c
c Correction function for non-constant (energy and momentum dependent) width:
      FUNCTION GTPCOR1(TOPP,ETOT)
c
c     TOPP - momentum of t quark = - momentum of tbar
c     ETOT - total energy of t-tbar system
c     calls: GENWDS, RAN2
c
c     Evaluates a correction factor to the width of t-tbar system.
c     in future has to be replaced by a function evaluating
c     width including radiative corrections and GTPCOR.
c     I include two factors reducing the width:
```

```
c     a - time dilatation: for decay in flight lifetime
c          increased accordingly to relativistic kinematics
c     b - overall energy-momentum conservation: I assume that
c          t and tbar decay in flight and in this decays energies
c          of Ws follow from 2-body kinematics. Then I calculate
c          effective mass squared of b-bar system (it may be
c          negative!) from en-momentum conservation.
c          If effective mass is < 2*Mb + 2 GeV configuration
c          is rejected. The weight is acceptance.

  c **
  c   Version tuned to provide O(1%) relative accuracy for Coulomb axial
  c   vertex function at first and second order (search for 'cctt'):
  c   - integrals A(p), Vhat, Vhhat provided analytically w/out cut-off
  c   - grid range fixed to 0.1 ... 10**6 absolut
  c   - and grid size enhanced to 600 points (900 foreseen in arrays).
  c
  c   This provides a compromise between stability and accuracy:
  c   We need a relatively high momentum resolution and large maximal
  c   momenta to achieve a ~1 percent accuracy, but the method of
  c   direct inversion of the discretised integral equation for objects
  c   whose integral is divergent induces instabilities at small
  c   momenta. As the behaviour there is known, they can be cut off and
  c   the vertex function fixed by hand; but limiting the grid
  c   further would impact on the accuracy.
  c   22.3.2017, tt

```
c                         [= constant in momentum space-] potential
c    xcdeltl  :  constant for the additional log(q^2/mu^2)-part of the
c                 delta-potential:
c                  xcdeltc*1 + xcdeltl*log(q^2/mu^2)
c    xcfullc  :  constant of the (p^2+q^2)/(p-q)^2-potential
c    xcfulll  :  constant for the additional log(q^2/mu^2)-part of the
c                 (p^2+q^2)/(p-q)^2-potential
c    xcrm2    :  constant of the 1/r^2-[1/|p-q|]-potential
c    xkincm   :  } kinetic corrections in the 0th order Green function:
c    xkinca   :  }  G_0(p):=1/[E+iGamma_t-p^2/m_t]*(1+xkincm)+xkinca
c     !!! WATCH THE SIGN IN G_0 !!!
c    jknflg   :  flag for these kinetic corrections:
c                 0 : no kinetic corrections applied
c                 1 : kinetic corrections applied with cutoff xcutv
c                      for  xkinca  only
c                 2 : kinetic corrections applied with cutoff xcutv
c                      for  xkinca  AND  xkincm
c    jgcflg   :  flag for G_0(p) in the LS equation:
c                 0 (standard choice) : G_0(p) as given above
c                 1 (for TIPT)        : G_0(p) = G_c^{0}(p) the 0th
c                                       order Coulomb Green function
c                                       in analytical form; not for
c                                       momenta  p > 1000*topmass
c    xkincv   :  additional kinematic vertexcorrection in G_0, see below:
c    jvflg    :  flag for the additional vertexcorrection  xkincv  in the
c                 ``zeroth order'' G_0(p) in the LS-equation:
c                 0 : no correction, means  G = G_0 + G_0 int V G
c                      with G_0=1/[E+iGamma_t-p^2/m_t]*(1+xkincm)+xkinca
c                 1 : apply the correction in the LS equation as
c                      G = G_0 + xkincv*p^2/m_t^2/[E+iGamma_t-p^2/m_t] +
c                          G_0 int V G
c                     and correct the integral over Im[G(p)] to get sigma_tot
c                     from the optical theorem by the same factor.
c                     The cutoff  xcutv  is applied for these corrections.
c
c -- Output:
c
c    xim      :  R^{P wave}_{ttbar} from the imaginary part of the Green
c                 function
c    xdi      :  R^{P wave}_{ttbar} from the integral over the momentum
c                 distribution: int_0^xcutv dp p^3/m_t*|F(p,E)|^2
c    np       :  number of points used for the grid; fixed in tttoppik
c    xpp      :  1-dim array (max. 900 elements) giving the momenta of
c                 the Gauss-Legendre grid (pp(i) in the code)
c    xww      :  1-dim array (max. 900 elements) giving the corresponding
c                 Gauss-Legendre weights for the grid
c    xdsdp    :  1-dim array (max. 900 elements) giving the
c                 momentum distribution of top: d\sigma^{P wave}/dp,
c                  normalized to R,
c                  at the momenta of the Gauss-Legendre grid xpp(i)
c    zftild   :  1-dim array (max. 900 elements) of COMPLEX*16 numbers
c                 giving the vertex function K_A for the P-wave
c                 at the momenta of the grid.
c                 Then F(p)=K_A (p)*G_0(p) corresponding to G=K_V*G_0.

              if ((npot.eq.1).or.(npot.eq.3).or.(npot.eq.4).or.
     u          (npot.eq.5)) then
c For pure coulomb and fixed order potentials there is no delta-part:
                  consde = 0.d0
```

```
          else if (npot.eq.2) then
c Initialize QCD-potential common-blocks and calculate constant multiplying
c  the delta-part of the 'qcutted' potential in momentum-space:
c            call iniphc(1)
c            call vqdelt(consde)
             write(*,*) ' Not supplied with this version. Stop.'
             stop
          else
             write (*,*) ' Potential not implemented! Stop. 1'
             stop
          endif
c Delta-part of potential is absorbed by subtracting vzero from the
c  original energy (shift from the potential to the free Hamiltonian):
          vzero = consde / (2.d0*pi)**3
c          write (*,*) 'vzero=', vzero
c
c Find x-values pp(i) and weigths w1(i) for the gaussian quadrature;
c  care about large number of points in the important intervals:
c       if (energy-vzero.le.0.d0) then
cc          call gauleg(0.d0, 1.d0, pp, w1, n/3)
cc          call gauleg(1.d0, 5.d0, pp(n/3+1), w1(n/3+1), n/3)
cc          call gauleg(0.d0, 0.2d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c          call gauleg(0.d0, 5.d0, pp, w1, n/3)
c          call gauleg(5.d0, 20.d0, pp(n/3+1), w1(n/3+1), n/3)
c          call gauleg(0.d0, 0.05d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c       else
cc Avoid numerical singular points in the inner of the intervals:
c          critp = sqrt((energy-vzero)*tmass)
c          if (critp.le.1.d0) then
cc Gauss-Legendre is symmetric => automatically principal-value prescription:
c             call gauleg(0.d0, 2.d0*critp, pp, w1, n/3)
c             call gauleg(2.d0*critp, 20.d0, pp(n/3+1),
c     u                   w1(n/3+1), n/3)
c             call gauleg(0.d0, 0.05d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c          else
cc Better behaviour at the border of the intervals:
c             call gauleg(0.d0, critp, pp, w1, n/3)
c             call gauleg(critp, 2.d0*critp, pp(n/3+1),
c     u                   w1(n/3+1), n/3)
c             call gauleg(0.d0, 1.d0/(2.d0*critp), pp(2*n/3+1),
c     u                   w1(2*n/3+1), n/3)
c          endif
c       endif
c
c Or different (simpler) method, good for V_JKT:
          if (energy.le.0.d0) then
             critp=tmass/3.d0
          else
             critp=max(tmass/3.d0,2.d0*sqrt(energy*tmass))
          endif
c          call gauleg(0.d0, critp, pp, w1, 2*n/3)
c          call gauleg(1.d0/xpmax, 1.d0/critp, pp(2*n/3+1),
c     u                   w1(2*n/3+1), n/3)
cctt Tuned March 2017 for best possible numerical behaviour of P-wave
```

```
            call gauleg(0.1d0, 2.d0, pp, w1, 10)
            call gauleg(2.d0, critp, pp(11), w1(11), 2*n/3-10)
            call gauleg(1.d-6, 1.d0/critp, pp(2*n/3+1),
     u                  w1(2*n/3+1), n/3)
c
c Do substitution p => 1/p for the last interval explicitly:
            do 10 i=2*n/3+1,n
               pp(i) = 1.d0/pp(i)
10          continue
c
c Reorder the arrays for the third interval:
            do 20 i=1,n/3
               xx(i) = pp(2*n/3+i)
               w2(i) = w1(2*n/3+i)
20          continue
            do 30 i=1,n/3
               pp(n-i+1) = xx(i)
               w1(n-i+1) = w2(i)
30          continue
c
c Calculate the integrals aax(p) for the given momenta pp(i)
c  and store weights and momenta for the output arrays:
            do 40 i=1,n
               a1(i) = aax(pp(i)) !!! FB: can get stuck in original Toppik!
               !!! FB: abuse 'np' as a flag to communicate unstable runs
               if ( abs(a1(i)) .gt. 1d10 ) then
                 np = -1
                 return
               endif
               xpp(i)=pp(i)
               xww(i)=w1(i)
40          continue
            do 41 i=n+1,nmax
               xpp(i)=0.d0
               xww(i)=0.d0
41          continue
c
c Solve the integral-equation by solving a system of algebraic equations:
            call saeax(pp, w1, bb, vec, a1, n)
c
c (The substitution for the integration to infinity  pp => 1/pp
c  is done already.)
            do 50 i=1,n
               zvfct(i)=bb(i)
               zftild(i)=vec(i)
               gg(i) = bb(i)*g0c(pp(i))
cc             gg(i) = (1.d0 + bb(i))*g0c(pp(i))

Chapter 31

Integration and Process Objects

This is the central part of the `WHIZARD` package. It provides the functionality for evaluating structure functions, kinematics and matrix elements, integration and event generation. It combines the various parts that deal with those tasks individually and organizes the data transfer between them.

subevt_expr This enables process observables as (abstract) expressions, to be evaluated for each process call.

parton_states A `parton_state_t` object represents an elementary partonic interaction. There are two versions: one for the isolated elementary process, one for the elementary process convoluted with the structure-function chain. The parton state is an effective state. It needs not coincide with the seed-kinematics state which is used in evaluating phase space.

process Here, all pieces are combined for the purpose of evaluating the elementary processes. The whole algorithm is coded in terms of abstract data types as defined in the appropriate modules: `prc_core` for matrix-element evaluation, `prc_core_def` for the associated configuration and driver, `sf_base` for beams and structure-functions, `phs_base` for phase space, and `mci_base` for integration and event generation.

process_config

process_counter Very simple object for statistics

process_mci

instances While the above modules set up all static information, the instances have the changing event data. There are term and process instances but no component instances.

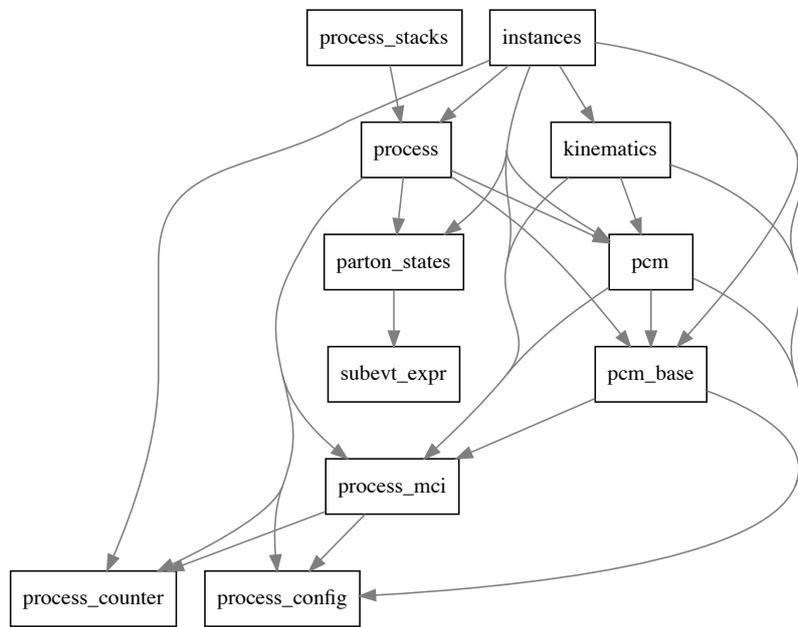
process_stacks Process stacks collect process objects.


Figure 31.1: Module dependencies in `src/process_integration`.

We combine here hard interactions, phase space, and (for scatterings) structure functions and interfaces them to the integration module.

The process object implements the combination of a fixed beam and structure-function setup with a number of elementary processes. The latter are called process components. The process object represents an entity which is supposedly observable. It should be meaningful to talk about the cross section of a process.

The individual components of a process are, technically, processes themselves, but they may have unphysical cross sections which have to be added for a physical result. Process components may be exclusive tree-level elementary processes, dipole subtraction term, loop corrections, etc.

The beam and structure function setup is common to all process components. Thus, there is only one instance of this part.

The process may be a scattering process or a decay process. In the latter case, there are no structure functions, and the beam setup consists of a single particle. Otherwise, the two classes are treated on the same footing.

Once a sampling point has been chosen, a process determines a set of partons with a correlated density matrix of quantum numbers. In general, each sampling point will generate, for each process component, one or more distinct parton configurations. This is the `computed` state. The computed state is the subject of the multi-channel integration algorithm.

For NLO computations, it is necessary to project the computed states onto another set of parton configurations (e.g., by recombining certain pairs). This is the `observed` state. When computing partonic observables, the information is taken from the observed state.

For the purpose of event generation, we will later select one parton configuration from the observed state and collapse the correlated quantum state. This configuration is then dressed by applying parton shower, decays and hadronization. The decay chain, in particular, combines a scattering process with possible subsequent decay processes on the parton level, which are full-fledged process objects themselves.

31.1 Process observables

We define an abstract `subevt_expr_t` object as an extension of the `subevt_t` type. The object contains a local variable list, variable instances (as targets for pointers in the variable list), and evaluation trees. The evaluation trees reference both the variables and the `subevt`.

There are two instances of the abstract type: one for process instances, one for physical events. Both have a common logical expression `selection` which determines whether the object passes user-defined cuts.

The intention is that we fill the `subevt_t` base object and compute the variables once we have evaluated a kinematical phase space point (or a complete event). We then evaluate the expressions and can use the results in further calculations.

The `process_expr_t` extension contains furthermore scale and weight expressions. The `event_expr_t` extension contains a reweighting-factor expression and a logical expression for event analysis. In practice, we will link the

variable list of the **event obs** object to the variable list of the currently active **process obs** object, such that the process variables are available to both objects. Event variables are meaningful only for physical events.

Note that there are unit tests, but they are deferred to the **expr tests** module.

      end if
    end subroutine subevt_expr_final
```

31.1.2   Initialization

Initialization: define local variables and establish pointers.

The common variables are **sqrts** (the nominal beam energy, fixed), **sqrts_hat** (the actual energy), **n_in**, **n_out**, and **n_tot** for the **subevt**. With the exception

of `sqrts`, all are implemented as pointers to subobjects.

⟨*Subevt expr: subevt expr: TBP*⟩+≡
```
    procedure (subevt_expr_setup_vars), deferred :: setup_vars
    procedure :: base_setup_vars => subevt_expr_setup_vars
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine subevt_expr_setup_vars (expr, sqrts)
      class(subevt_expr_t), intent(inout), target :: expr
      real(default), intent(in) :: sqrts
      call expr%var_list%final ()
      call var_list_append_real (expr%var_list, &
           var_str ("sqrts"), sqrts, &
           locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_real_ptr (expr%var_list, &
           var_str ("sqrts_hat"), expr%sqrts_hat, &
           is_known = expr%subevt_filled, &
           locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_int_ptr (expr%var_list, &
           var_str ("n_in"), expr%n_in, &
           is_known = expr%subevt_filled, &
           locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_int_ptr (expr%var_list, &
           var_str ("n_out"), expr%n_out, &
           is_known = expr%subevt_filled, &
           locked = .true., verbose = .false., intrinsic = .true.)
      call var_list_append_int_ptr (expr%var_list, &
           var_str ("n_tot"), expr%n_tot, &
           is_known = expr%subevt_filled, &
           locked = .true., verbose = .false., intrinsic = .true.)
    end subroutine subevt_expr_setup_vars
```

Append the subevent expr (its base-type core) itself to the variable list, if it is
not yet present.

⟨*Subevt expr: subevt expr: TBP*⟩+≡
```
    procedure :: setup_var_self => subevt_expr_setup_var_self
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine subevt_expr_setup_var_self (expr)
      class(subevt_expr_t), intent(inout), target :: expr
      if (.not. expr%var_list%contains (var_str ("@evt"))) then
         call var_list_append_subevt_ptr &
              (expr%var_list, &
              var_str ("@evt"), expr%subevt_t, &
              is_known = expr%subevt_filled, &
              locked = .true., verbose = .false., intrinsic=.true.)
      end if
    end subroutine subevt_expr_setup_var_self
```

Link a variable list to the local one. This could be done event by event, but
before evaluating expressions.

⟨*Subevt expr: subevt expr: TBP*⟩+≡
```
    procedure :: link_var_list => subevt_expr_link_var_list
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine subevt_expr_link_var_list (expr, var_list)
      class(subevt_expr_t), intent(inout) :: expr
      type(var_list_t), intent(in), target :: var_list
      call expr%var_list%link (var_list)
    end subroutine subevt_expr_link_var_list
```

Compile the selection expression. If there is no expression, the build method won't allocate the expression object.

⟨*Subevt expr: subevt expr: TBP*⟩+≡
```
    procedure :: setup_selection => subevt_expr_setup_selection
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine subevt_expr_setup_selection (expr, ef_cuts)
      class(subevt_expr_t), intent(inout), target :: expr
      class(expr_factory_t), intent(in) :: ef_cuts
      call ef_cuts%build (expr%selection)
      if (allocated (expr%selection)) then
         call expr%setup_var_self ()
         call expr%selection%setup_lexpr (expr%var_list)
         expr%has_selection = .true.
      end if
    end subroutine subevt_expr_setup_selection
```

(De)activate color storage and evaluation for the expression. The subevent particles will have color information.

⟨*Subevt expr: subevt expr: TBP*⟩+≡
```
    procedure :: colorize => subevt_expr_colorize
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine subevt_expr_colorize (expr, colorize_subevt)
      class(subevt_expr_t), intent(inout), target :: expr
      logical, intent(in) :: colorize_subevt
      expr%colorize_subevt = colorize_subevt
    end subroutine subevt_expr_colorize
```

31.1.3 Evaluation

Reset to initial state, i.e., mark the `subevt` as invalid.

⟨*Subevt expr: subevt expr: TBP*⟩+≡
```
    procedure :: reset_contents => subevt_expr_reset_contents
    procedure :: base_reset_contents => subevt_expr_reset_contents
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine subevt_expr_reset_contents (expr)
      class(subevt_expr_t), intent(inout) :: expr
      expr%subevt_filled = .false.
    end subroutine subevt_expr_reset_contents
```

Evaluate the selection expression and return the result. There is also a deferred version: this should evaluate the remaining expressions if the event has passed.

⟨*Subevt expr: subevt expr: TBP*⟩+≡
```
    procedure :: base_evaluate => subevt_expr_evaluate
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine subevt_expr_evaluate (expr, passed)
      class(subevt_expr_t), intent(inout) :: expr
      logical, intent(out) :: passed
      if (expr%has_selection) then
         call expr%selection%evaluate ()
         if (expr%selection%is_known ()) then
            passed = expr%selection%get_log ()
         else
            call msg_error ("Evaluate selection expression: result undefined")
            passed = .false.
         end if
      else
         passed = .true.
      end if
    end subroutine subevt_expr_evaluate
```

31.1.4   Implementation for partonic events

This implementation contains the expressions that we can evaluate for the partonic process during integration.

