state_write
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine omega_state_write (object, unit)
      class(omega_state_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(3x,A,L1)")  "O'Mega state: new kinematics = ", &
           object%new_kinematics
    end subroutine omega_state_write
```

⟨*Omega interface: omega state: TBP*⟩+≡
```
    procedure :: reset_new_kinematics => omega_state_reset_new_kinematics
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine omega_state_reset_new_kinematics (object)
      class(omega_state_t), intent(inout) :: object
      object%new_kinematics = .true.
    end subroutine omega_state_reset_new_kinematics
```

Allocate the workspace with the above specific type.

⟨*Omega interface: prc omega: TBP*⟩≡
```
    procedure :: allocate_workspace => prc_omega_allocate_workspace
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine prc_omega_allocate_workspace (object, core_state)
      class(prc_omega_t), intent(in) :: object
      class(prc_core_state_t), intent(inout), allocatable :: core_state
      allocate (omega_state_t :: core_state)
    end subroutine prc_omega_allocate_workspace
```

The following procedures are inherited from the base type as deferred, thus must be implemented. The corresponding unit tests are skipped here; the procedures are tested when called from the `processes` module.

Output: print just the ID of the associated matrix element. Then display any stored parameters and the helicity selection data. (The latter are printed only if active.)

⟨*Omega interface: prc omega: TBP*⟩+≡
```
    procedure :: write => prc_omega_write
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine prc_omega_write (object, unit)
      class(prc_omega_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit)
      write (u, "(3x,A)", advance="no")  "O'Mega process core:"
      if (object%data_known) then
         write (u, "(1x,A)")  char (object%data%id)
      else
         write (u, "(1x,A)")  "[undefined]"
      end if
      if (allocated (object%par)) then
         write (u, "(3x,A)")  "Parameter array:"
         do i = 1, size (object%par)
            write (u, "(5x,I0,1x,ES17.10)")  i, object%par(i)
         end do
      end if
      call object%helicity_selection%write (u)
      call object%qcd%write (u)
    end subroutine prc_omega_write
```

⟨*Omega interface: prc omega: TBP*⟩+≡
```
    procedure :: write_name => prc_omega_write_name
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine prc_omega_write_name (object, unit)
      class(prc_omega_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u,"(1x,A)") "Core: O'Mega"
    end subroutine prc_omega_write_name
```

Temporarily store the parameter array inside the **prc_omega** object, so we can use it later during the actual initialization. Also store threshold and cutoff for helicity selection.

⟨*Omega interface: prc omega: TBP*⟩+≡
```
    procedure :: set_parameters => prc_omega_set_parameters
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine prc_omega_set_parameters (prc_omega, model, &
         helicity_selection, qcd, use_color_factors)
      class(prc_omega_t), intent(inout) :: prc_omega
      class(model_data_t), intent(in), target, optional :: model
      type(helicity_selection_t), intent(in), optional :: helicity_selection
      type(qcd_t), intent(in), optional :: qcd
      logical, intent(in), optional :: use_color_factors
      if (present (model)) then
         if (.not. allocated (prc_omega%par)) &
              allocate (prc_omega%par (model%get_n_real ()))
         call model%real_parameters_to_array (prc_omega%par)
         prc_omega%scheme = model%get_scheme_num ()
      end if
      if (present (helicity_selection)) then
         prc_omega%helicity_selection = helicity_selection
      end if
      if (present (qcd)) then
         prc_omega%qcd = qcd
      end if
      if (present (use_color_factors)) then
         prc_omega%use_color_factors = use_color_factors
      end if
    end subroutine prc_omega_set_parameters
```

To fully initialize the process core, we perform base initialization, then initialize the external matrix element code.

This procedure overrides the **init** method of the base type, which we nevertheless can access via its binding **base_init**. When done, we have an allocated driver. The driver will call the **init** procedure for the external matrix element, and thus transfer the parameter set to where it finally belongs.

If requested, we initialize the helicity selction counter.

⟨*Omega interface: prc omega: TBP*⟩+≡
```
    procedure :: init => prc_omega_init
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine prc_omega_init (object, def, lib, id, i_component)
      class(prc_omega_t), intent(inout) :: object
```

```
      class(prc_core_def_t), intent(in), target :: def
      type(process_library_t), intent(in), target :: lib
      type(string_t), intent(in) :: id
      integer, intent(in) :: i_component
      call object%base_init (def, lib, id, i_component)
      call object%activate_parameters ()
    end subroutine prc_omega_init
```

Activate the stored parameters by transferring them to the external matrix
element. Also reset the helicity selection, if requested.

⟨*Omega interface: prc omega: TBP*⟩+≡
```
    procedure :: activate_parameters => prc_omega_activate_parameters
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine prc_omega_activate_parameters (object)
      class (prc_omega_t), intent(inout) :: object
      if (allocated (object%driver)) then
         if (allocated (object%par)) then
            select type (driver => object%driver)
            type is (omega_driver_t)
               if (associated (driver%init)) then
                  call driver%init (object%par, object%scheme)
               end if
            end select
         else
            call msg_bug ("prc_omega_activate: parameter set is not allocated")
         end if
         call object%reset_helicity_selection ()
      else
         call msg_bug ("prc_omega_activate: driver is not allocated")
      end if
    end subroutine prc_omega_activate_parameters
```

Tell whether a particular combination of flavor, helicity, color is allowed. Here
we have to consult the matrix-element driver.

⟨*Omega interface: prc omega: TBP*⟩+≡
```
    procedure :: is_allowed => prc_omega_is_allowed
```

⟨*Omega interface: procedures*⟩+≡
```
  function prc_omega_is_allowed (object, i_term, f, h, c) result (flag)
      class(prc_omega_t), intent(in) :: object
      integer, intent(in) :: i_term, f, h, c
      logical :: flag
      logical(c_bool) :: cflag
      select type (driver => object%driver)
      type is (omega_driver_t)
         call driver%is_allowed (f, h, c, cflag)
         flag = cflag
      end select
    end function prc_omega_is_allowed
```

Transfer the generated momenta directly to the hard interaction in the (only)
term. We assume that everything has been set up correctly, so the array fits.

We don't reset the `new_kinematics` flag here. This has to be done explicitly by the caller (`reset_new_kinematics`) when a new kinematics configuration is to be considered.

⟨*Omega interface: prc omega: TBP*⟩+≡
```
    procedure :: compute_hard_kinematics => prc_omega_compute_hard_kinematics
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine prc_omega_compute_hard_kinematics &
        (object, p_seed, i_term, int_hard, core_state)
      class(prc_omega_t), intent(in) :: object
      type(vector4_t), dimension(:), intent(in) :: p_seed
      integer, intent(in) :: i_term
      type(interaction_t), intent(inout) :: int_hard
      class(prc_core_state_t), intent(inout), allocatable :: core_state
      call int_hard%set_momenta (p_seed)
    end subroutine prc_omega_compute_hard_kinematics
```

This procedure is not called for `prc_omega_t`, just a placeholder.

⟨*Omega interface: prc omega: TBP*⟩+≡
```
    procedure :: compute_eff_kinematics => prc_omega_compute_eff_kinematics
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine prc_omega_compute_eff_kinematics &
        (object, i_term, int_hard, int_eff, core_state)
      class(prc_omega_t), intent(in) :: object
      integer, intent(in) :: i_term
      type(interaction_t), intent(in) :: int_hard
      type(interaction_t), intent(inout) :: int_eff
      class(prc_core_state_t), intent(inout), allocatable :: core_state
    end subroutine prc_omega_compute_eff_kinematics
```

Reset the helicity selection counters and start counting zero helicities. We assume that the `helicity_selection` object is allocated. Otherwise, reset and switch off helicity counting.

In the test routine, the driver is allocated but the driver methods are not. Therefore, guard against a disassociated method.

⟨*Omega interface: prc omega: TBP*⟩+≡
```
    procedure :: reset_helicity_selection => prc_omega_reset_helicity_selection
```

⟨*Omega interface: procedures*⟩+≡
```
    subroutine prc_omega_reset_helicity_selection (object)
      class(prc_omega_t), intent(inout) :: object
      select type (driver => object%driver)
      type is (omega_driver_t)
         if (associated (driver%reset_helicity_selection)) then
            if (object%helicity_selection%active) then
               call driver%reset_helicity_selection &
                    (real (object%helicity_selection%threshold, &
                    c_default_float), &
                    int (object%helicity_selection%cutoff, c_int))
            else
               call driver%reset_helicity_selection &
                    (0._c_default_float, 0_c_int)
            end if
```

```
          end if
      end select
    end subroutine prc_omega_reset_helicity_selection
```

Compute the amplitude. For the tree-level process, we can ignore the scale settings. The term index j is also irrelevant.

We first call **new_event** for the given momenta (which we must unpack), then retrieve the amplitude value for the given quantum numbers.

If the **core_state** status flag is present, we can make sure that we call **new_event** only once for a given kinematics. After the first call, we unset the **new_kinematics** flag.

The core objects computes the appropriate α_s value via the **qcd** subobject, taking into account the provided **fac_scale** value. However, if the extra parameter **alpha_qcd_forced** is allocated, it overrides this setting.

The **is_allowed** query is not redundant, since the status may change during the run if helicities are switched off.

⟨*Omega interface: prc omega: TBP*⟩+≡
```
    procedure :: compute_amplitude => prc_omega_compute_amplitude
```

⟨*Omega interface: procedures*⟩+≡
```
    function prc_omega_compute_amplitude &
        (object, j, p, f, h, c, fac_scale, ren_scale, alpha_qcd_forced, &
        core_state)  result (amp)
      class(prc_omega_t), intent(in) :: object

Generate, compile and load a simple process matrix element

The process is $e^+e^- \to \mu^+\mu^-$ for vanishing masses and $e = 0.3$. We initialize the process, build the library, and compute a particular matrix element for momenta of unit energy and right-angle scattering. The matrix element, as it happens, is equal to e^2. (Note that are no conversion factors applied, so this result is exact.)

For `GNU make`, `makeflags` is set to `-j1`. This eliminates a potential clash with a `-j<n>` flag if this test is called from a parallel make.

Check `prc_omega_t` wrapper and options

The process is $e^- e^+ \to e^- e^+$ for vanishing masses and $e = 0.3$. We build
the library using the high-level procedure `omega_make_process_component` and
the "black box" `prc_omega_t` object. Two variants with different settings for
restrictions and OpenMP.

For `GNU make`, `makeflags` is set to `-j1`. This eliminates a potential clash
with a `-j<n>` flag if this test is called from a parallel make.

QCD coupling

The process is $u\bar{u} \to d\bar{d}$ for vanishing masses. We compute the amplitude for a fixed configuration once, then reset α_s, then compute again.

For GNU make, makeflags is set to -j1. This eliminates a potential clash with a -j<n> flag if this test is called from a parallel make.

UFO model file support

Again, the process is $e^- e^+ \rightarrow e^- e^+$ for vanishing masses and $e = 0.3$. We build
the library using the high-level procedure `omega_make_process_component` and
the "black box" `prc_omega_t` object. OMega must be able to digest the specified
UFO file and provide use with a fresh model file that can be read after producing
the process code.

For `GNU make`, `makeflags` is set to `-j1`. This eliminates a potential clash
with a `-j<n>` flag if this test is called from a parallel make.

Generate matrix element diagrams

The same process as before. No amplitude is computed here, instead we just
generate Feynman (and color flow) diagrams, and check whether PS and PDF
files have been generated. This test is only run if event analysis is possible.

17.5   External matrix elements (squared)

This defines an abstract framework that can handle matrix elements which are
computed outside of WHIZARD. Such matrix elements typically (i) require extra
code or libraries to be configured linked at execution time, and (ii) provide only
plain or correlated squared matrix elements instead of amplitudes.

In particular, matrix-element libraries that conform to the BLHA standard
belong to this class. They have their own (also abstract) extension of the ab-
stract prc_external_t type introduced here. prc_external_t-type.

17.5.2 Abstract interface to external matrix elements

This process class allows us to factor out common necessities of processes that
involve external code or libraries.

Workspace

This is the workspace that is available for external matrix elements.

⟨*Prc external: public*⟩≡
```
public :: prc_external_state_t
```

⟨*Prc external: types*⟩+≡
```
type, abstract, extends (prc_core_state_t) :: prc_external_state_t
  logical :: new_kinematics = .true.
  real(default) :: alpha_qcd = -1
contains
```
⟨*Prc external: external state: TBP*⟩
```
end type prc_external_state_t
```

⟨*Prc external: external state: TBP*⟩≡
```
procedure :: reset_new_kinematics => prc_external_state_reset_new_kinematics
```

⟨*Prc external: procedures*⟩+≡
```
subroutine prc_external_state_reset_new_kinematics (object)
  class(prc_external_state_t), intent(inout) :: object
  object%new_kinematics = .true.
end subroutine prc_external_state_reset_new_kinematics
```

⟨*Prc external: external state: TBP*⟩+≡
```
    procedure :: get_alpha_qcd => prc_external_state_get_alpha_qcd
```

⟨*Prc external: procedures*⟩+≡
```
    function prc_external_state_get_alpha_qcd (object) result (alpha_qcd)
      real(default) :: alpha_qcd
      class(prc_external_state_t), intent(in) :: object
      alpha_qcd = object%alpha_qcd
    end function prc_external_state_get_alpha_qcd
```

Driver

We have to add two O'Mega-routines to the external matrix-element driver to
ensure proper process setup. The problem is that during the setup of the real
component, the particle and flavor data are taken from the Born component to
set up the subtraction terms. However, the Born component expects this data
to be obtained from the Omega code, accessed by the driver.

⟨*Prc external: public*⟩+≡
```
    public :: prc_external_driver_t
```

⟨*Prc external: types*⟩+≡
```
    type, abstract, extends (prc_core_driver_t) :: prc_external_driver_t
      procedure(omega_update_alpha_s), nopass, pointer :: &
              update_alpha_s => null ()
      procedure(omega_is_allowed), nopass, pointer :: &
              is_allowed => null ()
    end type prc_external_driver_t
```

Core

⟨*Prc external: public*⟩+≡
```
    public :: prc_external_t
```

⟨*Prc external: types*⟩+≡
```
    type, abstract, extends (prc_core_t) :: prc_external_t
      type(qcd_t) :: qcd
      integer :: n_flv = 1
      real(default), dimension(:), allocatable :: par
      integer :: scheme = 0
      type(sf_handler_t) :: sf_handler
      real(default) :: maximum_accuracy = 10000.0
    contains
```
⟨*Prc external: prc external: TBP*⟩
```
    end type prc_external_t
```

By definition, this class of process-core types require extra code.

⟨*Prc external: prc external: TBP*⟩≡
```
    procedure, nopass :: needs_external_code => &
        prc_external_needs_external_code
```

⟨*Prc external: procedures*⟩+≡
```
    function prc_external_needs_external_code () result (flag)
      logical :: flag
      flag = .true.
    end function prc_external_needs_external_code
```

⟨*Prc external: prc external: TBP*⟩+≡
```
    procedure :: get_n_flvs => prc_external_get_n_flvs
```

⟨*Prc external: procedures*⟩+≡
```
    pure function prc_external_get_n_flvs (object, i_flv) result (n)
      integer :: n
      class(prc_external_t), intent(in) :: object
      integer, intent(in) :: i_flv
      n = size (object%data%flv_state (:,i_flv))
    end function prc_external_get_n_flvs
```

⟨*Prc external: prc external: TBP*⟩+≡
```
    procedure :: get_flv_state => prc_external_get_flv_state
```

⟨*Prc external: procedures*⟩+≡
```
    function prc_external_get_flv_state (object, i_flv) result (flv)
      integer, dimension(:), allocatable :: flv
      class(prc_external_t), intent(in) :: object
      integer, intent(in) :: i_flv
      allocate (flv (size (object%data%flv_state (:,i_flv))))
      flv = object%data%flv_state (:,i_flv)
    end function prc_external_get_flv_state
```

Return one single squared test matrix element. It is fixed to 1, therefore the integration output will be the phase space volume.

⟨*Prc external: prc external: TBP*⟩+≡
```
    procedure :: compute_sqme => prc_external_compute_sqme
```

⟨*Prc external: procedures*⟩+≡
```
    subroutine prc_external_compute_sqme (object, i_flv, i_hel, p, &
         ren_scale, sqme, bad_point)
      class(prc_external_t), intent(in) :: object
      integer, intent(in) :: i_flv, i_hel
      type(vector4_t), dimension(:), intent(in) :: p
      real(default), intent(in) :: ren_scale
      real(default), intent(out) :: sqme
      logical, intent(out) :: bad_point
      sqme = one
      bad_point = .false.
    end subroutine prc_external_compute_sqme
```

Return an array of 4 numbers corresponding to the BLHA output convention. Used for testing.

⟨*Prc external: prc external: TBP*⟩+≡
```
    procedure :: compute_sqme_virt => prc_external_compute_sqme_virt
```

⟨*Prc external: procedures*⟩+≡
```
    subroutine prc_external_compute_sqme_virt (object, i_flv, i_hel, &
       p, ren_scale, sqme, bad_point)
      class(prc_external_t), intent(in) :: object
      integer, intent(in) :: i_flv, i_hel
      type(vector4_t), dimension(:), intent(in) :: p
      real(default), intent(in) :: ren_scale
      logical, intent(out) :: bad_point
      real(default), dimension(4), intent(out) :: sqme
      if (debug_on) call msg_debug2 (D_ME_METHODS, "prc_external_compute_sqme_virt")

Chapter 18

Generic Event Handling

Event records allow the MC to communicate with the outside world. The event record should exhibit the observable contents of a physical event. We should be able to read and write events. The actual implementation of the event need not be defined yet, for that purpose.

We have the following basic modules:

event_base Abstract base type for event records. The base type contains a reference to a `particle_set_t` object as the event core, and it holds some data that we should always expect, such as the squared matrix element and event weight.

eio_data Transparent container for the metadata of an event sample.

eio_base Abstract base type for event-record input and output. The implementations of this base type represent specific event I/O formats.

These are the implementation modules:

eio_checkpoints Auxiliary output format. The only purpose is to provide screen diagnostics during event output.

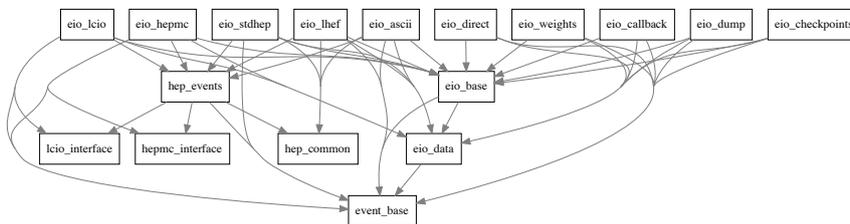
eio_callback Auxiliary output format. The only purpose is to execute a callback procedure, so we have a hook for external access during event output.


Figure 18.1: Module dependencies in `src/events`.

1842

eio_weights Print some event summary data, no details. The main use if for testing purposes.

eio_dump Dump the contents of WHIZARD's `particle_set` internal record, using the `write` method of that record as-is. The main use if for testing purposes.

hep_common Implements traditional HEP common blocks that are (still) used by some of the event I/O formats below.

hepmc_interface Access particle objects of the HepMC package. Functional only if this package is linked. The interface is working both for HepMC2 and HepMC3.

lcio_interface Access objects of the LCIO package. Functional only if this package is linked.

hep_events Interface between the event record and the common blocks.

eio_ascii Collection of event output formats that write ASCII files.

eio_lhef LHEF for input and output.

eio_stdhep Support for the StdHEP format (binary, machine-independent).

eio_hepmc Support for the HepMC format (C++).

eio_lcio Support for the LCIO format (C++).

18.1   Generic Event Handling

We introduce events first in form of an abstract type, together with some utilities. Abstract events can be used by other modules, in particular event I/O, without introducing an explicit dependency on the event implementation.

⟨`event_base.f90`⟩≡

  ⟨*Event base: public*⟩

  ⟨*Event base: parameters*⟩

⟨*Event base: types*⟩

⟨*Event base: interfaces*⟩

```
contains
```

⟨*Event base: procedures*⟩

```
end module event_base
```

18.1.1   generic event type

⟨*Event base: public*⟩≡
```
    public :: generic_event_t
```

⟨*Event base: types*⟩≡
```
    type, abstract :: generic_event_t
       !private
       logical :: particle_set_is_valid = .false.
       type(particle_set_t), pointer :: particle_set => null ()
       logical :: sqme_ref_known = .false.
       real(default) :: sqme_ref = 0
       logical :: sqme_prc_known = .false.
       real(default) :: sqme_prc = 0
       logical :: weight_ref_known = .false.
       real(default) :: weight_ref = 0
       logical :: weight_prc_known = .false.
       real(default) :: weight_prc = 0
       logical :: excess_prc_known = .false.
       real(default) :: excess_prc = 0
       logical :: n_dropped_known = .false.
       integer :: n_dropped = 0
       integer :: n_alt = 0
       logical :: sqme_alt_known = .false.
       real(default), dimension(:), allocatable :: sqme_alt
       logical :: weight_alt_known = .false.
       real(default), dimension(:), allocatable :: weight_alt
     contains
     ⟨Event base: generic event: TBP⟩
    end type generic_event_t
```

18.1.2   Initialization

This determines the number of alternate weights and sqme values.

⟨*Event base: generic event: TBP*⟩≡
```
    procedure :: base_init => generic_event_init
```

⟨*Event base: procedures*⟩≡
```
    subroutine generic_event_init (event, n_alt)
      class(generic_event_t), intent(out) :: event
      integer, intent(in) :: n_alt
      event%n_alt = n_alt
      allocate (event%sqme_alt (n_alt))
```

```
      allocate (event%weight_alt (n_alt))
    end subroutine generic_event_init
```

18.1.3 Access particle set

The particle set is the core of the event. We allow access to it via a pointer,
and we maintain the information whether the particle set is valid, i.e., has been
filled with meaningful data.

⟨*Event base: generic event: TBP*⟩+≡
```
    procedure :: has_valid_particle_set => generic_event_has_valid_particle_set
    procedure :: accept_particle_set => generic_event_accept_particle_set
    procedure :: discard_particle_set => generic_event_discard_particle_set
```

⟨*Event base: procedures*⟩+≡
```
    function generic_event_has_valid_particle_set (event) result (flag)
      class(generic_event_t), intent(in) :: event
      logical :: flag
      flag = event%particle_set_is_valid
    end function generic_event_has_valid_particle_set

    subroutine generic_event_accept_particle_set (event)
      class(generic_event_t), intent(inout) :: event
      event%particle_set_is_valid = .true.
    end subroutine generic_event_accept_particle_set

    subroutine generic_event_discard_particle_set (event)
      class(generic_event_t), intent(inout) :: event
      event%particle_set_is_valid = .false.
    end subroutine generic_event_discard_particle_set
```

These procedures deal with the particle set directly. Return the pointer:

⟨*Event base: generic event: TBP*⟩+≡
```
    procedure :: get_particle_set_ptr => generic_event_get_particle_set_ptr
```

⟨*Event base: procedures*⟩+≡
```
    function generic_event_get_particle_set_ptr (event) result (ptr)
      class(generic_event_t), intent(in) :: event
      type(particle_set_t), pointer :: ptr
      ptr => event%particle_set
    end function generic_event_get_particle_set_ptr
```

Let it point to some existing particle set:

⟨*Event base: generic event: TBP*⟩+≡
```
    procedure :: link_particle_set => generic_event_link_particle_set
```

⟨*Event base: procedures*⟩+≡
```
    subroutine generic_event_link_particle_set (event, particle_set)
      class(generic_event_t), intent(inout) :: event
      type(particle_set_t), intent(in), target :: particle_set
      event%particle_set => particle_set
      call event%accept_particle_set ()
    end subroutine generic_event_link_particle_set
```

18.1.4 Access sqme and weight

There are several incarnations: the current value, a reference value, alternate values.

⟨*Event base: generic event: TBP*⟩+≡
```
procedure :: sqme_prc_is_known => generic_event_sqme_prc_is_known
procedure :: sqme_ref_is_known => generic_event_sqme_ref_is_known
procedure :: sqme_alt_is_known => generic_event_sqme_alt_is_known
procedure :: weight_prc_is_known => generic_event_weight_prc_is_known
procedure :: weight_ref_is_known => generic_event_weight_ref_is_known
procedure :: weight_alt_is_known => generic_event_weight_alt_is_known
procedure :: excess_prc_is_known => generic_event_excess_prc_is_known
```

⟨*Event base: procedures*⟩+≡
```
function generic_event_sqme_prc_is_known (event) result (flag)
  class(generic_event_t), intent(in) :: event
  logical :: flag
  flag = event%sqme_prc_known
end function generic_event_sqme_prc_is_known

            integer, intent(in), optional :: unit
            logical, intent(in), optional :: show_process
            logical, intent(in), optional :: show_transforms
            logical, intent(in), optional :: show_decay
            logical, intent(in), optional :: verbose
            logical, intent(in), optional :: testflag
         end subroutine generic_event_write
      end interface
```

Generate an event, based on a selector index i_mci, and optionally on an extra set of random numbers r. For the main bunch of random numbers that the generator needs, the event object should contain its own generator.

⟨*Event base: generic event: TBP*⟩+≡
```
      procedure (generic_event_generate), deferred :: generate
```

⟨*Event base: interfaces*⟩+≡
```
      abstract interface
         subroutine generic_event_generate (event, i_mci, r, i_nlo)
            import
            class(generic_event_t), intent(inout) :: event
            integer, intent(in) :: i_mci
            real(default), dimension(:), intent(in), optional :: r
            integer, intent(in), optional :: i_nlo
         end subroutine generic_event_generate
```

```
        end interface
```

Alternative : inject a particle set that is supposed to represent the hard process. How this determines the event, is dependent on the event structure, therefore this is a deferred method.

⟨*Event base: generic event: TBP*⟩+≡
```
    procedure (generic_event_set_hard_particle_set), deferred :: &
         set_hard_particle_set
```

⟨*Event base: interfaces*⟩+≡
```
    abstract interface
       subroutine generic_event_set_hard_particle_set (event, particle_set)
         import
         class(generic_event_t), intent(inout) :: event
         type(particle_set_t), intent(in) :: particle_set
       end subroutine generic_event_set_hard_particle_set
    end interface
```

Event index handlers.

⟨*Event base: generic event: TBP*⟩+≡
```
    procedure (generic_event_set_index), deferred :: set_index
    procedure (generic_event_handler), deferred :: reset_index
    procedure (generic_event_increment_index), deferred :: increment_index
```

⟨*Event base: interfaces*⟩+≡
```
    abstract interface
       subroutine generic_event_set_index (event, index)
         import
         class(generic_event_t), intent(inout) :: event
         integer, intent(in) :: index
       end subroutine generic_event_set_index
    end interface

    abstract interface
       subroutine generic_event_handler (event)

         end subroutine generic_event_set_scale_forced
      end interface
```

18.1.6 Utilities

Applying this, current event contents are marked as incomplete but are not
deleted. In particular, the initialization is kept.

⟨*Event base: generic event: TBP*⟩+≡
```
      procedure :: reset_contents => generic_event_reset_contents
      procedure :: base_reset_contents => generic_event_reset_contents
```

⟨*Event base: procedures*⟩+≡
```
      subroutine generic_event_reset_contents (event)
        class(generic_event_t), intent(inout) :: event
        call event%discard_particle_set ()
        event%sqme_ref_known = .false.
        event%sqme_prc_known = .false.
        event%sqme_alt_known = .false.
        event%weight_ref_known = .false.
        event%weight_prc_known = .false.
        event%weight_alt_known = .false.
        event%excess_prc_known = .false.
      end subroutine generic_event_reset_contents
```

Pacify particle set.

⟨*Event base: generic event: TBP*⟩+≡
```
      procedure :: pacify_particle_set => generic_event_pacify_particle_set
```

⟨*Event base: procedures*⟩+≡
```
      subroutine generic_event_pacify_particle_set (event)
        class(generic_event_t), intent(inout) :: event
        if (event%has_valid_particle_set ())  call pacify (event%particle_set)
      end subroutine generic_event_pacify_particle_set
```

18.1.7 Event normalization

The parameters for event normalization. For unweighted events, NORM_UNIT is intended as default, while for weighted events, it is NORM_SIGMA.

Note: the unit test for this is in eio_data_2 below.

⟨*Event base: parameters*⟩≡
```
    integer, parameter, public :: NORM_UNDEFINED = 0
    integer, parameter, public :: NORM_UNIT = 1
    integer, parameter, public :: NORM_N_EVT = 2
    integer, parameter, public :: NORM_SIGMA = 3
    integer, parameter, public :: NORM_S_N = 4
```

These functions translate between the user representation and the internal one.

⟨*Event base: public*⟩+≡
```
    public :: event_normalization_mode
    public :: event_normalization_string
```

⟨*Event base: procedures*⟩+≡
```
    function event_normalization_mode (string, unweighted) result (mode)
      integer :: mode
      type(string_t), intent(in) :: string
      logical, intent(in) :: unweighted
      select case (lower_case (char (string)))
      case ("auto")
         if (unweighted) then
            mode = NORM_UNIT
         else
            mode = NORM_SIGMA
         end if
      case ("1")
         mode = NORM_UNIT
      case ("1/n")
         mode = NORM_N_EVT
      case ("sigma")
         mode = NORM_SIGMA
      case ("sigma/n")
         mode = NORM_S_N
      case default
         call msg_fatal ("Event normalization: unknown value '" &
              // char (string) // "'")
      end select
    end function event_normalization_mode

    function event_normalization_string (norm_mode) result (string)
      integer, intent(in) :: norm_mode
      type(string_t) :: string
      select case (norm_mode)
      case (NORM_UNDEFINED); string = "[undefined]"
      case (NORM_UNIT);      string = "'1'"
      case (NORM_N_EVT);     string = "'1/n'"
      case (NORM_SIGMA);     string = "'sigma'"
      case (NORM_S_N);       string = "'sigma/n'"
      case default;          string = "???"
      end select
```

```
      end function event_normalization_string
```

We place this here as a generic helper, so we can update event weights whenever we need, not just in connection with an event sample data object.

⟨*Event base: public*⟩+≡
```
    public :: event_normalization_update
```

⟨*Event base: procedures*⟩+≡
```
    subroutine event_normalization_update (weight, sigma, n, mode_new, mode_old)
      real(default), intent(inout) :: weight
      real(default), intent(in) :: sigma
      integer, intent(in) :: n
      integer, intent(in) :: mode_new, mode_old
      if (mode_new /= mode_old) then
         if (sigma > 0 .and. n > 0) then
            weight = weight / factor (mode_old) * factor (mode_new)
         else
            call msg_fatal ("Event normalization update: null sample")
         end if
      end if
    contains
      function factor (mode)
        real(default) :: factor
        integer, intent(in) :: mode
        select case (mode)
        case (NORM_UNIT);   factor = 1._default
        case (NORM_N_EVT);  factor = 1._default / n
        case (NORM_SIGMA);  factor = sigma
        case (NORM_S_N);    factor = sigma / n
        case default
           call msg_fatal ("Event normalization update: undefined mode")
        end select
      end function factor
    end subroutine event_normalization_update
```

18.1.8   Callback container

This derived type contains a callback procedure that can be executed during event I/O. The callback procedure is given the event object (with class generic_event) and an event index.

This is a simple wrapper. The object is abstract, so the the actual procedure is introduced by overriding the deferred one. We use the PASS attribute, so we may supplement runtime data in the callback object if desired.

⟨*Event base: public*⟩+≡
```
    public :: event_callback_t
```

⟨*Event base: types*⟩+≡
```
    type, abstract :: event_callback_t
       private
     contains
       procedure(event_callback_write), deferred :: write
       procedure(event_callback_proc), deferred :: proc
```

```
    end type event_callback_t
```

Identify the callback procedure in output

⟨*Event base: interfaces*⟩+≡
```
    abstract interface
       subroutine event_callback_write (event_callback, unit)
         import
         class(event_callback_t), intent(in) :: event_callback
         integer, intent(in), optional :: unit
       end subroutine event_callback_write
    end interface
```

This is the procedure interface.

⟨*Event base: interfaces*⟩+≡
```
    abstract interface
       subroutine event_callback_proc (event_callback, i, event)
         import
         class(event_callback_t), intent(in) :: event_callback
         integer(i64), intent(in) :: i
         class(generic_event_t), intent(in) :: event
       end subroutine event_callback_proc
    end interface
```

A dummy implementation for testing and fallback.

⟨*Event base: public*⟩+≡
```
    public :: event_callback_nop_t
```

⟨*Event base: types*⟩+≡
```
    type, extends (event_callback_t) :: event_callback_nop_t
       private
     contains
       procedure :: write => event_callback_nop_write
       procedure :: proc => event_callback_nop
    end type event_callback_nop_t
```

⟨*Event base: procedures*⟩+≡
```
    subroutine event_callback_nop_write (event_callback, unit)
      class(event_callback_nop_t), intent(in) :: event_callback
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A)")  "NOP"
    end subroutine event_callback_nop_write

    subroutine event_callback_nop (event_callback, i, event)
      class(event_callback_nop_t), intent(in) :: event_callback
      integer(i64), intent(in) :: i
      class(generic_event_t), intent(in) :: event
    end subroutine event_callback_nop
```

18.2 Event Sample Data

We define a simple and transparent container for (meta)data that are associated with an event sample.

⟨eio_data.f90⟩≡
  ⟨*File header*⟩

  ```
  module eio_data
  ```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
  ```
    use io_units
    use numeric_utils
    use diagnostics

    use event_base
  ```

  ⟨*Standard module head*⟩

  ⟨*EIO data: public*⟩

  ⟨*EIO data: types*⟩

  ```
  contains
  ```

  ⟨*EIO data: procedures*⟩

  ```
  end module eio_data
  ```

18.2.1 Event Sample Data

These are data that apply to an event sample as a whole. They are given in an easily portable form (no fancy structure) and are used for initializing event formats.

There are two MD5 sums here. md5sum_proc depends only on the definition of the contributing processes. A sample with matching checksum can be rescanned with modified model parameters, beam structure etc, to recalculate observables. md5sum_config includes all relevant data. Rescanning a sample with matching checksum will produce identical observables. (A third checksum might be added which depends on the event sample itself. This is not needed, so far.)

If alternate weights are part of the event sample (n_alt nonzero), there is a configuration MD5 sum for each of them.

⟨*EIO data: public*⟩≡
```
    public :: event_sample_data_t
```

⟨*EIO data: types*⟩≡
```
    type :: event_sample_data_t
       character(32) :: md5sum_prc = ""
       character(32) :: md5sum_cfg = ""
       logical :: unweighted = .true.
       logical :: negative_weights = .false.
       integer :: norm_mode = NORM_UNDEFINED
```

```
      integer :: n_beam = 0
      integer, dimension(2) :: pdg_beam = 0
      real(default), dimension(2) :: energy_beam = 0
      integer :: n_proc = 0
      integer :: n_evt = 0
      integer :: nlo_multiplier = 1
      integer :: split_n_evt = 0
      integer :: split_n_kbytes = 0
      integer :: split_index = 0
      real(default) :: total_cross_section = 0
      integer, dimension(:), allocatable :: proc_num_id
      integer :: n_alt = 0
      character(32), dimension(:), allocatable :: md5sum_alt
      real(default), dimension(:), allocatable :: cross_section
      real(default), dimension(:), allocatable :: error
    contains
    〈EIO data: event sample data: TBP〉
    end type event_sample_data_t
```

Initialize: allocate for the number of processes

〈*EIO data: event sample data: TBP*〉≡
```
      procedure :: init => event_sample_data_init
```

〈*EIO data: procedures*〉≡
```
    subroutine event_sample_data_init (data, n_proc, n_alt)
      class(event_sample_data_t), intent(out) :: data
      integer, intent(in) :: n_proc
      integer, intent(in), optional :: n_alt
      data%n_proc = n_proc
      allocate (data%proc_num_id (n_proc), source = 0)
      allocate (data%cross_section (n_proc), source = 0._default)
      allocate (data%error (n_proc), source = 0._default)
      if (present (n_alt)) then
         data%n_alt = n_alt
         allocate (data%md5sum_alt (n_alt))
         data%md5sum_alt = ""
      end if
    end subroutine event_sample_data_init
```

Output.

```

18.3   Abstract I/O Handler

This module defines an abstract object for event I/O and the associated methods.

There are `output` and `input` methods which write or read a single event from/to the I/O stream, respectively. The I/O stream itself may be a file, a common block, or an externally linked structure, depending on the concrete implementation.

A `write` method prints the current content of the implementation-dependent event record in human-readable form.

The `init_in`/`init_out` and `final` prepare and finalize the I/O stream, respectively. There is also a `switch_inout` method which turns an input stream into an output stream where events can be appended.

Optionally, output files can be split in chunks of well-defined size. The `split_out` method takes care of this.

⟨`eio_base.f90`⟩≡
  ⟨*File header*⟩

```

    use model_data
    use event_base
    use eio_data
```

  ⟨*Standard module head*⟩

  ⟨*EIO base: public*⟩

  ⟨*EIO base: types*⟩

  ⟨*EIO base: interfaces*⟩

```
  contains
```

  ⟨*EIO base: procedures*⟩

```
  end module eio_base
```

18.3.1 Type

We can assume that most implementations will need the file extension as a fixed string and, if they support file splitting, the current file index.

The fallback model is useful for implementations that are able to read unknown files which may contain hadrons etc., not in the current hard-interaction model.

⟨*EIO base: public*⟩≡

```
public :: eio_t
```

⟨*EIO base: types*⟩≡

```
type, abstract :: eio_t
   type(string_t) :: sample
   type(string_t) :: extension
   type(string_t) :: filename
   logical :: has_file = .false.
   logical :: split = .false.
   integer :: split_n_evt = 0
   integer :: split_n_kbytes = 0
   integer :: split_index = 0
   integer :: split_count = 0
   class(model_data_t), pointer :: fallback_model => null ()
 contains
 ⟨EIO base: eio: TBP⟩
   end type eio_t
```

Write to screen. If possible, this should display the contents of the current event, i.e., the last one that was written or read.

⟨*EIO base: eio: TBP*⟩≡

```
procedure (eio_write), deferred :: write
```

⟨*EIO base: interfaces*⟩≡

```
abstract interface
   subroutine eio_write (object, unit)
     import
     class(eio_t), intent(in) :: object
     integer, intent(in), optional :: unit
   end subroutine eio_write
end interface
```

Finalize. This should write/read footer data and close input/output channels.

⟨*EIO base: eio: TBP*⟩+≡

```
procedure (eio_final), deferred :: final
```

⟨*EIO base: interfaces*⟩+≡

```
abstract interface
   subroutine eio_final (object)
     import
     class(eio_t), intent(inout) :: object
   end subroutine eio_final
end interface
```

Determine splitting parameters from the event sample data.

⟨*EIO base: eio: TBP*⟩+≡
```
procedure :: set_splitting => eio_set_splitting
```

⟨*EIO base: procedures*⟩≡
```
subroutine eio_set_splitting (eio, data)
  class(eio_t), intent(inout) :: eio
  type(event_sample_data_t), intent(in) :: data
  eio%split = data%split_n_evt > 0 .or. data%split_n_kbytes > 0
  if (eio%split) then
     eio%split_n_evt = data%split_n_evt
     eio%split_n_kbytes = data%split_n_kbytes
     eio%split_index = data%split_index
     eio%split_count = 0
  end if
end subroutine eio_set_splitting
```

Update the byte count and check if it has increased. We use integer division to determine the number of **n_kbytes** blocks that are in the event file.

⟨*EIO base: eio: TBP*⟩+≡
```
procedure :: update_split_count => eio_update_split_count
```

⟨*EIO base: procedures*⟩+≡
```
subroutine eio_update_split_count (eio, increased)
  class(eio_t), intent(inout) :: eio
  logical, intent(out) :: increased
  integer :: split_count_old
  if (eio%split_n_kbytes > 0) then
     split_count_old = eio%split_count
     eio%split_count = eio%file_size_kbytes () / eio%split_n_kbytes
     increased = eio%split_count > split_count_old
  end if
end subroutine eio_update_split_count
```

Generate a filename, taking a possible split index into account.

⟨*EIO base: eio: TBP*⟩+≡
```
procedure :: set_filename => eio_set_filename
```

⟨*EIO base: procedures*⟩+≡
```
subroutine eio_set_filename (eio)
  class(eio_t), intent(inout) :: eio
  character(32) :: buffer
  if (eio%split) then
     write (buffer, "(I0,'.')")  eio%split_index
     eio%filename = eio%sample // "." // trim (buffer) // eio%extension
     eio%has_file = .true.
  else
     eio%filename = eio%sample // "." // eio%extension
     eio%has_file = .true.
  end if
end subroutine eio_set_filename
```

Set the fallback model.

⟨*EIO base: eio: TBP*⟩+≡
```
    procedure :: set_fallback_model => eio_set_fallback_model
```

⟨*EIO base: procedures*⟩+≡
```
    subroutine eio_set_fallback_model (eio, model)
      class(eio_t), intent(inout) :: eio
      class(model_data_t), intent(in), target :: model
      eio%fallback_model => model
    end subroutine eio_set_fallback_model
```

Initialize for output. We provide process names. This should open an event file if appropriate and write header data. Some methods may require event sample data.

⟨*EIO base: eio: TBP*⟩+≡
```
    procedure (eio_init_out), deferred :: init_out
```

⟨*EIO base: interfaces*⟩+≡
```
    abstract interface
      subroutine eio_init_out (eio, sample, data, success, extension)
        import
        class(eio_t), intent(inout) :: eio
        type(string_t), intent(in) :: sample
        type(event_sample_data_t), intent(in), optional :: data
        logical, intent(out), optional :: success
        type(string_t), intent(in), optional :: extension
      end subroutine eio_init_out
    end interface
```

Initialize for input. We provide process names. This should open an event file if appropriate and read header data. The `md5sum` can be used to check the integrity of the configuration, it it provides a checksum to compare with. In case the extension has changed the extension is also given as an argument.

The `data` argument is `intent(inout)`: we may read part of it and keep other parts and/or check them against the data in the file.

⟨*EIO base: eio: TBP*⟩+≡
```
    procedure (eio_init_in), deferred :: init_in
```

⟨*EIO base: interfaces*⟩+≡
```
    abstract interface
      subroutine eio_init_in (eio, sample, data, success, extension)
        import
        class(eio_t), intent(inout) :: eio
        type(string_t), intent(in) :: sample
        type(event_sample_data_t), intent(inout), optional :: data
        logical, intent(out), optional :: success
        type(string_t), intent(in), optional :: extension
      end subroutine eio_init_in
    end interface
```

Re-initialize for output. This should change the status of any event file from input to output and position it for appending new events.

⟨*EIO base: eio: TBP*⟩+≡
```
    procedure (eio_switch_inout), deferred :: switch_inout
```

⟨*EIO base: interfaces*⟩+≡
```
abstract interface
   subroutine eio_switch_inout (eio, success)
     import
     class(eio_t), intent(inout) :: eio
     logical, intent(out), optional :: success
   end subroutine eio_switch_inout
end interface
```

This is similar: split the output, i.e., close the current file and open a new one. The default implementation does nothing. For the feature to work, an implementation must override this.

⟨*EIO base: eio: TBP*⟩+≡
```
procedure :: split_out => eio_split_out
```

⟨*EIO base: procedures*⟩+≡
```
subroutine eio_split_out (eio)
  class(eio_t), intent(inout) :: eio
end subroutine eio_split_out
```

Determine the file size in kilobytes. More exactly, determine the size in units of 1024 storage units, as returned by the INQUIRE statement.

The implementation returns zero if there is no file. The `has_file` flag is set by the `set_filename` method, so we can be confident that the `inquire` call is meaningful. If this algorithm doesn't apply for a particular format, we still can override the procedure.

⟨*EIO base: eio: TBP*⟩+≡
```
procedure :: file_size_kbytes => eio_file_size_kbytes
```

⟨*EIO base: procedures*⟩+≡
```
function eio_file_size_kbytes (eio) result (kbytes)
  class(eio_t), intent(in) :: eio
  integer :: kbytes
  integer(i64) :: bytes
  if (eio%has_file) then
     inquire (file = char (eio%filename), size = bytes)
     if (bytes > 0) then
        kbytes = bytes / 1024
     else
        kbytes = 0
     end if
  else
     kbytes = 0
  end if
end function eio_file_size_kbytes
```

Output an event. All data can be taken from the `event` record. The index `i_prc` identifies the process among the processes that are contained in the current sample. The `reading` flag, if present, indicates that the event was read from file, not generated.

The `passed` flag tells us that this event has passed the selection criteria. Depending on the event format, we may choose to skip events that have not

passed.

⟨*EIO base: eio: TBP*⟩+≡
```
    procedure (eio_output), deferred :: output
```

⟨*EIO base: interfaces*⟩+≡
```
    abstract interface
       subroutine eio_output (eio, event, i_prc, reading, passed, pacify)
         import
         class(eio_t), intent(inout) :: eio
         class(generic_event_t), intent(in), target :: event
         integer, intent(in) :: i_prc
         logical, intent(in), optional :: reading, passed, pacify
       end subroutine eio_output
    end interface
```

Input an event. This should fill all event data that cannot be inferred from the associated process.

The input is broken down into two parts. First we read the `i_prc` index. So we know which process to expect in the subsequent event. If we have reached end of file, we also will know. Then, we read the event itself.

The parameter `iostat` is supposed to be set as the Fortran standard requires, negative for EOF and positive for error.

⟨*EIO base: eio: TBP*⟩+≡
```
    procedure (eio_input_i_prc), deferred :: input_i_prc
    procedure (eio_input_event), deferred :: input_event
```

⟨*EIO base: interfaces*⟩+≡
```
    abstract interface
       subroutine eio_input_i_prc (eio, i_prc, iostat)
         import
         class(eio_t), intent(inout) :: eio
         integer, intent(out) :: i_prc
         integer, intent(out) :: iostat
       end subroutine eio_input_i_prc
    end interface

    abstract interface
       subroutine eio_input_event (eio, event, iostat)
         import
         class(eio_t), intent(inout) :: eio
         class(generic_event_t), intent(inout), target :: event
         integer, intent(out) :: iostat
       end subroutine eio_input_event
    end interface
```

⟨*EIO base: eio: TBP*⟩+≡
```
    procedure (eio_skip), deferred :: skip
```

⟨*EIO base: interfaces*⟩+≡
```
    abstract interface
       subroutine eio_skip (eio, iostat)
         import
         class(eio_t), intent(inout) :: eio
         integer, intent(out) :: iostat
```

```
      end subroutine eio_skip
    end interface
```

18.3.2 Unit tests

Test module, followed by the corresponding implementation module.

⟨eio_base_ut.f90⟩≡
  ⟨*File header*⟩

```
  module eio_base_ut
    use unit_tests
    use eio_base_uti
```

  ⟨*Standard module head*⟩

  ⟨*EIO base: public test*⟩

  ⟨*EIO base: public test auxiliary*⟩

```
  contains
```

  ⟨*EIO base: test driver*⟩

```
  end module eio_base_ut
```

⟨eio_base_uti.f90⟩≡
  ⟨*File header*⟩

```
  module eio_base_uti
```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
```
    use io_units
    use lorentz
    use model_data
    use particles
    use event_base
    use eio_data

    use eio_base
```

  ⟨*Standard module head*⟩

  ⟨*EIO base: public test auxiliary*⟩

  ⟨*EIO base: test declarations*⟩

  ⟨*EIO base: test types*⟩

  ⟨*EIO base: test variables*⟩

```
  contains
```

⟨EIO base: tests⟩

⟨EIO base: test auxiliary⟩

```
  end module eio_base_uti
```

API: driver for the unit tests below.

⟨EIO base: public test⟩≡
```
    public :: eio_base_test
```

⟨EIO base: test driver⟩≡
```
    subroutine eio_base_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
```
⟨EIO base: execute tests⟩
```
    end subroutine eio_base_test
```

The caller has to provide procedures that prepare and cleanup the test environment. They depend on modules that are not available here.

⟨EIO base: test types⟩≡
```
    abstract interface
       subroutine eio_prepare_event (event, unweighted, n_alt)
         import
         class(generic_event_t), intent(inout), pointer :: event
         logical, intent(in), optional :: unweighted
         integer, intent(in), optional :: n_alt
       end subroutine eio_prepare_event
    end interface

    abstract interface
       subroutine eio_cleanup_event (event)
         import
         class(generic_event_t), intent(inout), pointer :: event
       end subroutine eio_cleanup_event
    end interface
```

We store pointers to the test-environment handlers as module variables. This allows us to call them from the test routines themselves, which don't allow for extra arguments.

⟨EIO base: public test auxiliary⟩≡
```
    public :: eio_prepare_test, eio_cleanup_test
```

⟨EIO base: test types⟩+≡
```
    procedure(eio_prepare_event), pointer :: eio_prepare_test => null ()
    procedure(eio_cleanup_event), pointer :: eio_cleanup_test => null ()
```

Similarly, for the fallback (hadron) model that some eio tests require:

⟨EIO base: test types⟩+≡
```
    abstract interface
       subroutine eio_prepare_model (model)
         import
         class(model_data_t), intent(inout), pointer :: model
       end subroutine eio_prepare_model
```

1873

```
      end interface

      abstract interface
         subroutine eio_cleanup_model (model)
           import
           class(model_data_t), intent(inout), target :: model
         end subroutine eio_cleanup_model
      end interface
```

⟨*EIO base: public test auxiliary*⟩+≡
```
      public :: eio_prepare_fallback_model, eio_cleanup_fallback_model
```

⟨*EIO base: test variables*⟩≡
```
      procedure(eio_prepare_model), pointer :: eio_prepare_fallback_model => null ()
      procedure(eio_cleanup_model), pointer :: eio_cleanup_fallback_model => null ()
```

Test type for event I/O

The contents simulate the contents of an external file. We have the `sample`
string as the file name and the array of momenta `event_p` as the list of events.
The second index is the event index. The `event_i` component is the pointer to
the current event, `event_n` is the total number of stored events.

⟨*EIO base: test types*⟩+≡
```
      type, extends (eio_t) :: eio_test_t
         integer :: event_n = 0
         integer :: event_i = 0
         integer :: i_prc = 0
         type(vector4_t), dimension(:,:), allocatable :: event_p
       contains
      ⟨EIO base: eio test: TBP⟩
      end type eio_test_t
```

Write to screen. Pretend that this is an actual event format.

⟨*EIO base: eio test: TBP*⟩≡
```
      procedure :: write => eio_test_write
```

⟨*EIO base: test auxiliary*⟩≡
```
      subroutine eio_test_write (object, unit)
        class(eio_test_t), intent(in) :: object
        integer, intent(in), optional :: unit
        integer :: u, i
        u = given_output_unit (unit)
        write (u, "(1x,A)")  "Test event stream"
        if (object%event_i /= 0) then
           write (u, "(1x,A,I0,A)")  "Event #", object%event_i, ":"
           do i = 1, size (object%event_p, 1)
              call vector4_write (object%event_p(i, object%event_i), u)
           end do
        end if
      end subroutine eio_test_write
```

Finalizer. For the test case, we just reset the event count, but keep the stored
"events". For the real implementations, the events would be stored on an ex-
ternal medium, so we would delete the object contents.

⟨*EIO base: eio test: TBP*⟩+≡
```
    procedure :: final => eio_test_final
```

⟨*EIO base: test auxiliary*⟩+≡
```
    subroutine eio_test_final (object)
      class(eio_test_t), intent(inout) :: object
      object%event_i = 0
    end subroutine eio_test_final
```

Initialization: We store the process IDs and the energy from the beam-data
object. We also allocate the momenta (i.e., the simulated event record) for
a fixed maximum size of 10 events, 2 momenta each. There is only a single
process.

⟨*EIO base: eio test: TBP*⟩+≡
```
    procedure :: init_out => eio_test_init_out
```

⟨*EIO base: test auxiliary*⟩+≡
```
    subroutine eio_test_init_out (eio, sample, data, success, extension)
      class(eio_test_t), intent(inout) :: eio
      type(string_t), intent(in) :: sample
      type(event_sample_data_t), intent(in), optional :: data
      logical, intent(out), optional :: success
      type(string_t), intent(in), optional :: extension
      eio%sample = sample
      eio%event_n = 0
      eio%event_i = 0
      allocate (eio%event_p (2, 10))
      if (present (success))  success = .true.
    end subroutine eio_test_init_out
```

Initialization for input. Nothing to do for the test type.

⟨*EIO base: eio test: TBP*⟩+≡
```
    procedure :: init_in => eio_test_init_in
```

⟨*EIO base: test auxiliary*⟩+≡
```
    subroutine eio_test_init_in (eio, sample, data, success, extension)
      class(eio_test_t), intent(inout) :: eio
      type(string_t), intent(in) :: sample
      type(event_sample_data_t), intent(inout), optional :: data
      logical, intent(out), optional :: success
      type(string_t), intent(in), optional :: extension
      if (present (success))  success = .true.
    end subroutine eio_test_init_in
```

Switch from output to input. Again, nothing to do for the test type.

⟨*EIO base: eio test: TBP*⟩+≡
```
    procedure :: switch_inout => eio_test_switch_inout
```

⟨*EIO base: test auxiliary*⟩+≡
```
    subroutine eio_test_switch_inout (eio, success)
      class(eio_test_t), intent(inout) :: eio
      logical, intent(out), optional :: success
      if (present (success))  success = .true.
    end subroutine eio_test_switch_inout
```

Output. Increment the event counter and store the momenta of the current event.