⟨*Subevt expr: public*⟩≡
```
    public :: parton_expr_t
```

⟨*Subevt expr: types*⟩+≡
```
    type, extends (subevt_expr_t) :: parton_expr_t
       integer, dimension(:), allocatable :: i_beam
       integer, dimension(:), allocatable :: i_in
       integer, dimension(:), allocatable :: i_out
       logical :: has_scale = .false.
       logical :: has_fac_scale = .false.
       logical :: has_ren_scale = .false.
       logical :: has_weight = .false.
       class(expr_t), allocatable :: scale
       class(expr_t), allocatable :: fac_scale
       class(expr_t), allocatable :: ren_scale
       class(expr_t), allocatable :: weight
     contains
     ⟨Subevt expr: parton expr: TBP⟩
    end type parton_expr_t
```

Finalizer.

⟨*Subevt expr: parton expr: TBP*⟩≡
```
    procedure :: final => parton_expr_final
```

⟨*Subevt expr: procedures*⟩+≡
```
    subroutine parton_expr_final (object)
      class(parton_expr_t), intent(inout) :: object
      call object%base_final ()
      if (object%has_scale) then
         call object%scale%final ()
      end if
      if (object%has_fac_scale) then
```

```
      call object%fac_scale%final ()
   end if
   if (object%has_ren_scale) then
      call object%ren_scale%final ()
   end if
   if (object%has_weight) then
      call object%weight%final ()
   end if
end subroutine parton_expr_final
```

Output: continue writing the active expressions, after the common selection expression.

Note: the `prefix` argument is declared in the `write` method of the `subevt_t` base type. Here, it is unused.

⟨*Subevt expr: parton expr: TBP*⟩+≡
```

Filling the partonic state consists of two parts. The first routine prepares the subevt without assigning momenta. It takes the particles from an `interaction_t`. It needs the indices and flavors for the beam, incoming, and outgoing particles.

We can assume that the particle content of the subevt does not change. Therefore, we set the event variables `n_in`, `n_out`, `n_tot` already in this initialization step.

⟨*Subevt expr: parton expr: TBP*⟩+≡
```
      procedure :: setup_subevt => parton_expr_setup_subevt
```
⟨*Subevt expr: procedures*⟩+≡

      call subevt_set_p2_incoming  (expr%subevt_t, f_in%get_mass ()   ** 2)
      call subevt_set_p2_outgoing  (expr%subevt_t, f_out%get_mass ()  ** 2)
      expr%n_in  = size (i_in)
      expr%n_out = size (i_out)
      expr%n_tot = expr%n_in + expr%n_out
    end subroutine parton_expr_setup_subevt
```

Transfer PDG codes, masses (initalization) and momenta to a predefined subevent. We use the flavor assignment of the first branch in the interaction state matrix. Only incoming and outgoing particles are transferred. Switch momentum sign for incoming particles.

⟨*Subevt expr: interfaces*⟩≡

31.1.5 Implementation for full events

This implementation contains the expressions that we can evaluate for the full
event. It also contains data that pertain to the event, suitable for communication
with external event formats. These data simultaneously serve as pointer targets
for the variable lists hidden in the expressions (eval trees).

Squared matrix element and weight values: when reading events from file,
the `ref` value is the number in the file, while the `prc` value is the number that
we calculate from the momenta in the file, possibly with different parameters.
When generating events the first time, or if we do not recalculate, the numbers
should coincide. Furthermore, the array of `alt` values is copied from an array
of alternative event records. These values should represent calculated values.

⟨*Subevt expr: public*⟩+≡
```

```

31.2   Parton states

A `parton_state_t` object contains the effective kinematics and dynamics of an elementary partonic interaction, with or without the beam/structure function state included. The type is abstract and has two distinct extensions. The `isolated_state_t` extension describes the isolated elementary interaction where the `int_eff` subobject contains the complex transition amplitude, exclusive in all quantum numbers. The particle content and kinematics describe the effective partonic state. The `connected_state_t` extension contains the partonic `subevt` and the expressions for cuts and scales which use it.

In the isolated state, the effective partonic interaction may either be identical to the hard interaction, in which case it is just a pointer to the latter. Or it may involve a rearrangement of partons, in which case we allocate it explicitly and flag this by `int_is_allocated`.

The `trace` evaluator contains the absolute square of the effective transition amplitude matrix, summed over final states. It is also summed over initial states, depending on the the beam setup allows. The result is used for integration.

The `matrix` evaluator is the counterpart of `trace` which is kept exclusive in all observable quantum numbers. The `flows` evaluator is furthermore exclusive in colors, but neglecting all color interference. The `matrix` and `flows` evaluators are filled only for sampling points that become part of physical events.

Note: It would be natural to make the evaluators allocatable. However, this causes memory corruption in gfortran 4.6.3. The extra `has_XXX` flags indicate whether evaluators are active, instead.

This module contains no unit tests. The tests are covered by the `processes` module below.

```

31.2.1 Abstract base type

The common part are the evaluators, one for the trace (summed over all quantum numbers), one for the transition matrix (summed only over unobservable quantum numbers), and one for the flow distribution (transition matrix without interferences, exclusive in color flow).

⟨*Parton states: types*⟩≡

```
    type, abstract :: parton_state_t
      logical :: has_trace = .false.
      logical :: has_matrix = .false.
      logical :: has_flows = .false.
      type(evaluator_t) :: trace
      type(evaluator_t) :: matrix
      type(evaluator_t) :: flows
    contains
    ⟨Parton states: parton state: TBP⟩
    end type parton_state_t
```

4310

The `isolated_state_t` extension contains the `sf_chain_eff` object and the (hard) effective interaction `int_eff`, separately, both are implemented as a pointer. The evaluators (trace, matrix, flows) apply to the hard interaction only.

If the effective interaction differs from the hard interaction, the pointer is allocated explicitly. Analogously for `sf_chain_eff`.

⟨*Parton states: public*⟩≡
```
    public :: isolated_state_t
```

⟨*Parton states: types*⟩+≡
```
    type, extends (parton_state_t) :: isolated_state_t
      logical :: sf_chain_is_allocated = .false.
      type(sf_chain_instance_t), pointer :: sf_chain_eff => null ()
      logical :: int_is_allocated = .false.
      type(interaction_t), pointer :: int_eff => null ()
    contains
    ⟨Parton states: isolated state: TBP⟩
    end type isolated_state_t
```

The `connected_state_t` extension contains all data that enable the evaluation of observables for the effective connected state. The evaluators connect the (effective) structure-function chain and hard interaction that were kept separate in the `isolated_state_t`.

The `flows_sf` evaluator is an extended copy of the structure-function

The `expr` subobject consists of the `subevt`, a simple event record, expressions for cuts etc. which refer to this record, and a `var_list` which contains event-specific variables, linked to the process variable list. Variables used within the expressions are looked up in `var_list`.

⟨*Parton states: public*⟩+≡
```
    public :: connected_state_t
```

⟨*Parton states: types*⟩+≡
```
    type, extends (parton_state_t) :: connected_state_t
      type(state_flv_content_t) :: state_flv
      logical :: has_flows_sf = .false.
      type(evaluator_t) :: flows_sf
      logical :: has_expr = .false.
      type(parton_expr_t) :: expr
    contains
    ⟨Parton states: connected state: TBP⟩
    end type connected_state_t
```

Output: each evaluator is written only when it is active. The `sf_chain` is only written if it is explicitly allocated.

⟨*Parton states: parton state: TBP*⟩≡

        call state%sf_chain_eff%final ()
     end if
  end select
end subroutine parton_state_final
```

31.2.2 Common Initialization

Initialize the isolated parton state. In this version, the effective structure-function chain sf_chain_eff and the effective interaction int_eff both are trivial pointers to the seed structure-function chain and to the hard interaction, respectively.

⟨*Parton states: isolated state: TBP*⟩≡
```
procedure :: init => isolated_state_init
```

⟨*Parton states: procedures*⟩+≡
```
subroutine isolated_state_init (state, sf_chain, int)
  class(isolated_state_t), intent(out) :: state
  type(sf_chain_instance_t), intent(in), target :: sf_chain
  type(interaction_t), intent(in), target :: int
  state%sf_chain_eff => sf_chain
```

```
      state%int_eff => int
    end subroutine isolated_state_init
```

31.2.3 Evaluator initialization: isolated state

Create an evaluator for the trace of the squared transition matrix. The trace
goes over all outgoing quantum numbers. Whether we trace over incoming
quantum numbers other than color, depends on the given qn_mask_in.

There are two options: explicitly computing the color factor table (use_cf
false; nc defined), or taking the color factor table from the hard matrix element
data.

⟨*Parton states: isolated state: TBP*⟩+≡
```
    procedure :: setup_square_trace => isolated_state_setup_square_trace
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine isolated_state_setup_square_trace (state, core, &
        qn_mask_in, col, keep_fs_flavor)
      class(isolated_state_t), intent(inout), target :: state
      class(prc_core_t), intent(in) :: core
      type(quantum_numbers_mask_t), intent(in), dimension(:) :: qn_mask_in
      !!! Actually need allocatable attribute here fore once because col might
      !!! enter the subroutine non-allocated.
      integer, intent(in), dimension(:), allocatable :: col
      logical, intent(in) :: keep_fs_flavor
      type(quantum_numbers_mask_t), dimension(:), allocatable :: qn_mask
      associate (data => core%data)
        allocate (qn_mask (data%n_in + data%n_out))
        qn_mask( : data%n_in) = &
                quantum_numbers_mask (.false., .true., .false.) &
                .or. qn_mask_in
        qn_mask(data%n_in + 1 : ) = &
                quantum_numbers_mask (.not. keep_fs_flavor, .true., .true.)
        if (core%use_color_factors) then
           call state%trace%init_square (state%int_eff, qn_mask, &
                col_flow_index = data%cf_index, &
                col_factor = data%color_factors, &
                col_index_hi = col, &
                nc = core%nc)
        else
           call state%trace%init_square (state%int_eff, qn_mask, nc = core%nc)
        end if
      end associate
      state%has_trace = .true.
    end subroutine isolated_state_setup_square_trace
```

Setup an identity-evaluator for the trace. This implies that me is considered to
be a squared amplitude, as for example for BLHA matrix elements.

⟨*Parton states: isolated state: TBP*⟩+≡
```
    procedure :: setup_identity_trace => isolated_state_setup_identity_trace
```

⟨*Parton states: procedures*⟩+≡

```
subroutine isolated_state_setup_identity_trace (state, core, qn_mask_in, &
    keep_fs_flavors, keep_colors)
  class(isolated_state_t), intent(inout), target :: state
  class(prc_core_t), intent(in) :: core
  type(quantum_numbers_mask_t), intent(in), dimension(:) :: qn_mask_in
  logical, intent(in), optional :: keep_fs_flavors, keep_colors
  type(quantum_numbers_mask_t), dimension(:), allocatable :: qn_mask
  logical :: fs_flv_flag, col_flag
  fs_flv_flag = .true.; col_flag = .true.
  if (present(keep_fs_flavors)) fs_flv_flag = .not. keep_fs_flavors
  if (present(keep_colors)) col_flag = .not. keep_colors
  associate (data => core%data)
     allocate (qn_mask (data%n_in + data%n_out))
     qn_mask( : data%n_in) = &
        quantum_numbers_mask (.false., col_flag, .false.) .or. qn_mask_in
     qn_mask(data%n_in + 1 : ) = &
        quantum_numbers_mask (fs_flv_flag, col_flag, .true.)
  end associate
  call state%int_eff%set_mask (qn_mask)
  call state%trace%init_identity (state%int_eff)
  state%has_trace = .true.
end subroutine isolated_state_setup_identity_trace
```

Setup the evaluator for the transition matrix, exclusive in helicities where this is requested.

For all unstable final-state particles we keep polarization according to the applicable decay options. If the process is a decay itself, this applies also to the initial state.

For all polarized final-state particles, we keep polarization including off-diagonal entries. We drop helicity completely for unpolarized final-state particles.

For the initial state, if the particle has not been handled yet, we apply the provided qn_mask_in which communicates the beam properties.

⟨*Parton states: isolated state: TBP*⟩+≡

31.2.4   Evaluator initialization: connected state

Setup a trace evaluator as a product of two evaluators (incoming state, effective interaction). In the result, all quantum numbers are summed over.

If the optional `int` interaction is provided, use this for the first factor in the convolution. Otherwise, use the final interaction of the stored `sf_chain`.

The `resonant` flag applies if we want to construct a decay chain. The resonance property can propagate to the final event output.

If an extended structure function is required `requires_extended_sf`, we have to not consider `sub` as a quantum number.

⟨*Parton states: connected state: TBP*⟩≡
```
    procedure :: setup_connected_trace => connected_state_setup_connected_trace
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_setup_connected_trace &

      mask = quantum_numbers_mask (.false., .true., .true.)
      if (present (int)) then
```

```
        src_int => int
    else
        src_int => isolated%sf_chain_eff%get_out_int_ptr ()
    end if
    call state%matrix%init_product &
         (src_int, isolated%matrix, mask, &
          qn_filter_conn = qn_filter_conn, &
          connections_are_resonant = resonant)
    state%has_matrix = .true.
  end subroutine connected_state_setup_connected_matrix
```

Setup a matrix evaluator as a product of two evaluators (incoming state, effective interation). In the intermediate state, only helicity is summed over. In the final state, we keep the quantum numbers which are present in the original evaluators.

If the optional `int` interaction is provided, use this for the first factor in the convolution. Otherwise, use the final interaction of the stored `sf_chain`, after creating an intermediate interaction that includes a correlated color state. We assume that for a caller-provided `int`, this is not necessary.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: setup_connected_flows => connected_state_setup_connected_flows
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_setup_connected_flows &
         (state, isolated, int, resonant, qn_filter_conn)
      class(connected_state_t), intent(inout), target :: state
      type(isolated_state_t), intent(in), target :: isolated
      type(interaction_t), intent(in), optional, target :: int
      logical, intent(in), optional :: resonant
      type(quantum_numbers_t), intent(in), optional :: qn_filter_conn
      type(quantum_numbers_mask_t) :: mask
      type(interaction_t), pointer :: src_int
      mask = quantum_numbers_mask (.false., .false., .true.)
      if (present (int)) then
         src_int => int
      else
         src_int => isolated%sf_chain_eff%get_out_int_ptr ()
         call state%flows_sf%init_color_contractions (src_int)
         state%has_flows_sf = .true.
         src_int => state%flows_sf%interaction_t

      state%has_flows = .true.
    end subroutine connected_state_setup_connected_flows
```

Determine and store the flavor content for the connected state. This queries the `matrix` evaluator component, which should hold the requested flavor information.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: setup_state_flv => connected_state_setup_state_flv
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_setup_state_flv (state, n_out_hard)
      class(connected_state_t), intent(inout), target :: state
      integer, intent(in) :: n_out_hard
      call interaction_get_flv_content &
           (state%matrix%interaction_t, state%state_flv, n_out_hard)
    end subroutine connected_state_setup_state_flv
```

Return the current flavor state object.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: get_state_flv => connected_state_get_state_flv
```

⟨*Parton states: procedures*⟩+≡
```
    function connected_state_get_state_flv (state) result (state_flv)
      class(connected_state_t), intent(in) :: state
      type(state_flv_content_t) :: state_flv
      state_flv = state%state_flv
    end function connected_state_get_state_flv
```

31.2.5   Cuts and expressions

Set up the subevt that corresponds to the connected interaction. The index arrays refer to the interaction.

We assign the particles as follows: the beam particles are the first two (decay process: one) entries in the trace evaluator. The incoming partons are identified by their link to the outgoing partons of the structure-function chain. The outgoing partons are those of the trace evaluator, which include radiated partons during the structure-function chain.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: setup_subevt => connected_state_setup_subevt
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_setup_subevt (state, sf_chain, f_beam, f_in, f_out)
      class(connected_state_t), intent(inout), target :: state
      type(sf_chain_instance_t), intent(in), target :: sf_chain
      type(flavor_t), dimension(:), intent(in) :: f_beam, f_in, f_out
      integer :: n_beam, n_in, n_out, n_vir, n_tot, i, j
      integer, dimension(:), allocatable :: i_beam, i_in, i_out
      integer :: sf_out_i
      type(interaction_t), pointer :: sf_int
      sf_int => sf_chain%get_out_int_ptr ()
      n_beam = size (f_beam)
      n_in = size (f_in)
      n_out = size (f_out)
      n_vir = state%trace%get_n_vir ()
      n_tot = state%trace%get_n_tot ()
      allocate (i_beam (n_beam), i_in (n_in), i_out (n_out))
      i_beam = [(i, i = 1, n_beam)]
      do j = 1, n_in
         sf_out_i = sf_chain%get_out_i (j)
         i_in(j) = interaction_find_link &
              (state%trace%interaction_t, sf_int, sf_out_i)
```

```
        end do
        i_out = [(i, i = n_vir + 1, n_tot)]
        call state%expr%setup_subevt (state%trace%interaction_t, &
             i_beam, i_in, i_out, f_beam, f_in, f_out)
        state%has_expr = .true.
     end subroutine connected_state_setup_subevt
```

Initialize the variable list specific for this state/term. We insert event variables
(`sqrts_hat`) and link the process variable list. The variable list acquires pointers
to subobjects of `state`, which must therefore have a `target` attribute.
⟨*Parton states: connected state: TBP*⟩+≡
```
     procedure :: setup_var_list => connected_state_setup_var_list
```

⟨*Parton states: procedures*⟩+≡
```
     subroutine connected_state_setup_var_list (state, process_var_list, beam_data)
       class(connected_state_t), intent(inout), target :: state
       type(var_list_t), intent(in), target :: process_var_list
       type(beam_data_t), intent(in) :: beam_data
       call state%expr%setup_vars (beam_data%get_sqrts ())
       call state%expr%link_var_list (process_var_list)
     end subroutine connected_state_setup_var_list
```

Allocate the cut expression etc.
⟨*Parton states: connected state: TBP*⟩+≡
```
     procedure :: setup_cuts => connected_state_setup_cuts
     procedure :: setup_scale => connected_state_setup_scale
     procedure :: setup_fac_scale => connected_state_setup_fac_scale
     procedure :: setup_ren_scale => connected_state_setup_ren_scale
     procedure :: setup_weight => connected_state_setup_weight
```

⟨*Parton states: procedures*⟩+≡
```
     subroutine connected_state_setup_cuts (state, ef_cuts)
       class(connected_state_t), intent(inout), target :: state
       class(expr_factory_t), intent(in) :: ef_cuts
       call state%expr%setup_selection (ef_cuts)
     end subroutine connected_state_setup_cuts

     subroutine connected_state_setup_scale (state, ef_scale)
       class(connected_state_t), intent(inout), target :: state
       class(expr_factory_t), intent(in) :: ef_scale
       call state%expr%setup_scale (ef_scale)
     end subroutine connected_state_setup_scale

     subroutine connected_state_setup_fac_scale (state, ef_fac_scale)
       class(connected_state_t), intent(inout), target :: state
       class(expr_factory_t), intent(in) :: ef_fac_scale
       call state%expr%setup_fac_scale (ef_fac_scale)
     end subroutine connected_state_setup_fac_scale

     subroutine connected_state_setup_ren_scale (state, ef_ren_scale)
       class(connected_state_t), intent(inout), target :: state
       class(expr_factory_t), intent(in) :: ef_ren_scale
       call state%expr%setup_ren_scale (ef_ren_scale)
     end subroutine connected_state_setup_ren_scale
```

```
    subroutine connected_state_setup_weight (state, ef_weight)
      class(connected_state_t), intent(inout), target :: state
      class(expr_factory_t), intent(in) :: ef_weight
      call state%expr%setup_weight (ef_weight)
    end subroutine connected_state_setup_weight
```