⟨*EIO base: eio test: TBP*⟩+≡
```
    procedure :: output => eio_test_output
```

⟨*EIO base: test auxiliary*⟩+≡
```
    subroutine eio_test_output (eio, event, i_prc, reading, passed, pacify)
      class(eio_test_t), intent(inout) :: eio
      class(generic_event_t), intent(in), target :: event
      logical, intent(in), optional :: reading, passed, pacify
      integer, intent(in) :: i_prc
      type(particle_set_t), pointer :: pset
      type(particle_t) :: prt
      eio%event_n = eio%event_n + 1
      eio%event_i = eio%event_n
      eio%i_prc = i_prc
      pset => event%get_particle_set_ptr ()
      prt = pset%get_particle (3)
      eio%event_p(1, eio%event_i) = prt%get_momentum ()
      prt = pset%get_particle (4)
      eio%event_p(2, eio%event_i) = prt%get_momentum ()
    end subroutine eio_test_output
```

Input. Increment the event counter and retrieve the momenta of the current event. For the test case, we do not actually modify the current event.

⟨*EIO base: eio test: TBP*⟩+≡
```
    procedure :: input_i_prc => eio_test_input_i_prc
    procedure :: input_event => eio_test_input_event
```

⟨*EIO base: test auxiliary*⟩+≡
```
    subroutine eio_test_input_i_prc (eio, i_prc, iostat)
      class(eio_test_t), intent(inout) :: eio
      integer, intent(out) :: i_prc
      integer, intent(out) :: iostat
      i_prc = eio%i_prc
      iostat = 0
    end subroutine eio_test_input_i_prc

    subroutine eio_test_input_event (eio, event, iostat)
      class(eio_test_t), intent(inout) :: eio
      class(generic_event_t), intent(inout), target :: event
      integer, intent(out) :: iostat
      eio%event_i = eio%event_i + 1
      iostat = 0
    end subroutine eio_test_input_event
```

⟨*EIO base: eio test: TBP*⟩+≡

  end subroutine eio_base_1
```

18.4 Direct Event Access

As a convenient application of the base type, we construct an event handler that allows us of setting and retrieving events just in the same way as an file I/O format, but directly dealing with particle data and momenta. This is an input and output format, but we do not care about counting events.

⟨eio_direct.f90⟩≡
  ⟨*File header*⟩

```
module eio_direct

⟨Use kinds⟩
⟨Use strings⟩
  use io_units
  use diagnostics
  use cputime
  use lorentz, only: vector4_t
  use particles, only: particle_set_t
  use model_data, only: model_data_t
  use event_base
  use eio_data
  use eio_base

⟨Standard module head⟩

⟨EIO direct: public⟩

⟨EIO direct: types⟩

contains

⟨EIO direct: procedures⟩

end module eio_direct
```

18.4.1   Type

⟨*EIO direct: public*⟩≡

    end subroutine eio_direct_reset_event_index
```

Set the selection indices. This is supposed to select the i_prc, i_mci, i_term, and channel entries of the event where the momentum set has to be stored, respectively. The selection indices determine the process, MCI set, calculation term, and phase-space channel is to be used for recalculation. The index values must not be zero, even if the do not apply.

⟨*EIO direct: eio direct: TBP*⟩+≡

18.6   Event Generation Callback

This is an output-only format. Its only use is to write screen messages every n events, to inform the user about progress.

⟨`eio_callback.f90`⟩≡
  ⟨*File header*⟩

```
  module eio_callback

    use kinds, only: i64
```
  ⟨*Use strings*⟩
```
    use io_units
    use diagnostics
    use cputime
    use event_base
    use eio_data
    use eio_base
```

  ⟨*Standard module head*⟩

  ⟨*EIO callback: public*⟩

  ⟨*EIO callback: types*⟩

```
    contains
```

  ⟨*EIO callback: procedures*⟩

```
    end module eio_callback
```

18.6.1   Type

⟨*EIO callback: public*⟩≡
```
      public :: eio_callback_t
```
⟨*EIO callback: types*⟩≡
```
      type, extends (eio_t) :: eio_callback_t
         class(event_callback_t), allocatable :: callback
         integer(i64) :: i_evt = 0
         integer :: i_interval = 0
         integer :: n_interval = 0
```

```
    !       type(timer_t) :: timer
      contains
      ⟨EIO callback: eio callback: TBP⟩
      end type eio_callback_t
```

18.6.2   Specific Methods

Set parameters that are specifically used for callback: the procedure and the
number of events to wait until the procedure is called (again).

⟨*EIO callback: eio callback: TBP*⟩≡
```
    procedure :: set_parameters => eio_callback_set_parameters
```

⟨*EIO callback: procedures*⟩≡
```
    subroutine eio_callback_set_parameters (eio, callback, count_interval)
      class(eio_callback_t), intent(inout) :: eio
      class(event_callback_t), intent(in) :: callback
      integer, intent(in) :: count_interval
      allocate (eio%callback, source = callback)
      eio%n_interval = count_interval
    end subroutine eio_callback_set_parameters
```

18.6.3   Common Methods

Output. This is not the actual event format, but a readable account of the
current status.

⟨*EIO callback: eio callback: TBP*⟩+≡
```
    procedure :: write => eio_callback_write
```

⟨*EIO callback: procedures*⟩+≡
```
    subroutine eio_callback_write (object, unit)
      class(eio_callback_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A)")  "Event-sample callback:"
      write (u, "(3x,A,I0)")  "interval  = ", object%n_interval
      write (u, "(3x,A,I0)")  "evt count = ", object%i_evt
    !        call object%timer%write (u)
    end subroutine eio_callback_write
```

Finalizer: trivial.

⟨*EIO callback: eio callback: TBP*⟩+≡
```
    procedure :: final => eio_callback_final
```

⟨*EIO callback: procedures*⟩+≡
```
    subroutine eio_callback_final (object)
      class(eio_callback_t), intent(inout) :: object
    end subroutine eio_callback_final
```

Activate checkpointing for event generation or writing.

⟨*EIO callback: eio callback: TBP*⟩+≡
```
    procedure :: init_out => eio_callback_init_out
```

⟨*EIO callback: procedures*⟩+≡
```
    subroutine eio_callback_init_out (eio, sample, data, success, extension)
      class(eio_callback_t), intent(inout) :: eio
      type(string_t), intent(in) :: sample
      type(string_t), intent(in), optional :: extension
      type(event_sample_data_t), intent(in), optional :: data
      logical, intent(out), optional :: success
      eio%i_evt = 0
      eiO%i_interval = 0
      if (present (success))  success = .true.
    end subroutine eio_callback_init_out
```

No callback for event reading.

⟨*EIO callback: eio callback: TBP*⟩+≡
```
    procedure :: init_in => eio_callback_init_in
```

⟨*EIO callback: procedures*⟩+≡
```
    subroutine eio_callback_init_in (eio, sample, data, success, extension)
      class(eio_callback_t), intent(inout) :: eio
      type(string_t), intent(in) :: sample
      type(string_t), intent(in), optional :: extension
      type(event_sample_data_t), intent(inout), optional :: data
      logical, intent(out), optional :: success
      call msg_bug ("Event callback: event input not supported")
      if (present (success))  success = .false.
    end subroutine eio_callback_init_in
```

Switch from input to output: also not supported.

⟨*EIO callback: eio callback: TBP*⟩+≡
```
    procedure :: switch_inout => eio_callback_switch_inout
```

⟨*EIO callback: procedures*⟩+≡
```
    subroutine eio_callback_switch_inout (eio, success)
      class(eio_callback_t), intent(inout) :: eio
      logical, intent(out), optional :: success
      call msg_bug ("Event callback: in-out switch not supported")
      if (present (success))  success = .false.
    end subroutine eio_callback_switch_inout
```

The actual callback. First increment counters, then call the procedure if the counter hits the interval.

⟨*EIO callback: eio callback: TBP*⟩+≡
```
    procedure :: output => eio_callback_output
```

⟨*EIO callback: procedures*⟩+≡
```

      call msg_bug ("Weight stream: in-out switch not supported")
      if (present (success))  success = .false.
    end subroutine eio_weights_switch_inout
```

Output an event. Write first the event indices, then weight and two values of
the squared matrix element: **sqme_ref** is the value stored in the event record,
and **sqme_prc** is the one stored in the process instance. (They can differ: when
recalculating, the former is read from file and the latter is the result of the new
calculation.)

For the alternative entries, the **sqme** value is always obtained by a new
calculation, and thus qualifies as **sqme_prc**.

Don't write the file if the **passed** flag is set and false.

18.9 ASCII File Formats

Here, we implement several ASCII file formats. It is possible to switch between them using flags.

⟨`eio_ascii.f90`⟩≡
  ⟨*File header*⟩

  ```
  module eio_ascii
  ```

  ⟨*Use strings*⟩
  ```
    use io_units
    use diagnostics
    use event_base
    use eio_data
    use eio_base
    use hep_common
    use hep_events
  ```

  ⟨*Standard module head*⟩

  ⟨*EIO ascii: public*⟩

  ⟨*EIO ascii: types*⟩

  ```
  contains
  ```

  ⟨*EIO ascii: procedures*⟩

  ```
  end module eio_ascii
  ```

18.9.1 Type

⟨*EIO ascii: public*⟩≡
  ```
    public :: eio_ascii_t
  ```

⟨*EIO ascii: types*⟩≡
  ```
    type, abstract, extends (eio_t) :: eio_ascii_t
      logical :: writing = .false.
      integer :: unit = 0
      logical :: keep_beams = .false.
      logical :: keep_remnants = .true.
      logical :: ensure_order = .false.
    contains
  ```
  ⟨*EIO ascii: eio ascii: TBP*⟩
  ```
    end type eio_ascii_t
  ```

⟨*EIO ascii: public*⟩+≡
  ```
    public :: eio_ascii_ascii_t
  ```

⟨*EIO ascii: types*⟩+≡
```
    type, extends (eio_ascii_t) :: eio_ascii_ascii_t
    end type eio_ascii_ascii_t
```

⟨*EIO ascii: public*⟩+≡
```
    public :: eio_ascii_athena_t
```

⟨*EIO ascii: types*⟩+≡
```
    type, extends (eio_ascii_t) :: eio_ascii_athena_t
    end type eio_ascii_athena_t
```

The debug format has a few options that can be controlled by Sindarin variables.

⟨*EIO ascii: public*⟩+≡
```
    public :: eio_ascii_debug_t
```

⟨*EIO ascii: types*⟩+≡
```
    type, extends (eio_ascii_t) :: eio_ascii_debug_t
       logical :: show_process = .true.
       logical :: show_transforms = .true.
       logical :: show_decay = .true.
       logical :: verbose = .true.
    end type eio_ascii_debug_t
```

⟨*EIO ascii: public*⟩+≡
```
    public :: eio_ascii_hepevt_t
```

⟨*EIO ascii: types*⟩+≡
```
    type, extends (eio_ascii_t) :: eio_ascii_hepevt_t
    end type eio_ascii_hepevt_t
```

⟨*EIO ascii: public*⟩+≡
```
    public :: eio_ascii_hepevt_verb_t
```

    end type eio_ascii_hepevt_verb_t
```

⟨*EIO ascii: public*⟩+≡
```
    public :: eio_ascii_lha_t
```

⟨*EIO ascii: types*⟩+≡
```
    type, extends (eio_ascii_t) :: eio_ascii_lha_t
    end type eio_ascii_lha_t
```

⟨*EIO ascii: public*⟩+≡
```
    public :: eio_ascii_lha_verb_t
```

⟨*EIO ascii: types*⟩+≡
```
    type, extends (eio_ascii_t) :: eio_ascii_lha_verb_t
    end type eio_ascii_lha_verb_t
```

⟨*EIO ascii: public*⟩+≡
```
    public :: eio_ascii_long_t
```

⟨*EIO ascii: types*⟩+≡
```
    type, extends (eio_ascii_t) :: eio_ascii_long_t
    end type eio_ascii_long_t
```

⟨*EIO ascii: public*⟩+≡
```
    public :: eio_ascii_mokka_t
```
⟨*EIO ascii: types*⟩+≡
```
    type, extends (eio_ascii_t) :: eio_ascii_mokka_t
    end type eio_ascii_mokka_t
```

⟨*EIO ascii: public*⟩+≡
```
    public :: eio_ascii_short_t
```
⟨*EIO ascii: types*⟩+≡
```
    type, extends (eio_ascii_t) :: eio_ascii_short_t
    end type eio_ascii_short_t
```

18.9.2   Specific Methods

Set parameters that are specifically used with ASCII file formats. In particular,
this is the file extension.

⟨*EIO ascii: eio ascii: TBP*⟩≡
```
    procedure :: set_parameters => eio_ascii_set_parameters
```

⟨*EIO ascii: procedures*⟩≡
```
    subroutine eio_ascii_set_parameters (eio, &
         keep_beams, keep_remnants, ensure_order, extension, &
         show_process, show_transforms, show_decay, verbose)
      class(eio_ascii_t), intent(inout) :: eio
      logical, intent(in), optional :: keep_beams
      logical, intent(in), optional :: keep_remnants
      logical, intent(in), optional :: ensure_order
      type(string_t), intent(in), optional :: extension
      logical, intent(in), optional :: show_process, show_transforms, show_decay
      logical, intent(in), optional :: verbose
      if (present (keep_beams))  eio%keep_beams = keep_beams
      if (present (keep_remnants))  eio%keep_remnants = keep_remnants
      if (present (ensure_order))  eio%ensure_order = ensure_order
      if (present (extension)) then
         eio%extension = extension
      else
         select type (eio)
         type is (eio_ascii_ascii_t)

Output an event. Write first the event indices, then weight and squared matrix element, then the particle set.

Events that did not pass the selection are skipped. The exceptions are the `ascii` and `debug` formats. These are the formats that contain the `passed` flag in their output, and should be most useful for debugging purposes.

18.10   HEP Common Blocks

Long ago, to transfer data between programs one had to set up a common
block and link both programs as libraries to the main executable. The HEP
community standardizes several of those common blocks.

The modern way of data exchange uses data files with standard formats.
However, the LHEF standard data format derives from a common block (actu-
ally, two).

WHIZARD used to support those common blocks, and LHEF was implemented
via writing/reading blocks. We still keep this convention, but intend to eliminate
common blocks (or any other static storage) from the workflow in the future.
This will gain flexibility towards concurrent running of program images.

We encapsulate everything here in a module. The module holds the variables
which are part of the common block. To access the common block variables,
we just have to use this module. (They are nevertheless in the common block,
since external software may access it in this way.)

Note: This code is taken essentially unchanged from WHIZARD 2.1 and does
not (yet) provide unit tests.

18.10.1 Event characteristics

The maximal number of particles in an event record.
⟨*HEP common: parameters*⟩≡
    integer, parameter, public :: MAXNUP = 500
The number of particles in this event.
⟨*HEP common: variables*⟩≡

1948

```
    integer, public :: NUP
```

The process ID for this event.

⟨*HEP common: variables*⟩+≡
```
    integer, public :: IDPRUP
```

The weight of this event (±1 for unweighted events).

⟨*HEP common: variables*⟩+≡
```
    double precision, public :: XWGTUP
```

The factorization scale that is used for PDF calculation (−1 if undefined).

⟨*HEP common: variables*⟩+≡
```
    double precision, public :: SCALUP
```

The QED and QCD couplings α used for this event (−1 if undefined).

⟨*HEP common: variables*⟩+≡
```
    double precision, public :: AQEDUP
    double precision, public :: AQCDUP
```

18.10.2   Particle characteristics

The PDG code:

⟨*HEP common: variables*⟩+≡
```
    integer, dimension(MAXNUP), public :: IDUP
```

The status code. Incoming: −1, outgoing: +1. Intermediate t-channel propagator: −2 (currently not used by WHIZARD). Intermediate resonance whose mass should be preserved: 2. Intermediate resonance for documentation: 3 (currently not used). Beam particles: −9.

⟨*HEP common: variables*⟩+≡
```
    integer, dimension(MAXNUP), public :: ISTUP
```

Index of first and last mother.

⟨*HEP common: variables*⟩+≡
```
    integer, dimension(2,MAXNUP), public :: MOTHUP
```

Color line index of the color and anticolor entry for the particle. The standard recommends using large numbers; we start from MAXNUP+1.

⟨*HEP common: variables*⟩+≡
```
    integer, dimension(2,MAXNUP), public :: ICOLUP
```

Momentum, energy, and invariant mass: (p_x, p_y, p_z, E, M). For space-like particles, M is the negative square root of the absolute value of the invariant mass.

⟨*HEP common: variables*⟩+≡
```
    double precision, dimension(5,MAXNUP), public :: PUP
```

Invariant lifetime (distance) from production to decay in mm.

⟨*HEP common: variables*⟩+≡
```
    double precision, dimension(MAXNUP), public :: VTIMUP
```

Cosine of the angle between the spin-vector and a particle and the 3-momentum of its mother, given in the lab frame. If undefined/unpolarized: 9.

⟨*HEP common: variables*⟩+≡
```
    double precision, dimension(MAXNUP), public :: SPINUP
```

18.10.3 The HEPRUP common block

This common block is filled once per run.

Run characteristics

The maximal number of different processes.

⟨*HEP common: parameters*⟩+≡
```
integer, parameter, public :: MAXPUP = 100
```

The beam PDG codes.

⟨*HEP common: variables*⟩+≡
```
integer, dimension(2), public :: IDBMUP
```

The beam energies in GeV.

⟨*HEP common: variables*⟩+≡
```
double precision, dimension(2), public :: EBMUP
```

The PDF group and set for the two beams. (Undefined: use −1; LHAPDF: use group = 0).

⟨*HEP common: variables*⟩+≡
```
integer, dimension(2), public :: PDFGUP
integer, dimension(2), public :: PDFSUP
```

The (re)weighting model. 1: events are weighted, the shower generator (SHG) selects processes according to the maximum weight (in pb) and unweights events. 2: events are weighted, the SHG selects processes according to their cross section (in pb) and unweights events. 3: events are unweighted and simply run through the SHG. 4: events are weighted, and the SHG keeps the weight. Negative numbers: negative weights are allowed (and are reweighted to ±1 by the SHG, if allowed).

WHIZARD only supports modes 3 and 4, as the SHG is not given control over process selection. This is consistent with writing events to file, for offline showering.

⟨*HEP common: variables*⟩+≡
```
integer, public :: IDWTUP
```

The number of different processes.

⟨*HEP common: variables*⟩+≡
```
integer, public :: NPRUP
```

Process characteristics

Cross section and error in pb. (Cross section is needed only for IDWTUP = 2, so here both values are given for informational purposes only.)

⟨*HEP common: variables*⟩+≡
```
double precision, dimension(MAXPUP), public :: XSECUP
double precision, dimension(MAXPUP), public :: XERRUP
```

Maximum weight, i.e., the maximum value that XWGTUP can take. Also unused for the supported weighting models. It is ±1 for unweighted events.

⟨*HEP common: variables*⟩+≡
```
double precision, dimension(MAXPUP), public :: XMAXUP
```

Internal ID of the selected process, matches `IDPRUP` below.

⟨*HEP common: variables*⟩+≡
```
integer, dimension(MAXPUP), public :: LPRUP
```

The common block

⟨*HEP common: common blocks*⟩≡
```
common /HEPRUP/ &
     IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP, &
     XSECUP, XERRUP, XMAXUP, LPRUP
save /HEPRUP/
```

Fill the run characteristics of the common block. The initialization sets the beam properties, number of processes, and weighting model.

⟨*HEP common: public*⟩≡
```
public :: heprup_init
```

⟨*HEP common: procedures*⟩≡
```
subroutine heprup_init &
     (beam_pdg, beam_energy, n_processes, unweighted, negative_weights)
  integer, dimension(2), intent(in) :: beam_pdg
  real(default), dimension(2), intent(in) :: beam_energy
  integer, intent(in) :: n_processes
  logical, intent(in) :: unweighted
  logical, intent(in) :: negative_weights
  IDBMUP = beam_pdg
  EBMUP = beam_energy
  PDFGUP = -1
  PDFSUP = -1
  if (unweighted) then
     IDWTUP = 3
  else
     IDWTUP = 4
  end if
  if (negative_weights)  IDWTUP = - IDWTUP
  NPRUP = n_processes
end subroutine heprup_init
```

The HEPRUP (event) common block is needed for the interface to the shower. Filling of it is triggered by some output file formats. If these are not present, the common block is filled with some dummy information. Be generous with the number of processes in HEPRUP so that PYTHIA only rarely needs to be reinitialized in case events with higher process ids are generated.

      write (u, "(3x,A6,' = ',I9,3x,1x,9x,3x,8x,A)")  "NPRUP ", NPRUP, &
           "Number of user subprocesses"
      do i = 1, NPRUP
         write (u, "(1x,A,I0)")  "Subprocess #", i
         write (u, "(3x,A6,' = ',ES12.5,1x,12x,8x,A)")  "XSECUP", XSECUP(i), &
              "Cross section in pb"
         write (u, "(3x,A6,' = ',ES12.5,1x,12x,8x,A)")  "XERRUP", XERRUP(i), &
              "Cross section error in pb"
         write (u, "(3x,A6,' = ',ES12.5,1x,12x,8x,A)")  "XMAXUP", XMAXUP(i), &
              "Maximum event weight (cf. IDWTUP)"
         write (u, "(3x,A6,' = ',I9,3x,1x,12x,8x,A)")  "LPRUP ", LPRUP(i), &
              "Subprocess ID"
      end do
    end subroutine heprup_write_verbose
```

18.10.5   Run parameter output (other formats)

This routine writes the initialization block according to the LHEF standard. It uses the current contents of the HEPRUP block.

⟨*HEP common: public*⟩+≡
```
    public :: heprup_write_lhef
```

⟨*HEP common: procedures*⟩+≡
```
    subroutine heprup_write_lhef (unit)
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "(2(1x,I0),2(1x,ES17.10),6(1x,I0))") &
           IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
      do i = 1, NPRUP
         write (u, "(3(1x,ES17.10),1x,I0)") &
              XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
      end do
    end subroutine heprup_write_lhef
```

This routine is a complete dummy at the moment. It uses the current contents of the HEPRUP block. At the end, it should depend on certain input flags for the different ASCII event formats.

⟨*HEP common: public*⟩+≡
```
    public :: heprup_write_ascii
```

⟨*HEP common: procedures*⟩+≡
```
    subroutine heprup_write_ascii (unit)
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "(2(1x,I0),2(1x,ES17.10),6(1x,I0))") &
           IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
      do i = 1, NPRUP
         write (u, "(3(1x,ES17.10),1x,I0)") &
              XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
      end do
    end subroutine heprup_write_ascii
```

Run parameter input (LHEF)

In a LHEF file, the parameters are written in correct order on separate lines, but we should not count on the precise format. List-directed input should just work.

⟨*HEP common: public*⟩+≡
```
    public :: heprup_read_lhef
```

⟨*HEP common: procedures*⟩+≡
```
    subroutine heprup_read_lhef (u)
      integer, intent(in) :: u
      integer :: i
      read (u, *) &
           IDBMUP, EBMUP, PDFGUP, PDFSUP, IDWTUP, NPRUP
      do i = 1, NPRUP
         read (u, *) &
              XSECUP(i), XERRUP(i), XMAXUP(i), LPRUP(i)
      end do
    end subroutine heprup_read_lhef
```

18.10.6 The HEPEUP common block

⟨HEP common: common blocks⟩+≡
```
common /HEPEUP/ &
     NUP, IDPRUP, XWGTUP, SCALUP, AQEDUP, AQCDUP, &
     IDUP, ISTUP, MOTHUP, ICOLUP, PUP, VTIMUP, SPINUP
save /HEPEUP/
```

Initialization

Fill the event characteristics of the common block. The initialization sets only the number of particles and initializes the rest with default values. The other routine sets the optional parameters.

⟨HEP common: public⟩+≡
```
public :: hepeup_init
public :: hepeup_set_event_parameters
```

⟨HEP common: procedures⟩+≡
```
subroutine hepeup_init (n_tot)
  integer, intent(in) :: n_tot
  NUP = n_tot
  IDPRUP = 0
  XWGTUP = 1
  SCALUP = -1
  AQEDUP = -1
  AQCDUP = -1
end subroutine hepeup_init

subroutine hepeup_set_event_parameters &
     (proc_id, weight, scale, alpha_qed, alpha_qcd)
  integer, intent(in), optional :: proc_id
  real(default), intent(in), optional :: weight, scale, alpha_qed, alpha_qcd
  if (present (proc_id))   IDPRUP = proc_id
  if (present (weight))    XWGTUP = weight
  if (present (scale))     SCALUP = scale
  if (present (alpha_qed)) AQEDUP = alpha_qed
  if (present (alpha_qcd)) AQCDUP = alpha_qcd
end subroutine hepeup_set_event_parameters
```

Extract event information. The caller determines the parameters.

⟨HEP common: public⟩+≡
```
public :: hepeup_get_event_parameters
```

⟨HEP common: procedures⟩+≡
```
subroutine hepeup_get_event_parameters &
     (proc_id, weight, scale, alpha_qed, alpha_qcd)
  integer, intent(out), optional :: proc_id
  real(default), intent(out), optional :: weight, scale, alpha_qed, alpha_qcd
  if (present (proc_id))   proc_id   = IDPRUP
  if (present (weight))    weight    = XWGTUP
  if (present (scale))     scale     = SCALUP
  if (present (alpha_qed)) alpha_qed = AQEDUP
  if (present (alpha_qcd)) alpha_qcd = AQCDUP
```

```
      end subroutine hepeup_get_event_parameters
```

Particle data

Below we need the particle status codes which are actually defined in the
`subevents` module.

Set the entry for a specific particle. All parameters are set with the exception
of lifetime and spin, where default values are stored.

⟨*HEP common: public*⟩+≡
```
    public :: hepeup_set_particle
```

⟨*HEP common: procedures*⟩+≡
```
    subroutine hepeup_set_particle (i, pdg, status, parent, col, p, m2)
      integer, intent(in) :: i
      integer, intent(in) :: pdg, status
      integer, dimension(:), intent(in) :: parent
      type(vector4_t), intent(in) :: p
      integer, dimension(2), intent(in) :: col
      real(default), intent(in) :: m2
      if (i > MAXNUP) then
         call msg_error (arr=[ &
              var_str ("Too many particles in HEPEUP common block. " // &
                         "If this happened "), &
              var_str ("during event output, your events will be " // &
                         "invalid; please consider "), &
              var_str ("switching to a modern event format like HEPMC. " // &
                         "If you are not "), &
              var_str ("using an old, HEPEUP based format and " // &
                         "nevertheless get this error,"), &
              var_str ("please notify the WHIZARD developers,") ])
         return
      end if
      IDUP(i) = pdg
      select case (status)
      case (PRT_BEAM);         ISTUP(i) = -9
      case (PRT_INCOMING);     ISTUP(i) = -1
      case (PRT_BEAM_REMNANT); ISTUP(i) =  3
      case (PRT_OUTGOING);     ISTUP(i) =  1
      case (PRT_RESONANT);     ISTUP(i) =  2
      case (PRT_VIRTUAL);      ISTUP(i) =  3
      case default;            ISTUP(i) =  0
      end select
      select case (size (parent))
      case (0);      MOTHUP(:,i) = 0
      case (1);      MOTHUP(1,i) = parent(1); MOTHUP(2,i) = 0
      case default;  MOTHUP(:,i) = [ parent(1), parent(size (parent)) ]
      end select
      if (col(1) > 0) then
         ICOLUP(1,i) = 500 + col(1)
      else
         ICOLUP(1,i) = 0
      end if
      if (col(2) > 0) then
```

```
        ICOLUP(2,i) = 500 + col(2)
    else
        ICOLUP(2,i) = 0
    end if
    PUP(1:3,i) = vector3_get_components (space_part (p))
    PUP(4,i) = energy (p)
    PUP(5,i) = sign (sqrt (abs (m2)), m2)
    VTIMUP(i) = 0
    SPINUP(i) = 9
end subroutine hepeup_set_particle
```

Set the lifetime, actually $c\tau$ measured im mm, where τ is the invariant lifetime.

⟨*HEP common: public*⟩+≡
```
    public :: hepeup_set_particle_lifetime
```

⟨*HEP common: procedures*⟩+≡
```
    subroutine hepeup_set_particle_lifetime (i, lifetime)
      integer, intent(in) :: i
      real(default), intent(in) :: lifetime
      VTIMUP(i) = lifetime
    end subroutine hepeup_set_particle_lifetime
```

Set the particle spin entry. We need the cosine of the angle of the spin axis with respect to the three-momentum of the parent particle.

If the particle has a full polarization density matrix given, we need the particle momentum and polarization as well as the mother-particle momentum. The polarization is transformed into a spin vector (which is sensible only for spin-1/2 or massless particles), which then is transformed into the lab frame (by a rotation of the 3-axis to the particle momentum axis). Finally, we compute the scalar product of this vector with the mother-particle three-momentum.

This puts severe restrictions on the applicability of this definition, and Lorentz invariance is lost. Unfortunately, the Les Houches Accord requires this computation.

⟨*HEP common: public*⟩+≡
```
    public :: hepeup_set_particle_spin
```

⟨*HEP common: interfaces*⟩≡
```
    interface hepeup_set_particle_spin
       module procedure hepeup_set_particle_spin_pol
    end interface
```

⟨*HEP common: procedures*⟩+≡
```
    subroutine hepeup_set_particle_spin_pol (i, p, pol, p_mother)
      integer, intent(in) :: i
      type(vector4_t), intent(in) :: p
      type(polarization_t), intent(in) :: pol
      type(vector4_t), intent(in) :: p_mother
      type(vector3_t) :: s3, p3
      type(vector4_t) :: s4
      s3 = vector3_moving (pol%get_axis ())
      p3 = space_part (p)
      s4 = rotation_to_2nd (3, p3) * vector4_moving (0._default, s3)
      SPINUP(i) = enclosed_angle_ct (s4, p_mother)
```

```
      end subroutine hepeup_set_particle_spin_pol
```

Extract particle data. The caller decides which ones to retrieve.

Status codes: beam remnants share the status code with virtual particles. However, for the purpose of WHIZARD we should identify them. We use the PDG code for this.

⟨*HEP common: public*⟩+≡
```
    public :: hepeup_get_particle
```

⟨*HEP common: procedures*⟩+≡
```
    subroutine hepeup_get_particle (i, pdg, status, parent, col, p, m2)
      integer, intent(in) :: i
      integer, intent(out), optional :: pdg, status
      integer, dimension(:), intent(out), optional :: parent
      type(vector4_t), intent(out), optional :: p
      integer, dimension(2), intent(out), optional :: col
      real(default), dimension(5,MAXNUP) :: pup_def
      real(default), intent(out), optional :: m2
      if (present (pdg))  pdg = IDUP(i)
      if (present (status)) then
         select case (ISTUP(i))
         case (-9);  status = PRT_BEAM
         case (-1);  status = PRT_INCOMING
         case (1);    status = PRT_OUTGOING
         case (2);    status = PRT_RESONANT
         case (3);
            select case (abs (IDUP(i)))
            case (HADRON_REMNANT, HADRON_REMNANT_SINGLET, &
                  HADRON_REMNANT_TRIPLET, HADRON_REMNANT_OCTET)

      if (present (col)) then
         col = ICOLUP(:,i)
      end if
      if (present (p)) then
         pup_def = PUP
         p = vector4_moving (pup_def(4,i), vector3_moving (pup_def(1:3,i)))
      end if
      if (present (m2)) then
         m2 = sign (PUP(5,i) ** 2, PUP(5,i))
      end if
```

```
      end subroutine hepeup_get_particle
```

18.10.7   The HEPEVT and HEPEV4 common block

For the LEP Monte Carlos, a standard common block has been proposed in
AKV89. We strongly recommend its use. (The description is an abbreviated
transcription of AKV89, Vol. 3, pp. 327-330).

NMXHEP is the maximum number of entries:

⟨*HEP common: variables*⟩+≡
```
      integer, parameter :: NMXHEP = 4000
```

NEVHEP is normally the event number, but may take special values as follows:

0 the program does not keep track of event numbers. -1 a special initializa-
tion record. -2 a special final record.

⟨*HEP common: variables*⟩+≡
```
      integer :: NEVHEP
```

NHEP holds the number of entries for this event.

⟨*HEP common: variables*⟩+≡
```
      integer, public :: NHEP
```

The entry ISTHEP(N) gives the status code for the Nth entry, with the following
semantics: 0 a null entry. 1 an existing entry, which has not decayed or frag-
mented. 2 a decayed or fragmented entry, which is retained for event history
information. 3 documentation line. 4- 10 reserved for future standards. 11-200
at the disposal of each model builder. 201- at the disposal of users.

⟨*HEP common: variables*⟩+≡
```
      integer, dimension(NMXHEP), public :: ISTHEP
```

The Particle Data Group has proposed standard particle codes, which are to be
stored in IDHEP(N).

⟨*HEP common: variables*⟩+≡
```
      integer, dimension(NMXHEP), public :: IDHEP
```

JMOHEP(1,N) points to the mother of the Nth entry, if any. It is set to zero for
initial entries. JMOHEP(2,N) points to the second mother, if any.

⟨*HEP common: variables*⟩+≡
```
      integer, dimension(2, NMXHEP), public :: JMOHEP
```

JDAHEP(1,N) and JDAHEP(2,N) point to the first and last daughter of the Nth
entry, if any. These are zero for entries which have not yet decayed. The other
daughters are stored in between these two.

⟨*HEP common: variables*⟩+≡
```
      integer, dimension(2, NMXHEP), public :: JDAHEP
```

In `PHEP` we store the momentum of the particle, more specifically this means that `PHEP(1,N)`, `PHEP(2,N)`, and `PHEP(3,N)` contain the momentum in the x, y, and z direction (as defined by the machine people), measured in GeV/c. `PHEP(4,N)` contains the energy in GeV and `PHEP(5,N)` the mass in GeV/c^2. The latter may be negative for spacelike partons.

⟨*HEP common: variables*⟩+≡
```
double precision, dimension(5, NMXHEP), public :: PHEP
```

Finally `VHEP` is the place to store the position of the production vertex. `VHEP(1,N)`, `VHEP(2,N)`, and `VHEP(3,N)` contain the x, y, and z coordinate (as defined by the machine people), measured in mm. `VHEP(4,N)` contains the production time in mm/c.

⟨*HEP common: variables*⟩+≡
```
double precision, dimension(4, NMXHEP) :: VHEP
```

As an amendment to the proposed standard common block HEPEVT, we also have a polarisation common block HEPSPN, as described in AKV89. `SHEP(1,N)`, `SHEP(2,N)`, and `SHEP(3,N)` give the x, y, and z component of the spinvector s of a fermion in the fermions restframe.

Furthermore, we add the polarization of the corresponding outgoing particles:

⟨*HEP common: variables*⟩+≡
```
integer, dimension(NMXHEP) :: hepevt_pol
```

By this variable the identity of the current process is given, defined via the LPRUP codes.

⟨*HEP common: variables*⟩+≡
```
integer, public :: idruplh
```

This is the event weight, i.e. the cross section divided by the total number of generated events for the output of the parton shower programs.

⟨*HEP common: variables*⟩+≡
```
double precision, public :: eventweightlh
```

There are the values for the electromagnetic and the strong coupling constants, α_{em} and α_s.

⟨*HEP common: variables*⟩+≡
```
double precision, public :: alphaqedlh, alphaqcdlh
```

This is the squared scale Q of the event.

⟨*HEP common: variables*⟩+≡
```
double precision, dimension(10), public :: scalelh
```

Finally, these variables contain the spin information and the color/anticolor flow of the particles.

⟨*HEP common: variables*⟩+≡
```
double precision, dimension (3,NMXHEP), public :: spinlh
integer, dimension (2,NMXHEP), public :: icolorflowlh
```

By convention, `SHEP(4,N)` is always 1. All this is taken from StdHep 4.06 manual and written using Fortran90 conventions.

⟨*HEP common: common blocks*⟩+≡
```
common /HEPEVT/ &
     NEVHEP, NHEP, ISTHEP, IDHEP, &
     JMOHEP, JDAHEP, PHEP, VHEP
save /HEPEVT/
```

Here we store HEPEVT parameters of the WHIZARD 1 realization which are not part of the HEPEVT common block.

⟨*HEP common: variables*⟩+≡
```
integer :: hepevt_n_out, hepevt_n_remnants
```

⟨*HEP common: variables*⟩+≡
```
double precision :: hepevt_weight, hepevt_function_value
double precision :: hepevt_function_ratio
```

The HEPEV4 common block is an extension of the HEPEVT common block to allow for partonic colored events, including especially the color flow etc.

⟨*HEP common: common blocks*⟩+≡
```
common /HEPEV4/ &
     eventweightlh, alphaqedlh, alphaqcdlh, scalelh, &
     spinlh, icolorflowlh, idruplh
save /HEPEV4/
```

Filling HEPEVT: If the event count is not provided, set `NEVHEP` to zero. If the event count is -1 or -2, the record corresponds to initialization and finalization, and the event is irrelevant.

Note that the event count may be larger than 2^{31} (2 GEvents). In that case, cut off the upper bits since `NEVHEP` is probably limited to default integer.

For the HEPEV4 common block, it is unclear why the `scalelh` variable is 10-dimensional. We choose to only set the first value of the array.

⟨*HEP common: public*⟩+≡
```
public :: hepevt_init
public :: hepevt_set_event_parameters
```

⟨*HEP common: procedures*⟩+≡
```
subroutine hepevt_init (n_tot, n_out)
  integer, intent(in) :: n_tot, n_out
  NHEP               = n_tot
  NEVHEP             = 0
  idruplh            = 0
  hepevt_n_out       = n_out
  hepevt_n_remnants  = 0
  hepevt_weight      = 1
  eventweightlh      = 1
  hepevt_function_value = 0
  hepevt_function_ratio = 1
  alphaqcdlh         = -1
  alphaqedlh         = -1
  scalelh            = -1
```

```
      end subroutine hepevt_init

      subroutine hepevt_set_event_parameters &
           (proc_id, weight, function_value, function_ratio, &
            alpha_qcd, alpha_qed, scale, i_evt)
        integer, intent(in), optional :: proc_id
        integer, intent(in), optional :: i_evt
        real(default), intent(in), optional :: weight, function_value, &
             function_ratio, alpha_qcd, alpha_qed, scale
        if (present (proc_id))  idruplh = proc_id
        if (present (i_evt))  NEVHEP = i_evt
        if (present (weight)) then
           hepevt_weight = weight
           eventweightlh = weight
        end if
        if (present (function_value)) hepevt_function_value = &
             function_value
        if (present (function_ratio)) hepevt_function_ratio = &
             function_ratio
        if (present (alpha_qcd))  alphaqcdlh = alpha_qcd
        if (present (alpha_qed))  alphaqedlh = alpha_qed
        if (present (scale))  scalelh(1) = scale
        if (present (i_evt))  NEVHEP = i_evt
      end subroutine hepevt_set_event_parameters
```

Set the entry for a specific particle. All parameters are set with the exception of lifetime and spin, where default values are stored.

⟨*HEP common: public*⟩+≡
```
      public :: hepevt_set_particle
```

⟨*HEP common: procedures*⟩+≡
```

end subroutine hepeup_write_lha
```

This routine writes event output according to the HEPEVT standard. It uses the current contents of the HEPEVT block and some additional parameters according to the standard in WHIZARD 1. For the long ASCII format, the value of the sample function (i.e. the product of squared matrix element, structure functions and phase space factor is printed out). The option of reweighting matrix elements with respect to some reference cross section is not implemented in WHIZARD 2 for this event format, therefore the second entry in the long ASCII format (the function ratio) is always one. The ATHENA format is an implementation of the HEPEVT format that is readable by the ATLAS ATHENA software framework. It is very similar to the WHIZARD 1 HEPEVT format, except that it contains an event counter, a particle counter inside the event, and has the HEPEVT ISTHEP status before the PDG code. The MOKKA format

is a special ASCII format that contains the information to be parsed to the MOKKA LC fast simulation software.

18.10.11   Data Transfer: particle sets

The WHIZARD format for handling particle data in events is `particle_set_t`. We
have to interface this to the common blocks.

   We first create a new particle set that contains only the particles that are
supported by the LHEF format. These are: beam, incoming, resonant, outgoing.
We drop particles with unknown, virtual or beam-remnant status.

   From this set we fill the common block. Event information such as process
ID and weight is not transferred here; this has to be done by the caller. The spin
information is set only if the particle has a unique mother, and if its polarization
is fully defined.

   We use this routine also to hand over information to Pythia which lets Tauola
access SPINUP. Tauola expects in SPINUP the helicity and not the LHA con-
vention. We switch to this mode with `tauola_convention`.

end subroutine hepeup_from_particle_set
```

Input. The particle set should be allocated properly, but we replace the particle contents.

If there are no beam particles in the event, we try to reconstruct beam particles and beam remnants. We assume for simplicity that the beam particles, if any, are the first two particles. If they are absent, the first two particles should be the incoming partons.

```

The HEPEVT common block is quite similar, but does contain less information,
e.g. no color flows (it was LEP time). The spin information is set only if the
particle has a unique mother, and if its polarization is fully defined.

18.11   HepMC events

This section provides the interface to the HepMC C++ library for handling
Monte-Carlo events.

   Each C++ class of HepMC that we use is mirrored by a Fortran type, which
contains as its only component the C pointer to the C++ object.

   Each C++ method of HepMC that we use has a C wrapper function. This
function takes a pointer to the host object as its first argument. Further ar-
guments are either C pointers, or in the case of simple types (integer, real),
interoperable C/Fortran objects.

   The C wrapper functions have explicit interfaces in the Fortran module.
They are called by Fortran wrapper procedures. These are treated as methods
of the corresponding Fortran type.

```

18.11.1 Interface check

This function can be called in order to verify that we are using the actual HepMC library, and not the dummy version.

⟨*HepMC interface: interfaces*⟩≡
```
    interface
       logical(c_bool) function hepmc_available () bind(C)
         import
       end function hepmc_available
    end interface
```

⟨*HepMC interface: public*⟩≡
```
    public :: hepmc_is_available
```

⟨*HepMC interface: procedures*⟩≡
```
    function hepmc_is_available () result (flag)
      logical :: flag
      flag = hepmc_available ()
    end function hepmc_is_available
```

18.11.2 FourVector

The C version of four-vectors is often transferred by value, and the associated procedures are all inlined. The wrapper needs to transfer by reference, so we create FourVector objects on the heap which have to be deleted explicitly. The input is a `vector4_t` or `vector3_t` object from the `lorentz` module.

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_four_vector_t
```

⟨*HepMC interface: types*⟩≡
```
    type :: hepmc_four_vector_t
       private
       type(c_ptr) :: obj
    end type hepmc_four_vector_t
```

In the C constructor, the zero-component (fourth argument) is optional; if missing, it is set to zero. The Fortran version has initializer form and takes either a three-vector or a four-vector. A further version extracts the four-vector from a HepMC particle object.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       type(c_ptr) function new_four_vector_xyz (x, y, z) bind(C)
         import
         real(c_double), value :: x, y, z
       end function new_four_vector_xyz
    end interface
    interface
       type(c_ptr) function new_four_vector_xyzt (x, y, z, t) bind(C)
         import
         real(c_double), value :: x, y, z, t
       end function new_four_vector_xyzt
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_four_vector_init
```

⟨*HepMC interface: interfaces*⟩+≡
```
    interface hepmc_four_vector_init
       module procedure hepmc_four_vector_init_v4
       module procedure hepmc_four_vector_init_v3
       module procedure hepmc_four_vector_init_hepmc_prt
    end interface
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_four_vector_init_v4 (pp, p)
      type(hepmc_four_vector_t), intent(out) :: pp
      type(vector4_t), intent(in) :: p
      real(default), dimension(0:3) :: pa
      pa = vector4_get_components (p)
      pp%obj = new_four_vector_xyzt &
           (real (pa(1), c_double), &
            real (pa(2), c_double), &
            real (pa(3), c_double), &
            real (pa(0), c_double))
    end subroutine hepmc_four_vector_init_v4
```

```
subroutine hepmc_four_vector_init_v3 (pp, p)
  type(hepmc_four_vector_t), intent(out) :: pp
  type(vector3_t), intent(in) :: p
  real(default), dimension(3) :: pa
  pa = vector3_get_components (p)
  pp%obj = new_four_vector_xyz &
       (real (pa(1), c_double), &
        real (pa(2), c_double), &
        real (pa(3), c_double))
end subroutine hepmc_four_vector_init_v3

subroutine hepmc_four_vector_init_hepmc_prt (pp, prt)

      function four_vector_e (p_obj) result (e) bind(C)
        import
        real(c_double) :: e
        type(c_ptr), value :: p_obj
      end function four_vector_e
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_four_vector_to_vector4
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_four_vector_to_vector4 (pp, p)
      type(hepmc_four_vector_t), intent(in) :: pp
      type(vector4_t), intent(out) :: p
      real(default) :: E
      real(default), dimension(3) :: p3
      E = four_vector_e (pp%obj)
      p3(1) = four_vector_px (pp%obj)
      p3(2) = four_vector_py (pp%obj)
      p3(3) = four_vector_pz (pp%obj)
      p = vector4_moving (E, vector3_moving (p3))
    end subroutine hepmc_four_vector_to_vector4
```

18.11.3 Polarization

Polarization objects are temporarily used for assigning particle polarization. We add a flag `polarized`. If this is false, the polarization is not set and should not be transferred to `hepmc_particle` objects.

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_polarization_t
```

⟨*HepMC interface: types*⟩+≡
```
    type :: hepmc_polarization_t
      private
      logical :: polarized = .false.
      type(c_ptr) :: obj
    end type hepmc_polarization_t
```

Constructor. The C wrapper takes polar and azimuthal angle as arguments. The Fortran version allows for either a complete polarization density matrix, or for a definite (diagonal) helicity.

HepMC does not allow to specify the degree of polarization, therefore we have to map it to either 0 or 1. We choose 0 for polarization less than 0.5 and 1 for polarization greater than 0.5. Even this simplification works only for spin-1/2 and for massless particles; massive vector bosons cannot be treated this way. In particular, zero helicity is always translated as unpolarized.

For massive vector bosons, we arbitrarily choose the convention that the longitudinal (zero) helicity state is mapped to the theta angle $\pi/2$. This works under the condition that helicity is projected onto one of the basis states.

⟨*HepMC interface: interfaces*⟩+≡
```
interface
   type(c_ptr) function new_polarization (theta, phi) bind(C)
     import
     real(c_double), value :: theta, phi
   end function new_polarization
end interface
```

⟨*HepMC interface: public*⟩+≡
```
public :: hepmc_polarization_init
```

⟨*HepMC interface: interfaces*⟩+≡
```
interface hepmc_polarization_init
   module procedure hepmc_polarization_init_pol
   module procedure hepmc_polarization_init_hel
   module procedure hepmc_polarization_init_int
end interface
```

⟨*HepMC interface: procedures*⟩+≡
```
subroutine hepmc_polarization_init_pol (hpol, pol)
  type(hepmc_polarization_t), intent(out) :: hpol
  type(polarization_t), intent(in) :: pol
  real(default) :: r, theta, phi
  if (pol%is_polarized ()) then
     call pol%to_angles (r, theta, phi)
     if (r >= 0.5) then
        hpol%polarized = .true.
        hpol%obj = new_polarization &
             (real (theta, c_double), real (phi, c_double))
     end if
  end if
end subroutine hepmc_polarization_init_pol

subroutine hepmc_polarization_init_hel (hpol, hel)
  type(hepmc_polarization_t), intent(out) :: hpol
  type(helicity_t), intent(in) :: hel
  integer, dimension(2) :: h
  if (hel%is_defined ()) then
     h = hel%to_pair ()
     select case (h(1))
     case (1:)
        hpol%polarized = .true.
        hpol%obj = new_polarization (0._c_double, 0._c_double)
     case (:-1)
        hpol%polarized = .true.
        hpol%obj = new_polarization (real (pi, c_double), 0._c_double)
     case (0)
        hpol%polarized = .true.
        hpol%obj = new_polarization (real (pi/2, c_double), 0._c_double)
     end select
  end if
end subroutine hepmc_polarization_init_hel
```

```
subroutine hepmc_polarization_init_int (hpol, hel)
  type(hepmc_polarization_t), intent(out) :: hpol
  integer, intent(in) :: hel
  select case (hel)
  case (1:)
     hpol%polarized = .true.
     hpol%obj = new_polarization (0._c_double, 0._c_double)
  case (:-1)
     hpol%polarized = .true.
     hpol%obj = new_polarization (real (pi, c_double), 0._c_double)
  case (0)
     hpol%polarized = .true.
     hpol%obj = new_polarization (real (pi/2, c_double), 0._c_double)
  end select
end subroutine hepmc_polarization_init_int
```

Destructor. The C object is deallocated only if the `polarized` flag is set.

⟨*HepMC interface: interfaces*⟩+≡
```
interface
   subroutine polarization_delete (pol_obj) bind(C)
     import
     type(c_ptr), value :: pol_obj
   end subroutine polarization_delete
end interface
```

⟨*HepMC interface: public*⟩+≡
```
public :: hepmc_polarization_final
```

⟨*HepMC interface: procedures*⟩+≡
```
subroutine hepmc_polarization_final (hpol)
  type(hepmc_polarization_t), intent(inout) :: hpol
  if (hpol%polarized)  call polarization_delete (hpol%obj)
end subroutine hepmc_polarization_final
```

Recover polarization from HepMC polarization object (with the abovementioned deficiencies).

⟨*HepMC interface: interfaces*⟩+≡
```
interface
   function polarization_theta (pol_obj) result (theta) bind(C)
     import
     real(c_double) :: theta
     type(c_ptr), value :: pol_obj
   end function polarization_theta
end interface
interface
   function polarization_phi (pol_obj) result (phi) bind(C)
     import
     real(c_double) :: phi
     type(c_ptr), value :: pol_obj
   end function polarization_phi
end interface
```

⟨*HepMC interface: public*⟩+≡
```
public :: hepmc_polarization_to_pol
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_polarization_to_pol (hpol, flv, pol)
      type(hepmc_polarization_t), intent(in) :: hpol
      type(flavor_t), intent(in) :: flv
      type(polarization_t), intent(out) :: pol
      real(default) :: theta, phi
      theta = polarization_theta (hpol%obj)
      phi = polarization_phi (hpol%obj)
      call pol%init_angles (flv, 1._default, theta, phi)
    end subroutine hepmc_polarization_to_pol
```

Recover helicity. Here, ϕ is ignored and only the sign of $\cos\theta$ is relevant, mapped to positive/negative helicity.

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_polarization_to_hel
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_polarization_to_hel (hpol, flv, hel)
      type(hepmc_polarization_t), intent(in) :: hpol
      type(flavor_t), intent(in) :: flv
      type(helicity_t), intent(out) :: hel
      real(default) :: theta
      integer :: hmax
      theta = polarization_theta (hpol%obj)
      hmax = flv%get_spin_type () / 2
      call hel%init (sign (hmax, nint (cos (theta))))
    end subroutine hepmc_polarization_to_hel
```

18.11.4   GenParticle

Particle objects have the obvious meaning.

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_particle_t
```

⟨*HepMC interface: types*⟩+≡
```
    type :: hepmc_particle_t
      private
      type(c_ptr) :: obj
    end type hepmc_particle_t
```

Constructor. The C version takes a FourVector object, which in the Fortran wrapper is created on the fly from a `vector4` Lorentz vector.

No destructor is needed as long as all particles are entered into vertex containers.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      type(c_ptr) function new_gen_particle (prt_obj, pdg_id, status) bind(C)
        import
        type(c_ptr), value :: prt_obj
        integer(c_int), value :: pdg_id, status
      end function new_gen_particle
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_particle_init
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_particle_init (prt, p, pdg, status)
      type(hepmc_particle_t), intent(out) :: prt
      type(vector4_t), intent(in) :: p
      integer, intent(in) :: pdg, status
      type(hepmc_four_vector_t) :: pp

      type(hepmc_four_vector_t) :: pp
      call hepmc_four_vector_init (pp, prt)
      call hepmc_four_vector_to_vector4 (pp, p)
      call hepmc_four_vector_final (pp)
    end function hepmc_particle_get_momentum
```

Return the invariant mass squared of the particle object. HepMC stores the
signed invariant mass (no squaring).

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      function gen_particle_generated_mass (prt_obj) result (mass) bind(C)
        import
        real(c_double) :: mass
        type(c_ptr), value :: prt_obj
      end function gen_particle_generated_mass
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_particle_get_mass_squared
```

⟨*HepMC interface: procedures*⟩+≡
```
    function hepmc_particle_get_mass_squared (prt) result (m2)
      real(default) :: m2
      type(hepmc_particle_t), intent(in) :: prt
      real(default) :: m
      m = gen_particle_generated_mass (prt%obj)
```

1987

```
      m2 = sign (m**2, m)
    end function hepmc_particle_get_mass_squared
```

Return the PDG ID:

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       function gen_particle_pdg_id (prt_obj) result (pdg_id) bind(C)
         import
         integer(c_int) :: pdg_id
         type(c_ptr), value :: prt_obj
       end function gen_particle_pdg_id
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_particle_get_pdg
```

      end if
    end function hepmc_vertex_to_vertex
```

18.11.5 GenVertex

Vertices are made of particles (incoming and outgoing).

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_t
```

⟨*HepMC interface: types*⟩+≡
```
    type :: hepmc_vertex_t
       private
       type(c_ptr) :: obj
    end type hepmc_vertex_t
```

Constructor. Two versions, one plain, one with the position in space and time (measured in mm) as argument. The Fortran version has initializer form, and the vertex position is an optional argument.