Reset the expression object: invalidate the subevt.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: reset_expressions => connected_state_reset_expressions
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_reset_expressions (state)
      class(connected_state_t), intent(inout) :: state
      if (state%has_expr)  call state%expr%reset_contents ()
    end subroutine connected_state_reset_expressions
```

31.2.6 Evaluation

Transfer momenta to the trace evaluator and fill the `subevt` with this effective
kinematics, if applicable.

Note: we may want to apply a boost for the `subevt`.

⟨*Parton states: parton state: TBP*⟩+≡
```
    procedure :: receive_kinematics => parton_state_receive_kinematics
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine parton_state_receive_kinematics (state)
      class(parton_state_t), intent(inout), target :: state
      if (state%has_trace) then
         call state%trace%receive_momenta ()
         select type (state)
         class is (connected_state_t)
            if (state%has_expr) then
               call state%expr%fill_subevt (state%trace%interaction_t)
            end if
         end select
      end if
    end subroutine parton_state_receive_kinematics
```

Recover kinematics: We assume that the trace evaluator is filled with momenta.
Send those momenta back to the sources, then fill the variables and subevent
as above.

The incoming momenta of the connected state are not connected to the
isolated state but to the beam interaction. Therefore, the incoming momenta
within the isolated state do not become defined, yet. Instead, we reconstruct
the beam (and ISR) momentum configuration.

⟨*Parton states: parton state: TBP*⟩+≡
```
    procedure :: send_kinematics => parton_state_send_kinematics
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine parton_state_send_kinematics (state)
      class(parton_state_t), intent(inout), target :: state
      if (state%has_trace) then
         call interaction_send_momenta (state%trace%interaction_t)
         select type (state)
         class is (connected_state_t)
            call state%expr%fill_subevt (state%trace%interaction_t)
         end select
      end if
    end subroutine parton_state_send_kinematics
```

Evaluate the expressions. The routine evaluates first the cut expression. If
the event passes, it evaluates the other expressions. Where no expressions are
defined, default values are inserted.

⟨*Parton states: connected state: TBP*⟩+≡
```
    procedure :: evaluate_expressions => connected_state_evaluate_expressions
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine connected_state_evaluate_expressions (state, passed, &
         scale, fac_scale, ren_scale, weight, scale_forced, force_evaluation)
      class(connected_state_t), intent(inout) :: state
      logical, intent(out) :: passed
      real(default), intent(out) :: scale, fac_scale, ren_scale, weight
      real(default), intent(in), allocatable, optional :: scale_forced
      logical, intent(in), optional :: force_evaluation
      if (state%has_expr) then
         call state%expr%evaluate (passed, scale, fac_scale, ren_scale, weight, &
              scale_forced, force_evaluation)
      end if
    end subroutine connected_state_evaluate_expressions
```

Evaluate the structure-function chain, if it is allocated explicitly. The argument
is the factorization scale.

   If the chain is merely a pointer, the chain should already be evaluated at
this point.

⟨*Parton states: isolated state: TBP*⟩+≡
```
    procedure :: evaluate_sf_chain => isolated_state_evaluate_sf_chain
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine isolated_state_evaluate_sf_chain (state, fac_scale)
      class(isolated_state_t), intent(inout) :: state
      real(default), intent(in) :: fac_scale
      if (state%sf_chain_is_allocated)  call state%sf_chain_eff%evaluate (fac_scale)
    end subroutine isolated_state_evaluate_sf_chain
```

Evaluate the trace.

⟨*Parton states: parton state: TBP*⟩+≡
```
    procedure :: evaluate_trace => parton_state_evaluate_trace
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine parton_state_evaluate_trace (state)
      class(parton_state_t), intent(inout) :: state
```

```
      if (state%has_trace) call state%trace%evaluate ()
    end subroutine parton_state_evaluate_trace
```

⟨*Parton states: parton state: TBP*⟩+≡
```
    procedure :: evaluate_matrix => parton_state_evaluate_matrix
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine parton_state_evaluate_matrix (state)
      class(parton_state_t), intent(inout) :: state
      if (state%has_matrix) call state%matrix%evaluate ()
    end subroutine parton_state_evaluate_matrix
```

Evaluate the extra evaluators that we need for physical events.

⟨*Parton states: parton state: TBP*⟩+≡
```
    procedure :: evaluate_event_data => parton_state_evaluate_event_data
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine parton_state_evaluate_event_data (state, only_momenta)
      class(parton_state_t), intent(inout) :: state
      logical, intent(in), optional :: only_momenta
      logical :: only_mom
      only_mom = .false.; if (present (only_momenta)) only_mom = only_momenta
      select type (state)
      type is (connected_state_t)
         if (state%has_flows_sf) then
            call state%flows_sf%receive_momenta ()
            if (.not. only_mom) call state%flows_sf%evaluate ()
         end if
      end select
      if (state%has_matrix) then
         call state%matrix%receive_momenta ()
         if (.not. only_mom) call state%matrix%evaluate ()
      end if
      if (state%has_flows) then
         call state%flows%receive_momenta ()
         if (.not. only_mom) call state%flows%evaluate ()
      end if
    end subroutine parton_state_evaluate_event_data
```

Normalize the helicity density matrix by its trace, i.e., factor out the trace and put it into an overall normalization factor. The trace and flow evaluators are unchanged.

⟨*Parton states: parton state: TBP*⟩+≡
```
    procedure :: normalize_matrix_by_trace => &
         parton_state_normalize_matrix_by_trace
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine parton_state_normalize_matrix_by_trace (state)
      class(parton_state_t), intent(inout) :: state
      if (state%has_matrix) call state%matrix%normalize_by_trace ()
    end subroutine parton_state_normalize_matrix_by_trace
```

31.2.7 Accessing the state

Three functions return a pointer to the event-relevant interactions.

⟨*Parton states: parton state: TBP*⟩+≡
```
procedure :: get_trace_int_ptr => parton_state_get_trace_int_ptr
procedure :: get_matrix_int_ptr => parton_state_get_matrix_int_ptr
procedure :: get_flows_int_ptr => parton_state_get_flows_int_ptr
```

⟨*Parton states: procedures*⟩+≡
```
function parton_state_get_trace_int_ptr (state) result (ptr)
  class(parton_state_t), intent(in), target :: state
  type(interaction_t), pointer :: ptr
  if (state%has_trace) then
     ptr => state%trace%interaction_t
  else
     ptr => null ()
  end if
end function parton_state_get_trace_int_ptr

function parton_state_get_matrix_int_ptr (state) result (ptr)
  class(parton_state_t), intent(in), target :: state
  type(interaction_t), pointer :: ptr
  if (state%has_matrix) then
     ptr => state%matrix%interaction_t
  else
     ptr => null ()
  end if
end function parton_state_get_matrix_int_ptr

function parton_state_get_flows_int_ptr (state) result (ptr)
  class(parton_state_t), intent(in), target :: state
  type(interaction_t), pointer :: ptr
  if (state%has_flows) then
     ptr => state%flows%interaction_t
  else
     ptr => null ()
  end if
end function parton_state_get_flows_int_ptr
```

Return the indices of the beam particles and the outgoing particles within the trace (and thus, matrix and flows) evaluator, respectively.

⟨*Parton states: connected state: TBP*⟩+≡
```
procedure :: get_beam_index => connected_state_get_beam_index
procedure :: get_in_index => connected_state_get_in_index
```

⟨*Parton states: procedures*⟩+≡
```
subroutine connected_state_get_beam_index (state, i_beam)
  class(connected_state_t), intent(in) :: state
  integer, dimension(:), intent(out) :: i_beam
  call state%expr%get_beam_index (i_beam)
end subroutine connected_state_get_beam_index

subroutine connected_state_get_in_index (state, i_in)
  class(connected_state_t), intent(in) :: state
  integer, dimension(:), intent(out) :: i_in
```

```
      call state%expr%get_in_index (i_in)
    end subroutine connected_state_get_in_index
```

⟨*Parton states: public*⟩+≡
```
    public :: refill_evaluator
```

⟨*Parton states: procedures*⟩+≡
```
    subroutine refill_evaluator (sqme, qn, flv_index, evaluator)
      complex(default), intent(in), dimension(:) :: sqme
      type(quantum_numbers_t), intent(in), dimension(:,:) :: qn
      integer, intent(in), dimension(:), optional :: flv_index
      type(evaluator_t), intent(inout) :: evaluator
      integer :: i, i_flv
      do i = 1, size (sqme)
         if (present (flv_index)) then
            i_flv = flv_index(i)
         else
            i_flv = i
         end if
         call evaluator%add_to_matrix_element (qn(:,i_flv), sqme(i), &
              match_only_flavor = .true.)
      end do
    end subroutine refill_evaluator
```

Return the number of outgoing (hard) particles for the state.

⟨*Parton states: parton state: TBP*⟩+≡
```
    procedure :: get_n_out => parton_state_get_n_out
```

⟨*Parton states: procedures*⟩+≡
```
    function parton_state_get_n_out (state) result (n)
      class(parton_state_t), intent(in), target :: state
      integer :: n
      n = state%trace%get_n_out ()
    end function parton_state_get_n_out
```

31.3   Process component management

This module contains tools for managing and combining process components
and matrix-element code and values, acting at a level below the actual process
definition.

31.3.1   Abstract base type

The types introduced here are abstract base types.

⟨pcm_base.f90⟩≡
  ⟨*File header*⟩

  module pcm_base

  ⟨*Use kinds*⟩
    use io_units

```
  use diagnostics
  use format_utils, only: write_integer_array
  use format_utils, only: write_separator
  use physics_defs, only: BORN, NLO_REAL
⟨Use strings⟩
  use os_interface, only: os_data_t

  use process_libraries, only: process_component_def_t
  use process_libraries, only: process_library_t

  use prc_core_def
  use prc_core

  use variables, only: var_list_t
  use mappings, only: mapping_defaults_t
  use phs_base, only: phs_config_t
  use phs_forests, only: phs_parameters_t
  use mci_base, only: mci_t
  use model_data, only: model_data_t
  use models, only: model_t

  use blha_config, only: blha_master_t
  use blha_olp_interfaces, only: blha_template_t
  use process_config
  use process_mci, only: process_mci_entry_t
```

⟨*Standard module head*⟩

⟨*PCM base: public*⟩

⟨*PCM base: parameters*⟩

⟨*PCM base: types*⟩

⟨*PCM base: interfaces*⟩

```
  contains
```

⟨*PCM base: procedures*⟩

```
  end module pcm_base
```

31.3.2 Core management

This object holds information about the cores used by the components and allocates the corresponding manager instance.

i_component is the index of the process component which this core belongs to. The pointer to the core definition is a convenient help in configuring the core itself.

We allow for a **blha_config** configuration object that covers BLHA cores. The BLHA standard is suitable generic to warrant support outside of specific type extension (i.e., applies to LO and NLO if requested). The BLHA configuration is allocated only if the core requires it.

⟨*PCM base: public*⟩≡
```
    public :: core_entry_t
```

⟨*PCM base: types*⟩≡
```
    type :: core_entry_t
       integer :: i_component = 0
       logical :: active = .false.
       class(prc_core_def_t), pointer :: core_def => null ()
       type(blha_template_t), allocatable :: blha_config
       class(prc_core_t), allocatable :: core
     contains
     ⟨PCM base: core entry: TBP⟩
     end type core_entry_t
```

⟨*PCM base: core entry: TBP*⟩≡
```
    procedure :: get_core_ptr => core_entry_get_core_ptr
```

⟨*PCM base: procedures*⟩≡
```
    function core_entry_get_core_ptr (core_entry) result (core)
      class(core_entry_t), intent(in), target :: core_entry
      class(prc_core_t), pointer :: core
      if (allocated (core_entry%core)) then
         core => core_entry%core
      else
         core => null ()
      end if
    end function core_entry_get_core_ptr
```

Configure the core object after allocation with correct type. The `core_def`
object pointer and the index `i_component` of the associated process component
are already there.

⟨*PCM base: core entry: TBP*⟩+≡
```
    procedure :: configure => core_entry_configure
```

⟨*PCM base: procedures*⟩+≡
```
    subroutine core_entry_configure (core_entry, lib, id)
      class(core_entry_t), intent(inout) :: core_entry
      type(process_library_t), intent(in), target :: lib
      type(string_t), intent(in) :: id
      call core_entry%core%init &
           (core_entry%core_def, lib, id, core_entry%i_component)
    end subroutine core_entry_configure
```

31.3.3 Process component manager

This object may hold process and method-specific data, and it should allocate
the corresponding manager instance.

The number of components determines the `component_selected` array.

`i_phs_config` is a lookup table that returns the PHS configuration index for
a given component index.

    `i_core` is a lookup table that returns the core-entry index for a given component index.

⟨PCM base: public⟩+≡
```
    public :: pcm_t
```

⟨PCM base: types⟩+≡
```
    type, abstract :: pcm_t
       logical :: initialized = .false.
       logical :: has_pdfs = .false.
       integer :: n_components = 0
       integer :: n_cores = 0
       integer :: n_mci = 0
       logical, dimension(:), allocatable :: component_selected
       logical, dimension(:), allocatable :: component_active
       integer, dimension(:), allocatable :: i_phs_config
       integer, dimension(:), allocatable :: i_core
       integer, dimension(:), allocatable :: i_mci
       type(blha_template_t) :: blha_defaults
       logical :: uses_blha = .false.
       type(os_data_t) :: os_data
    contains
    ⟨PCM base: pcm: TBP⟩
    end type pcm_t
```

The factory method. We use the `inout` intent, so calling this again is an error.

⟨PCM base: pcm: TBP⟩≡
```
    procedure(pcm_allocate_instance), deferred :: allocate_instance
```

⟨PCM base: interfaces⟩≡
```
    abstract interface
       subroutine pcm_allocate_instance (pcm, instance)
         import
         class(pcm_t), intent(in) :: pcm
         class(pcm_instance_t), intent(inout), allocatable :: instance
       end subroutine pcm_allocate_instance
    end interface
```

⟨PCM base: pcm: TBP⟩+≡
```
    procedure(pcm_is_nlo), deferred :: is_nlo
```

⟨PCM base: interfaces⟩+≡
```
    abstract interface
       function pcm_is_nlo (pcm) result (is_nlo)
          import
          logical :: is_nlo
          class(pcm_t), intent(in) :: pcm
       end function pcm_is_nlo
    end interface
```

⟨PCM base: pcm: TBP⟩+≡
```
    procedure(pcm_final), deferred :: final
```

⟨*PCM base: interfaces*⟩+≡

```
abstract interface
   subroutine pcm_final (pcm)
      import
      class(pcm_t), intent(inout) :: pcm
   end subroutine pcm_final
end interface
```

31.3.4 Initialization methods

The PCM has the duty to coordinate and configure the process-object components.

Initialize the PCM configuration itself, using environment data.

⟨*PCM base: pcm: TBP*⟩+≡

```
procedure(pcm_init), deferred :: init
```

⟨*PCM base: interfaces*⟩+≡

```
abstract interface
   subroutine pcm_init (pcm, env, meta)
      import
      class(pcm_t), intent(out) :: pcm
      type(process_environment_t), intent(in) :: env
      type(process_metadata_t), intent(in) :: meta
   end subroutine pcm_init
end interface
```

Initialize the BLHA configuration block, the component-independent default settings. This is to be called by pcm_init. We use the provided variable list.

This block is filled regardless of whether BLHA is actually used, because why not? We use a default value for the scheme (not set in unit tests).

⟨*PCM base: pcm: TBP*⟩+≡

```
procedure :: set_blha_defaults => pcm_set_blha_defaults
```

⟨*PCM base: procedures*⟩+≡

```
subroutine pcm_set_blha_defaults (pcm, polarized_beams, var_list)
  class(pcm_t), intent(inout) :: pcm
  type(var_list_t), intent(in) :: var_list
  logical, intent(in) :: polarized_beams
  logical :: muon_yukawa_off
  real(default) :: top_yukawa
  type(string_t) :: ew_scheme
  muon_yukawa_off = &
       var_list%get_lval (var_str ("?openloops_switch_off_muon_yukawa"))
  top_yukawa = &
       var_list%get_rval (var_str ("blha_top_yukawa"))
  ew_scheme = &
       var_list%get_sval (var_str ("$blha_ew_scheme"))
  if (ew_scheme == "")  ew_scheme = "Gmu"
  call pcm%blha_defaults%init &
       (polarized_beams, muon_yukawa_off, top_yukawa, ew_scheme)
end subroutine pcm_set_blha_defaults
```

Read the method settings from the variable list and store them in the BLHA master. The details depend on the `pcm` concrete type.

⟨*PCM base: pcm: TBP*⟩+≡
```
    procedure(pcm_set_blha_methods), deferred :: set_blha_methods
```

⟨*PCM base: interfaces*⟩+≡
```
    abstract interface
       subroutine pcm_set_blha_methods (pcm, blha_master, var_list)
         import
         class(pcm_t), intent(in) :: pcm
         type(blha_master_t), intent(inout) :: blha_master
         type(var_list_t), intent(in) :: var_list
       end subroutine pcm_set_blha_methods
    end interface
```

Produce the LO and NLO flavor-state tables (as far as available), as appropriate for BLHA configuration. We may inspect either the PCM itself or the array of process cores.

⟨*PCM base: pcm: TBP*⟩+≡
```
    procedure(pcm_get_blha_flv_states), deferred :: get_blha_flv_states
```

⟨*PCM base: interfaces*⟩+≡
```
    abstract interface
       subroutine pcm_get_blha_flv_states (pcm, core_entry, flv_born, flv_real)
         import
         class(pcm_t), intent(in) :: pcm
         type(core_entry_t), dimension(:), intent(in) :: core_entry
         integer, dimension(:,:), allocatable, intent(out) :: flv_born
         integer, dimension(:,:), allocatable, intent(out) :: flv_real
       end subroutine pcm_get_blha_flv_states
    end interface
```

Allocate the right number of process components. The number is also stored in the process meta. Initially, all components are active but none are selected.

⟨*PCM base: pcm: TBP*⟩+≡
```
    procedure :: allocate_components => pcm_allocate_components
```

⟨*PCM base: procedures*⟩+≡
```
    subroutine pcm_allocate_components (pcm, comp, meta)
      class(pcm_t), intent(inout) :: pcm
      type(process_component_t), dimension(:), allocatable, intent(out) :: comp
      type(process_metadata_t), intent(in) :: meta
      pcm%n_components = meta%n_components
      allocate (comp (pcm%n_components))
      allocate (pcm%component_selected (pcm%n_components), source = .false.)
      allocate (pcm%component_active (pcm%n_components), source = .true.)
    end subroutine pcm_allocate_components
```

Each process component belongs to a category/type, which we identify by a universal integer constant. The categories can be taken from the process definition. For easy lookup, we store the categories in an array.

⟨*PCM base: pcm: TBP*⟩+≡
```
    procedure(pcm_categorize_components), deferred :: categorize_components
```

4335

⟨*PCM base: interfaces*⟩+≡

```
abstract interface
   subroutine pcm_categorize_components (pcm, config)
     import
     class(pcm_t), intent(inout) :: pcm
     type(process_config_data_t), intent(in) :: config
   end subroutine pcm_categorize_components
end interface
```

Allocate the right number and type(s) of process-core objects, i.e., the interface object between the process and matrix-element code.

Within the `pcm` block, also associate cores with components and store relevant configuration data, including the `i_core` lookup table.

⟨*PCM base: pcm: TBP*⟩+≡

```
procedure(pcm_allocate_cores), deferred :: allocate_cores
```

⟨*PCM base: interfaces*⟩+≡

```
abstract interface
   subroutine pcm_allocate_cores (pcm, config, core_entry)
     import
     class(pcm_t), intent(inout) :: pcm
     type(process_config_data_t), intent(in) :: config
     type(core_entry_t), dimension(:), allocatable, intent(out) :: core_entry
   end subroutine pcm_allocate_cores
end interface
```

Generate and interface external code for a single core, if this is required.

⟨*PCM base: pcm: TBP*⟩+≡

```
procedure(pcm_prepare_any_external_code), deferred :: &
     prepare_any_external_code
```

⟨*PCM base: interfaces*⟩+≡

```
abstract interface
   subroutine pcm_prepare_any_external_code &
        (pcm, core_entry, i_core, libname, model, var_list)
     import
     class(pcm_t), intent(in) :: pcm
     type(core_entry_t), intent(inout) :: core_entry
     integer, intent(in) :: i_core
     type(string_t), intent(in) :: libname
     type(model_data_t), intent(in), target :: model
     type(var_list_t), intent(in) :: var_list
   end subroutine pcm_prepare_any_external_code
end interface
```

Prepare the BLHA configuration for a core object that requires it. This does not affect the core object, which may not yet be allocated.

⟨*PCM base: pcm: TBP*⟩+≡

```
procedure(pcm_setup_blha), deferred :: setup_blha
```

⟨*PCM base: interfaces*⟩+≡

```
abstract interface
   subroutine pcm_setup_blha (pcm, core_entry)
```

```
                import
                class(pcm_t), intent(in) :: pcm
                type(core_entry_t), intent(inout) :: core_entry
            end subroutine pcm_setup_blha
        end interface
```

Configure the BLHA interface for a core object that requires it. This is separate
from the previous method, assuming that the `pcm` has to allocate the actual cores
and acquire some data in-between.

⟨*PCM base: pcm: TBP*⟩+≡
```
        procedure(pcm_prepare_blha_core), deferred :: prepare_blha_core
```

⟨*PCM base: interfaces*⟩+≡
```
        abstract interface
            subroutine pcm_prepare_blha_core (pcm, core_entry, model)
                import
                class(pcm_t), intent(in) :: pcm
                type(core_entry_t), intent(inout) :: core_entry
                class(model_data_t), intent(in), target :: model
            end subroutine pcm_prepare_blha_core
        end interface
```

Allocate and configure the MCI (multi-channel integrator) records and their
relation to process components, appropriate for the algorithm implemented by
`pcm`.

Create a `mci_t` template: the procedure `dispatch_mci` is called as a factory
method for allocating the `mci_t` object with a specific concrete type. The call
may depend on the concrete `pcm` type.

⟨*PCM base: public*⟩+≡
```
        public :: dispatch_mci_proc
```

⟨*PCM base: interfaces*⟩+≡
```
        abstract interface
            subroutine dispatch_mci_proc (mci, var_list, process_id, is_nlo)
                import
                class(mci_t), allocatable, intent(out) :: mci
                type(var_list_t), intent(in) :: var_list
                type(string_t), intent(in) :: process_id
                logical, intent(in), optional :: is_nlo
            end subroutine dispatch_mci_proc
        end interface
```

⟨*PCM base: pcm: TBP*⟩+≡
```

      end subroutine pcm_call_dispatch_mci
   end interface
```

Proceed with PCM configuration based on the core and component configuration data. Base version is empty.

⟨*PCM base: pcm: TBP*⟩+≡
```
   procedure(pcm_complete_setup), deferred :: complete_setup
```

⟨*PCM base: interfaces*⟩+≡
```
   abstract interface
      subroutine pcm_complete_setup (pcm, core_entry, component, model)
         import
         class(pcm_t), intent(inout) :: pcm
         type(core_entry_t), dimension(:), intent(in) :: core_entry
         type(process_component_t), dimension(:), intent(inout) :: component
         type(model_t), intent(in), target :: model
      end subroutine pcm_complete_setup
   end interface
```

Retrieve information

Return the core index that belongs to a particular component.

⟨*PCM base: pcm: TBP*⟩+≡
```
   procedure :: get_i_core => pcm_get_i_core
```

⟨*PCM base: procedures*⟩+≡
```
   function pcm_get_i_core (pcm, i_component) result (i_core)
     class(pcm_t), intent(in) :: pcm
     integer, intent(in) :: i_component
     integer :: i_core
     if (allocated (pcm%i_core)) then
        i_core = pcm%i_core(i_component)
     else
        i_core = 0
     end if
   end function pcm_get_i_core
```

Phase-space configuration

Allocate and initialize the right number and type(s) of phase-space configuration entries. The `i_phs_config` lookup table must be set accordingly.

⟨*PCM base: pcm: TBP*⟩+≡
```
    procedure(pcm_init_phs_config), deferred :: init_phs_config
```

⟨*PCM base: interfaces*⟩+≡
```
    abstract interface
       subroutine pcm_init_phs_config &
            (pcm, phs_entry, meta, env, phs_par, mapping_defs)
         import
         class(pcm_t), intent(inout) :: pcm
         type(process_phs_config_t), &
              dimension(:), allocatable, intent(out) :: phs_entry
         type(process_metadata_t), intent(in) :: meta
         type(process_environment_t), intent(in) :: env

⟨*Process: types*⟩+≡
```
    type :: process_results_t
       private
    end type process_results_t
```

31.4.3 The process type

A process object is the workspace for the process instance. After initialization, its contents are filled by integration passes which shape the integration grids and compute cross sections. Processes are set up initially from user-level configuration data. After calculating integrals and thus developing integration grid data, the program may use a process object or a copy of it for the purpose of generating events.

The process object consists of several subobjects with their specific purposes. The corresponding types are defined below. (Technically, the subobject type definitions have to come before the process type definition, but with NOWEB magic we reverse this order here.)

The `type` determines whether we are considering a decay or a scattering process.

The `meta` object describes the process and its environment. All contents become fixed when the object is initialized.

The `config` object holds physical and technical configuration data that have been obtained during process initialization, and which are common to all process components.

The individual process components are configured in the `component` objects. These objects contain more configuration parameters and workspace, as needed for the specific process variant.

The `term` objects describe parton configurations which are technically used as phase-space points. Each process component may split into several terms with distinct kinematics and particle content. Furthermore, each term may project on a different physical state, e.g., by particle recombination. The `term` object provides the framework for this projection, for applying cuts, weight, and thus completing the process calculation.

The `beam_config` object describes the incoming particles, either the decay mother or the scattering beams. It also contains the structure-function information.

The `mci_entry` objects configure a MC input parameter set and integrator, each. The number of parameters depends on the process component and on the beam and structure-function setup.

The `pcm` component is the process-component manager. This polymorphic object manages and hides the details of dealing with NLO processes where several components have to be combined in a non-trivial way. It also acts as an abstract factory for the corresponding object in `process_instance`, which does the actual work for this matter.

⟨*Process: public*⟩≡

31.4.4 Process pointer

Wrapper type for storing pointers to process objects in arrays.

⟨*Process: public*⟩+≡
```
    public :: process_ptr_t
```

⟨*Process: types*⟩+≡
```
    type :: process_ptr_t
       type(process_t), pointer :: p => null ()
    end type process_ptr_t
```

31.4.5 Output

This procedure is an important debugging and inspection tool; it is not used during normal operation. The process object is written to a file (identified by unit, which may also be standard output). Optional flags determine whether we show everything or just the interesting parts.

The shorthand as a traditional TBP.

⟨*Process: process: TBP*⟩≡
```
    procedure :: write => process_write
```

⟨*Process: procedures*⟩≡
```
    subroutine process_write (process, screen, unit, &
        show_os_data, show_var_list, show_rng, show_expressions, pacify)
      class(process_t), intent(in) :: process
      logical, intent(in) :: screen
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: show_os_data
      logical, intent(in), optional :: show_var_list
      logical, intent(in), optional :: show_rng
      logical, intent(in), optional :: show_expressions
      logical, intent(in), optional :: pacify
      integer :: u, iostat
      character(0) :: iomsg
      integer, dimension(:), allocatable :: v_list
      u = given_output_unit (unit)
      allocate (v_list (0))
      call set_flag (v_list, F_SHOW_OS_DATA, show_os_data)
      call set_flag (v_list, F_SHOW_VAR_LIST, show_var_list)
      call set_flag (v_list, F_SHOW_RNG, show_rng)
      call set_flag (v_list, F_SHOW_EXPRESSIONS, show_expressions)
      call set_flag (v_list, F_PACIFY, pacify)
      if (screen) then
         call process%write_formatted (u, "LISTDIRECTED", v_list, iostat, iomsg)
      else
         call process%write_formatted (u, "DT", v_list, iostat, iomsg)
      end if
    end subroutine process_write
```

Standard DTIO procedure with binding.

For the particular application, the screen format is triggered by the `LISTDIRECTED` option for the `iotype` format editor string. The other options activate when the particular parameter value is found in `v_list`.

NOTE: The DTIO `generic` binding is supported by gfortran since 7.0.

TODO wk 2018: The default could be to show everything, and we should have separate switches for all major parts. Currently, there are only a few.

⟨*Process: process: TBP*⟩+≡

Finalizer. Explicitly iterate over all subobjects that may contain allocated pointers.

TODO wk 2018 (workaround): The finalizer for the `config_data` component is not called. The reason is that this deletes model data local to the process, but these could be referenced by pointers (flavor objects) from some persistent event record. Obviously, such side effects should be avoided, but this requires refactoring the event-handling procedures.

⟨*Process: process: TBP*⟩+≡

    end subroutine process_final
```

Process setup

Initialize a process. We need a process library `lib` and the process identifier `proc_id` (string). We will fetch the current run ID from the variable list `var_list`.

We collect all important data from the environment and store them in the appropriate places. OS data, model, and variable list are copied into `env` (true snapshot), also the process library (pointer only).

The `meta` subobject is initialized with process ID and attributes taken from the process library.

We initialize the `config` subobject with all data that are relevant for this run, using the settings from `env`. These data determine the MD5 sum for this run, which allows us to identify the setup and possibly skips in a later re-run.

We also allocate and initialize the embedded RNG factory. We take the seed from the `var_list`, and we should return the `var_list` to the caller with a new seed.

Finally, we allocate the process component manager `pcm`, which implements the chosen algorithm for process integration. The first task of the manager is to allocate the component array and to determine the component categories (e.g., Born/Virtual etc.).

TODO wk 2018: The `pcm` dispatcher should be provided by the caller, if we eventually want to eliminate dependencies on concrete `pcm_t` extensions.

⟨*Process: process: TBP*⟩+≡

        end associate
      end associate
    end subroutine process_init
```

31.4.6 Process component manager

The `pcm` (read: process-component manager) takes the responsibility of steering the actual algorithm of configuration and integration. Depending on the concrete type, different algorithms can be implemented.

The first version of this supports just two implementations: leading-order (tree-level) integration and event generation, and NLO (QCD/FKS subtraction). We thus can start with a single logical for steering the dispatcher.

TODO wk 2018: Eventually, we may eliminate all references to the extensions of `pcm_t` from this module and therefore move this outside the module as well.

⟨*Process: procedures*⟩+≡
```
    subroutine dispatch_pcm (pcm, is_nlo)
      class(pcm_t), allocatable, intent(out) :: pcm
      logical, intent(in) :: is_nlo
      if (.not. is_nlo) then
         allocate (pcm_default_t :: pcm)
      else
         allocate (pcm_nlo_t :: pcm)
      end if
    end subroutine dispatch_pcm
```

This step is performed after phase-space and core objects are done: collect all missing information and prepare the process component manager for the appropriate integration algorithm.

⟨*Process: process: TBP*⟩+≡

```
    procedure :: complete_pcm_setup => process_complete_pcm_setup
```

⟨*Process: procedures*⟩+≡
```
    subroutine process_complete_pcm_setup (process)
      class(process_t), intent(inout) :: process
      call process%pcm%complete_setup &
           (process%core_entry, process%component, process%env%get_model_ptr ())
    end subroutine process_complete_pcm_setup
```

31.4.7 Core management

Allocate cores (interface objects to matrix-element code).

The `dispatch_core` procedure is taken as an argument, so we do not depend on the implementation, and thus on the specific core types.

The `helicity_selection` object collects data that the matrix-element code needs for configuring the appropriate behavior.

After the cores have been allocated, and assuming the phs initial configuration has been done before, we proceed with computing the `pcm` internal data.

⟨*Process: process: TBP*⟩+≡
```
    procedure :: setup_cores => process_setup_cores
```

⟨*Process: procedures*⟩+≡
```
    subroutine process_setup_cores (process, dispatch_core, &
         helicity_selection, use_color_factors, has_beam_pol)
      class(process_t), intent(inout) :: process
      procedure(dispatch_core_proc) :: dispatch_core
      type(helicity_selection_t), intent(in), optional :: helicity_selection
      logical, intent(in), optional :: use_color_factors
      logical, intent(in), optional :: has_beam_pol
      integer :: i
      associate (pcm => process%pcm)
        call pcm%allocate_cores (process%config, process%core_entry)
        do i = 1, size (process%core_entry)
           call dispatch_core (process%core_entry(i)%core, &
                process%core_entry(i)%core_def, &
                process%config%model, &
                helicity_selection, &
                process%config%qcd, &
                use_color_factors, &
                has_beam_pol)
           call process%core_entry(i)%configure &
                (process%env%get_lib_ptr (), process%meta%id)
           if (process%core_entry(i)%core%uses_blha ()) then
              call pcm%setup_blha (process%core_entry(i))
           end if
        end do
      end associate
    end subroutine process_setup_cores
```

⟨*Process: interfaces*⟩≡
```
    abstract interface
       subroutine dispatch_core_proc (core, core_def, model, &
```

```
            helicity_selection, qcd, use_color_factors, has_beam_pol)
        import
        class(prc_core_t), allocatable, intent(inout) :: core
        class(prc_core_def_t), intent(in) :: core_def
        class(model_data_t), intent(in), target, optional :: model
        type(helicity_selection_t), intent(in), optional :: helicity_selection
        type(qcd_t), intent(in), optional :: qcd
        logical, intent(in), optional :: use_color_factors
        logical, intent(in), optional :: has_beam_pol
      end subroutine dispatch_core_proc
    end interface
```

Use the `pcm` to initialize the BLHA interface for each core which requires it.

⟨*Process: process: TBP*⟩+≡
```
    procedure :: prepare_blha_cores => process_prepare_blha_cores
```

⟨*Process: procedures*⟩+≡
```
    subroutine process_prepare_blha_cores (process)
      class(process_t), intent(inout), target :: process
      integer :: i
      associate (pcm => process%pcm)
        do i = 1, size (process%core_entry)
          associate (core_entry => process%core_entry(i))
            if (core_entry%core%uses_blha ()) then
              pcm%uses_blha = .true.
              call pcm%prepare_blha_core (core_entry, process%config%model)
            end if
          end associate
        end do
      end associate
    end subroutine process_prepare_blha_cores
```

Create the BLHA interface data, using PCM for specific data, and write the
BLHA contract file(s).

We take various configuration data and copy them to the `blha_master`
record, which then creates and writes the contracts.

For assigning the QCD/QED coupling powers, we inspect the first process
component only. The other parameters are taken as-is from the process envi-
ronment variables.

⟨*Process: process: TBP*⟩+≡

    end subroutine process_create_blha_interface
```

Initialize the process components, one by one. We require templates for the `mci`
(integrator) and `phs_config` (phase-space) configuration data.

The `active` flag is set if the component has an associated matrix element,
so we can compute it. The case of no core is a unit-test case.

The specifics depend on the algorithm and are delegated to the `pcm` process-
component manager.

The optional `phs_config` overrides a pre-generated config array (for unit
test).

Initialize the beam setup. This is the trivial version where the incoming state

of the matrix element coincides with the initial state of the process. For a scattering process, we need the c.m. energy, all other variables are set to their default values (no polarization, lab frame and c.m. frame coincide, etc.)

We assume that all components consistently describe a scattering process, i.e., two incoming particles.

Note: The current layout of the `beam_data_t` record requires that the flavor for each beam is unique. For processes with multiple flavors in the initial state, one has to set up beams explicitly. This restriction could be removed by extending the code in the `beams` module.

    end subroutine process_init_phs_config
```

We complete the kinematics configuration after the beam setup, but before
we configure the chain of structure functions. The reason is that we need the
total energy `sqrts` for the kinematics, but the structure-function setup requires
the number of channels, which depends on the kinematics configuration. For
instance, the kinematics module may return the need for parameterizing an
s-channel resonance.

Insert the structure-function configuration data. First allocate the storage, then insert data one by one. The third procedure declares a mapping (of the MC input parameters) for a specific channel and structure-function combination.

We take the number of channels from the corresponding entry in the `config_data` section.

Otherwise, these a simple wrapper routines. The extra level in the call tree may allow for simple addressing of multiple concurrent beam configurations, not implemented currently.

If we do not want structure functions, we simply do not call those procedures.

⟨*Process: process: TBP*⟩+≡
```
    procedure :: init_sf_chain => process_init_sf_chain
    generic :: set_sf_channel => set_sf_channel_single

```

```
      end do
   end subroutine process_set_sf_channel_array
```

Notify about the structure-function setup.

⟨Process: process: TBP⟩+≡
```
   procedure :: sf_startup_message => process_sf_startup_message
```

⟨Process: procedures⟩+≡
```
   subroutine process_sf_startup_message (process, sf_string, unit)
     class(process_t), intent(in) :: process
     type(string_t), intent(in) :: sf_string
     integer, intent(in), optional :: unit
     call process%beam_config%sf_startup_message (sf_string, unit)
   end subroutine process_sf_startup_message
```

As soon as both the kinematics configuration and the structure-function setup are complete, we match parameterizations (channels) for both. The matching entries are (re)set in the `component` phase-space configuration, while the structure-function configuration is left intact.

⟨Process: process: TBP⟩+≡
```
   procedure :: collect_channels => process_collect_channels
```

⟨Process: procedures⟩+≡
```
   subroutine process_collect_channels (process, coll)
     class(process_t), intent(inout) :: process
     type(phs_channel_collection_t), intent(inout) :: coll
     integer :: i
     do i = 1, process%meta%n_components
        associate (component => process%component(i))
          if (component%active) &
             call component%collect_channels (coll)
        end associate
     end do
   end subroutine process_collect_channels
```

Independently, we should be able to check if any component does not contain phase-space parameters. Such a process can only be integrated if there are structure functions.

⟨Process: process: TBP⟩+≡
```
   procedure :: contains_trivial_component => process_contains_trivial_component
```

⟨Process: procedures⟩+≡
```
   function process_contains_trivial_component (process) result (flag)
     class(process_t), intent(in) :: process

    end subroutine process_set_ren_scale

    subroutine process_set_weight (process, ef_weight)
      class(process_t), intent(inout) :: process
      class(expr_factory_t), intent(in) :: ef_weight
      allocate (process%config%ef_weight, source = ef_weight)
    end subroutine process_set_weight
```

MD5 sum

The MD5 sum of the process object should reflect the state completely, including integration results. It is used for checking the integrity of event files. This global checksum includes checksums for the various parts. In particular, the MCI object receives a checksum that includes the configuration of all configuration parts relevant for an individual integration. This checksum is used for checking the integrity of integration grids.

We do not need MD5 sums for the process terms, since these are generated from the component definitions.

⟨*Process: process: TBP*⟩+≡
```
procedure :: compute_md5sum => process_compute_md5sum
```

⟨*Process: procedures*⟩+≡
```
subroutine process_compute_md5sum (process)
  class(process_t), intent(inout) :: process

```

31.4.8 Default iterations

If the user does not specify the passes and iterations for integration, we should
be able to give reasonable defaults. These depend on the process, therefore
we implement the following procedures as methods of the process object. The
algorithm is not very sophisticated yet, it may be improved by looking at the
process in more detail.

We investigate only the first process component, assuming that it character-
izes the complexity of the process reasonable well.

The number of passes is limited to two: one for adaption, one for integration.

⟨*Process: process: TBP*⟩+≡
```
  procedure :: get_n_pass_default => process_get_n_pass_default
  procedure :: adapt_grids_default => process_adapt_grids_default
  procedure :: adapt_weights_default => process_adapt_weights_default
```

⟨*Process: procedures*⟩+≡
```
  function process_get_n_pass_default (process) result (n_pass)
    class(process_t), intent(in) :: process
    integer :: n_pass
    integer :: n_eff
    type(process_component_def_t), pointer :: config
    config => process%component(1)%config
    n_eff = config%get_n_tot () - 2
    select case (n_eff)
    case (1)
       n_pass = 1
    case default
       n_pass = 2
    end select
  end function process_get_n_pass_default

  function process_adapt_grids_default (process, pass) result (flag)
    class(process_t), intent(in) :: process
    integer, intent(in) :: pass
    logical :: flag
    integer :: n_eff
    type(process_component_def_t), pointer :: config
    config => process%component(1)%config
    n_eff = config%get_n_tot () - 2
    select case (n_eff)
    case (1)
       flag = .false.
    case default
       select case (pass)
       case (1);  flag = .true.
       case (2);  flag = .false.
       case default
          call msg_bug ("adapt grids default: impossible pass index")
       end select
    end select
  end function process_adapt_grids_default

  function process_adapt_weights_default (process, pass) result (flag)
    class(process_t), intent(in) :: process
```

```
      integer, intent(in) :: pass
      logical :: flag
      integer :: n_eff
      type(process_component_def_t), pointer :: config
      config => process%component(1)%config
      n_eff = config%get_n_tot () - 2
      select case (n_eff)
      case (1)
         flag = .false.
      case default
         select case (pass)
         case (1);  flag = .true.
         case (2);  flag = .false.
         case default
            call msg_bug ("adapt weights default: impossible pass index")
         end select
      end select
   end function process_adapt_weights_default
```

The number of iterations and calls per iteration depends on the number of outgoing particles.