A destructor is unnecessary as long as all vertices are entered into an event container.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
```

```
      type(c_ptr) function new_gen_vertex () bind(C)
        import
      end function new_gen_vertex
    end interface
    interface
      type(c_ptr) function new_gen_vertex_pos (prt_obj) bind(C)
        import
        type(c_ptr), value :: prt_obj
      end function new_gen_vertex_pos
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_init
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_vertex_init (v, x)
      type(hepmc_vertex_t), intent(out) :: v
      type(vector4_t), intent(in), optional :: x
      type(hepmc_four_vector_t) :: pos
      if (present (x)) then
         call hepmc_four_vector_init (pos, x)
         v%obj = new_gen_vertex_pos (pos%obj)

18.11.6   Vertex-particle-in iterator

This iterator iterates over all incoming particles in an vertex. We store a pointer
to the vertex in addition to the iterator. This allows for simple end checking.
      The iterator is actually a constant iterator; it can only read.

⟨*HepMC interface: public*⟩+≡
```
      public :: hepmc_vertex_particle_in_iterator_t
```

⟨*HepMC interface: types*⟩+≡
```
      type :: hepmc_vertex_particle_in_iterator_t
        private
        type(c_ptr) :: obj
        type(c_ptr) :: v_obj
      end type hepmc_vertex_particle_in_iterator_t
```

Constructor. The iterator is initialized at the first particle in the vertex.

⟨*HepMC interface: interfaces*⟩+≡
```
      interface
        type(c_ptr) function &
            new_vertex_particles_in_const_iterator (v_obj) bind(C)
          import
          type(c_ptr), value :: v_obj
        end function new_vertex_particles_in_const_iterator
      end interface
```

⟨*HepMC interface: public*⟩+≡
```
      public :: hepmc_vertex_particle_in_iterator_init
```

⟨*HepMC interface: procedures*⟩+≡
```
      subroutine hepmc_vertex_particle_in_iterator_init (it, v)
        type(hepmc_vertex_particle_in_iterator_t), intent(out) :: it
        type(hepmc_vertex_t), intent(in) :: v
        it%obj = new_vertex_particles_in_const_iterator (v%obj)
        it%v_obj = v%obj
      end subroutine hepmc_vertex_particle_in_iterator_init
```

Destructor. Necessary because the iterator is allocated on the heap.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       subroutine vertex_particles_in_const_iterator_delete (it_obj) bind(C)
         import
         type(c_ptr), value :: it_obj
       end subroutine vertex_particles_in_const_iterator_delete
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_particle_in_iterator_final
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_vertex_particle_in_iterator_final (it)
      type(hepmc_vertex_particle_in_iterator_t), intent(inout) :: it
      call vertex_particles_in_const_iterator_delete (it%obj)
    end subroutine hepmc_vertex_particle_in_iterator_final
```

Increment

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       subroutine vertex_particles_in_const_iterator_advance (it_obj) bind(C)
         import
         type(c_ptr), value :: it_obj
       end subroutine vertex_particles_in_const_iterator_advance
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_particle_in_iterator_advance
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_vertex_particle_in_iterator_advance (it)
      type(hepmc_vertex_particle_in_iterator_t), intent(inout) :: it
      call vertex_particles_in_const_iterator_advance (it%obj)
    end subroutine hepmc_vertex_particle_in_iterator_advance
```

Reset to the beginning

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       subroutine vertex_particles_in_const_iterator_reset &
            (it_obj, v_obj) bind(C)
         import
         type(c_ptr), value :: it_obj, v_obj
       end subroutine vertex_particles_in_const_iterator_reset
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_particle_in_iterator_reset
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_vertex_particle_in_iterator_reset (it)
      type(hepmc_vertex_particle_in_iterator_t), intent(inout) :: it
      call vertex_particles_in_const_iterator_reset (it%obj, it%v_obj)
    end subroutine hepmc_vertex_particle_in_iterator_reset
```

Test: return true as long as we are not past the end.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       function vertex_particles_in_const_iterator_is_valid &
            (it_obj, v_obj) result (flag) bind(C)
         import
         logical(c_bool) :: flag
         type(c_ptr), value :: it_obj, v_obj
       end function vertex_particles_in_const_iterator_is_valid
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_particle_in_iterator_is_valid
```

⟨*HepMC interface: procedures*⟩+≡
```
    function hepmc_vertex_particle_in_iterator_is_valid (it) result (flag)
      logical :: flag
      type(hepmc_vertex_particle_in_iterator_t), intent(in) :: it
      flag = vertex_particles_in_const_iterator_is_valid (it%obj, it%v_obj)
    end function hepmc_vertex_particle_in_iterator_is_valid
```

Return the particle pointed to by the iterator. (The particle object should not
be finalized, since it contains merely a pointer to the particle which is owned by
the vertex.)

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       type(c_ptr) function &
            vertex_particles_in_const_iterator_get (it_obj) bind(C)
         import

      integer(c_int) :: nth
      nth = n
      prt%obj = vertex_get_nth_particle_out (vtx%obj, nth)
    end function hepmc_vertex_get_nth_particle_out
```

18.11.7 Vertex-particle-out iterator

This iterator iterates over all incoming particles in an vertex. We store a pointer
to the vertex in addition to the iterator. This allows for simple end checking.

The iterator is actually a constant iterator; it can only read.

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_particle_out_iterator_t
```

⟨*HepMC interface: types*⟩+≡
```
    type :: hepmc_vertex_particle_out_iterator_t
      private
      type(c_ptr) :: obj
      type(c_ptr) :: v_obj
    end type hepmc_vertex_particle_out_iterator_t
```

Constructor. The iterator is initialized at the first particle in the vertex.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      type(c_ptr) function &
          new_vertex_particles_out_const_iterator (v_obj) bind(C)
        import
        type(c_ptr), value :: v_obj
      end function new_vertex_particles_out_const_iterator
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_particle_out_iterator_init
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_vertex_particle_out_iterator_init (it, v)
      type(hepmc_vertex_particle_out_iterator_t), intent(out) :: it
      type(hepmc_vertex_t), intent(in) :: v
      it%obj = new_vertex_particles_out_const_iterator (v%obj)
      it%v_obj = v%obj
    end subroutine hepmc_vertex_particle_out_iterator_init
```

Destructor. Necessary because the iterator is allocated on the heap.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      subroutine vertex_particles_out_const_iterator_delete (it_obj) bind(C)
        import

```
    public :: hepmc_vertex_particle_out_iterator_final
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_vertex_particle_out_iterator_final (it)
      type(hepmc_vertex_particle_out_iterator_t), intent(inout) :: it
      call vertex_particles_out_const_iterator_delete (it%obj)
    end subroutine hepmc_vertex_particle_out_iterator_final
```

Increment

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      subroutine vertex_particles_out_const_iterator_advance (it_obj) bind(C)
        import
        type(c_ptr), value :: it_obj
      end subroutine vertex_particles_out_const_iterator_advance
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_particle_out_iterator_advance
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_vertex_particle_out_iterator_advance (it)
      type(hepmc_vertex_particle_out_iterator_t), intent(inout) :: it
      call vertex_particles_out_const_iterator_advance (it%obj)
    end subroutine hepmc_vertex_particle_out_iterator_advance
```

Reset to the beginning

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      subroutine vertex_particles_out_const_iterator_reset &
          (it_obj, v_obj) bind(C)
        import
        type(c_ptr), value :: it_obj, v_obj
      end subroutine vertex_particles_out_const_iterator_reset
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_particle_out_iterator_reset
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_vertex_particle_out_iterator_reset (it)
      type(hepmc_vertex_particle_out_iterator_t), intent(inout) :: it
      call vertex_particles_out_const_iterator_reset (it%obj, it%v_obj)
    end subroutine hepmc_vertex_particle_out_iterator_reset
```

Test: return true as long as we are not past the end.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      function vertex_particles_out_const_iterator_is_valid &
          (it_obj, v_obj) result (flag) bind(C)
        import
        logical(c_bool) :: flag
        type(c_ptr), value :: it_obj, v_obj
      end function vertex_particles_out_const_iterator_is_valid
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_particle_out_iterator_is_valid
```

⟨*HepMC interface: procedures*⟩+≡
```
    function hepmc_vertex_particle_out_iterator_is_valid (it) result (flag)
      logical :: flag
      type(hepmc_vertex_particle_out_iterator_t), intent(in) :: it
      flag = vertex_particles_out_const_iterator_is_valid (it%obj, it%v_obj)
    end function hepmc_vertex_particle_out_iterator_is_valid
```

Return the particle pointed to by the iterator. (The particle object should not be finalized, since it contains merely a pointer to the particle which is owned by the vertex.)

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      type(c_ptr) function &
          vertex_particles_out_const_iterator_get (it_obj) bind(C)
        import
        type(c_ptr), value :: it_obj
      end function vertex_particles_out_const_iterator_get
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_vertex_particle_out_iterator_get
```

⟨*HepMC interface: procedures*⟩+≡
```
    function hepmc_vertex_particle_out_iterator_get (it) result (prt)
      type(hepmc_particle_t) :: prt
      type(hepmc_vertex_particle_out_iterator_t), intent(in) :: it
      prt%obj = vertex_particles_out_const_iterator_get (it%obj)
    end function hepmc_vertex_particle_out_iterator_get
```

18.11.8 GenEvent

The main object of HepMC is a GenEvent. The object is filled by GenVertex objects, which in turn contain GenParticle objects.

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_t
```

⟨*HepMC interface: types*⟩+≡
```
    type :: hepmc_event_t
       private
       type(c_ptr) :: obj
    end type hepmc_event_t
```

Constructor. Arguments are process ID (integer) and event ID (integer).
   The Fortran version has initializer form.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       type(c_ptr) function new_gen_event (proc_id, event_id) bind(C)
         import
         integer(c_int), value :: proc_id, event_id
       end function new_gen_event
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_init
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_event_init (evt, proc_id, event_id)
      type(hepmc_event_t), intent(out) :: evt
      integer, intent(in), optional :: proc_id, event_id
      integer(c_int) :: pid, eid
      pid = 0;  if (present (proc_id))  pid = proc_id
      eid = 0;  if (present (event_id)) eid = event_id
      evt%obj = new_gen_event (pid, eid)
    end subroutine hepmc_event_init
```

Destructor.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       subroutine gen_event_delete (evt_obj) bind(C)
         import
         type(c_ptr), value :: evt_obj
       end subroutine gen_event_delete
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_final
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_event_final (evt)
      type(hepmc_event_t), intent(inout) :: evt
      call gen_event_delete (evt%obj)
    end subroutine hepmc_event_final
```

Screen output. Printing to file is possible in principle (using a C++ output channel), by allowing an argument. Printing to an open Fortran unit is obviously not possible.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       subroutine gen_event_print (evt_obj) bind(C)
         import
         type(c_ptr), value :: evt_obj
       end subroutine gen_event_print
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_print
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_event_print (evt)
      type(hepmc_event_t), intent(in) :: evt
      call gen_event_print (evt%obj)
    end subroutine hepmc_event_print
```

Get the event number.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       integer(c_int) function gen_event_event_number (evt_obj) bind(C)
         use iso_c_binding !NODEP!
         type(c_ptr), value :: evt_obj
       end function gen_event_event_number
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_get_event_index
```

⟨*HepMC interface: procedures*⟩+≡
```
    function hepmc_event_get_event_index (evt) result (i_proc)
      integer :: i_proc
      type(hepmc_event_t), intent(in) :: evt
      i_proc = gen_event_event_number (evt%obj)
    end function hepmc_event_get_event_index
```

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       integer(c_int) function gen_event_get_n_particles &
            (evt_obj) bind(C)
         import
         type(c_ptr), value :: evt_obj
       end function gen_event_get_n_particles
    end interface
      interface

```

⟨*HepMC interface: procedures*⟩+≡
```
    function hepmc_event_get_alpha_qed (evt) result (alpha)
      real(default) :: alpha
      type(hepmc_event_t), intent(in) :: evt
      alpha = gen_event_alpha_qed (evt%obj)
    end function hepmc_event_get_alpha_qed
```

Clear a weight value to the end of the weight container.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       subroutine gen_event_clear_weights (evt_obj) bind(C)
         use iso_c_binding !NODEP!
         type(c_ptr), value :: evt_obj
       end subroutine gen_event_clear_weights
    end interface
```

The HepMC weights are measured in pb.

⟨*HepMC interface: parameters*⟩≡
```
    real(default), parameter :: pb_per_fb = 1.e-3_default
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_clear_weights
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_event_clear_weights (evt)
      type(hepmc_event_t), intent(in) :: evt
      call gen_event_clear_weights (evt%obj)
    end subroutine hepmc_event_clear_weights
```

Add a weight value to the end of the weight container.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       subroutine gen_event_add_weight (evt_obj, w) bind(C)
         use iso_c_binding !NODEP!
         type(c_ptr), value :: evt_obj
         real(c_double), value :: w
       end subroutine gen_event_add_weight
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_add_weight
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_event_add_weight (evt, weight)
      type(hepmc_event_t), intent(in) :: evt
      real(default), intent(in) :: weight
      real(c_double) :: w
      w = weight * pb_per_fb
      call gen_event_add_weight (evt%obj, w)
    end subroutine hepmc_event_add_weight
```

Get the size of the weight container (the number of valid elements).
⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       integer(c_int) function gen_event_weights_size (evt_obj) bind(C)
         use iso_c_binding !NODEP!
         type(c_ptr), value :: evt_obj
       end function gen_event_weights_size
    end interface
```
⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_get_weights_size
```
⟨*HepMC interface: procedures*⟩+≡
```
    function hepmc_event_get_weights_size (evt) result (n)
      integer :: n
      type(hepmc_event_t), intent(in) :: evt
      n = gen_event_weights_size (evt%obj)
    end function hepmc_event_get_weights_size
```

Get the value of the weight with index i. (Count from 1, while C counts from zero.)
⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       real(c_double) function gen_event_weight (evt_obj, i) bind(C)
         use iso_c_binding !NODEP!
         type(c_ptr), value :: evt_obj
         integer(c_int), value :: i
       end function gen_event_weight
    end interface
```
⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_get_weight
```
⟨*HepMC interface: procedures*⟩+≡
```
    function hepmc_event_get_weight (evt, index) result (weight)
      real(default) :: weight
      type(hepmc_event_t), intent(in) :: evt
      integer, intent(in) :: index
      integer(c_int) :: i
      i = index - 1
      weight = gen_event_weight (evt%obj, i) / pb_per_fb
    end function hepmc_event_get_weight
```

Add a vertex to the event container.
⟨*HepMC interface: interfaces*⟩+≡

```
      interface
         subroutine gen_event_add_vertex (evt_obj, v_obj) bind(C)
           import
           type(c_ptr), value :: evt_obj
           type(c_ptr), value :: v_obj
         end subroutine gen_event_add_vertex
      end interface
```

⟨*HepMC interface: public*⟩+≡
```
      public :: hepmc_event_add_vertex
```

⟨*HepMC interface: procedures*⟩+≡
```
      subroutine hepmc_event_add_vertex (evt, v)
        type(hepmc_event_t), intent(inout) :: evt
        type(hepmc_vertex_t), intent(in) :: v
        call gen_event_add_vertex (evt%obj, v%obj)
      end subroutine hepmc_event_add_vertex
```

Mark a particular vertex as the signal process (hard interaction).

⟨*HepMC interface: interfaces*⟩+≡
```
      interface
         subroutine gen_event_set_signal_process_vertex (evt_obj, v_obj) bind(C)
           import
           type(c_ptr), value :: evt_obj
           type(c_ptr), value :: v_obj
         end subroutine gen_event_set_signal_process_vertex
      end interface
```

⟨*HepMC interface: public*⟩+≡
```
      public :: hepmc_event_set_signal_process_vertex
```

⟨*HepMC interface: procedures*⟩+≡
```
      subroutine hepmc_event_set_signal_process_vertex (evt, v)
        type(hepmc_event_t), intent(inout) :: evt
        type(hepmc_vertex_t), intent(in) :: v
        call gen_event_set_signal_process_vertex (evt%obj, v%obj)
      end subroutine hepmc_event_set_signal_process_vertex
```

Return the the signal process (hard interaction).

⟨*HepMC interface: interfaces*⟩+≡
```
      interface
         function gen_event_get_signal_process_vertex (evt_obj) &
             result (v_obj) bind(C)
           import
           type(c_ptr), value :: evt_obj
           type(c_ptr) :: v_obj
         end function gen_event_get_signal_process_vertex
      end interface
```

⟨*HepMC interface: public*⟩+≡
```
      public :: hepmc_event_get_signal_process_vertex
```

⟨*HepMC interface: procedures*⟩+≡
```
      function hepmc_event_get_signal_process_vertex (evt) result (v)
        type(hepmc_event_t), intent(in) :: evt
        type(hepmc_vertex_t) :: v
```

```
      v%obj = gen_event_get_signal_process_vertex (evt%obj)
    end function hepmc_event_get_signal_process_vertex
```

Set the beam particles explicitly.

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_set_beam_particles
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_event_set_beam_particles (evt, prt1, prt2)
      type(hepmc_event_t), intent(inout) :: evt
      type(hepmc_particle_t), intent(in) :: prt1, prt2
      logical(c_bool) :: flag
      flag = gen_event_set_beam_particles (evt%obj, prt1%obj, prt2%obj)
    end subroutine hepmc_event_set_beam_particles
```

The C function returns a boolean which we do not use.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      logical(c_bool) function gen_event_set_beam_particles &
           (evt_obj, prt1_obj, prt2_obj) bind(C)
        import
        type(c_ptr), value :: evt_obj, prt1_obj, prt2_obj
      end function gen_event_set_beam_particles
    end interface
```

Set the cross section and error explicitly. Note that HepMC uses pb, while
WHIZARD uses fb.

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_set_cross_section
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_event_set_cross_section (evt, xsec, xsec_err)
      type(hepmc_event_t), intent(inout) :: evt
      real(default), intent(in) :: xsec, xsec_err
      call gen_event_set_cross_section &
           (evt%obj, &
           real (xsec * 1e-3_default, c_double), &
           real (xsec_err * 1e-3_default, c_double))
    end subroutine hepmc_event_set_cross_section
```

The C function returns a boolean which we do not use.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      subroutine gen_event_set_cross_section (evt_obj, xs, xs_err) bind(C)
        import
        type(c_ptr), value :: evt_obj
        real(c_double), value :: xs, xs_err
      end subroutine gen_event_set_cross_section
    end interface
```

18.11.9 Event-particle iterator

This iterator iterates over all particles in an event. We store a pointer to the event in addition to the iterator. This allows for simple end checking.

 The iterator is actually a constant iterator; it can only read.

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_particle_iterator_t
```

⟨*HepMC interface: types*⟩+≡
```
    type :: hepmc_event_particle_iterator_t
      private
      type(c_ptr) :: obj
      type(c_ptr) :: evt_obj
    end type hepmc_event_particle_iterator_t
```

Constructor. The iterator is initialized at the first particle in the event.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      type(c_ptr) function new_event_particle_const_iterator (evt_obj) bind(C)
        import
        type(c_ptr), value :: evt_obj
      end function new_event_particle_const_iterator
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_particle_iterator_init
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_event_particle_iterator_init (it, evt)
      type(hepmc_event_particle_iterator_t), intent(out) :: it
      type(hepmc_event_t), intent(in) :: evt
      it%obj = new_event_particle_const_iterator (evt%obj)
      it%evt_obj = evt%obj
    end subroutine hepmc_event_particle_iterator_init
```

Destructor. Necessary because the iterator is allocated on the heap.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
      subroutine event_particle_const_iterator_delete (it_obj) bind(C)
        import
        type(c_ptr), value :: it_obj
      end subroutine event_particle_const_iterator_delete
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_particle_iterator_final
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_event_particle_iterator_final (it)
      type(hepmc_event_particle_iterator_t), intent(inout) :: it
      call event_particle_const_iterator_delete (it%obj)
    end subroutine hepmc_event_particle_iterator_final
```

Increment

⟨*HepMC interface: interfaces*⟩+≡

```
interface
   subroutine event_particle_const_iterator_advance (it_obj) bind(C)
     import
     type(c_ptr), value :: it_obj
   end subroutine event_particle_const_iterator_advance
end interface
```

⟨*HepMC interface: public*⟩+≡

```
public :: hepmc_event_particle_iterator_advance
```

⟨*HepMC interface: procedures*⟩+≡

```
subroutine hepmc_event_particle_iterator_advance (it)
  type(hepmc_event_particle_iterator_t), intent(inout) :: it
  call event_particle_const_iterator_advance (it%obj)
end subroutine hepmc_event_particle_iterator_advance
```

Reset to the beginning

⟨*HepMC interface: interfaces*⟩+≡

```
interface
   subroutine event_particle_const_iterator_reset (it_obj, evt_obj) bind(C)
     import
     type(c_ptr), value :: it_obj, evt_obj
   end subroutine event_particle_const_iterator_reset
end interface
```

⟨*HepMC interface: public*⟩+≡

```
public :: hepmc_event_particle_iterator_reset
```

⟨*HepMC interface: procedures*⟩+≡

```
subroutine hepmc_event_particle_iterator_reset (it)
  type(hepmc_event_particle_iterator_t), intent(inout) :: it
  call event_particle_const_iterator_reset (it%obj, it%evt_obj)
end subroutine hepmc_event_particle_iterator_reset
```

Test: return true as long as we are not past the end.

⟨*HepMC interface: interfaces*⟩+≡

```
interface
   function event_particle_const_iterator_is_valid &
        (it_obj, evt_obj) result (flag) bind(C)
     import
     logical(c_bool) :: flag
     type(c_ptr), value :: it_obj, evt_obj
   end function event_particle_const_iterator_is_valid
end interface
```

⟨*HepMC interface: public*⟩+≡

```
public :: hepmc_event_particle_iterator_is_valid
```

⟨*HepMC interface: procedures*⟩+≡

```
function hepmc_event_particle_iterator_is_valid (it) result (flag)
  logical :: flag
  type(hepmc_event_particle_iterator_t), intent(in) :: it
  flag = event_particle_const_iterator_is_valid (it%obj, it%evt_obj)
end function hepmc_event_particle_iterator_is_valid
```

Return the particle pointed to by the iterator. (The particle object should not be finalized, since it contains merely a pointer to the particle which is owned by the vertex.)

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       type(c_ptr) function event_particle_const_iterator_get (it_obj) bind(C)
         import
         type(c_ptr), value :: it_obj
       end function event_particle_const_iterator_get
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_particle_iterator_get
```

⟨*HepMC interface: procedures*⟩+≡
```
    function hepmc_event_particle_iterator_get (it) result (prt)
      type(hepmc_particle_t) :: prt
      type(hepmc_event_particle_iterator_t), intent(in) :: it
      prt%obj = event_particle_const_iterator_get (it%obj)
    end function hepmc_event_particle_iterator_get
```

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       type(c_ptr) function gen_event_get_nth_particle (evt_obj, n) bind(C)
         import
         type(c_ptr), value :: evt_obj
         integer(c_int), value :: n
       end function gen_event_get_nth_particle
    end interface
      interface
       integer(c_int) function gen_event_get_nth_beam (evt_obj, n) bind(C)
         import
         type(c_ptr), value :: evt_obj
         integer(c_int), value :: n
       end function gen_event_get_nth_beam
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_event_get_nth_particle
    public :: hepmc_event_get_nth_beam
```

⟨*HepMC interface: procedures*⟩+≡
```
    function hepmc_event_get_nth_particle (evt, n) result (prt)
      type(hepmc_particle_t) :: prt
      type(hepmc_event_t), intent(in) :: evt

18.11.10   I/O streams

There is a specific I/O stream type for handling the output of GenEvent objects (i.e., Monte Carlo event samples) to file. Opening the file is done by the constructor, closing by the destructor.

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_iostream_t
```

⟨*HepMC interface: types*⟩+≡
```
    type :: hepmc_iostream_t
       private
       type(c_ptr) :: obj
    end type hepmc_iostream_t
```

Constructor for an output stream associated to a file.

⟨*HepMC interface: interfaces*⟩+≡
```
    interface
       type(c_ptr) function new_io_gen_event_out (filename) bind(C)
         import
         character(c_char), dimension(*), intent(in) :: filename
       end function new_io_gen_event_out
    end interface
    interface
       type(c_ptr) function new_io_gen_event_out_hepmc2 (filename) bind(C)
         import
         character(c_char), dimension(*), intent(in) :: filename
       end function new_io_gen_event_out_hepmc2
    end interface
```

⟨*HepMC interface: public*⟩+≡
```
    public :: hepmc_iostream_open_out
```

⟨*HepMC interface: procedures*⟩+≡
```
    subroutine hepmc_iostream_open_out (iostream, filename, hepmc2)
      type(hepmc_iostream_t), intent(out) :: iostream
      type(string_t), intent(in) :: filename
      logical, intent(in), optional :: hepmc2
      logical :: hepmc2_mode
      hepmc2_mode = .false.
      if (present (hepmc2))  hepmc2_mode = hepmc2
      if (hepmc2_mode) then
         iostream%obj = &
```

2014

```
                new_io_gen_event_out_hepmc2 (char (filename) // c_null_char)
        else
           iostream%obj = &
                new_io_gen_event_out (char (filename) // c_null_char)
        end if
     end subroutine hepmc_iostream_open_out
```

Constructor for an input stream associated to a file.