⟨*Process: process: TBP*⟩+≡
```

         case (6);   n_calls = 100000
         case (7:);  n_calls = 200000
         end select
      end select
    end function process_get_n_calls_default
```

31.4.9   Constant process data

Manually set the Run ID (unit test only).

⟨*Process: process: TBP*⟩+≡
```
    procedure :: set_run_id => process_set_run_id
```

⟨*Process: procedures*⟩+≡
```
    subroutine process_set_run_id (process, run_id)
      class(process_t), intent(inout) :: process
      type(string_t), intent(in) :: run_id
      process%meta%run_id = run_id
    end subroutine process_set_run_id
```

The following methods return basic process data that stay constant after initialization.

The process and IDs.

⟨*Process: process: TBP*⟩+≡
```
    procedure :: get_id => process_get_id
    procedure :: get_num_id => process_get_num_id
    procedure :: get_run_id => process_get_run_id
    procedure :: get_library_name => process_get_library_name
```

⟨*Process: procedures*⟩+≡
```
    function process_get_id (process) result (id)
      class(process_t), intent(in) :: process
```

```
      type(string_t) :: id
      id = process%meta%id
   end function process_get_id

   function process_get_num_id (process) result (id)
     class(process_t), intent(in) :: process
     integer :: id
     id = process%meta%num_id
   end function process_get_num_id

   function process_get_run_id (process) result (id)
     class(process_t), intent(in) :: process
     type(string_t) :: id
     id = process%meta%run_id
   end function process_get_run_id

   function process_get_library_name (process) result (id)
     class(process_t), intent(in) :: process
     type(string_t) :: id
     id = process%meta%lib_name
   end function process_get_library_name
```

The number of incoming particles.
⟨*Process: process: TBP*⟩+≡
```
   procedure :: get_n_in => process_get_n_in
```
⟨*Process: procedures*⟩+≡
```
   function process_get_n_in (process) result (n)
     class(process_t), intent(in) :: process
     integer :: n
     n = process%config%n_in
   end function process_get_n_in
```

The number of MCI data sets.
⟨*Process: process: TBP*⟩+≡
```
   procedure :: get_n_mci => process_get_n_mci
```
⟨*Process: procedures*⟩+≡
```
   function process_get_n_mci (process) result (n)
     class(process_t), intent(in) :: process
     integer :: n
     n = process%config%n_mci
   end function process_get_n_mci
```

The number of process components, total.
⟨*Process: process: TBP*⟩+≡
```
   procedure :: get_n_components => process_get_n_components
```
⟨*Process: procedures*⟩+≡
```
   function process_get_n_components (process) result (n)
     class(process_t), intent(in) :: process
     integer :: n
     n = process%meta%n_components
   end function process_get_n_components
```

The number of process terms, total.

⟨*Process: process: TBP*⟩+≡
```
procedure :: get_n_terms => process_get_n_terms
```

⟨*Process: procedures*⟩+≡
```
function process_get_n_terms (process) result (n)
  class(process_t), intent(in) :: process
  integer :: n
  n = process%config%n_terms
end function process_get_n_terms
```

Return the indices of the components that belong to a specific MCI entry.

⟨*Process: process: TBP*⟩+≡
```
procedure :: get_i_component => process_get_i_component
```

⟨*Process: procedures*⟩+≡
```
subroutine process_get_i_component (process, i_mci, i_component)
  class(process_t), intent(in) :: process
  integer, intent(in) :: i_mci
  integer, dimension(:), intent(out), allocatable :: i_component
  associate (mci_entry => process%mci_entry(i_mci))
    allocate (i_component (size (mci_entry%i_component)))
    i_component = mci_entry%i_component
  end associate
end subroutine process_get_i_component
```

Return the ID of a specific component.

⟨*Process: process: TBP*⟩+≡
```
procedure :: get_component_id => process_get_component_id
```

⟨*Process: procedures*⟩+≡
```
function process_get_component_id (process, i_component) result (id)
  class(process_t), intent(in) :: process
  integer, intent(in) :: i_component
  type(string_t) :: id
  id = process%meta%component_id(i_component)
end function process_get_component_id
```

Return a pointer to the definition of a specific component.

⟨*Process: process: TBP*⟩+≡
```
procedure :: get_component_def_ptr => process_get_component_def_ptr

    end subroutine process_make_rng
```

31.4.10 Compute an amplitude

Each process variant should allow for computing an amplitude value directly, without generating a process instance.

The process component is selected by the index `i`. The term within the process component is selected by `j`. The momentum combination is transferred as the array `p`. The function sets the specific quantum state via the indices of a flavor `f`, helicity `h`, and color `c` combination. Each index refers to the list of flavor, helicity, and color states, respectively, as stored in the process data.

Optionally, we may set factorization and renormalization scale. If unset, the partonic c.m. energy is inserted.

The function checks arguments for validity. For invalid arguments (quantum states), we return zero.

⟨*Process: process: TBP*⟩+≡

```
    procedure :: compute_amplitude => process_compute_amplitude
```

⟨*Process: procedures*⟩+≡

```
    function process_compute_amplitude &

⟨*Standard module head*⟩

⟨*Process config: public*⟩

⟨*Process config: parameters*⟩

⟨*Process config: types*⟩

```
  contains
```

⟨*Process config: procedures*⟩

```
  end module process_config
```

Identifiers for the NLO setup.

⟨*Process config: parameters*⟩≡
```
      integer, parameter, public :: COMP_DEFAULT = 0
      integer, parameter, public :: COMP_REAL_FIN = 1
      integer, parameter, public :: COMP_MASTER = 2
      integer, parameter, public :: COMP_VIRT = 3
      integer, parameter, public :: COMP_REAL = 4
      integer, parameter, public :: COMP_REAL_SING = 5
      integer, parameter, public :: COMP_MISMATCH = 6
      integer, parameter, public :: COMP_PDF = 7
      integer, parameter, public :: COMP_SUB = 8
      integer, parameter, public :: COMP_RESUM = 9
```

31.5.1   Output selection flags

We declare a number of identifiers for write methods, so they only displays
selected parts. The identifiers can be supplied to the `vlist` array argument of
the standard F2008 derived-type writer call.

⟨*Process config: parameters*⟩+≡
```
      integer, parameter, public :: F_PACIFY = 1
      integer, parameter, public :: F_SHOW_VAR_LIST = 11
      integer, parameter, public :: F_SHOW_EXPRESSIONS = 12
      integer, parameter, public :: F_SHOW_LIB = 13
      integer, parameter, public :: F_SHOW_MODEL = 14
      integer, parameter, public :: F_SHOW_QCD = 15
      integer, parameter, public :: F_SHOW_OS_DATA = 16
      integer, parameter, public :: F_SHOW_RNG = 17
      integer, parameter, public :: F_SHOW_BEAMS = 18
```

This is a simple function that returns true if a flag value is present in `v_list`, but not its negative. If neither is present, it returns `default`.

⟨*Process config: public*⟩≡
```
    public :: flagged
```

⟨*Process config: procedures*⟩≡
```
    function flagged (v_list, id, def) result (flag)
      logical :: flag
      integer, dimension(:), intent(in) :: v_list
      integer, intent(in) :: id
      logical, intent(in), optional :: def
      logical :: default_result
      default_result = .false.;  if (present (def))  default_result = def
      if (default_result) then
         flag = all (v_list /= -id)
      else
         flag = all (v_list /= -id) .and. any (v_list == id)
      end if
    end function flagged
```

Related: if flag is set (unset), append `value` (its negative) to the `v_list`, respectively. `v_list` must be allocated.

⟨*Process config: public*⟩+≡
```
    public :: set_flag
```

⟨*Process config: procedures*⟩+≡
```
    subroutine set_flag (v_list, value, flag)
      integer, dimension(:), intent(inout), allocatable :: v_list
      integer, intent(in) :: value
      logical, intent(in), optional :: flag
      if (present (flag)) then
         if (flag) then
            v_list = [v_list, value]
         else
            v_list = [v_list, -value]
         end if
      end if
    end subroutine set_flag
```

31.5.2 Generic configuration data

This information concerns physical and technical properties of the process. It is fixed upon initialization, using data from the process specification and the variable list.

The number `n_in` is the number of incoming beam particles, simultaneously the number of incoming partons, 1 for a decay and 2 for a scattering process. (The number of outgoing partons may depend on the process component.)

The number `n_components` is the number of components that constitute the current process.

The number `n_terms` is the number of distinct contributions to the scattering matrix that constitute the current process. Each component may generate several terms.

The number `n_mci` is the number of independent MC integration configurations that this process uses. Distinct process components that share a MCI configuration may be combined pointwise. (Nevertheless, a given MC variable set may correspond to several "nearby" kinematical configurations.) This is also the number of distinct sampling-function results that this process can generate. Process components that use distinct variable sets are added only once after an integration pass has completed.

The `model` pointer identifies the physics model and its parameters. This is a pointer to an external object.

Various `parse_node_t` objects are taken from the SINDARIN input. They encode expressions for evaluating cuts and scales. The workspaces for evaluating those expressions are set up in the `effective_state` subobjects. Note that these are really pointers, so the actual nodes are not stored inside the process object.

The `md5sum` is taken and used to verify the process configuration when re-reading data from file.

⟨*Process config: public*⟩+≡
```
    public :: process_config_data_t
```

⟨*Process config: types*⟩≡
```
    type :: process_config_data_t
      class(process_def_t), pointer :: process_def => null ()
      integer :: n_in = 0
      integer :: n_components = 0
      integer :: n_terms = 0
      integer :: n_mci = 0
      type(string_t) :: model_name
      class(model_data_t), pointer :: model => null ()
      type(qcd_t) :: qcd
      class(expr_factory_t), allocatable :: ef_cuts
      class(expr_factory_t), allocatable :: ef_scale
      class(expr_factory_t), allocatable :: ef_fac_scale
      class(expr_factory_t), allocatable :: ef_ren_scale

      call write_separator (u)
      write (u, "(3x,A,A,A)")  "MD5 sum (config)  = '", config%md5sum, "'"
   end if
```

```
        end subroutine process_config_data_write
```

Initialize. We use information from the process metadata and from the process library, given the process ID. We also store the currently active OS data set.

The model pointer references the model data within the `env` record. That should be an instance of the global model.

We initialize the QCD object, unless the environment information is unavailable (unit tests).

The RNG factory object is imported by moving the allocation.

⟨*Process config: process config data: TBP*⟩+≡
```
        procedure :: init => process_config_data_init
```

⟨*Process config: procedures*⟩+≡
```
    subroutine process_config_data_init (config, meta, env)
      class(process_config_data_t), intent(out) :: config
      type(process_metadata_t), intent(in) :: meta
      type(process_environment_t), intent(in) :: env
      config%process_def => env%lib%get_process_def_ptr (meta%id)
      config%n_in = config%process_def%get_n_in ()

      config%model => env%get_model_ptr ()
      config%model_name = config%model%get_name ()
      if (env%got_var_list ()) then
         call dispatch_qcd &
              (config%qcd, env%get_var_list_ptr (), env%get_os_data ())
      end if
    end subroutine process_config_data_init
```

Current implementation: nothing to finalize.

⟨*Process config: process config data: TBP*⟩+≡
```
        procedure :: final => process_config_data_final
```

⟨*Process config: procedures*⟩+≡
```
    subroutine process_config_data_final (config)
      class(process_config_data_t), intent(inout) :: config
    end subroutine process_config_data_final
```

Return a copy of the QCD data block.

⟨*Process config: process config data: TBP*⟩+≡
```
        procedure :: get_qcd => process_config_data_get_qcd
```

⟨*Process config: procedures*⟩+≡
```
    function process_config_data_get_qcd (config) result (qcd)
      class(process_config_data_t), intent(in) :: config
      type(qcd_t) :: qcd
      qcd = config%qcd
    end function process_config_data_get_qcd
```

Compute the MD5 sum of the configuration data. This encodes, in particular, the model and the expressions for cut, scales, weight, etc. It should not contain the IDs and number of components, etc., since the MD5 sum should be useful for integrating individual components.

This is done only once. If the MD5 sum is nonempty, the calculation is skipped.

⟨*Process config: process config data: TBP*⟩+≡
```
    procedure :: compute_md5sum => process_config_data_compute_md5sum
```

⟨*Process config: procedures*⟩+≡
```
    subroutine process_config_data_compute_md5sum (config)
      class(process_config_data_t), intent(inout) :: config
      integer :: u
      if (config%md5sum == "") then
         u = free_unit ()
         open (u, status = "scratch", action = "readwrite")
         call config%write (u, counters = .false., &
              model = .true., expressions = .true.)
         rewind (u)
         config%md5sum = md5sum (u)
         close (u)
      end if
    end subroutine process_config_data_compute_md5sum
```

⟨*Process config: process config data: TBP*⟩+≡
```
    procedure :: get_md5sum => process_config_data_get_md5sum
```

⟨*Process config: procedures*⟩+≡
```
    pure function process_config_data_get_md5sum (config) result (md5)
      character(32) :: md5

      md5 = config%md5sum
    end function process_config_data_get_md5sum
```

31.5.3 Environment

This record stores a snapshot of the process environment at the point where the process object is created.

Model and variable list are implemented as pointer, so they always have the `target` attribute.

For unit-testing purposes, setting the var list is optional. If not set, the pointer is null.

⟨*Process config: public*⟩+≡
```
    public :: process_environment_t
```

⟨*Process config: types*⟩+≡
```
    type :: process_environment_t
      private
      type(model_t), pointer :: model => null ()
      type(var_list_t), pointer :: var_list => null ()
      logical :: var_list_is_set = .false.
      type(process_library_t), pointer :: lib => null ()
      type(beam_structure_t) :: beam_structure
      type(os_data_t) :: os_data
    contains
    ⟨Process config: process environment: TBP⟩
```

```
      end type process_environment_t
```

Model and local var list are snapshots and need a finalizer.

⟨*Process config: process environment: TBP*⟩≡
```
    procedure :: final => process_environment_final
```

⟨*Process config: procedures*⟩+≡
```
    subroutine process_environment_final (env)
      class(process_environment_t), intent(inout) :: env
      if (associated (env%model)) then
         call env%model%final ()
         deallocate (env%model)
      end if
      if (associated (env%var_list)) then
         call env%var_list%final (follow_link=.true.)
         deallocate (env%var_list)
      end if
    end subroutine process_environment_final
```

Output, DTIO compatible.

⟨*Process config: process environment: TBP*⟩+≡
```
    procedure :: write => process_environment_write
    procedure :: write_formatted => process_environment_write_formatted
    ! generic :: write (formatted) => write_formatted
```

      iostat = 0
  end subroutine process_environment_write_formatted
```

Initialize: Make a snapshot of the provided model. Make a link to the current process library.

Also make a snapshot of the variable list, if provided. If none is provided, there is an empty variable list nevertheless, so a pointer lookup does not return null.

If no beam structure is provided, the beam-structure member is empty and will yield a number of zero beams when queried.

⟨*Process config: process environment: TBP*⟩+≡
```
procedure :: init => process_environment_init
```

⟨*Process config: procedures*⟩+≡
```
subroutine process_environment_init &

      os_data = env%os_data
    end function process_environment_get_os_data
```

31.5.4 Metadata

This information describes the process. It is fixed upon initialization.

The `id` string is the name of the process object, as given by the user. The matrix element generator will use this string for naming Fortran procedures and types, so it should qualify as a Fortran name.

The `num_id` is meaningful if nonzero. It is used for communication with external programs or file standards which do not support string IDs.

The `run_id` string distinguishes among several runs for the same process. It identifies process instances with respect to adapted integration grids and similar run-specific data. The run ID is kept when copying processes for creating instances, however, so it does not distinguish event samples.

The `lib_name` identifies the process library where the process definition and the process driver are located.

The `lib_index` is the index of entry in the process library that corresponds to the current process.

The `component_id` array identifies the individual process components.

The `component_description` is an array of human-readable strings that characterize the process components, for instance `a, b => c, d`.

The `active` mask array marks those components which are active. The others are skipped.

      meta%active(i) = .false.
    end subroutine process_metadata_deactivate_component
```

31.5.5 Phase-space configuration

A process can have a number of independent phase-space configuration entries, depending on the process definition and evaluation algorithm. Each entry holds various configuration-parameter data and the actual `phs_config_t` record, which can vary in concrete type.

⟨*Process config: public*⟩+≡
```
    public :: process_phs_config_t
```

⟨*Process config: types*⟩+≡
```
    type :: process_phs_config_t
      type(phs_parameters_t) :: phs_par
      type(mapping_defaults_t) :: mapping_defs
      class(phs_config_t), allocatable :: phs_config
    contains
    ⟨Process config: process phs config: TBP⟩
    end type process_phs_config_t
```

Output, DTIO compatible.

⟨*Process config: process phs config: TBP*⟩≡
```
    procedure :: write => process_phs_config_write
```

4421

```
    procedure :: write_formatted => process_phs_config_write_formatted
    ! generic :: write (formatted) => write_formatted
```

⟨*Process config: procedures*⟩+≡
```
    subroutine process_phs_config_write (phs_config, unit)
      class(process_phs_config_t), intent(in) :: phs_config
      integer, intent(in), optional :: unit
      integer :: u, iostat
      integer, dimension(:), allocatable :: v_list
      character(0) :: iomsg
      u = given_output_unit (unit)
      allocate (v_list (0))
      call phs_config%write_formatted (u, "LISTDIRECTED", v_list, iostat, iomsg)
    end subroutine process_phs_config_write
```

DTIO standard write.

⟨*Process config: procedures*⟩+≡
```

      end associate
      iostat = 0
    end subroutine process_phs_config_write_formatted
```

31.5.6   Beam configuration

The object `data` holds all details about the initial beam configuration. The allocatable array `sf` holds the structure-function configuration blocks. There are **n_strfun** entries in the structure-function chain (not counting the initial beam object). We maintain **n_channel** independent parameterizations of this chain. If this is greater than zero, we need a multi-channel sampling algorithm, where for each point one channel is selected to generate kinematics.

The number of parameters that are required for generating a structure-function chain is **n_sfpar**.

The flag `azimuthal_dependence` tells whether the process setup is symmetric about the beam axis in the c.m. system. This implies that there is no transversal beam polarization. The flag `lab_is_cm_frame` is obvious.

⟨*Process config: public*⟩+≡
```
    public :: process_beam_config_t
```

⟨*Process config: types*⟩+≡
```
    type :: process_beam_config_t
      type(beam_data_t) :: data
```

```
    integer :: n_strfun = 0
    integer :: n_channel = 1
    integer :: n_sfpar = 0
    type(sf_config_t), dimension(:), allocatable :: sf
    type(sf_channel_t), dimension(:), allocatable :: sf_channel
    logical :: azimuthal_dependence = .false.
    logical :: lab_is_cm_frame = .true.
    character(32) :: md5sum = ""
    logical :: sf_trace = .false.
    type(string_t) :: sf_trace_file
  contains
  ⟨Process config: process beam config: TBP⟩
  end type process_beam_config_t
```

Here we write beam data only if they are actually used.

The verbose flag is passed to the beam-data writer.

⟨*Process config: process beam config: TBP*⟩≡
```
    procedure :: write => process_beam_config_write
```

⟨*Process config: procedures*⟩+≡
```
    subroutine process_beam_config_write (object, unit, verbose)
      class(process_beam_config_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      integer :: u, i, c
      u = given_output_unit (unit)
      call object%data%write (u, verbose = verbose)
      if (object%data%initialized) then

```

31.5.7 Process components

A process component is an individual contribution to a process (scattering or decay) which needs not be physical. The sum over all components should be physical.

The `index` indentifies this component within its parent process.

The actual process component is stored in the `core` subobject. We use a polymorphic subobject instead of an extension of `process_component_t`, because the individual entries in the array of process components can have different types. In short, `process_component_t` is a wrapper for the actual process variants.

If the `active` flag is false, we should skip this component. This happens if the associated process has vanishing matrix element.

The index array `i_term` points to the individual terms generated by this component. The indices refer to the parent process.

The index `i_mci` is the index of the MC integrator and parameter set which are associated to this process component.

⟨*Process config: public*⟩+≡
```
    public :: process_component_t
```

⟨*Process config: types*⟩+≡
```
    type :: process_component_t
      type(process_component_def_t), pointer :: config => null ()
      integer :: index = 0
      logical :: active = .false.
      integer, dimension(:), allocatable :: i_term
      integer :: i_mci = 0
      class(phs_config_t), allocatable :: phs_config
      character(32) :: md5sum_phs = ""
      integer :: component_type = COMP_DEFAULT
    contains
    ⟨Process config: process component: TBP⟩
    end type process_component_t
```

Finalizer. The MCI template may (potentially) need a finalizer. The process configuration finalizer may include closing an open scratch file.

⟨*Process config: process component: TBP*⟩≡
```
    procedure :: final => process_component_final
```

⟨*Process config: procedures*⟩+≡
```
    subroutine process_component_final (object)
      class(process_component_t), intent(inout) :: object
      if (allocated (object%phs_config)) then
        call object%phs_config%final ()
      end if
    end subroutine process_component_final
```

The meaning of `verbose` depends on the process variant.

```

31.5.8 Process terms

For straightforward tree-level calculations, each process component corresponds to a unique elementary interaction. However, in the case of NLO calculations with subtraction terms, a process component may split into several separate contributions to the scattering, which are qualified by interactions with distinct kinematics and particle content. We represent their configuration as

`process_term_t` objects, the actual instances will be introduced below as `term_instance_t`. In any case, the process term contains an elementary interaction with a definite quantum-number and momentum content.

The index `i_term_global` identifies the term relative to the process.

The index `i_component` identifies the process component which generates this term, relative to the parent process.

The index `i_term` identifies the term relative to the process component (not the process).

The `data` subobject holds all process constants.

The number of allowed flavor/helicity/color combinations is stored as `n_allowed`. This is the total number of independent entries in the density matrix. For each combination, the index of the flavor, helicity, and color state is stored in the arrays `flv`, `hel`, and `col`, respectively.

The flag `rearrange` is true if we need to rearrange the particles of the hard interaction, to obtain the effective parton state.

The interaction `int` holds the quantum state for the (resolved) hard interaction, the parent-child relations of the particles, and their momenta. The momenta are not filled yet; this is postponed to copies of `int` which go into the process instances.

If recombination is in effect, we should allocate `int_eff` to describe the rearranged partonic state.

This type is public only for use in a unit test.

⟨*Process config: public*⟩+≡
```
    public :: process_term_t
```

⟨*Process config: types*⟩+≡
```
    type :: process_term_t
       integer :: i_term_global = 0
       integer :: i_component = 0
       integer :: i_term = 0
       integer :: i_sub = 0
       integer :: i_core = 0
       integer :: n_allowed = 0
       type(process_constants_t) :: data
       real(default) :: alpha_s = 0
       integer, dimension(:), allocatable :: flv, hel, col
       integer :: n_sub, n_sub_color, n_sub_spin
       type(interaction_t) :: int
       type(interaction_t), pointer :: int_eff => null ()
     contains
     ⟨Process config: process term: TBP⟩
    end type process_term_t
```

For the output, we skip the process constants and the tables of allowed quantum numbers. Those can also be read off from the interaction object.

⟨*Process config: process term: TBP*⟩≡

         end if
         write (u, "(1x,A1,1x,I0,2x)", advance="no")  sgn, i
         call quantum_numbers_write (it%get_quantum_numbers (), u)
         write (u, *)
         call it%advance ()
      end do
    end subroutine process_term_write_state_summary
```

Finalizer: the `int` and potentially `int_eff` components have a finalizer that we
must call.

⟨*Process config: process term: TBP*⟩+≡
```
      procedure :: final => process_term_final
```

⟨*Process config: procedures*⟩+≡
```
    subroutine process_term_final (term)
      class(process_term_t), intent(inout) :: term
      call term%int%final ()
    end subroutine process_term_final
```

Initialize the term. We copy the process constants from the `core` object and set up the `int` hard interaction accordingly.

The `alpha_s` value is useful for writing external event records. This is the constant value which may be overridden by a event-specific running value. If the model does not contain the strong coupling, the value is zero.

The `rearrange` part is commented out; this or something equivalent could become relevant for NLO algorithms.

⟨*Process config: process term: TBP*⟩+≡
```
    procedure :: init => process_term_init
```

⟨*Process config: procedures*⟩+≡
```
    subroutine process_term_init &
        (term, i_term_global, i_component, i_term, core, model, &
         nlo_type, use_beam_pol, subtraction_method, &
         has_pdfs, n_emitters)
      class(process_term_t), intent(inout), target :: term
      integer, intent(in) :: i_term_global
      integer, intent(in) :: i_component
      integer, intent(in) :: i_term
      class(prc_core_t), intent(inout) :: core
      class(model_data_t), intent(in), target :: model
      integer, intent(in), optional :: nlo_type
      logical, intent(in), optional :: use_beam_pol
      type(string_t), intent(in), optional :: subtraction_method
      logical, intent(in), optional :: has_pdfs
      integer, intent(in), optional :: n_emitters
      class(modelpar_data_t), pointer :: alpha_s_ptr
      logical :: use_internal_color
      term%i_term_global = i_term_global
      term%i_component = i_component
      term%i_term = i_term
      call core%get_constants (term%data, i_term)
      alpha_s_ptr => model%get_par_data_ptr (var_str ("alphas"))
      if (associated (alpha_s_ptr)) then
         term%alpha_s = alpha_s_ptr%get_real ()
      else
         term%alpha_s = -1
      end if
      use_internal_color = .false.
      if (present (subtraction_method)) &
           use_internal_color = (char (subtraction_method) == 'omega') &
           .or. (char (subtraction_method) == 'threshold')
      call term%setup_interaction (core, model, nlo_type = nlo_type, &
           pol_beams = use_beam_pol, use_internal_color = use_internal_color, &
           has_pdfs = has_pdfs, n_emitters = n_emitters)
    end subroutine process_term_init
```

We fetch the process constants which determine the quantum numbers and use those to create the interaction. The interaction contains incoming and outgoing particles, no virtuals. The incoming particles are parents of the outgoing ones.

Keeping previous WHIZARD conventions, we invert the color assignment (but not flavor or helicity) for the incoming particles. When the color-flow square matrix is evaluated, this inversion is done again, so in the color-flow sequence we get the color assignments of the matrix element.

Why are these four subtraction entries for structure-function aware interactions? Taking the soft or collinear limit of the real-emission matrix element, the behavior of the parton energy fractions has to be taken into account. In the pure real case, $x_\oplus$ and $x_\ominus$ are given by

$$x_\oplus = \frac{\bar{x}_\oplus}{\sqrt{1-\xi}}\sqrt{\frac{2-\xi(1-y)}{2-\xi(1+y)}}, \quad x_\ominus = \frac{\bar{x}_\ominus}{\sqrt{1-\xi}}\sqrt{\frac{2-\xi(1+y)}{2-\xi(1-y)}}.$$

In the soft limit, $\xi \to 0$, this yields $x_\oplus = \bar{x}_\oplus$ and $x_\ominus = \bar{x}_\ominus$. In the collinear limit, $y \to 1$, it is $x_\oplus = \bar{x}_\oplus/(1-\xi)$ and $x_\ominus = \bar{x}_\ominus$. Likewise, in the anti-collinear limit $yo - 1$, the inverse relation holds. We therefore have to distinguish four cases with the PDF assignments $f(x_\oplus) \cdot f(x_\ominus)$, $f(\bar{x}_\oplus) \cdot f(\bar{x}_\ominus)$, $f(\bar{x}_\oplus/(1-\xi)) \cdot f(\bar{x}_\ominus)$ and $f(\bar{x}_\oplus) \cdot f(\bar{x}_\ominus/(1-\xi))$.

The n_emitters optional argument is provided by the caller if this term requires spin-correlated matrix elements, and thus involves additional subtractions.

⟨*Process config: process term: TBP*⟩+≡
```
    procedure :: get_process_constants => process_term_get_process_constants
```

⟨*Process config: procedures*⟩+≡
```
    subroutine process_term_get_process_constants &
        (term, prc_constants)
      class(process_term_t), intent(inout) :: term
      type(process_constants_t), intent(out) :: prc_constants
      prc_constants = term%data
    end subroutine process_term_get_process_constants
```

31.6   Process call statistics

Very simple object for statistics. Could be moved to a more basic chapter.

⟨`process_counter.f90`⟩≡
```
  ⟨File header⟩

  module process_counter

    use io_units

  ⟨Standard module head⟩

  ⟨Process counter: public⟩

  ⟨Process counter: parameters⟩

  ⟨Process counter: types⟩

  contains

  ⟨Process counter: procedures⟩

  end module process_counter
```

This object can record process calls, categorized by evaluation status. It is a part of the `mci_entry` component below.

⟨*Process counter: public*⟩≡
```
    public :: process_counter_t
```

⟨*Process counter: types*⟩≡
```
    type :: process_counter_t
       integer :: total = 0
       integer :: failed_kinematics = 0
       integer :: failed_cuts = 0
       integer :: has_passed = 0
       integer :: evaluated = 0
       integer :: complete = 0
```

```
    contains
    ⟨Process counter: process counter: TBP⟩
  end type process_counter_t
```

Here are the corresponding numeric codes:

⟨*Process counter: parameters*⟩≡
```
    integer, parameter, public :: STAT_UNDEFINED = 0
    integer, parameter, public :: STAT_INITIAL = 1
    integer, parameter, public :: STAT_ACTIVATED = 2
    integer, parameter, public :: STAT_BEAM_MOMENTA = 3
    integer, parameter, public :: STAT_FAILED_KINEMATICS = 4
    integer, parameter, public :: STAT_SEED_KINEMATICS = 5
    integer, parameter, public :: STAT_HARD_KINEMATICS = 6
    integer, parameter, public :: STAT_EFF_KINEMATICS = 7
    integer, parameter, public :: STAT_FAILED_CUTS = 8
    integer, parameter, public :: STAT_PASSED_CUTS = 9
    integer, parameter, public :: STAT_EVALUATED_TRACE = 10
    integer, parameter, public :: STAT_EVENT_COMPLETE = 11
```

Output.

⟨*Process counter: process counter: TBP*⟩≡
```
    procedure :: write => process_counter_write
```

⟨*Process counter: procedures*⟩≡
```
    subroutine process_counter_write (object, unit)
      class(process_counter_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      if (object%total > 0) then
         write (u, "(1x,A)")  "Call statistics (current run):"
         write (u, "(3x,A,I0)")  "total       = ", object%total
         write (u, "(3x,A,I0)")  "failed kin. = ", object%failed_kinematics
         write (u, "(3x,A,I0)")  "failed cuts = ", object%failed_cuts
         write (u, "(3x,A,I0)")  "passed cuts = ", object%has_passed
         write (u, "(3x,A,I0)")  "evaluated   = ", object%evaluated
      else
         write (u, "(1x,A)")  "Call statistics (current run): [no calls]"
      end if
    end subroutine process_counter_write
```

Reset. Just enforce default initialization.

⟨*Process counter: process counter: TBP*⟩+≡
```
    procedure :: reset => process_counter_reset
```

⟨*Process counter: procedures*⟩+≡
```
    subroutine process_counter_reset (counter)
      class(process_counter_t), intent(out) :: counter
      counter%total = 0
      counter%failed_kinematics = 0
      counter%failed_cuts = 0
      counter%has_passed = 0
      counter%evaluated = 0
```

```
      counter%complete = 0
    end subroutine process_counter_reset
```

We record an event according to the lowest status code greater or equal to the
actual status. This is actually done by the process instance; the process object
just copies the instance counter.

⟨*Process counter: process counter: TBP*⟩+≡
```
    procedure :: record => process_counter_record
```

⟨*Process counter: procedures*⟩+≡
```
    subroutine process_counter_record (counter, status)
      class(process_counter_t), intent(inout) :: counter
      integer, intent(in) :: status
      if (status <= STAT_FAILED_KINEMATICS) then
         counter%failed_kinematics = counter%failed_kinematics + 1
      else if (status <= STAT_FAILED_CUTS) then
         counter%failed_cuts = counter%failed_cuts + 1
      else if (status <= STAT_PASSED_CUTS) then
         counter%has_passed = counter%has_passed + 1
      else
         counter%evaluated = counter%evaluated + 1
      end if
      counter%total = counter%total + 1
    end subroutine process_counter_record
```

31.7   Multi-channel integration

⟨process_mci.f90⟩≡

```

  ⟨*Standard module head*⟩

⟨*Process mci: public*⟩

⟨*Process mci: parameters*⟩

⟨*Process mci: types*⟩

```
contains
```

⟨*Process mci: procedures*⟩

```
end module process_mci
```

31.7.1 Process MCI entry

The `process_mci_entry_t` block contains, for each process component that is integrated independently, the configuration data for its MC input parameters. Each input parameter set is handled by a `mci_t` integrator.

The MC input parameter set is broken down into the parameters required by the structure-function chain and the parameters required by the phase space of the elementary process.

The MD5 sum collects all information about the associated processes that may affect the integration. It does not contain the MCI object itself or integration results.

MC integration is organized in passes. Each pass may consist of several iterations, and for each iteration there is a number of calls. We store explicitly the values that apply to the current pass. Previous values are archived in the `results` object.

The `counter` receives the counter statistics from the associated process instance, for diagnostics.

The `results` object records results, broken down in passes and iterations.

⟨*Process mci: public*⟩≡
```
    public :: process_mci_entry_t
```

⟨*Process mci: types*⟩≡
```
    type :: process_mci_entry_t
        integer :: i_mci = 0
        integer, dimension(:), allocatable :: i_component
        integer :: process_type = PRC_UNKNOWN
        integer :: n_par = 0
        integer :: n_par_sf = 0
        integer :: n_par_phs = 0
        character(32) :: md5sum = ""
        integer :: pass = 0
        integer :: n_it = 0
        integer :: n_calls = 0
        logical :: activate_timer = .false.
        real(default) :: error_threshold = 0
        class(mci_t), allocatable :: mci
        type(process_counter_t) :: counter
        type(integration_results_t) :: results
        logical :: negative_weights = .false.
```

```
   logical :: combined_integration = .false.
   integer :: real_partition_type = REAL_FULL
   integer :: associated_real_component = 0
 contains
 ⟨Process mci: process mci entry: TBP⟩
end type process_mci_entry_t
```

Finalizer for the `mci` component.

⟨*Process mci: process mci entry: TBP*⟩≡
```
   procedure :: final => process_mci_entry_final
```

⟨*Process mci: procedures*⟩≡
```
   subroutine process_mci_entry_final (object)
     class(process_mci_entry_t), intent(inout) :: object
     if (allocated (object%mci))  call object%mci%final ()
   end subroutine process_mci_entry_final
```

Output. Write pass/iteration information only if set (the pass index is nonzero).
Write the MCI block only if it exists (for some self-tests it does not). Write
results only if there are any.

⟨*Process mci: process mci entry: TBP*⟩+≡

Configure the MCI entry. This is intent(inout) since some specific settings may be done before this. The actual `mci_t` object is an instance of the `mci_template` argument, which determines the concrete types.

In a unit-test context, the `mci_template` argument may be unallocated.

We obtain the number of channels and the number of parameters, separately for the structure-function chain and for the associated process component. We assume that the phase-space object has already been configured.

We assume that there is only one process component directly associated with a MCI entry.

     call mci_entry%mci%sampler_test (mci_sampler, n_calls)
   end subroutine process_mci_entry_sampler_test
```

Integrate.

The integrate method counts as an integration pass; the pass count is increased by one. We transfer the pass parameters (number of iterations and number of calls) to the actual integration routine.

The mci_entry is intent(inout) because the integrator contains the random-number state.

Note: The results are written to screen and to logfile. This behavior is hardcoded.

⟨*Process mci: process mci entry: TBP*⟩+≡

   subroutine process_mci_entry_prepare_simulation (mci_entry)
     class(process_mci_entry_t), intent(inout) :: mci_entry
     call mci_entry%mci%prepare_simulation ()
   end subroutine process_mci_entry_prepare_simulation
```

Generate an event. The instance should be initialized, otherwise event generation is directed by the `mci` integrator subobject. The integrator instance is contained in a `mci_work` subobject of the process instance, which simultaneously serves as the sampler object. (We avoid the anti-aliasing rules if we assume that the sampling itself does not involve the integrator instance contained in the process instance.)

Regarding weighted events, we only take events which are valid, which means that they have valid kinematics and have passed cuts. Therefore, we have a rejection loop. For unweighted events, the unweighting routine should already take care of this.

The `keep_failed` flag determines whether events which failed cuts are nevertheless produced, to be recorded with zero weight. Alternatively, failed events are dropped, and this fact is recorded by the counter `n_dropped`.