⟨*HepMC interface: interfaces*⟩+≡
```
     interface
        type(c_ptr) function new_io_gen_event_in (filename) bind(C)
          import
          character(c_char), dimension(*), intent(in) :: filename
        end function new_io_gen_event_in
     end interface
     interface
        type(c_ptr) function new_io_gen_event_in_hepmc2 (filename) bind(C)
          import
          character(c_char), dimension(*), intent(in) :: filename
        end function new_io_gen_event_in_hepmc2
     end interface
```

⟨*HepMC interface: public*⟩+≡
```
     public :: hepmc_iostream_open_in
```

⟨*HepMC interface: procedures*⟩+≡
```
     subroutine hepmc_iostream_open_in (iostream, filename, hepmc2)
       type(hepmc_iostream_t), intent(out) :: iostream
       type(string_t), intent(in) :: filename

    end subroutine hepmc_interface_test

This test example is an abridged version from the build-from-scratch example
in the HepMC distribution. We create two vertices for $p \to q$ PDF splitting,
then a vertex for a $qq \to W^- g$ hard-interaction process, and finally a vertex for
$W^- \to qq$ decay. The setup is for LHC kinematics.

Extending the original example, we set color flow for the incoming quarks
and polarization for the outgoing photon. For the latter, we have to define a
particle-data object for the photon, so a flavor object can be correctly initialized.

18.12   LCIO events

This section provides the interface to the LCIO C++ library for handling Monte-Carlo events.

Each C++ class of LCIO that we use is mirrored by a Fortran type, which contains as its only component the C pointer to the C++ object.

Each C++ method of LCIO that we use has a C wrapper function. This function takes a pointer to the host object as its first argument. Further arguments are either C pointers, or in the case of simple types (integer, real), interoperable C/Fortran objects.

The C wrapper functions have explicit interfaces in the Fortran module. They are called by Fortran wrapper procedures. These are treated as methods of the corresponding Fortran type.

    end subroutine lcio_run_header_write
```

18.12.3   LCIO Event and LC Collection

The main object of LCIO is a LCEventImpl. The object is filled by MCParticle objects, which are set as LCCollection.

⟨*LCIO interface: public*⟩+≡
```
    public :: lccollection_t
```

⟨*LCIO interface: types*⟩+≡
```
    type :: lccollection_t
       private
       type(c_ptr) :: obj
    end type lccollection_t
```

Initializer.

⟨*LCIO interface: interfaces*⟩+≡
```
    interface
       type(c_ptr) function new_lccollection () bind(C)
         import
       end function new_lccollection
    end interface
```

⟨*LCIO interface: public*⟩+≡
```
    public :: lcio_event_t
```

⟨*LCIO interface: types*⟩+≡
```
    type :: lcio_event_t
       private
       type(c_ptr) :: obj
       type(lccollection_t) :: lccoll
    end type lcio_event_t
```

Constructor. Arguments are process ID (integer) and event ID (integer).
    The Fortran version has initializer form.

⟨*LCIO interface: interfaces*⟩+≡

```
      interface
         type(c_ptr) function new_lcio_event (proc_id, event_id, run_id) bind(C)
           import
           integer(c_int), value :: proc_id, event_id, run_id
         end function new_lcio_event
      end interface
```

⟨*LCIO interface: public*⟩+≡
```
      public :: lcio_event_init
```

⟨*LCIO interface: procedures*⟩+≡
```
      subroutine lcio_event_init (evt, proc_id, event_id, run_id)
        type(lcio_event_t), intent(out) :: evt
        integer, intent(in), optional :: proc_id, event_id, run_id
        integer(c_int) :: pid, eid, rid
        pid = 0;  if (present (proc_id))  pid = proc_id
        eid = 0;  if (present (event_id)) eid = event_id
        rid = 0;  if (present (run_id))   rid = run_id
        evt%obj = new_lcio_event (pid, eid, rid)
        evt%lccoll%obj = new_lccollection ()
      end subroutine lcio_event_init
```

Destructor.
⟨*LCIO interface: interfaces*⟩+≡
```
      interface
         subroutine lcio_event_delete (evt_obj) bind(C)
           import
           type(c_ptr), value :: evt_obj
         end subroutine lcio_event_delete
      end interface
```

Show event on screen.
⟨*LCIO interface: interfaces*⟩+≡
```
      interface
         subroutine dump_lcio_event (evt_obj) bind(C)
           import
           type(c_ptr), value :: evt_obj
         end subroutine dump_lcio_event
      end interface
```

⟨*LCIO interface: public*⟩+≡
```
      public :: show_lcio_event
```

⟨*LCIO interface: procedures*⟩+≡

      p = vector4_moving ( E, vector3_moving ([ px, py, pz ]))
    end function lcio_particle_get_momentum
```

Return the invariant mass squared of the particle object. LCIO stores the signed
invariant mass (no squaring).

⟨*LCIO interface: interfaces*⟩+≡
```
    interface
      function lcio_mass (prt_obj) result (mass) bind(C)
        import
        real(c_double) :: mass
        type(c_ptr), value :: prt_obj
      end function lcio_mass
    end interface
```
⟨*LCIO interface: public*⟩+≡
```
    public :: lcio_particle_get_mass_squared
```
⟨*LCIO interface: procedures*⟩+≡
```
    function lcio_particle_get_mass_squared (prt) result (m2)
      real(default) :: m2
      type(lcio_particle_t), intent(in) :: prt
      real(default) :: m
      m = lcio_mass (prt%obj)
      m2 = sign (m**2, m)
    end function lcio_particle_get_mass_squared
```

Return vertex and production time of a LCIO particle.

⟨*LCIO interface: interfaces*⟩+≡
```
    interface
      real(c_double) function lcio_vtx_x (prt) bind(C)
        import
```

```
      type(c_ptr), value :: prt
    end function lcio_vtx_x
end interface
interface
   real(c_double) function lcio_vtx_y (prt) bind(C)
     import
     type(c_ptr), value :: prt
   end function lcio_vtx_y
end interface
interface
   real(c_double) function lcio_vtx_z (prt) bind(C)
     import
     type(c_ptr), value :: prt
   end function lcio_vtx_z
end interface
interface
   real(c_float) function lcio_prt_time (prt) bind(C)
     import
     type(c_ptr), value :: prt
   end function lcio_prt_time
end interface
```

(Decay) times in LCIO are in nanoseconds, so they need to get converted to mm for the internal format.

⟨*LCIO interface: public*⟩+≡
```
public :: lcio_particle_get_vertex
public :: lcio_particle_get_time
```

⟨*LCIO interface: procedures*⟩+≡
```
function lcio_particle_get_vertex (prt) result (vtx)
  type(vector3_t) :: vtx
  type(lcio_particle_t), intent(in) :: prt
  real(default) :: vx, vy, vz
  vx = lcio_vtx_x (prt%obj)
  vy = lcio_vtx_y (prt%obj)
  vz = lcio_vtx_z (prt%obj)
  vtx = vector3_moving ([vx, vy, vz])
end function lcio_particle_get_vertex

function lcio_particle_get_time (prt) result (time)
  real(default) :: time
  type(lcio_particle_t), intent(in) :: prt
  time = lcio_prt_time (prt%obj)
  time = time / ns_per_mm
end function lcio_particle_get_time
```

18.12.5 Polarization

For polarization there is a three-component float entry foreseen in the LCIO format. Completely generic density matrices can in principle be attached to events as float vectors added to `LCCollection` of the `LCEvent`. This is not yet implemented currently. Here, we restrict ourselves to the same implementation as in HepMC format: we use two entries as the polarization angles, while the first

2034

entry gives the degree of polarization (something not specified in the HepMC format). *For massive vector bosons, we arbitrarily choose the convention that the longitudinal (zero) helicity state is mapped to the theta angle $\pi/2$. This works under the condition that helicity is projected onto one of the basis states.*

⟨*LCIO interface: interfaces*⟩+≡
```
interface
   subroutine lcio_particle_set_spin (prt_obj, s1, s2, s3) bind(C)
     import
     type(c_ptr), value :: prt_obj
     real(c_double), value :: s1, s2, s3
   end subroutine lcio_particle_set_spin
end interface
```

⟨*LCIO interface: public*⟩+≡
```
public :: lcio_polarization_init
```

⟨*LCIO interface: interfaces*⟩+≡
```
interface lcio_polarization_init
   module procedure lcio_polarization_init_pol
   module procedure lcio_polarization_init_hel
   module procedure lcio_polarization_init_int
end interface
```

⟨*LCIO interface: procedures*⟩+≡
```
subroutine lcio_polarization_init_pol (prt, pol)
  type(lcio_particle_t), intent(inout) :: prt
  type(polarization_t), intent(in) :: pol
  real(default) :: r, theta, phi
  if (pol%is_polarized ()) then
     call pol%to_angles (r, theta, phi)
     call lcio_particle_set_spin (prt%obj, &
           real(r, c_double), real (theta, c_double), real (phi, c_double))
  end if
end subroutine lcio_polarization_init_pol

subroutine lcio_polarization_init_hel (prt, hel)
  type(lcio_particle_t), intent(inout) :: prt
  type(helicity_t), intent(in) :: hel
  integer, dimension(2) :: h
  if (hel%is_defined ()) then
     h = hel%to_pair ()
     select case (h(1))
     case (1:)
        call lcio_particle_set_spin (prt%obj, 1._c_double, &
              0._c_double, 0._c_double)
     case (:-1)
        call lcio_particle_set_spin (prt%obj, 1._c_double, &

18.12.6 LCIO Writer type

There is a specific LCIO Writer type for handling the output of LCEventImpl
objects (i.e., Monte Carlo event samples) to file. Opening the file is done by the
constructor, closing by the destructor.

⟨*LCIO interface: public*⟩+≡
```
    public :: lcio_writer_t
```

⟨*LCIO interface: types*⟩+≡
```
    type :: lcio_writer_t
      private
      type(c_ptr) :: obj
    end type lcio_writer_t
```

Constructor for an output associated to a file.

⟨*LCIO interface: interfaces*⟩+≡
```
    interface
      type(c_ptr) function open_lcio_writer_new (filename, complevel) bind(C)
        import
        character(c_char), dimension(*), intent(in) :: filename
        integer(c_int), intent(in) :: complevel
      end function open_lcio_writer_new
    end interface
```

⟨*LCIO interface: public*⟩+≡
```
    public :: lcio_writer_open_out
```

⟨*LCIO interface: procedures*⟩+≡
```
    subroutine lcio_writer_open_out (lcio_writer, filename)
      type(lcio_writer_t), intent(out) :: lcio_writer
      type(string_t), intent(in) :: filename
      lcio_writer%obj = open_lcio_writer_new (char (filename) // &
           c_null_char, 9_c_int)
    end subroutine lcio_writer_open_out
```

Destructor:

⟨*LCIO interface: interfaces*⟩+≡
```
    interface
       subroutine lcio_writer_delete (io_obj) bind(C)
         import
         type(c_ptr), value :: io_obj
       end subroutine lcio_writer_delete
    end interface
```

⟨*LCIO interface: public*⟩+≡
```
    public :: lcio_writer_close
```

⟨*LCIO interface: procedures*⟩+≡
```
    subroutine lcio_writer_close (lciowriter)
      type(lcio_writer_t), intent(inout) :: lciowriter
      call lcio_writer_delete (lciowriter%obj)
    end subroutine lcio_writer_close
```

Write a single event to the LCIO writer.

⟨*LCIO interface: interfaces*⟩+≡
```
    interface
       subroutine lcio_write_event (io_obj, evt_obj) bind(C)
         import
         type(c_ptr), value :: io_obj, evt_obj
       end subroutine lcio_write_event
    end interface
```

⟨*LCIO interface: public*⟩+≡
```
    public :: lcio_event_write
```

⟨*LCIO interface: procedures*⟩+≡
```
    subroutine lcio_event_write (wrt, evt)
      type(lcio_writer_t), intent(inout) :: wrt
      type(lcio_event_t), intent(in) :: evt
      call lcio_write_event (wrt%obj, evt%obj)
    end subroutine lcio_event_write
```

18.12.7   LCIO Reader type

There is a specific LCIO Reader type for handling the input of LCEventImpl objects (i.e., Monte Carlo event samples) from file. Opening the file is done by the constructor, closing by the destructor.

⟨*LCIO interface: public*⟩+≡
```
    public :: lcio_reader_t
```

⟨*LCIO interface: types*⟩+≡
```
type :: lcio_reader_t
   private
   type(c_ptr) :: obj
end type lcio_reader_t
```

Constructor for an output associated to a file.
⟨*LCIO interface: interfaces*⟩+≡
```
interface
   type(c_ptr) function open_lcio_reader (filename) bind(C)
     import
     character(c_char), dimension(*), intent(in) :: filename
   end function open_lcio_reader
end interface
```

⟨*LCIO interface: public*⟩+≡
```
public :: lcio_open_file
```

⟨*LCIO interface: procedures*⟩+≡
```
subroutine lcio_open_file (lcio_reader, filename)
  type(lcio_reader_t), intent(out) :: lcio_reader
  type(string_t), intent(in) :: filename
  lcio_reader%obj = open_lcio_reader (char (filename) // c_null_char)
end subroutine lcio_open_file
```

Destructor:
⟨*LCIO interface: interfaces*⟩+≡
```
interface
   subroutine lcio_reader_delete (io_obj) bind(C)
     import
     type(c_ptr), value :: io_obj
   end subroutine lcio_reader_delete
end interface
```

⟨*LCIO interface: public*⟩+≡
```
public :: lcio_reader_close
```

⟨*LCIO interface: procedures*⟩+≡
```
subroutine lcio_reader_close (lcioreader)
  type(lcio_reader_t), intent(inout) :: lcioreader
  call lcio_reader_delete (lcioreader%obj)
end subroutine lcio_reader_close
```

Read a single event from the event file. Return true if successful.
⟨*LCIO interface: interfaces*⟩+≡
```
interface
   type(c_ptr) function read_lcio_event (io_obj) bind(C)
     import
     type(c_ptr), value :: io_obj
   end function read_lcio_event
end interface
```

⟨*LCIO interface: public*⟩+≡
```
public :: lcio_read_event
```

⟨*LCIO interface: procedures*⟩+≡
```
    subroutine lcio_read_event (lcrdr, evt, ok)
      type(lcio_reader_t), intent(inout) :: lcrdr
      type(lcio_event_t), intent(out) :: evt
      logical, intent(out) :: ok
      evt%obj = read_lcio_event (lcrdr%obj)
      ok = c_associated (evt%obj)
    end subroutine lcio_read_event
```

Get the event index.

⟨*LCIO interface: interfaces*⟩+≡
```
    interface
      integer(c_int) function lcio_event_get_event_number (evt_obj) bind(C)
        import
        type(c_ptr), value :: evt_obj
      end function lcio_event_get_event_number
    end interface
```

⟨*LCIO interface: public*⟩+≡
```
    public :: lcio_event_get_event_index
```

⟨*LCIO interface: procedures*⟩+≡
```
    function lcio_event_get_event_index (evt) result (i_evt)
      integer :: i_evt
      type(lcio_event_t), intent(in) :: evt
      i_evt = lcio_event_get_event_number (evt%obj)
    end function lcio_event_get_event_index
```

Extract the process ID. This is stored (at the moment abusively) in the RUN ID as well as in an additional event parameter.

⟨*LCIO interface: interfaces*⟩+≡
```
    interface
      integer(c_int) function lcio_event_signal_process_id (evt_obj) bind(C)
        import
        type(c_ptr), value :: evt_obj
      end function lcio_event_signal_process_id
    end interface
```

⟨*LCIO interface: public*⟩+≡
```
    public :: lcio_event_get_process_id
```

18.13   HEP Common and Events

This is a separate module that manages data exchange between the common blocks and event_t objects. We separate this from the previous module in order to avoid a circular module dependency. It also contains the functions necessary for communication between hepmc_event_t and event_t or lcio_event_t and event_t as well as particle_set_t and particle_t objects.

⟨hep_events.f90⟩≡

      else
         call msg_bug ("HEPEUP: event incomplete")
      end if
    end subroutine hepeup_from_event
```

Reverse.

Note: The current implementation sets the particle set of the hard process and is therefore not useful if the event on file is dressed. This should be reconsidered.

Note: setting of scale or alpha is not yet supported by the event_t object. Ticket #628.

⟨*HEP events: public*⟩+≡
```
    public :: hepeup_to_event
```

⟨*HEP events: procedures*⟩+≡

```
subroutine hepeup_to_event &

 end subroutine hepevt_from_event
```

HepMC format

The master output function fills a HepMC GenEvent object that is already
initialized, but has no vertices in it.

We first set up the vertex lists and enter the vertices into the HepMC event.
Then, we assign first all incoming particles and then all outgoing particles to
their associated vertices. Particles which have neither parent nor children entries
(this should not happen) are dropped.

Finally, we insert the beam particles. If there are none, use the incoming
particles instead. Transform a particle into a `hepmc_particle` object, including
color and polarization. The HepMC status is equivalent to the HEPEVT status,
in particular: 0 = null entry, 1 = physical particle, 2 = decayed/fragmented SM
hadron, tau or muon, 3 = other unphysical particle entry, 4 = incoming particles,
11 = intermediate resonance such as squarks. The use of 11 for intermediate res-
onances is as done by HERWIG, see http://herwig.hepforge.org/trac/wiki/FaQs.

⟨*HEP events: procedures*⟩+≡
```
    subroutine particle_to_hepmc (prt, hprt)
      type(particle_t), intent(in) :: prt
      type(hepmc_particle_t), intent(out) :: hprt
      integer :: hepmc_status
```

```
      select case (prt%get_status ())
      case (PRT_UNDEFINED)
         hepmc_status = 0
      case (PRT_OUTGOING)
         hepmc_status = 1
      case (PRT_BEAM)
         hepmc_status = 4
      case (PRT_RESONANT)
         if (abs(prt%get_pdg()) == 13 .or. &
             abs(prt%get_pdg()) == 15) then
            hepmc_status = 2
         else
            hepmc_status = 11
         end if
      case default
         hepmc_status = 3
      end select
      call hepmc_particle_init (hprt, &
           prt%get_momentum (), prt%get_pdg (), &
           hepmc_status)
      if (HEPMC2_AVAILABLE) then
         call hepmc_particle_set_color (hprt, prt%get_color ())
         select case (prt%get_polarization_status ())
         case (PRT_DEFINITE_HELICITY)
            call hepmc_particle_set_polarization (hprt, &
                 prt%get_helicity ())
         case (PRT_GENERIC_POLARIZATION)
            call hepmc_particle_set_polarization (hprt, &
                 prt%get_polarization ())
         end select
      end if
    end subroutine particle_to_hepmc
```

For HepMC3, a HepMC particle needs first to be attached to a vertex and an event before non-intrinsic particle properties (color flow and helicity) could be set.

Initialize a particle from a HepMC particle object. The model is necessary
for making a fully qualified flavor component. We have the additional flag
`polarized` which tells whether the polarization information should be inter-
preted or ignored, and the lookup array of barcodes. Note that the lookup
array is searched linearly, a possible bottleneck for large particle arrays. If
necessary, the barcode array could be replaced by a hash table.

If a particle set is initialized from a HepMC event record, we have to specify the treatment of polarization (unpolarized or density matrix) which is common to all particles. Correlated polarization information is not available.

There is some complication in reconstructing incoming particles and beam remnants. First of all, they all will be tagged as virtual. We then define an incoming particle as

Fill a WHIZARD event from a HepMC event record. In HepMC the weights
are in a weight container. If the size of this container is larger than one, it is
ambiguous to assign the event a specific weight. For now we only allow to read
in unweighted events.

LCIO event format

The master output function fills a LCIO event object that is already initialized, but has no particles in it.

In contrast to HepMC in LCIO there are no vertices (except for tracker and other detector specifications). So we assign first all incoming particles and then all outgoing particles to LCIO particle types. Particles which have neither parent nor children entries (this should not happen) are dropped. Finally, we insert the beam particles. If there are none, use the incoming particles instead.

Transform a particle into a `lcio_particle` object, including color and polarization. The LCIO status is equivalent to the HepMC status, in particular: 0 = null entry, 1 = physical particle, 2 = decayed/fragmented SM hadron, tau or muon, 3 = other unphysical particle entry, 4 = incoming particles, 11 = intermediate resonance such as squarks. The use of 11 for intermediate resonances is as done by HERWIG, see http://herwig.hepforge.org/trac/wiki/FaQs.

A beam-remnant particle (e.g., ISR photon) that has no children is tagged as outgoing, otherwise unphysical.

Initialize the tag objects. Some tags depend on the LHEF version. In particular,
the tags that in LHEF 2.0 identify individual weights by name in each event
block, in LHEF 3.0 are replaced by info tags in the init block and a single
weights tag in the event block. The name attributes of those tags are specific
for WHIZARD.

```

Input an event. Upon input of **i_prc**, we can just read in the whole HEPEUP common block. These data are known to come first. The **i_prc** value can be deduced from the IDPRUP value by a table lookup.

Reading the common block bypasses the **cstream** which accesses the input unit. This is consistent with the LHEF specification. After the common-block data have been swallowed, we can resume reading from stream.

We don't catch actual I/O errors. However, we return a negative value in **iostat** if we reached the terminating **</LesHouchesEvents>** tag.

Since we have already read the event information from file, this input routine can transfer the common-block contents to the event record. Also, we read any further information in the event record.

Since LHEF doesn't give this information, we must assume that the MCI group, term, and channel can all be safely set to 1. This works if there is only one MCI group and term. The channel doesn't matter for the matrix element.

The event index is incremented, as if the event was generated. The LHEF format does not support event indices.

  end subroutine err_version
end subroutine eio_lhef_read_header
```

18.14.5   Version-Specific Code: 1.0

In version 1.0, the init tag contains just HEPRUP data. While a `cstream` is
connected to the input unit, we bypass it temporarily for the purpose of reading
the HEPRUP contents. This is consistent with the LHEF standard.

This routine does not read the closing tag of the init block.

⟨*EIO LHEF: eio lhef: TBP*⟩+≡
```
procedure :: read_init_10 => eio_lhef_read_init_10
```

⟨*EIO LHEF: procedures*⟩+≡
```
subroutine eio_lhef_read_init_10 (eio, data)
  class(eio_lhef_t), intent(in) :: eio
  type(event_sample_data_t), intent(out) :: data
  integer :: n_proc, i
  call heprup_read_lhef (eio%unit)
  call heprup_get_run_parameters (n_processes = n_proc)
  call data%init (n_proc)
  data%n_beam = 2
  call heprup_get_run_parameters ( &
      unweighted = data%unweighted, &
      negative_weights = data%negative_weights, &
      beam_pdg = data%pdg_beam, &
      beam_energy = data%energy_beam)
  if (data%unweighted) then
    data%norm_mode = NORM_UNIT
  else
    data%norm_mode = NORM_SIGMA
  end if
  do i = 1, n_proc
    call heprup_get_process_parameters (i, &
          process_id = data%proc_num_id(i), &
```

```
                cross_section = data%cross_section(i), &
                error = data%error(i))
        end do
    end subroutine eio_lhef_read_init_10
```

18.14.6   Version-Specific Code: 2.0

This is the init information for the 2.0 format, after the HEPRUP data. We
have the following tags:

- `generator` Generator name and version.

- `xsecinfo` Cross section and weights data. We have the total cross sec-
  tion and number of events (assuming that the event file is intact), but
  information on minimum and maximum weights is not available before
  the file is complete. We just write the mandatory tags. (Note that the
  default values of the other tags describe a uniform unit weight, but we can
  determine most values only after the sample is complete.)

- `cutsinfo` This optional tag is too specific to represent the possibilities of
  WHIZARD, so we skip it.

- `procinfo` This optional tag is useful for giving details of NLO calculations.
  Skipped.

- `mergetype` Optional, also not applicable.

⟨*EIO LHEF: eio lhef: TBP*⟩+≡
```
    procedure :: write_init_20 => eio_lhef_write_init_20
```

⟨*EIO LHEF: procedures*⟩+≡
```
    subroutine eio_lhef_write_init_20 (eio, data)
      class(eio_lhef_t), intent(in) :: eio
      type(event_sample_data_t), intent(in) :: data
      integer :: u
      u = eio%unit
      call eio%tag_generator%write (u)
      write (u, "(A)", advance="no")  "WHIZARD"
      call eio%tag_generator%close (u);  write (u, *)
      call eio%tag_xsecinfo%write (u);  write (u, *)
    end subroutine eio_lhef_write_init_20
```

When reading the init block, we first call the 1.0 routine that fills HEPRUP.
Then we consider the possible tags. Only the `generator` and `xsecinfo` tags
are of interest. We skip everything else except for the closing tag.

This is additional event-specific information for the 3.0 format, after the HEP-EUP data. We can specify weights, starting from the master weight and adding alternative weights. The weight tags are already allocated, so we just have to transfer the weight values to strings, assemble them and write them to file. All weights are collected in a single tag.

Note: If efficiency turns out to be an issue, we may revert to traditional character buffer writing. However, we need to know the maximum length.

⟨*EIO LHEF: eio lhef: TBP*⟩+≡

```

Read extra event data. If there is a `weights` tag and if there was a `weightinfo`
entry labeled **sqme_prc**, we extract the corresponding entry from the weights
string and store this as the event's squared matrix-element value. Other tags,
including tags written by the above writer, are skipped.

18.15   STDHEP File Formats

Here, we implement the two existing STDHEP file formats, one based on the HEPRUP/HEPEUP common blocks, the other based on the HEPEVT common block. The second one is actually the standard STDHEP format.

⟨eio_stdhep.f90⟩≡
  ⟨*File header*⟩

```
  module eio_stdhep

    use kinds, only: i32, i64
```
  ⟨*Use strings*⟩
```
    use io_units
    use string_utils
    use diagnostics
    use event_base
    use hep_common
    use hep_events
    use eio_data
    use eio_base
```

  ⟨*Standard module head*⟩

  ⟨*EIO stdhep: public*⟩

  ⟨*EIO stdhep: types*⟩

  ⟨*EIO stdhep: variables*⟩

```
  contains
```

  ⟨*EIO stdhep: procedures*⟩

```
  end module eio_stdhep
```

18.15.1   Type

⟨*EIO stdhep: public*⟩≡
```
    public :: eio_stdhep_t
```

⟨*EIO stdhep: types*⟩≡
```
    type, abstract, extends (eio_t) :: eio_stdhep_t
       logical :: writing = .false.
       logical :: reading = .false.
       integer :: unit = 0
       logical :: keep_beams = .false.
       logical :: keep_remnants = .true.
```

```
      logical :: ensure_order = .false.
      logical :: recover_beams = .false.
      logical :: use_alphas_from_file = .false.
      logical :: use_scale_from_file = .false.
      integer, dimension(:), allocatable :: proc_num_id
      integer(i64) :: n_events_expected = 0
   contains
   ⟨EIO stdhep: eio stdhep: TBP⟩
   end type eio_stdhep_t
```

⟨*EIO stdhep: public*⟩+≡
```
    public :: eio_stdhep_hepevt_t
```

⟨*EIO stdhep: types*⟩+≡
```
    type, extends (eio_stdhep_t) :: eio_stdhep_hepevt_t
    end type eio_stdhep_hepevt_t
```

⟨*EIO stdhep: public*⟩+≡
```
    public :: eio_stdhep_hepeup_t
```

⟨*EIO stdhep: types*⟩+≡
```
    type, extends (eio_stdhep_t) :: eio_stdhep_hepeup_t
    end type eio_stdhep_hepeup_t
```

⟨*EIO stdhep: public*⟩+≡
```
    public :: eio_stdhep_hepev4_t
```

⟨*EIO stdhep: types*⟩+≡
```
    type, extends (eio_stdhep_t) :: eio_stdhep_hepev4_t
    end type eio_stdhep_hepev4_t
```

18.15.2   Specific Methods

Set parameters that are specifically used with STDHEP file formats.