⟨*Process mci: process mci entry: TBP*⟩+≡

```

⟨Process mci: procedures⟩+≡

```fortran
subroutine mci_work_write (mci_work, unit, testflag)
  class(mci_work_t), intent(in) :: mci_work
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: testflag
  integer :: u, i
  u = given_output_unit (unit)
  write (u, "(1x,A,I0,A)")  "Active MCI instance #", &
       mci_work%config%i_mci, " ="
  write (u, "(2x)", advance="no")
  do i = 1, mci_work%config%n_par
     write (u, "(1x,F7.5)", advance="no")  mci_work%x(i)
     if (i == mci_work%config%n_par_sf) &
          write (u, "(1x,'|')", advance="no")
  end do
  write (u, *)
  if (associated (mci_work%mci)) then
     call mci_work%mci%write (u, pacify = testflag)
     call mci_work%counter%write (u)
  end if
end subroutine mci_work_write
```

The `mci` component may require finalization.

⟨Process mci: mci work: TBP⟩+≡

```fortran
procedure :: final => mci_work_final
```

⟨Process mci: procedures⟩+≡

```fortran
subroutine mci_work_final (mci_work)
  class(mci_work_t), intent(inout) :: mci_work
  if (associated (mci_work%mci)) then
     call mci_work%mci%final ()
     deallocate (mci_work%mci)
  end if
end subroutine mci_work_final
```

Initialize with the maximum length that we will need. Contents are not initialized.

The integrator inside the `mci_entry` object is responsible for allocating and initializing its own instance, which is referred to by a pointer in the `mci_work` object.

⟨Process mci: mci work: TBP⟩+≡

```fortran
procedure :: init => mci_work_init
```

⟨Process mci: procedures⟩+≡

```fortran
subroutine mci_work_init (mci_work, mci_entry)
  class(mci_work_t), intent(out) :: mci_work
  type(process_mci_entry_t), intent(in), target :: mci_entry
  mci_work%config => mci_entry
  allocate (mci_work%x (mci_entry%n_par))
  if (allocated (mci_entry%mci)) then
     call mci_entry%mci%allocate_instance (mci_work%mci)
     call mci_work%mci%init (mci_entry%mci)
  end if
```

```
    end subroutine mci_work_init
```

Set parameters explicitly, either all at once, or separately for the structure-function and process parts.

⟨*Process mci: mci work: TBP*⟩+≡
```
    procedure :: set => mci_work_set
    procedure :: set_x_strfun => mci_work_set_x_strfun
    procedure :: set_x_process => mci_work_set_x_process
```

⟨*Process mci: procedures*⟩+≡
```
    subroutine mci_work_set (mci_work, x)
      class(mci_work_t), intent(inout) :: mci_work
      real(default), dimension(:), intent(in) :: x
      mci_work%x = x
    end subroutine mci_work_set

    subroutine mci_work_set_x_strfun (mci_work, x)
      class(mci_work_t), intent(inout) :: mci_work
      real(default), dimension(:), intent(in) :: x
      mci_work%x(1 : mci_work%config%n_par_sf) = x
    end subroutine mci_work_set_x_strfun

    subroutine mci_work_set_x_process (mci_work, x)
      class(mci_work_t), intent(inout) :: mci_work
      real(default), dimension(:), intent(in) :: x
      mci_work%x(mci_work%config%n_par_sf + 1 : mci_work%config%n_par) = x
    end subroutine mci_work_set_x_process
```

Return the array of active components, i.e., those that correspond to the currently selected MC parameter set.

⟨*Process mci: mci work: TBP*⟩+≡
```
    procedure :: get_active_components => mci_work_get_active_components
```

⟨*Process mci: procedures*⟩+≡
```
    function mci_work_get_active_components (mci_work) result (i_component)
      class(mci_work_t), intent(in) :: mci_work
      integer, dimension(:), allocatable :: i_component
      allocate (i_component (size (mci_work%config%i_component)))
      i_component = mci_work%config%i_component
    end function mci_work_get_active_components
```

Return the active parameters as a simple array with correct length. Do this separately for the structure-function parameters and the process parameters.

⟨*Process mci: mci work: TBP*⟩+≡
```
    procedure :: get_x_strfun => mci_work_get_x_strfun
    procedure :: get_x_process => mci_work_get_x_process
```

⟨*Process mci: procedures*⟩+≡
```
    pure function mci_work_get_x_strfun (mci_work) result (x)
      class(mci_work_t), intent(in) :: mci_work
      real(default), dimension(mci_work%config%n_par_sf) :: x
      x = mci_work%x(1 : mci_work%config%n_par_sf)
    end function mci_work_get_x_strfun
```

```
    pure function mci_work_get_x_process (mci_work) result (x)
      class(mci_work_t), intent(in) :: mci_work
      real(default), dimension(mci_work%config%n_par_phs) :: x
      x = mci_work%x(mci_work%config%n_par_sf + 1 : mci_work%config%n_par)
    end function mci_work_get_x_process
```

Initialize and finalize event generation for the specified MCI entry. This also
resets the counter.

⟨*Process mci: mci work: TBP*⟩+≡
```
    procedure :: init_simulation => mci_work_init_simulation
    procedure :: final_simulation => mci_work_final_simulation
```

⟨*Process mci: procedures*⟩+≡
```
    subroutine mci_work_init_simulation (mci_work, safety_factor, keep_failed_events)
      class(mci_work_t), intent(inout) :: mci_work
      real(default), intent(in), optional :: safety_factor
      logical, intent(in), optional :: keep_failed_events
      call mci_work%mci%init_simulation (safety_factor)
      call mci_work%counter%reset ()
      if (present (keep_failed_events)) &
         mci_work%keep_failed_events = keep_failed_events
    end subroutine mci_work_init_simulation

    subroutine mci_work_final_simulation (mci_work)
      class(mci_work_t), intent(inout) :: mci_work
      call mci_work%mci%final_simulation ()
    end subroutine mci_work_final_simulation
```

Counter.

⟨*Process mci: mci work: TBP*⟩+≡
```
    procedure :: reset_counter => mci_work_reset_counter
    procedure :: record_call => mci_work_record_call
    procedure :: get_counter => mci_work_get_counter
```

⟨*Process mci: procedures*⟩+≡
```
    subroutine mci_work_reset_counter (mci_work)
      class(mci_work_t), intent(inout) :: mci_work
      call mci_work%counter%reset ()
    end subroutine mci_work_reset_counter

    subroutine mci_work_record_call (mci_work, status)
      class(mci_work_t), intent(inout) :: mci_work
      integer, intent(in) :: status
      call mci_work%counter%record (status)
    end subroutine mci_work_record_call

    pure function mci_work_get_counter (mci_work) result (counter)
      class(mci_work_t), intent(in) :: mci_work
      type(process_counter_t) :: counter
      counter = mci_work%counter
    end function mci_work_get_counter
```

```

31.8.1 Default process component manager

This is the configuration object which has the duty of allocating the corresponding instance. The default version is trivial.

⟨*Pcm: public*⟩≡
```
    public :: pcm_default_t
```
⟨*Pcm: types*⟩≡
```
    type, extends (pcm_t) :: pcm_default_t
     contains
```
⟨*Pcm: pcm default: TBP*⟩
```
    end type pcm_default_t
```

⟨*Pcm: pcm default: TBP*⟩≡
```
    procedure :: allocate_instance => pcm_default_allocate_instance
```
⟨*Pcm: procedures*⟩≡
```
    subroutine pcm_default_allocate_instance (pcm, instance)
      class(pcm_default_t), intent(in) :: pcm
      class(pcm_instance_t), intent(inout), allocatable :: instance
      allocate (pcm_instance_default_t :: instance)
    end subroutine pcm_default_allocate_instance
```

Finalizer: apply to core manager.

⟨*Pcm: pcm default: TBP*⟩+≡
```
    procedure :: final => pcm_default_final
```
⟨*Pcm: procedures*⟩+≡
```
    subroutine pcm_default_final (pcm)

  class(pcm_instance_default_t), intent(inout) :: pcm_instance
end subroutine pcm_instance_default_final
```

31.8.2 Implementations for the default manager

Categorize components. Nothing to do here, all components are of Born type.

⟨*Pcm: pcm default: TBP*⟩+≡
```
procedure :: categorize_components => pcm_default_categorize_components
```

⟨*Pcm: procedures*⟩+≡
```
subroutine pcm_default_categorize_components (pcm, config)
  class(pcm_default_t), intent(inout) :: pcm
  type(process_config_data_t), intent(in) :: config
end subroutine pcm_default_categorize_components
```

Phase-space configuration

Default setup for tree processes: a single phase-space configuration that is valid for all components.

⟨*Pcm: pcm default: TBP*⟩+≡
```
procedure :: init_phs_config => pcm_default_init_phs_config
```

⟨Pcm: procedures⟩+≡
```
    subroutine pcm_default_init_phs_config &
        (pcm, phs_entry, meta, env, phs_par, mapping_defs)
      class(pcm_default_t), intent(inout) :: pcm
      type(process_phs_config_t), &
          dimension(:), allocatable, intent(out) :: phs_entry
      type(process_metadata_t), intent(in) :: meta
      type(process_environment_t), intent(in) :: env
      type(mapping_defaults_t), intent(in) :: mapping_defs
      type(phs_parameters_t), intent(in) :: phs_par
      allocate (phs_entry (1))
      allocate (pcm%i_phs_config (pcm%n_components), source=1)
      call dispatch_phs (phs_entry(1)%phs_config, &
          env%get_var_list_ptr (), &
          env%get_os_data (), &
          meta%id, &
          mapping_defs, phs_par)
    end subroutine pcm_default_init_phs_config
```

Core management

The default component manager assigns one core per component. We allocate
and configure the core objects, using the process-component configuration data.

⟨Pcm: pcm default: TBP⟩+≡
```
    procedure :: allocate_cores => pcm_default_allocate_cores
```

⟨Pcm: procedures⟩+≡
```
    subroutine pcm_default_allocate_cores (pcm, config, core_entry)
      class(pcm_default_t), intent(inout) :: pcm
      type(process_config_data_t), intent(in) :: config
      type(core_entry_t), dimension(:), allocatable, intent(out) :: core_entry
      type(process_component_def_t), pointer :: component_def
      integer :: i
      allocate (pcm%i_core (pcm%n_components), source = 0)
      pcm%n_cores = pcm%n_components
      allocate (core_entry (pcm%n_cores))
      do i = 1, pcm%n_cores
         pcm%i_core(i) = i
         core_entry(i)%i_component = i
         component_def => config%process_def%get_component_def_ptr (i)
         core_entry(i)%core_def => component_def%get_core_def_ptr ()
         core_entry(i)%active = component_def%can_be_integrated ()
      end do
    end subroutine pcm_default_allocate_cores
```

Extra code is required for certain core types (threshold) or if BLHA uses an
external OLP (Born only, this case) for getting its matrix elements.

⟨Pcm: pcm default: TBP⟩+≡
```
    procedure :: prepare_any_external_code => &
        pcm_default_prepare_any_external_code
```

⟨*Pcm: procedures*⟩+≡
```
    subroutine pcm_default_prepare_any_external_code &
        (pcm, core_entry, i_core, libname, model, var_list)
      class(pcm_default_t), intent(in) :: pcm
      type(core_entry_t), intent(inout) :: core_entry
      integer, intent(in) :: i_core
      type(string_t), intent(in) :: libname
      type(model_data_t), intent(in), target :: model
      type(var_list_t), intent(in) :: var_list
      if (core_entry%active) then
        associate (core => core_entry%core)
          if (core%needs_external_code ()) then
            call core%prepare_external_code &
                (core%data%flv_state, &
                var_list, pcm%os_data, libname, model, i_core, .false.)
          end if
        end associate
      end if
    end subroutine pcm_default_prepare_any_external_code
```

Allocate and configure the BLHA record for a specific core, assuming that the
core type requires it. In the default case, this is a Born configuration.

⟨*Pcm: pcm default: TBP*⟩+≡
```
    procedure :: setup_blha => pcm_default_setup_blha
```

⟨*Pcm: procedures*⟩+≡
```
    subroutine pcm_default_setup_blha (pcm, core_entry)
      class(pcm_default_t), intent(in) :: pcm
      type(core_entry_t), intent(inout) :: core_entry
      allocate (core_entry%blha_config, source = pcm%blha_defaults)
      call core_entry%blha_config%set_born ()
    end subroutine pcm_default_setup_blha
```

Apply the configuration, using `pcm` data.

⟨*Pcm: pcm default: TBP*⟩+≡
```
    procedure :: prepare_blha_core => pcm_default_prepare_blha_core
```

⟨*Pcm: procedures*⟩+≡
```
    subroutine pcm_default_prepare_blha_core (pcm, core_entry, model)
      class(pcm_default_t), intent(in) :: pcm
      type(core_entry_t), intent(inout) :: core_entry
      class(model_data_t), intent(in), target :: model
      integer :: n_in
      integer :: n_legs
      integer :: n_flv
      integer :: n_hel
      select type (core => core_entry%core)
      class is (prc_blha_t)
        associate (blha_config => core_entry%blha_config)
          n_in = core%data%n_in
          n_legs = core%data%get_n_tot ()
          n_flv = core%data%n_flv
          n_hel = blha_config%get_n_hel (core%data%flv_state (1:n_in,1), model)
          call core%init_blha (blha_config, n_in, n_legs, n_flv, n_hel)
```

```
      call core%init_driver (pcm%os_data)
    end associate
  end select
end subroutine pcm_default_prepare_blha_core
```

Read the method settings from the variable list and store them in the BLHA master. This version: no NLO flag.

⟨*Pcm: pcm default: TBP*⟩+≡
```
procedure :: set_blha_methods => pcm_default_set_blha_methods
```

⟨*Pcm: procedures*⟩+≡
```
subroutine pcm_default_set_blha_methods (pcm, blha_master, var_list)
  class(pcm_default_t), intent(in) :: pcm
  type(blha_master_t), intent(inout) :: blha_master
  type(var_list_t), intent(in) :: var_list
  call blha_master%set_methods (.false., var_list)
end subroutine pcm_default_set_blha_methods
```

Produce the LO and NLO flavor-state tables (as far as available), as appropriate for BLHA configuration.

The default version looks at the first process core only, to get the Born data. (Multiple cores are thus unsupported.) The NLO flavor table is left unallocated.

⟨*Pcm: pcm default: TBP*⟩+≡
```
procedure :: get_blha_flv_states => pcm_default_get_blha_flv_states
```

⟨*Pcm: procedures*⟩+≡
```
subroutine pcm_default_get_blha_flv_states &
     (pcm, core_entry, flv_born, flv_real)
  class(pcm_default_t), intent(in) :: pcm
  type(core_entry_t), dimension(:), intent(in) :: core_entry
  integer, dimension(:,:), allocatable, intent(out) :: flv_born
  integer, dimension(:,:), allocatable, intent(out) :: flv_real
  flv_born = core_entry(1)%core%data%flv_state
end subroutine pcm_default_get_blha_flv_states
```

Allocate and configure the MCI (multi-channel integrator) records. There is one record per active process component. Second procedure: call the MCI dispatcher with default-setup arguments.

⟨*Pcm: pcm default: TBP*⟩+≡
```
procedure :: setup_mci => pcm_default_setup_mci
procedure :: call_dispatch_mci => pcm_default_call_dispatch_mci
```

⟨*Pcm: procedures*⟩+≡
```
subroutine pcm_default_setup_mci (pcm, mci_entry)
  class(pcm_default_t), intent(inout) :: pcm
  type(process_mci_entry_t), &
       dimension(:), allocatable, intent(out) :: mci_entry
  class(mci_t), allocatable :: mci_template
  integer :: i, i_mci
  pcm%n_mci = count (pcm%component_active)
  allocate (pcm%i_mci (pcm%n_components), source = 0)
  i_mci = 0
  do i = 1, pcm%n_components
```

```
        if (pcm%component_active(i)) then
            i_mci = i_mci + 1
            pcm%i_mci(i) = i_mci
        end if
    end do
    allocate (mci_entry (pcm%n_mci))
  end subroutine pcm_default_setup_mci

  subroutine pcm_default_call_dispatch_mci (pcm, &
          dispatch_mci, var_list, process_id, mci_template)
    class(pcm_default_t), intent(inout) :: pcm
    procedure(dispatch_mci_proc) :: dispatch_mci
    type(var_list_t), intent(in) :: var_list
    type(string_t), intent(in) :: process_id
    class(mci_t), allocatable, intent(out) :: mci_template
    call dispatch_mci (mci_template, var_list, process_id)
  end subroutine pcm_default_call_dispatch_mci
```

Nothing left to do for the default algorithm.

⟨*Pcm: pcm default: TBP*⟩+≡
```
    procedure :: complete_setup => pcm_default_complete_setup
```

⟨*Pcm: procedures*⟩+≡
```
    subroutine pcm_default_complete_setup (pcm, core_entry, component, model)
      class(pcm_default_t), intent(inout) :: pcm
      type(core_entry_t), dimension(:), intent(in) :: core_entry
      type(process_component_t), dimension(:), intent(inout) :: component
      type(model_t), intent(in), target :: model
    end subroutine pcm_default_complete_setup
```

Component management

Initialize a single component. We require all process-configuration blocks, and specific templates for the phase-space and integrator configuration.

We also provide the current component index i and the active flag.

In the default mode, all components are marked as master components.

⟨*Pcm: pcm default: TBP*⟩+≡
```

```

As appropriate for the NLO/FKS algorithm, the category defined by the process, is called `nlo_type`. We refine this by setting the component category `component_type` separately.

The component types `COMP_MISMATCH`, `COMP_PDF`, `COMP_SUB` are set only if the algorithm uses combined integration. Otherwise, they are set to `COMP_DEFAULT`.

The component type `COMP_REAL` is further distinguished between `COMP_REAL_SING` or `COMP_REAL_FIN`, if the algorithm uses real partitions. The former acts as a reference component for the latter, and we always assume that it is the first real component.

Each component is assigned its own core. Exceptions: the finite-real component gets the same core as the singular-real component. The mismatch component gets the same core as the subtraction component.

TODO wk 2018: this convention for real components can be improved. Check whether all component types should be assigned, not just for combined integration.

```

Core management

Allocate the core (matrix-element interface) objects that we will need for evaluation. Every component gets an associated core, except for the real-finite and

mismatch components (if any). Those components are associated with their previous corresponding real-singular and subtraction cores, respectively.

After cores are allocated, configure the region-data block that is maintained by the NLO process-component manager.

⟨*Pcm: pcm nlo: TBP*⟩+≡
```
procedure :: allocate_cores => pcm_nlo_allocate_cores
```

⟨*Pcm: procedures*⟩+≡
```
subroutine pcm_nlo_allocate_cores (pcm, config, core_entry)
  class(pcm_nlo_t), intent(inout) :: pcm
  type(process_config_data_t), intent(in) :: config
  type(core_entry_t), dimension(:), allocatable, intent(out) :: core_entry
      type(process_component_def_t), pointer :: component_def
  integer :: i, i_core
  allocate (pcm%i_core (pcm%n_components), source = 0)
  pcm%n_cores = pcm%n_components &
        - count (pcm%component_type(:) == COMP_REAL_FIN) &
        - count (pcm%component_type(:) == COMP_MISMATCH)
  allocate (core_entry (pcm%n_cores))
  allocate (pcm%nlo_type_core (pcm%n_cores), source = BORN)
  i_core = 0
  do i = 1, pcm%n_components
     select case (pcm%component_type(i))
     case default
        i_core = i_core + 1
        pcm%i_core(i) = i_core
        pcm%nlo_type_core(i_core) = pcm%nlo_type(i)
        core_entry(i_core)%i_component = i
        component_def => config%process_def%get_component_def_ptr (i)
        core_entry(i_core)%core_def => component_def%get_core_def_ptr ()

        case (NLO_REAL, NLO_SUBTRACTION)
           core_entry(i)%active = .true.
        end select
     case (COMP_REAL_FIN)
        pcm%i_core(i) = pcm%i_core(pcm%i_real)
     case (COMP_MISMATCH)
        pcm%i_core(i) = pcm%i_core(pcm%i_sub)
     end select
  end do
 end subroutine pcm_nlo_allocate_cores
```

Extra code is required for certain core types (threshold) or if BLHA uses an external OLP for getting its matrix elements. OMega matrix elements, by definition, do not need extra code. NLO-virtual or subtraction matrix elements always need extra code.

More precisely: for the Born and virtual matrix element, the extra code is accessed only if the component is active. The radiation (real) and the subtraction corrections (singular and finite), extra code is accessed in any case.

The flavor state is taken from the region_data table in the pcm record. We use the Born and real flavor-state tables as appropriate.

⟨*Pcm: pcm nlo: TBP*⟩+≡
```
    procedure :: prepare_any_external_code => &
        pcm_nlo_prepare_any_external_code
```
⟨*Pcm: procedures*⟩+≡
```
    subroutine pcm_nlo_prepare_any_external_code &
        (pcm, core_entry, i_core, libname, model, var_list)

            end if
          end associate
      end if
    end subroutine pcm_nlo_prepare_any_external_code
```

Allocate and configure the BLHA record for a specific core, assuming that the
core type requires it. The configuration depends on the NLO type of the core.

⟨*Pcm: pcm nlo: TBP*⟩+≡
```
    procedure :: setup_blha => pcm_nlo_setup_blha
```
⟨*Pcm: procedures*⟩+≡
```
    subroutine pcm_nlo_setup_blha (pcm, core_entry)
      class(pcm_nlo_t), intent(in) :: pcm
      type(core_entry_t), intent(inout) :: core_entry
      allocate (core_entry%blha_config, source = pcm%blha_defaults)
      select case (pcm%nlo_type(core_entry%i_component))
      case (BORN)
        call core_entry%blha_config%set_born ()
      case (NLO_REAL)
        call core_entry%blha_config%set_real_trees ()
      case (NLO_VIRTUAL)
        call core_entry%blha_config%set_loop ()
      case (NLO_SUBTRACTION)
        call core_entry%blha_config%set_subtraction ()
        call core_entry%blha_config%set_internal_color_correlations ()
      case (NLO_DGLAP)
        call core_entry%blha_config%set_dglap ()
```

```
      end select
    end subroutine pcm_nlo_setup_blha
```

After phase-space configuration data and core entries are available, we fill tables and compute the remaining NLO data that will steer the integration and subtraction algorithm.

There are three parts: recognize a threshold-type process core (if it exists), prepare the region-data tables (always), and prepare for real partitioning (if requested).

The real-component phase space acts as the source for resonance-history information, required for the region data.

⟨*Pcm: pcm nlo: TBP*⟩+≡

```
    procedure :: complete_setup => pcm_nlo_complete_setup
```

⟨*Pcm: procedures*⟩+≡