⟨*EIO stdhep: eio stdhep: TBP*⟩≡
```
    procedure :: set_parameters => eio_stdhep_set_parameters
```

⟨*EIO stdhep: procedures*⟩≡
```
    subroutine eio_stdhep_set_parameters (eio, &
         keep_beams, keep_remnants, ensure_order, recover_beams, &
         use_alphas_from_file, use_scale_from_file, extension)
      class(eio_stdhep_t), intent(inout) :: eio
      logical, intent(in), optional :: keep_beams
      logical, intent(in), optional :: keep_remnants
      logical, intent(in), optional :: ensure_order
      logical, intent(in), optional :: recover_beams
      logical, intent(in), optional :: use_alphas_from_file
      logical, intent(in), optional :: use_scale_from_file
      type(string_t), intent(in), optional :: extension
      if (present (keep_beams))  eio%keep_beams = keep_beams
      if (present (keep_remnants))  eio%keep_remnants = keep_remnants
      if (present (ensure_order))  eio%ensure_order = ensure_order
```

```
      if (present (recover_beams))  eio%recover_beams = recover_beams
      if (present (use_alphas_from_file)) &
           eio%use_alphas_from_file = use_alphas_from_file

18.16 HepMC Output

The HepMC event record is standardized. It is an ASCII format. We try our best at using it for both input and output.

⟨eio_hepmc.f90⟩≡
  ⟨*File header*⟩

  ```
  module eio_hepmc
  ```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
  ```
    use io_units
    use string_utils
    use diagnostics
    use particles
    use model_data
    use event_base
    use hep_events
    use eio_data
    use eio_base
    use hepmc_interface
  ```

  ⟨*Standard module head*⟩

  ⟨*EIO HepMC: public*⟩

  ⟨*EIO HepMC: types*⟩

  ```
  contains
  ```

  ⟨*EIO HepMC: procedures*⟩

  ```
  end module eio_hepmc
  ```

18.16.1 Type

A type `hepmc_event` is introduced as container to store HepMC event data, particularly for splitting the reading into read out of the process index and the proper event data.

Note: the `keep_beams` flag is not supported. Beams will always be written. Tools like `Rivet` can use the cross section information of a HepMC file for scaling plots. As there is no header in HepMC and this is written for every event, we make it optional with `output_cross_section`.

⟨*EIO HepMC: public*⟩≡
  ```
    public :: eio_hepmc_t
  ```

⟨*EIO HepMC: types*⟩≡
  ```
    type, extends (eio_t) :: eio_hepmc_t
       logical :: writing = .false.
       logical :: reading = .false.
       type(event_sample_data_t) :: data
       ! logical :: keep_beams = .false.
       logical :: recover_beams = .false.
  ```

```
    logical :: use_alphas_from_file = .false.
    logical :: use_scale_from_file = .false.
    logical :: output_cross_section = .false.
    logical :: hepmc2_mode = .false.
    type(hepmc_iostream_t) :: iostream

18.17 LCIO Output

The LCIO event record is standardized for the use with Linear e^+e^- colliders. It is a binary event format. We try our best at using it for both input and output.

18.17.1 Type

A type `lcio_event` is introduced as container to store LCIO event data, particularly for splitting the reading into read out of the process index and the proper event data.

Note: the `keep_beams` flag is not supported.

⟨*EIO LCIO: public*⟩≡
```
    public :: eio_lcio_t
```

⟨*EIO LCIO: types*⟩≡
```
    type, extends (eio_t) :: eio_lcio_t
       logical :: writing = .false.
       logical :: reading = .false.
       type(event_sample_data_t) :: data
       logical :: recover_beams = .false.
       logical :: use_alphas_from_file = .false.
       logical :: use_scale_from_file = .false.
       integer :: n_alt = 0
       type(lcio_writer_t) :: lcio_writer
       type(lcio_reader_t) :: lcio_reader
       type(lcio_run_header_t) :: lcio_run_hdr
       type(lcio_event_t) :: lcio_event
       integer, dimension(:), allocatable :: proc_num_id
     contains
     ⟨EIO LCIO: eio lcio: TBP⟩
    end type eio_lcio_t
```

18.17.2 Specific Methods

Set parameters that are specifically used with LCIO.

⟨*EIO LCIO: eio lcio: TBP*⟩≡
```
    procedure :: set_parameters => eio_lcio_set_parameters
```

⟨*EIO LCIO: procedures*⟩≡
```
    subroutine eio_lcio_set_parameters &

Chapter 19

Phase Space

The abstract representation of a type that parameterizes phase space, with methods for construction and evaluation.

phs_base Abstract phase-space representation.

A simple implementation:

phs_1none This implements a non-functional dummy module for the phase space. A process which uses this module cannot be integrated. The purpose of this module is to provide a placeholder for processes which do not require phase-space evaluation. They may still allow for evaluating matrix elements.

phs_single Parameterize the phase space of a single particle, i.e., the solid angle. This is useful only for very restricted problems, but it avoids the complexity of a generic approach in those trivial cases.

The standard implementation is called *wood* phase space. It consists of several auxiliary modules and the actual implementation module.

mappings Generate invariant masses and decay angles from given random numbers (or the inverse operation). Each mapping pertains to a particular node in a phase-space tree. Different mappings account for uniform distributions, resonances, zero-mass behavior, and so on.

phs_trees Phase space parameterizations for scattering processes are defined recursively as if there was an initial particle decaying. This module sets up a representation in terms of abstract trees, where each node gets a unique binary number. Each tree is stored as an array of branches, where integers indicate the connections. This emulates pointers in a transparent way. Real pointers would also be possible, but seem to be less efficient for this particular case.

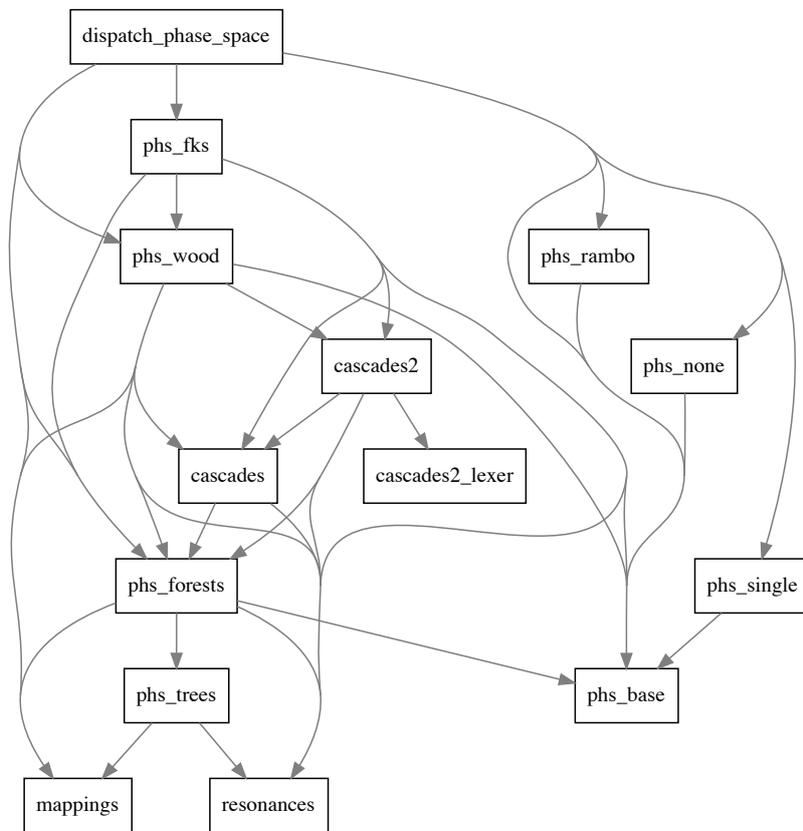
phs_forests The type defined by this module collects the decay trees corresponding to a given process and the applicable mappings. To set this up, a file is read which is either written by the user or by the **cascades** module functions. The module also contains the routines that evaluate phase space, i.e., generate momenta from random numbers and back.


Figure 19.1: Module dependencies in `src/phase_space`.

cascades This module is a pseudo Feynman diagram generator with the particular purpose of finding the phase space parameterizations best suited for a given process. It uses a model file to set up the possible vertices, generates all possible diagrams, identifies resonances and singularities, and simplifies the list by merging equivalent diagrams and dropping irrelevant ones. This process can be controlled at several points by user-defined parameters. Note that it depends on the particular values of particle masses, so it cannot be done before reading the input file.

phs_wood Make the functionality available in form of an implementation of the abstract phase-space type.

phs_fks Phase-space parameterization with modifications for the FKS scheme.

19.1 Abstract phase-space module

In this module we define an abstract base type (and a trivial test implementation) for multi-channel phase-space parameterizations.

  ⟨*PHS base: procedures*⟩

  end module phs_base

19.1.1 Phase-space channels

The kinematics configuration may generate multiple parameterizations of phase space. Some of those have specific properties, such as a resonance in the s channel.

Channel properties

This is the abstract type for the channel properties. We need them as a data transfer container, so everything is public and transparent.

⟨*PHS base: public*⟩≡
    public :: channel_prop_t

⟨*PHS base: types*⟩≡
    type, abstract :: channel_prop_t

2155

```
 contains
   procedure (channel_prop_to_string), deferred :: to_string
   generic :: operator (==) => is_equal
   procedure (channel_eq), deferred :: is_equal
 end type channel_prop_t
```

⟨*PHS base: interfaces*⟩≡
```
    abstract interface
      function channel_prop_to_string (object) result (string)
        import
        class(channel_prop_t), intent(in) :: object
        type(string_t) :: string
      end function channel_prop_to_string
    end interface
```

⟨*PHS base: interfaces*⟩+≡
```
    abstract interface
      function channel_eq (prop1, prop2) result (flag)
        import
        class(channel_prop_t), intent(in) :: prop1, prop2
        logical :: flag
      end function channel_eq
    end interface
```

Here is a resonance as a channel property. Mass and width are stored here in physical units.

⟨*PHS base: public*⟩+≡
```
    public :: resonance_t
```

⟨*PHS base: types*⟩+≡
```
    type, extends (channel_prop_t) :: resonance_t
      real(default) :: mass = 0
      real(default) :: width = 0
     contains
      procedure :: to_string => resonance_to_string
      procedure :: is_equal => resonance_is_equal
    end type resonance_t
```

Print mass and width.

⟨*PHS base: procedures*⟩≡
```
    function resonance_to_string (object) result (string)
      class(resonance_t), intent(in) :: object
      type(string_t) :: string
      character(32) :: buffer
      string = "resonant: m ="
      write (buffer, "(" // FMT_19 // ")")  object%mass
      string = string // trim (buffer) // " GeV, w ="
      write (buffer, "(" // FMT_19 // ")")  object%width
      string = string // trim (buffer) // " GeV"
    end function resonance_to_string
```

Equality.

⟨*PHS base: procedures*⟩+≡
```
    function resonance_is_equal (prop1, prop2) result (flag)
      class(resonance_t), intent(in) :: prop1
      class(channel_prop_t), intent(in) :: prop2
      logical :: flag
      select type (prop2)
      type is (resonance_t)
         flag = prop1%mass == prop2%mass .and. prop1%width == prop2%width
      class default
         flag = .false.
      end select
    end function resonance_is_equal
```

This is the limiting case of a resonance, namely an on-shell particle. We just store the mass in physical units.

⟨*PHS base: public*⟩+≡
```
    public :: on_shell_t
```

⟨*PHS base: types*⟩+≡
```
    type, extends (channel_prop_t) :: on_shell_t
      real(default) :: mass = 0
     contains
       procedure :: to_string => on_shell_to_string
       procedure :: is_equal => on_shell_is_equal
    end type on_shell_t
```

Print mass and width.

⟨*PHS base: procedures*⟩+≡
```
    function on_shell_to_string (object) result (string)
      class(on_shell_t), intent(in) :: object
      type(string_t) :: string
      character(32) :: buffer
      string = "on shell: m ="
      write (buffer, "(" // FMT_19 // ")")  object%mass
      string = string // trim (buffer) // " GeV"
    end function on_shell_to_string
```

Equality.

⟨*PHS base: procedures*⟩+≡
```
    function on_shell_is_equal (prop1, prop2) result (flag)
      class(on_shell_t), intent(in) :: prop1
      class(channel_prop_t), intent(in) :: prop2
      logical :: flag
      select type (prop2)
      type is (on_shell_t)
         flag = prop1%mass == prop2%mass
      class default
         flag = .false.
      end select
    end function on_shell_is_equal
```

Channel equivalences

This type describes an equivalence. The current channel is equivalent to channel `c`. The equivalence involves a permutation `perm` of integration dimensions and, within each integration dimension, a mapping `mode`.

⟨PHS base: types⟩+≡
```
type :: phs_equivalence_t
   integer :: c = 0
   integer, dimension(:), allocatable :: perm
   integer, dimension(:), allocatable :: mode
 contains
 ⟨PHS base: phs equivalence: TBP⟩
end type phs_equivalence_t
```

The mapping modes are

⟨PHS base: types⟩+≡
```
integer, parameter, public :: &
     EQ_IDENTITY = 0, EQ_INVERT = 1, EQ_SYMMETRIC = 2, EQ_INVARIANT = 3
```

In particular, if a channel is equivalent to itself in the **EQ_SYMMETRIC** mode, the integrand can be assumed to be symmetric w.r.t. a reflection $x \to 1 - x$ of the correponding integration variable.

These are the associated tags, for output:

⟨PHS base: types⟩+≡
```
character, dimension(0:3), parameter :: TAG = ["+", "-", ":", "x"]
```

Write an equivalence.

⟨PHS base: phs equivalence: TBP⟩≡
```
procedure :: write => phs_equivalence_write
```

⟨PHS base: procedures⟩+≡
```
subroutine phs_equivalence_write (object, unit)
  class(phs_equivalence_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, j
  u = given_output_unit (unit)
  write (u, "(5x,'=',1x,I0,1x)", advance = "no")  object%c
  if (allocated (object%perm)) then
     write (u, "(A)", advance = "no")  "("
     do j = 1, size (object%perm)
        if (j > 1)  write (u, "(1x)", advance = "no")
        write (u, "(I0,A1)", advance = "no") &
             object%perm(j), TAG(object%mode(j))
     end do
     write (u, "(A)")  ")"
  else
     write (u, "(A)")
  end if
end subroutine phs_equivalence_write
```

Initialize an equivalence. This allocates the `perm` and `mode` arrays with equal size.

⟨*PHS base: phs equivalence: TBP*⟩+≡
```
procedure :: init => phs_equivalence_init
```

⟨*PHS base: procedures*⟩+≡
```
subroutine phs_equivalence_init (eq, n_dim)
  class(phs_equivalence_t), intent(out) :: eq
  integer, intent(in) :: n_dim
  allocate (eq%perm (n_dim), source = 0)
  allocate (eq%mode (n_dim), source = EQ_IDENTITY)
end subroutine phs_equivalence_init
```

Channel objects

The channel entry holds (optionally) specific properties.

`sf_channel` is the structure-function channel that corresponds to this phase-space channel. The structure-function channel may be set up with a specific mapping that depends on the phase-space channel properties. (The default setting is to leave the properties empty.)

⟨*PHS base: public*⟩+≡
```
public :: phs_channel_t
```

⟨*PHS base: types*⟩+≡
```
type :: phs_channel_t
  class(channel_prop_t), allocatable :: prop
  integer :: sf_channel = 1
  type(phs_equivalence_t), dimension(:), allocatable :: eq
 contains
 ⟨PHS base: phs channel: TBP⟩
end type phs_channel_t
```

Output.

⟨*PHS base: phs channel: TBP*⟩≡
```
procedure :: write => phs_channel_write
```

⟨*PHS base: procedures*⟩+≡
```
subroutine phs_channel_write (object, unit)
  class(phs_channel_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, j
  u = given_output_unit (unit)
  write (u, "(1x,I0)", advance="no") object%sf_channel
  if (allocated (object%prop)) then
     write (u, "(1x,A)")  char (object%prop%to_string ())
  else
     write (u, *)
  end if
  if (allocated (object%eq)) then
     do j = 1, size (object%eq)
        call object%eq(j)%write (u)
     end do
  end if
```

```
      end subroutine phs_channel_write
```

Identify the channel with an s-channel resonance.

⟨*PHS base: phs channel: TBP*⟩+≡
```
    procedure :: set_resonant => channel_set_resonant
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine channel_set_resonant (channel, mass, width)
      class(phs_channel_t), intent(inout) :: channel
      real(default), intent(in) :: mass, width
      allocate (resonance_t :: channel%prop)
      select type (prop => channel%prop)
      type is (resonance_t)
         prop%mass = mass
         prop%width = width
      end select
    end subroutine channel_set_resonant
```

Identify the channel with an on-shell particle.

⟨*PHS base: phs channel: TBP*⟩+≡
```
    procedure :: set_on_shell => channel_set_on_shell
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine channel_set_on_shell (channel, mass)
      class(phs_channel_t), intent(inout) :: channel
      real(default), intent(in) :: mass
      allocate (on_shell_t :: channel%prop)
      select type (prop => channel%prop)
      type is (on_shell_t)
         prop%mass = mass
      end select
    end subroutine channel_set_on_shell
```

19.1.2   Property collection

We can set up a list of all distinct channel properties for a given set of channels.

⟨*PHS base: public*⟩+≡
```
    public :: phs_channel_collection_t
```

⟨*PHS base: types*⟩+≡
```
    type :: prop_entry_t
       integer :: i = 0
       class(channel_prop_t), allocatable :: prop
       type(prop_entry_t), pointer :: next => null ()
    end type prop_entry_t

    type :: phs_channel_collection_t
       integer :: n = 0
       type(prop_entry_t), pointer :: first => null ()
     contains
     ⟨PHS base: phs channel collection: TBP⟩
    end type phs_channel_collection_t
```

Finalizer for the list.

⟨PHS base: phs channel collection: TBP⟩≡
```
    procedure :: final => phs_channel_collection_final
```

⟨PHS base: procedures⟩+≡
```
    subroutine phs_channel_collection_final (object)
      class(phs_channel_collection_t), intent(inout) :: object
      type(prop_entry_t), pointer :: entry
      do while (associated (object%first))
         entry => object%first
         object%first => entry%next
         deallocate (entry)
      end do
    end subroutine phs_channel_collection_final
```

Output.
    Note: eliminating the `string` auxiliary triggers an ICE in gfortran 4.7.2.

⟨PHS base: phs channel collection: TBP⟩+≡
```
    procedure :: write => phs_channel_collection_write
```

⟨PHS base: procedures⟩+≡
```
    subroutine phs_channel_collection_write (object, unit)
      class(phs_channel_collection_t), intent(in) :: object
      integer, intent(in), optional :: unit
      type(prop_entry_t), pointer :: entry
      type(string_t) :: string
      integer :: u
      u = given_output_unit (unit)
      entry => object%first
      do while (associated (entry))
         if (allocated (entry%prop)) then
            string = entry%prop%to_string ()
            write (u, "(1x,I0,1x,A)")  entry%i, char (string)
         else
            write (u, "(1x,I0)")  entry%i
         end if
         entry => entry%next
      end do
    end subroutine phs_channel_collection_write
```

Push a new property to the stack if it is not yet included. Simultaneously, set the `sf_channel` entry in the phase-space channel object to the index of the matching entry, or the new entry if there was no match.

⟨PHS base: phs channel collection: TBP⟩+≡
```
    procedure :: push => phs_channel_collection_push
```

⟨PHS base: procedures⟩+≡
```
    subroutine phs_channel_collection_push (coll, channel)
      class(phs_channel_collection_t), intent(inout) :: coll
      type(phs_channel_t), intent(inout) :: channel
      type(prop_entry_t), pointer :: entry, new
      if (associated (coll%first)) then
         entry => coll%first
         do
```

```
            if (allocated (entry%prop)) then
               if (allocated (channel%prop)) then
                  if (entry%prop == channel%prop) then
                     channel%sf_channel = entry%i
                     return
                  end if
               end if
            else if (.not. allocated (channel%prop)) then
               channel%sf_channel = entry%i
               return
            end if
            if (associated (entry%next)) then
               entry => entry%next
            else
               exit
            end if
         end do
         allocate (new)
         entry%next => new
      else
         allocate (new)
         coll%first => new
      end if
      coll%n = coll%n + 1
      new%i = coll%n

            call msg_bug ("PHS channel collection: get entry: illegal index")
         end if
    end subroutine phs_channel_collection_get_entry
```

19.1.3   Kinematics configuration

Here, we store the universal information that is specifically relevant for phase-space generation. It is a subset of the process data, supplemented by basic information on phase-space parameterization channels.

A concrete implementation will contain more data, that describe the phase space in detail.

MD5 sums: the phase space setup depends on the process, it depends on the model parameters (the masses, that is), and on the configuration parameters. (It does not depend on the QCD setup.)

⟨*PHS base: public*⟩+≡
```
    public :: phs_config_t
```

⟨*PHS base: types*⟩+≡
```
    type, abstract :: phs_config_t
       ! private
       type(string_t) :: id
       integer :: n_in = 0
       integer :: n_out = 0
       integer :: n_tot = 0
       integer :: n_state = 0
       integer :: n_par = 0
       integer :: n_channel = 0
       real(default) :: sqrts = 0
       logical :: sqrts_fixed = .true.
       logical :: cm_frame = .true.

  end do
  phs_config%id = phs_config%id // suffix
end subroutine phs_config_set_component_index
```

This procedure should complete the phase-space configuration. We need the
`sqrts` value as overall scale, which is known only after the beams have been de-
fined. The procedure should determine the number of channels, their properties
(if any), and allocate and fill the `channel` array accordingly.

⟨*PHS base: phs config: TBP*⟩+≡
```
procedure (phs_config_configure), deferred :: configure
```

⟨*PHS base: interfaces*⟩+≡
```
abstract interface

        import
        class(phs_t), intent(inout), pointer :: phs
      end subroutine phs_config_allocate_instance
    end interface
```

19.1.4   Extract data

Return the number of MC input parameters.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: get_n_par => phs_config_get_n_par
```

⟨*PHS base: procedures*⟩+≡
```
    function phs_config_get_n_par (phs_config) result (n)
      class(phs_config_t), intent(in) :: phs_config
      integer :: n
      n = phs_config%n_par
    end function phs_config_get_n_par
```

Return dimensions (parameter indices) for which the phase-space dimension is flat, so integration and event generation can be simplified.

⟨*PHS base: phs config: TBP*⟩+≡
```
    procedure :: get_flat_dimensions => phs_config_get_flat_dimensions
```

⟨*PHS base: procedures*⟩+≡
```
    function phs_config_get_flat_dimensions (phs_config) result (dim_flat)
      class(phs_config_t), intent(in) :: phs_config
      integer, dimension(:), allocatable :: dim_flat
      if (allocated (phs_config%dim_flat)) then
         allocate (dim_flat (size (phs_config%dim_flat)))
         dim_flat = phs_config%dim_flat
      else
         allocate (dim_flat (0))
      end if
    end function phs_config_get_flat_dimensions
```

2168

Return the number of phase-space channels.

⟨*PHS base: phs config: TBP*⟩+≡
```
procedure :: get_n_channel => phs_config_get_n_channel
```

⟨*PHS base: procedures*⟩+≡
```
function phs_config_get_n_channel (phs_config) result (n)
  class(phs_config_t), intent(in) :: phs_config
  integer :: n
  n = phs_config%n_channel
end function phs_config_get_n_channel
```

Return the structure-function channel that corresponds to the phase-space channel c. If the channel array is not allocated (which happens if there is no structure function), return zero.

⟨*PHS base: phs config: TBP*⟩+≡
```
procedure :: get_sf_channel => phs_config_get_sf_channel
```

⟨*PHS base: procedures*⟩+≡
```
function phs_config_get_sf_channel (phs_config, c) result (c_sf)
  class(phs_config_t), intent(in) :: phs_config
  integer, intent(in) :: c
  integer :: c_sf
  if (allocated (phs_config%channel)) then
     c_sf = phs_config%channel(c)%sf_channel
  else
     c_sf = 0
  end if
end function phs_config_get_sf_channel
```

Return the mass(es) of the incoming particle(s). We take the first flavor combination in the array, assuming that masses must be degenerate among flavors.

⟨*PHS base: phs config: TBP*⟩+≡
```
procedure :: get_masses_in => phs_config_get_masses_in
```

⟨*PHS base: procedures*⟩+≡
```
subroutine phs_config_get_masses_in (phs_config, m)
  class(phs_config_t), intent(in) :: phs_config
  real(default), dimension(:), intent(out) :: m
  integer :: i
  do i = 1, phs_config%n_in
     m(i) = phs_config%flv(i,1)%get_mass ()
  end do
end subroutine phs_config_get_masses_in
```

Return the MD5 sum of the configuration.

⟨*PHS base: phs config: TBP*⟩+≡
```

end function phs_config_get_md5sum
```

19.1.5 Phase-space point instance

The `phs_t` object holds the workspace for phase-space generation. In the base object, we have the MC input parameters `r` and the Jacobian factor `f`, for each channel, and the incoming and outgoing momenta.

Note: The `active_channel` array is not used yet, all elements are initialized with `.true.`. It should be touched by the integrator if it decides to drop irrelevant channels.

⟨*PHS base: public*⟩+≡
```
public :: phs_t
```

⟨*PHS base: types*⟩+≡
```
type, abstract :: phs_t
   class(phs_config_t), pointer :: config => null ()
   logical :: r_defined = .false.
   integer :: selected_channel = 0

```

⟨PHS base: procedures⟩+≡
```
    subroutine phs_base_select_channel (phs, channel)
      class(phs_t), intent(inout) :: phs
      integer, intent(in), optional :: channel
      if (present (channel)) then
         phs%selected_channel = channel
      else
         phs%selected_channel = 0
      end if
    end subroutine phs_base_select_channel
```

Set incoming momenta. Assume that array shapes match. If requested, compute the Lorentz transformation from the c.m. to the lab frame and apply that transformation to the incoming momenta.

In the c.m. frame, the sum of three-momenta is zero. In a scattering process, the z axis is the direction of the first beam, the second beam is along the negative z axis. The transformation from the c.m. to the lab frame is a rotation from the z axis to the boost axis followed by a boost, such that the c.m. momenta are transformed into the lab-frame momenta. In a decay process, we just boost along the flight direction, without rotation.

⟨PHS base: phs: TBP⟩+≡
```
    procedure :: set_incoming_momenta => phs_set_incoming_momenta
```

⟨PHS base: procedures⟩+≡
```
    subroutine phs_set_incoming_momenta (phs, p)

      real(default) :: f
      f = phs%flux * phs%volume
    end function phs_get_overall_factor
```

Compute flux factor. We do this during initialization (when the incoming momenta `p` are undefined), unless `sqrts` is variable. We do this again once for each phase-space point, but then we skip the calculation if `sqrts` is fixed.

There are three different flux factors.

1. For a decaying massive particle, the factor is

$$f = (2\pi)^4/(2M) \tag{19.1}$$

2. For a $2 \to n$ scattering process with $n > 1$, the factor is

$$f = (2\pi)^4/(2\sqrt{\lambda}) \tag{19.2}$$

where for massless incoming particles, $\sqrt{\lambda} = s$.

3. For a $2 \to 1$ on-shell production process, the factor includes an extra $1/(2\pi)^3$ factor and a $1/m^2$ factor from the phase-space delta function $\delta(x_1 x_2 - m^2/s)$, which originate from the one-particle phase space that we integrate out.

$$f = 2\pi/(2sm^2) \tag{19.3}$$

The delta function is handled by the structure-function parameterization.

⟨*PHS base: phs: TBP*⟩+≡
```
procedure :: compute_flux => phs_compute_flux
```

⟨*PHS base: procedures*⟩+≡
```

     case (2:)
        lda = lambda (s_hat, phs%m_in(1) ** 2, phs%m_in(2) ** 2)
        if (lda > 0) then
           phs%flux = conv * twopi4 / (2 * sqrt (lda))
        else
           phs%flux = 0
        end if
     case (1)
        phs%flux = conv * twopi &
             / (2 * phs%config%sqrts ** 2 * phs%m_out(1) ** 2)
     case default
        phs%flux = 0
     end select
  end select
end subroutine phs_compute_flux
```

Evaluate the phase-space point for a particular channel and compute momenta, Jacobian, and phase-space volume. This is, of course, deferred to the implementation.

⟨*PHS base: phs: TBP*⟩+≡

```
      procedure (phs_evaluate_selected_channel), deferred :: &
          evaluate_selected_channel
```

⟨*PHS base: interfaces*⟩+≡
```
    abstract interface
       subroutine phs_evaluate_selected_channel (phs, c_in, r_in)
         import
         class(phs_t), intent(inout) :: phs
         integer, intent(in) :: c_in
         real(default), dimension(:), intent(in) :: r_in
       end subroutine phs_evaluate_selected_channel
    end interface
```

Compute the inverse mappings to completely fill the `r` and `f` arrays, for the non-selected channels.

⟨*PHS base: phs: TBP*⟩+≡
```
    procedure (phs_evaluate_other_channels), deferred :: &
        evaluate_other_channels
```

⟨*PHS base: interfaces*⟩+≡
```
    abstract interface
       subroutine phs_evaluate_other_channels (phs, c_in)
         import
         class(phs_t), intent(inout) :: phs
         integer, intent(in) :: c_in
       end subroutine phs_evaluate_other_channels
    end interface
```

Inverse evaluation. If all momenta are known, we compute the inverse mappings to fill the `r` and `f` arrays.

⟨*PHS base: phs: TBP*⟩+≡
```
    procedure (phs_inverse), deferred :: inverse
```

⟨*PHS base: interfaces*⟩+≡
```
    abstract interface
       subroutine phs_inverse (phs)
         import
         class(phs_t), intent(inout) :: phs
       end subroutine phs_inverse
    end interface
```

⟨*PHS base: phs: TBP*⟩+≡
```
    procedure :: get_sqrts => phs_get_sqrts
```

⟨*PHS base: procedures*⟩+≡
```
    function phs_get_sqrts (phs) result (sqrts)
      real(default) :: sqrts
      class(phs_t), intent(in) :: phs
      sqrts = phs%config%sqrts
    end function phs_get_sqrts
```

Uniform angular distribution

These procedures implement the uniform angular distribution, generated from two parameters x_1 and x_2:

$$\cos\theta = 1 - 2x_1, \qquad \phi = 2\pi x_2 \tag{19.4}$$

We generate a rotation (Lorentz transformation) which rotates the positive z axis into this point on the unit sphere. This rotation is applied to the p momenta, which are assumed to be back-to-back, on-shell, and with the correct mass.

   We do not compute a Jacobian (constant). The uniform distribution is assumed to be normalized.

⟨*PHS base: public*⟩+≡
```
    public :: compute_kinematics_solid_angle
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine compute_kinematics_solid_angle (p, q, x)
      type(vector4_t), dimension(2), intent(in) :: p
      type(vector4_t), dimension(2), intent(out) :: q
      real(default), dimension(2), intent(in) :: x
      real(default) :: ct, st, phi
      type(lorentz_transformation_t) :: rot
      integer :: i
      ct = 1 - 2*x(1)
      st = sqrt (1 - ct**2)
      phi = twopi * x(2)
      rot = rotation (phi, 3) * rotation (ct, st, 2)
      do i = 1, 2
         q(i) = rot * p(i)
      end do
    end subroutine compute_kinematics_solid_angle
```

This is the inverse transformation. We assume that the outgoing momenta are rotated versions of the incoming momenta, back-to-back. Thus, we determine the angles from $q(1)$ alone. p is unused.

⟨*PHS base: public*⟩+≡
```
    public :: inverse_kinematics_solid_angle
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine inverse_kinematics_solid_angle (p, q, x)
      type(vector4_t), dimension(:), intent(in) :: p
      type(vector4_t), dimension(2), intent(in) :: q
      real(default), dimension(2), intent(out) :: x
      real(default) :: ct, phi
      ct = polar_angle_ct (q(1))
      phi = azimuthal_angle (q(1))
      x(1) = (1 - ct) / 2
      x(2) = phi / twopi
    end subroutine inverse_kinematics_solid_angle
```

19.1.6   Auxiliary stuff

The `pacify` subroutine, which is provided by the Lorentz module, has the purpose of setting numbers to zero which are (by comparing with a `tolerance` parameter) considered equivalent with zero. This is useful for numerical checks.

⟨*PHS base: public*⟩+≡
```
    public :: pacify
```

⟨*PHS base: interfaces*⟩+≡
```
    interface pacify
       module procedure pacify_phs
    end interface pacify
```

⟨*PHS base: procedures*⟩+≡
```
    subroutine pacify_phs (phs)
      class(phs_t), intent(inout) :: phs
      if (phs%p_defined) then
         call pacify (phs%p, 30 * epsilon (1._default) * phs%config%sqrts)
         call pacify (phs%lt_cm_to_lab, 30 * epsilon (1._default))
      end if
      if (phs%q_defined) then
         call pacify (phs%q, 30 * epsilon (1._default) * phs%config%sqrts)
      end if
    end subroutine pacify_phs
```

19.1.7   Unit tests

```
    end subroutine phs_base_test
```

Test process data

We provide a procedure that initializes a test case for the process constants. This set of process data contains just the minimal contents that we need for the phase space. The rest is left uninitialized.

⟨*PHS base: public test auxiliary*⟩≡
```
    public :: init_test_process_data
```

⟨*PHS base: test auxiliary*⟩≡
```
    subroutine init_test_process_data (id, data)
      type(process_constants_t), intent(out) :: data
      type(string_t), intent(in), optional :: id
      if (present (id)) then
         data%id = id
      else
```

```
      data%id = "testproc"
    end if
    data%model_name = "Test"
    data%n_in = 2
    data%n_out = 2
    data%n_flv = 1
    allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
    data%flv_state = 25
  end subroutine init_test_process_data
```

This is the variant for a decay process.

⟨*PHS base: public test auxiliary*⟩+≡
```
    public :: init_test_decay_data
```

⟨*PHS base: test auxiliary*⟩+≡
```
    subroutine init_test_decay_data (id, data)
      type(process_constants_t), intent(out) :: data
      type(string_t), intent(in), optional :: id
      if (present (id)) then
         data%id = id
      else
         data%id = "testproc"
      end if
      data%model_name = "Test"
      data%n_in = 1
      data%n_out = 2
      data%n_flv = 1
      allocate (data%flv_state (data%n_in + data%n_out, data%n_flv))
      data%flv_state(:,1) = [25, 6, -6]
    end subroutine init_test_decay_data
```

Test kinematics configuration

This is a trivial implementation of the **phs_config_t** configuration object.

⟨*PHS base: public test auxiliary*⟩+≡
```
    public :: phs_test_config_t
```

⟨*PHS base: test types*⟩≡
```
    type, extends (phs_config_t) :: phs_test_config_t
      logical :: create_equivalences = .false.
    contains
      procedure :: final => phs_test_config_final
      procedure :: write => phs_test_config_write
      procedure :: configure => phs_test_config_configure
      procedure :: startup_message => phs_test_config_startup_message
      procedure, nopass :: allocate_instance => phs_test_config_allocate_instance
    end type phs_test_config_t
```

The finalizer is empty.

⟨*PHS base: test auxiliary*⟩+≡
```
    subroutine phs_test_config_final (object)
      class(phs_test_config_t), intent(inout) :: object
```

```
      end subroutine phs_test_config_final
```

The `cm_frame` parameter is not tested here; we defer this to the `phs_single` implementation.

⟨*PHS base: test auxiliary*⟩+≡

```
    subroutine phs_test_config_write (object, unit, include_id)
      class(phs_test_config_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: include_id
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A)")  "Partonic phase-space configuration:"
      call object%base_write (unit)
    end subroutine phs_test_config_write

    subroutine phs_test_config_configure (phs_config, sqrts, &
         sqrts_fixed, cm_frame, azimuthal_dependence, rebuild, &
         ignore_mismatch, nlo_type, subdir)
      class(phs_test_config_t), intent(inout) :: phs_config
      real(default), intent(in) :: sqrts
      logical, intent(in), optional :: sqrts_fixed
      logical, intent(in), optional :: cm_frame
      logical, intent(in), optional :: azimuthal_dependence
      logical, intent(in), optional :: rebuild
      logical, intent(in), optional :: ignore_mismatch
      integer, intent(in), optional :: nlo_type
      type(string_t), intent(in), optional :: subdir
      phs_config%n_channel = 2
      phs_config%n_par = 2
      phs_config%sqrts = sqrts
      if (.not. present (nlo_type)) &
        phs_config%nlo_type = BORN
      if (present (sqrts_fixed)) then
         phs_config%sqrts_fixed = sqrts_fixed
      end if
      if (present (cm_frame)) then
         phs_config%cm_frame = cm_frame
      end if
      if (present (azimuthal_dependence)) then
         phs_config%azimuthal_dependence = azimuthal_dependence
      end if
      if (allocated (phs_config%channel))  deallocate (phs_config%channel)
      allocate (phs_config%channel (phs_config%n_channel))
      if (phs_config%create_equivalences) then
         call setup_test_equivalences (phs_config)
         call setup_test_channel_props (phs_config)
      end if
      call phs_config%compute_md5sum ()
    end subroutine phs_test_config_configure
```

If requested, we make up an arbitrary set of equivalences.

⟨*PHS base: test auxiliary*⟩+≡

```
    subroutine setup_test_equivalences (phs_config)
```

```
      class(phs_test_config_t), intent(inout) :: phs_config
      integer :: i
      associate (channel => phs_config%channel(1))
        allocate (channel%eq (2))
        do i = 1, size (channel%eq)
           call channel%eq(i)%init (phs_config%n_par)
        end do
        associate (eq => channel%eq(1))
          eq%c = 1;   eq%perm = [1, 2];   eq%mode = [EQ_IDENTITY, EQ_SYMMETRIC]
        end associate
        associate (eq => channel%eq(2))
          eq%c = 2;   eq%perm = [2, 1];   eq%mode = [EQ_INVARIANT, EQ_IDENTITY]
        end associate
      end associate
    end subroutine setup_test_equivalences
```

Ditto, for channel properties.

⟨*PHS base: test auxiliary*⟩+≡
```
    subroutine setup_test_channel_props (phs_config)
      class(phs_test_config_t), intent(inout) :: phs_config
      associate (channel => phs_config%channel(2))
        call channel%set_resonant (140._default, 3.1415_default)
      end associate
    end subroutine setup_test_channel_props
```

Startup message

⟨*PHS base: test auxiliary*⟩+≡
```
    subroutine phs_test_config_startup_message (phs_config, unit)
      class(phs_test_config_t), intent(in) :: phs_config
      integer, intent(in), optional :: unit
      call phs_config%base_startup_message (unit)
      write (msg_buffer, "(A)") "Phase space: Test"
      call msg_message (unit = unit)
    end subroutine phs_test_config_startup_message
```

The instance type that matches phs_test_config_t is phs_test_t.

⟨*PHS base: test auxiliary*⟩+≡
```
    subroutine phs_test_config_allocate_instance (phs)
      class(phs_t), intent(inout), pointer :: phs
      allocate (phs_test_t :: phs)
    end subroutine phs_test_config_allocate_instance
```

Test kinematics implementation

This implementation of kinematics generates a simple two-particle configuration from the incoming momenta. The incoming momenta must be in the c.m. system, all masses equal.

There are two channels: one generates $\cos\theta$ and ϕ uniformly, in the other channel we map the r_1 parameter which belongs to $\cos\theta$.

We should store the mass parameter that we need.

⟨*PHS base: public test auxiliary*⟩+≡

```
        public :: phs_test_t
```

⟨*PHS base: test types*⟩+≡
```
    type, extends (phs_t) :: phs_test_t
       real(default) :: m = 0
       real(default), dimension(:), allocatable :: x
     contains
     ⟨PHS base: phs test: TBP⟩
     end type phs_test_t
```

Output. The specific data are displayed only if `verbose` is set.

⟨*PHS base: phs test: TBP*⟩≡
```
    procedure :: write => phs_test_write
```

⟨*PHS base: test auxiliary*⟩+≡
```
    subroutine phs_test_write (object, unit, verbose)
      class(phs_test_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      integer :: u
      logical :: verb
      u = given_output_unit (unit)
      verb = .false.;  if (present (verbose))  verb = verbose
      if (verb) then
         write (u, "(1x,A)")  "Partonic phase space: data"
         write (u, "(3x,A," // FMT_19 // ")")  "m = ", object%m
      end if
      call object%base_write (u)
    end subroutine phs_test_write
```

The finalizer is empty.

⟨*PHS base: phs test: TBP*⟩+≡
```
    procedure :: final => phs_test_final
```

⟨*PHS base: test auxiliary*⟩+≡
```
    subroutine phs_test_final (object)
      class(phs_test_t), intent(inout) :: object
    end subroutine phs_test_final
```

Initialization: set the mass value.

⟨*PHS base: phs test: TBP*⟩+≡
```
    procedure :: init => phs_test_init
```

⟨*PHS base: test auxiliary*⟩+≡
```
    subroutine phs_test_init (phs, phs_config)
      class(phs_test_t), intent(out) :: phs
      class(phs_config_t), intent(in), target :: phs_config
      call phs%base_init (phs_config)
      phs%m = phs%config%flv(1,1)%get_mass ()
      allocate (phs%x (phs_config%n_par), source = 0._default)
    end subroutine phs_test_init
```

Evaluation. In channel 1, we uniformly generate $\cos\theta$ and ϕ, with Jacobian normalized to one. In channel 2, we prepend a mapping $r_1 \rightarrow r_1^{(1/3)}$ with Jacobian $f = 3r_1^2$.

The component x is allocated in the first subroutine, used and deallocated in the second one.

⟨*PHS base: phs test: TBP*⟩+≡
```

19.2 Dummy phase space

This module implements a dummy phase space module for cases where the program structure demands the existence of a phase-space module, but no phase space integration is performed.

⟨phs_none.f90⟩≡
  ⟨*File header*⟩

  module phs_none

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
    use io_units, only: given_output_unit
    use diagnostics, only: msg_message, msg_fatal
    use phs_base, only: phs_config_t, phs_t

  ⟨*Standard module head*⟩

  ⟨*PHS none: public*⟩

  ⟨*PHS none: types*⟩

  contains

  ⟨*PHS none: procedures*⟩

  end module phs_none

19.2.1 Configuration

Nothing to configure, but we provide the type and methods.

⟨*PHS none: public*⟩≡
    public :: phs_none_config_t

⟨*PHS none: types*⟩≡
    type, extends (phs_config_t) :: phs_none_config_t
    contains
    ⟨*PHS none: phs none config: TBP*⟩
    end type phs_none_config_t

The finalizer is empty.

⟨*PHS none: phs none config: TBP*⟩≡
    procedure :: final => phs_none_config_final

⟨*PHS none: procedures*⟩≡
    subroutine phs_none_config_final (object)
      class(phs_none_config_t), intent(inout) :: object
    end subroutine phs_none_config_final

Output. No contents, just an informative line.

⟨*PHS none: phs none config: TBP*⟩+≡
    procedure :: write => phs_none_config_write

⟨*PHS none: procedures*⟩+≡
```
    subroutine phs_none_config_write (object, unit, include_id)
      class(phs_none_config_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: include_id
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A)")  "Partonic phase-space configuration: non-functional dummy"
    end subroutine phs_none_config_write
```

Configuration: we have to implement this method, but it obviously does nothing.

⟨*PHS none: phs none config: TBP*⟩+≡
```
    procedure :: configure => phs_none_config_configure
```

⟨*PHS none: procedures*⟩+≡
```
    subroutine phs_none_config_configure (phs_config, sqrts, &
        sqrts_fixed, cm_frame, azimuthal_dependence, rebuild, ignore_mismatch, &
        nlo_type, subdir)
      class(phs_none_config_t), intent(inout) :: phs_config
      real(default), intent(in) :: sqrts
      logical, intent(in), optional :: sqrts_fixed
      logical, intent(in), optional :: cm_frame
      logical, intent(in), optional :: azimuthal_dependence
      logical, intent(in), optional :: rebuild
      logical, intent(in), optional :: ignore_mismatch
      integer, intent(in), optional :: nlo_type
      type(string_t), intent(in), optional :: subdir
    end subroutine phs_none_config_configure
```

Startup message, after configuration is complete.

⟨*PHS none: phs none config: TBP*⟩+≡
```
    procedure :: startup_message => phs_none_config_startup_message
```

⟨*PHS none: procedures*⟩+≡
```
    subroutine phs_none_config_startup_message (phs_config, unit)
      class(phs_none_config_t), intent(in) :: phs_config
      integer, intent(in), optional :: unit
      call msg_message ("Phase space: none")
    end subroutine phs_none_config_startup_message
```

Allocate an instance: the actual phase-space object.

⟨*PHS none: phs none config: TBP*⟩+≡
```
    procedure, nopass :: allocate_instance => phs_none_config_allocate_instance
```

⟨*PHS none: procedures*⟩+≡
```
    subroutine phs_none_config_allocate_instance (phs)
      class(phs_t), intent(inout), pointer :: phs
      allocate (phs_none_t :: phs)
    end subroutine phs_none_config_allocate_instance
```

19.2.2   Kinematics implementation

This is considered as empty, but we have to implement the minimal set of methods.

⟨PHS none: public⟩+≡
```
    public :: phs_none_t
```

⟨PHS none: types⟩+≡
```
    type, extends (phs_t) :: phs_none_t
     contains
     ⟨PHS none: phs none: TBP⟩
    end type phs_none_t
```

Output.

⟨PHS none: phs none: TBP⟩≡
```
    procedure :: write => phs_none_write
```

⟨PHS none: procedures⟩+≡
```
    subroutine phs_none_write (object, unit, verbose)
      class(phs_none_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      integer :: u
      u = given_output_unit (unit)
      write (u, "(A)")  "Partonic phase space: none"
    end subroutine phs_none_write
```

The finalizer is empty.

⟨PHS none: phs none: TBP⟩+≡
```
    procedure :: final => phs_none_final
```

⟨PHS none: procedures⟩+≡
```
    subroutine phs_none_final (object)
      class(phs_none_t), intent(inout) :: object
    end subroutine phs_none_final
```

Initialization, trivial.

⟨PHS none: phs none: TBP⟩+≡
```
    procedure :: init => phs_none_init
```

⟨PHS none: procedures⟩+≡
```
    subroutine phs_none_init (phs, phs_config)
      class(phs_none_t), intent(out) :: phs
      class(phs_config_t), intent(in), target :: phs_config
      call phs%base_init (phs_config)
    end subroutine phs_none_init
```

Evaluation. This must not be called at all.

⟨PHS none: phs none: TBP⟩+≡
```
    procedure :: evaluate_selected_channel => phs_none_evaluate_selected_channel
    procedure :: evaluate_other_channels => phs_none_evaluate_other_channels
```

⟨*PHS none: procedures*⟩+≡
```
    subroutine phs_none_evaluate_selected_channel (phs, c_in, r_in)
      class(phs_none_t), intent(inout) :: phs
      integer, intent(in) :: c_in
      real(default), intent(in), dimension(:) :: r_in
      call msg_fatal ("Phase space: attempt to evaluate with the 'phs_none' method")
    end subroutine phs_none_evaluate_selected_channel

    subroutine phs_none_evaluate_other_channels (phs, c_in)
      class(phs_none_t), intent(inout) :: phs
      integer, intent(in) :: c_in
    end subroutine phs_none_evaluate_other_channels
```

Inverse evaluation, likewise.

⟨*PHS none: phs none: TBP*⟩+≡
```
    procedure :: inverse => phs_none_inverse
```

⟨*PHS none: procedures*⟩+≡
```
    subroutine phs_none_inverse (phs)
      class(phs_none_t), intent(inout) :: phs
      call msg_fatal ("Phase space: attempt to evaluate inverse with the 'phs_none' method")
    end subroutine phs_none_inverse
```

19.2.3 Unit tests

Test module, followed by the corresponding implementation module.

```

⟨*PHS none: test declarations*⟩≡
```
    public :: phs_none_1
```

⟨*PHS none: tests*⟩≡
```
    subroutine phs_none_1 (u)
      integer, intent(in) :: u
      type(model_data_t), target :: model
      type(process_constants_t) :: process_data
      class(phs_config_t), allocatable :: phs_data
      real(default) :: sqrts

      write (u, "(A)")  "* Test output: phs_none_1"
      write (u, "(A)")  "*   Purpose: display &
           &phase-space configuration data"
      write (u, "(A)")

      allocate (phs_none_config_t :: phs_data)
```

2199

```
      call phs_data%init (process_data, model)

      sqrts = 1000._default
      call phs_data%configure (sqrts, azimuthal_dependence=.false.)

      call phs_data%write (u)

      call phs_data%final ()
      call model%final ()

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: phs_none_1"

    end subroutine phs_none_1
```

19.3 Single-particle phase space

This module implements the phase space for a single particle, i.e., the solid angle, in a straightforward parameterization with a single channel. The phase-space implementation may be used either for $1 \rightarrow 2$ decays or for $2 \rightarrow 2$ scattering processes, so the number of incoming particles is the only free parameter in the configuration. In the latter case, we should restrict its use to non-resonant s-channel processes, because there is no mapping of the scattering angle.

(We might extend this later to account for generic $2 \rightarrow 2$ situations, e.g., account for a Coulomb singularity or detect an s-channel resonance structure that requires matching structure-function mappings.)

This is derived from the **phs_test** implementation in the **phs_base** module above, even more simplified, but intended for actual use.

⟨phs_single.f90⟩≡
  ⟨*File header*⟩

  module phs_single

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
    use io_units
    use constants
    use numeric_utils
    use diagnostics
    use os_interface
    use lorentz
    use physics_defs
    use model_data
    use flavors
    use process_constants
    use phs_base

  ⟨*Standard module head*⟩

  ⟨*PHS single: public*⟩

  ⟨*PHS single: types*⟩

  contains

  ⟨*PHS single: procedures*⟩

  end module phs_single

19.3.1 Configuration

⟨*PHS single: public*⟩≡
    public :: phs_single_config_t

⟨*PHS single: types*⟩≡
    type, extends (phs_config_t) :: phs_single_config_t
    contains
    ⟨*PHS single: phs single config: TBP*⟩

```
          end type phs_single_config_t
```

The finalizer is empty.

⟨*PHS single: phs single config: TBP*⟩≡
```
    procedure :: final => phs_single_config_final
```

⟨*PHS single: procedures*⟩≡
```
    subroutine phs_single_config_final (object)
      class(phs_single_config_t), intent(inout) :: object
    end subroutine phs_single_config_final
```

Output.

⟨*PHS single: phs single config: TBP*⟩+≡
```
    procedure :: write => phs_single_config_write
```

⟨*PHS single: procedures*⟩+≡
```
    subroutine phs_single_config_write (object, unit, include_id)

     ⟨PHS single: phs single: TBP⟩
    end type phs_single_t
```

Output. The `verbose` setting is irrelevant, we just display the contents of the base object.

⟨*PHS single: phs single: TBP*⟩≡
```
procedure :: write => phs_single_write
```

⟨*PHS single: procedures*⟩+≡
```
subroutine phs_single_write (object, unit, verbose)
  class(phs_single_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: verbose
  integer :: u
  u = given_output_unit (unit)
  call object%base_write (u)
end subroutine phs_single_write
```

The finalizer is empty.

⟨*PHS single: phs single: TBP*⟩+≡
```
procedure :: final => phs_single_final
```

⟨*PHS single: procedures*⟩+≡
```
subroutine phs_single_final (object)
  class(phs_single_t), intent(inout) :: object
end subroutine phs_single_final
```

Initialization. We allocate arrays (`base_init`) and adjust the phase-space volume. The massless two-particle phase space volume is

$$\Phi_2 = \frac{1}{4(2\pi)^5} = 2.55294034614 \times 10^{-5} \tag{19.5}$$

For a decay with nonvanishing masses (m_3, m_4), there is a correction factor

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}} \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \tag{19.6}$$

For a scattering process with nonvanishing masses, the correction factor is

$$\Phi_2(m)/\Phi_2(0) = \frac{1}{\hat{s}^2} \lambda^{1/2}(\hat{s}, m_1^2, m_2^2) \, \lambda^{1/2}(\hat{s}, m_3^2, m_4^2). \tag{19.7}$$

If the energy is fixed, this is constant. Otherwise, we have to account for varying $\hat{s}$.

⟨*PHS single: phs single: TBP*⟩+≡
```
procedure :: init => phs_single_init
```

⟨*PHS single: procedures*⟩+≡
```
subroutine phs_single_init (phs, phs_config)
  class(phs_single_t), intent(out) :: phs
  class(phs_config_t), intent(in), target :: phs_config
  call phs%base_init (phs_config)
  phs%volume = 1 / (4 * twopi5)
  call phs%compute_factor ()
end subroutine phs_single_init
```

Compute the correction factor for nonzero masses. We do this during initialization (when the incoming momenta p are undefined), unless sqrts is variable. We do this again once for each phase-space point, but then we skip the calculation if sqrts is fixed.

⟨*PHS single: phs single: TBP*⟩+≡
```
procedure :: compute_factor => phs_single_compute_factor
```

⟨*PHS single: procedures*⟩+≡