```
    subroutine pcm_nlo_complete_setup (pcm, core_entry, component, model)
      class(pcm_nlo_t), intent(inout) :: pcm
      type(core_entry_t), dimension(:), intent(in) :: core_entry
      type(process_component_t), dimension(:), intent(inout) :: component
      type(model_t), intent(in), target :: model
      integer :: i
      call pcm%handle_threshold_core (core_entry)
      call pcm%setup_region_data &
           (core_entry, component(pcm%i_real)%phs_config, model)
      call pcm%setup_real_partition ()
    end subroutine pcm_nlo_complete_setup
```

Apply the BLHA configuration to a core object, using the region data from `pcm` for determining the particle content.

⟨*Pcm: pcm nlo: TBP*⟩+≡

```
    procedure :: prepare_blha_core => pcm_nlo_prepare_blha_core
```

⟨*Pcm: procedures*⟩+≡

```
    subroutine pcm_nlo_prepare_blha_core (pcm, core_entry, model)
      class(pcm_nlo_t), intent(in) :: pcm
      type(core_entry_t), intent(inout) :: core_entry
      class(model_data_t), intent(in), target :: model
      integer :: n_in
      integer :: n_legs
      integer :: n_flv
      integer :: n_hel
      select type (core => core_entry%core)
      class is (prc_blha_t)
        associate (blha_config => core_entry%blha_config)
          n_in = core%data%n_in
          select case (pcm%nlo_type(core_entry%i_component))
          case (NLO_REAL)
            n_legs = pcm%region_data%get_n_legs_real ()
            n_flv = pcm%region_data%get_n_flv_real ()
          case default
            n_legs = pcm%region_data%get_n_legs_born ()
            n_flv = pcm%region_data%get_n_flv_born ()
          end select
```

```
          n_hel = blha_config%get_n_hel (core%data%flv_state (1:n_in,1), model)
          call core%init_blha (blha_config, n_in, n_legs, n_flv, n_hel)
          call core%init_driver (pcm%os_data)
        end associate
      end select
    end subroutine pcm_nlo_prepare_blha_core
```

Read the method settings from the variable list and store them in the BLHA master. This version: NLO flag set.

⟨*Pcm: pcm nlo: TBP*⟩+≡
```
    procedure :: set_blha_methods => pcm_nlo_set_blha_methods
```

⟨*Pcm: procedures*⟩+≡
```
    subroutine pcm_nlo_set_blha_methods (pcm, blha_master, var_list)
      class(pcm_nlo_t), intent(in) :: pcm
      type(blha_master_t), intent(inout) :: blha_master
      type(var_list_t), intent(in) :: var_list
      call blha_master%set_methods (.true., var_list)
    end subroutine pcm_nlo_set_blha_methods
```

Produce the LO and NLO flavor-state tables (as far as available), as appropriate for BLHA configuration.

The NLO version copies the tables from the region data inside `pcm`. The core array is not needed.

⟨*Pcm: pcm nlo: TBP*⟩+≡
```
    procedure :: get_blha_flv_states => pcm_nlo_get_blha_flv_states
```

⟨*Pcm: procedures*⟩+≡
```
    subroutine pcm_nlo_get_blha_flv_states &
        (pcm, core_entry, flv_born, flv_real)
      class(pcm_nlo_t), intent(in) :: pcm
      type(core_entry_t), dimension(:), intent(in) :: core_entry
      integer, dimension(:,:), allocatable, intent(out) :: flv_born
      integer, dimension(:,:), allocatable, intent(out) :: flv_real
      call pcm%region_data%get_all_flv_states (flv_born, flv_real)
    end subroutine pcm_nlo_get_blha_flv_states
```

Allocate and configure the MCI (multi-channel integrator) records. The relation depends on the `combined_integration` setting. If we integrate components separately, each component gets its own record, except for the subtraction component. If we do the combination, there is one record for the master (Born) component and a second one for the real-finite component, if present.

Each entry acquires some NLO-specific initialization. Generic configuration follows later.

Second procedure: call the MCI dispatcher with NLO-setup arguments.

⟨*Pcm: pcm nlo: TBP*⟩+≡
```
    procedure :: setup_mci => pcm_nlo_setup_mci
    procedure :: call_dispatch_mci => pcm_nlo_call_dispatch_mci
```

⟨*Pcm: procedures*⟩+≡
```
    subroutine pcm_nlo_setup_mci (pcm, mci_entry)
      class(pcm_nlo_t), intent(inout) :: pcm
```

```fortran
    type(process_mci_entry_t), &

31.9 Kinematics instance

In this data type we combine all objects (instances) necessary for generating (or
recovering) a kinematical configuration. The components work together as an
implementation of multi-channel phase space.

sf_chain is an instance of the structure-function chain. It is used both for
generating kinematics and, after the proper scale has been determined, evalu-
ating the structure function entries.

phs is an instance of the phase space for the elementary process.

The array `f` contains the products of the Jacobians that originate from parameter mappings in the structure-function chain or in the phase space. We allocate this explicitly if either `sf_chain` or `phs` are explicitly allocated, otherwise we can take over a pointer.

All components are implemented as pointers to (anonymous) targets. For each component, there is a flag that tells whether this component is to be regarded as a proper component ('owned' by the object) or as a pointer.

Generate kinematics, given a phase-space channel and a MC parameter set. The main result is the momentum array p, but we also fill the momentum entries in the structure-function chain and the Jacobian-factor array f. Regarding phase space, We fill only the parameter arrays for the selected channel.

⟨*Kinematics: kinematics: TBP*⟩+≡
```
    procedure :: compute_selected_channel => kinematics_compute_selected_channel
```

⟨*Kinematics: procedures*⟩+≡

        end if
      end select
```

```
                end subroutine kinematics_compute_selected_channel
```

Complete kinematics by filling the non-selected phase-space parameter arrays.

⟨*Kinematics: kinematics: TBP*⟩+≡
```
    procedure :: compute_other_channels => kinematics_compute_other_channels
```

⟨*Kinematics: procedures*⟩+≡
```
    subroutine kinematics_compute_other_channels (k, mci_work, phs_channel)
      class(kinematics_t), intent(inout) :: k
      type(mci_work_t), intent(in) :: mci_work
      integer, intent(in) :: phs_channel
      integer :: c, c_sf
      call k%phs%evaluate_other_channels (phs_channel)
      do c = 1, k%n_channel
         c_sf = k%phs%config%get_sf_channel (c)
         k%f(c) = k%sf_chain%get_f (c_sf) * k%phs%get_f (c)
      end do
    end subroutine kinematics_compute_other_channels
```

Just fetch the outgoing momenta of the `sf_chain` subobject, which become the incoming (seed) momenta of the hard interaction.

This is a stripped down-version of the above which we use when recovering kinematics. Momenta are known, but no MC parameters yet.

(We do not use the `get_out_momenta` method of the chain, since this relies on the structure-function interactions, which are not necessary filled here. We do rely on the momenta of the last evaluator in the chain, however.)

⟨*Kinematics: kinematics: TBP*⟩+≡
```
    procedure :: get_incoming_momenta => kinematics_get_incoming_momenta
```

⟨*Kinematics: procedures*⟩+≡
```
    subroutine kinematics_get_incoming_momenta (k, p)
      class(kinematics_t), intent(in) :: k
      type(vector4_t), dimension(:), intent(out) :: p
      type(interaction_t), pointer :: int
      integer :: i
      int => k%sf_chain%get_out_int_ptr ()
      do i = 1, k%n_in
         p(i) = int%get_momentum (k%sf_chain%get_out_i (i))
      end do
    end subroutine kinematics_get_incoming_momenta
```

This inverts the remainder of the above `compute` method. We know the momenta and recover the rest, as far as needed. If we select a channel, we can complete the inversion and reconstruct the MC parameter set.

⟨*Kinematics: kinematics: TBP*⟩+≡
```
    procedure :: recover_mcpar => kinematics_recover_mcpar
```

⟨*Kinematics: procedures*⟩+≡
```
    subroutine kinematics_recover_mcpar (k, mci_work, phs_channel, p)

31.10.1 Term instance

A `term_instance_t` object contains all data that describe a term. Each process component consists of one or more distinct terms which may differ in kinematics, but whose squared transition matrices have to be added pointwise.

The `active` flag is set when this term is connected to an active process component. Inactive terms are skipped for kinematics and evaluation.

The `k_term` object is the instance of the kinematics setup (structure-function chain, phase space, etc.) that applies specifically to this term. In ordinary cases, it consists of straight pointers to the seed kinematics.

The `amp` array stores the amplitude values when we get them from evaluating the associated matrix-element code.

The `int_hard` interaction describes the elementary hard process. It receives the momenta and the amplitude entries for each sampling point.

The `isolated` object holds the effective parton state for the elementary interaction. The amplitude entries are computed from `int_hard`.

The `connected` evaluator set convolutes this scattering matrix with the beam (and possibly structure-function) density matrix.

The `checked` flag is set once we have applied cuts on this term. The result of this is stored in the `passed` flag. Once the term has passed cuts, we calculate the various scale and weight expressions.

    call term%connected%final ()
    call term%isolated%final ()
    call term%int_hard%final ()
    term%pcm_instance => null ()
  end subroutine term_instance_final
```

For initialization, we make use of defined assignment for the `interaction_t` type. This creates a deep copy.

The hard interaction (incoming momenta) is linked to the structure function instance. In the isolated state, we either set pointers to both, or we create modified copies (`rearrange`) as effective structure-function chain and interaction, respectively.

Finally, we set up the `subevt` component that will be used for evaluating observables, collecting particles from the trace evaluator in the effective connected state. Their quantum numbers must be determined by following back source links and set explicitly, since they are already eliminated in that trace.

The `rearrange` parts are still commented out; they could become relevant for a NLO algorithm.

Setup beam polarisation quantum numbers, iff beam polarisation is required.

We retrieve the full helicity information from `term%config%data` and reduce the information only to the inital state. Afterwards, we uniquify the initial state polarization by a applying a index (hash) table.

The helicity information is fed into an array of quantum numbers to assign flavor, helicity and subtraction indices correctly to their matrix element.

Setup seed kinematics, starting from the MC parameter set given as argument.
As a result, the k_seed kinematics object is evaluated (except for the structure-
function matrix-element evaluation, which we postpone until we know the fac-
torization scale), and we have a valid p_seed momentum array.

    end subroutine term_instance_recover_sfchain
```

Compute the momenta in the hard interactions, one for each term that constitutes this process component. In simple cases this amounts to just copying momenta. In more advanced cases, we may generate distinct sets of momenta from the seed kinematics.

The interactions in the term instances are accessed individually. We may choose to calculate all terms at once together with the seed kinematics, use component%core_state for storage, and just fill the interactions here.

⟨*Instances: term instance: TBP*⟩+≡

```
procedure :: compute_hard_kinematics => &
    term_instance_compute_hard_kinematics
```

⟨*Instances: procedures*⟩+≡

```
subroutine term_instance_compute_hard_kinematics (term, skip_term, success)
  class(term_instance_t), intent(inout) :: term
  integer, intent(in), optional :: skip_term
  logical, intent(out) :: success
  type(vector4_t), dimension(:), allocatable :: p
  if (allocated (term%core_state)) &
      call term%core_state%reset_new_kinematics ()
  if (present (skip_term)) then
      if (term%config%i_term_global == skip_term) return
  end if

      success = .true.
  end if
  call term%int_hard%set_momenta (p)
end subroutine term_instance_compute_hard_kinematics
```

Here, we invert this. We fetch the incoming momenta which reside in the appropriate **sf_chain** object, stored within the **k_seed** subobject. On the other hand, we have the outgoing momenta of the effective interaction. We rely on the process core to compute the remaining seed momenta and to fill the momenta within the hard interaction. (The latter is trivial if hard and effective interaction coincide.)

After this is done, the incoming momenta in the trace evaluator that corresponds to the hard (effective) interaction, are still left undefined. We remedy

this by calling `receive_kinematics` once.

Color-correlated matrix elements should be obtained from the external BLHA provider. According to the standard, the matrix elements output is a one-dimensional array. For FKS subtraction, we require the matrix B_{ij}. BLHA prescribes a mapping $(i, j) \rightarrow k$, where k is the index of the matrix element in the output array. It focusses on the off-diagonal entries, i.e. $i \neq j$. The subroutine `blha_color_c_fill_offdiag` realizes this mapping. The diagonal entries can simply be obtained as the product of the Born matrix element and either C_A or C_F, which is achieved by `blha_color_c_fill_diag`. For simple processes, i.e. those with only one color line, it is $B_{ij} = C_F \cdot B$. For those, we keep the possibility of computing color correlations by a multiplication of the Born matrix element with C_F. It is triggered by the `use_internal_color_correlations` flag and should be used only for testing purposes. However, it is also used for the threshold computation where the process is well-defined and fixed.

```

Complete the kinematics computation for the effective parton states.

We assume that the `compute_hard_kinematics` method of the process component instance has already been called, so the `int_hard` contains the correct hard kinematics. The duty of this procedure is first to compute the effective kinematics and store this in the `int_eff` effective interaction inside the `isolated` parton state. The effective kinematics may differ from the kinematics in the hard interaction. It may involve parton recombination or parton splitting. The `rearrange_partons` method is responsible for this part.

We may also call a method to compute the effective structure-function chain at this point. This is not implemented yet.

In the simple case that no rearrangement is necessary, as indicated by the `rearrange` flag, the effective interaction is a pointer to the hard interaction, and we can skip the rearrangement method. Similarly for the effective structure-function chain. (If we have an algorithm that uses rarrangement, it should evaluate `k_term` explicitly.)

The final step of kinematics setup is to transfer the effective kinematics to the evaluators and to the `subevt`.

⟨*Instances: term instance: TBP*⟩+≡
```
procedure :: compute_eff_kinematics => &
     term_instance_compute_eff_kinematics
```

⟨*Instances: procedures*⟩+≡
```
subroutine term_instance_compute_eff_kinematics (term)
  class(term_instance_t), intent(inout) :: term
  term%checked = .false.
  term%passed = .false.
  call term%isolated%receive_kinematics ()
  call term%connected%receive_kinematics ()
end subroutine term_instance_compute_eff_kinematics
```

Inverse. Reconstruct the connected state from the momenta in the trace evaluator (which we assume to be set), then reconstruct the isolated state as far as possible. The second part finalizes the momentum configuration, using the incoming seed momenta

⟨*Instances: term instance: TBP*⟩+≡
```
procedure :: recover_hard_kinematics => &
     term_instance_recover_hard_kinematics
```

⟨*Instances: procedures*⟩+≡
```
subroutine term_instance_recover_hard_kinematics (term)
  class(term_instance_t), intent(inout) :: term
  term%checked = .false.
  term%passed = .false.
  call term%connected%send_kinematics ()
  call term%isolated%send_kinematics ()
end subroutine term_instance_recover_hard_kinematics
```

Check the term whether it passes cuts and, if successful, evaluate scales and weights. The factorization scale is also given to the term kinematics, enabling structure-function evaluation.

⟨*Instances: term instance: TBP*⟩+≡
```
procedure :: evaluate_expressions => &
     term_instance_evaluate_expressions
```

⟨*Instances: procedures*⟩+≡
```
    subroutine term_instance_evaluate_expressions (term, scale_forced)
      class(term_instance_t), intent(inout) :: term
      real(default), intent(in), allocatable, optional :: scale_forced
      call term%connected%evaluate_expressions (term%passed, &
           term%scale, term%fac_scale, term%ren_scale, term%weight, &
           scale_forced, force_evaluation = .true.)
      term%checked = .true.
    end subroutine term_instance_evaluate_expressions
```

Evaluate the trace: first evaluate the hard interaction, then the trace evaluator. We use the `evaluate_interaction` method of the process component which generated this term. The `subevt` and cut expressions are not yet filled.

The `component` argument is intent(inout) because the `compute_amplitude` method may modify the `core_state` workspace object.

Retrieve the matrix elements from a matrix element provider and place them
into `term%amp`.

For the handling of NLO calculations, FKS applies a book keeping handling flavor and/or particle type (e.g. for QCD: quark/gluon and quark flavor) in order to calculate the subtraction terms. Therefore, we have to insert the calculated matrix elements correctly into the state matrix where each entry corresponds to a set of quantum numbers. We apply a mapping `hard_qn_ind` from a list of quantum numbers provided by FKS to the hard process `int_hard`.

The calculated matrix elements are insert into `term%amp` in the following way. The first `n_born` particles are the matrix element of the hard process. In non-trivial beams, we store another `n_beams_rescaled` copies of these matrix elements as the first `n_beams_rescaled` subtractions. This is a remnant from times before the method `term_instance_set_sf_factors` and these entries are not used anymore. However, eliminating these entries involves deeper changes in how the connection tables for the evaluator product are set up and should therefore be part of a larger refactoring of the interactions & state matrices. The next $n_{\mathrm{born}} \times n_{sub}$ are color-correlated born matrix elements.

        call term%isolated%evaluate_trace ()
        call term%connected%evaluate_trace ()
      end subroutine term_instance_evaluate_trace
```

Include rescaled structure functions due to NLO calculation. We rescale the
structure function for the real subtraction **sf_rescale_collinear**, the collinear
counter terms **sf_rescale_dglap_t** and for the case, in which we have an emit-
ter in the initial state, we rescale the kinematics for it using **sf_rescale_real_t**.
References: arXiv:0709.2092, (2.35)-(2.42).
Obviously, it is completely irrelevant, which beam is treated. It becomes prob-
lematic when handling **e, p**-beams.

    end function term_instance_get_fac_scale
```

We take the strong coupling from the process core. The value is calculated when a new event is requested, so we should call it only after the event has been evaluated. If it is not available there (a negative number is returned), we take the value stored in the term configuration, which should be determined by the model. If the model does not provide a value, the result is zero.

31.10.2   The process instance

A process instance contains all process data that depend on the sampling point and thus change often. In essence, it is an event record at the elementary (parton) level. We do not call it such, to avoid confusion with the actual event records. If decays are involved, the latter are compositions of several elementary processes (i.e., their instances).

We implement the process instance as an extension of the `mci_sampler_t` that we need for computing integrals and generate events.

The base type contains: the `integrand`, the `selected_channel`, the two-dimensional array `x` of parameters, and the one-dimensional array `f` of Jacobians. These subobjects are public and used for communicating with the multi-channel integrator.

The `process` pointer accesses the process of which this record is an instance. It is required whenever the calculation needs invariant configuration data, therefore the process should stay in memory for the whole lifetime of its instances.

The `evaluation_status` code is used to check the current status. In particular, failure at various stages is recorded there.

The `count` object records process evaluations, broken down according to status.

The `sqme` value is the single real number that results from evaluating and tracing the kinematics and matrix elements. This is the number that is handed over to an integration routine.

The `weight` value is the event weight. It is defined when an event has been generated from the process instance, either weighted or unweighted. The value is the `sqme` value times Jacobian weights from the integration, or unity, respectively.

The `i_mci` index chooses a subset of components that are associated with a common parameter set and integrator, i.e., that are added coherently.

The `sf_chain` subobject is a realization of the beam and structure-function configuration in the `process` object. It is not used for calculation directly but serves as the template for the sf-chain instances that are contained in the `component` objects.

The `component` subobjects determine the state of each component.

The `term` subobjects are workspace for evaluating kinematics, matrix elements, cuts etc.

The `mci_work` subobject contains the array of real input parameters (random numbers) that generates the kinematical point. It also contains the workspace for the MC integrators. The active entry of the `mci_work` array is selected by the `i_mci` index above.

The `hook` pointer accesses a list of after evaluate objects which are evalutated after the matrix element.

⟨*Instances: public*⟩≡
```
    public :: process_instance_t
```

⟨*Instances: types*⟩+≡
```
    type, extends (mci_sampler_t) :: process_instance_t
       type(process_t), pointer :: process => null ()
       integer :: evaluation_status = STAT_UNDEFINED
       real(default) :: sqme = 0
       real(default) :: weight = 0
       real(default) :: excess = 0
       integer :: n_dropped = 0
       integer :: i_mci = 0
       integer :: selected_channel = 0
       type(sf_chain_t) :: sf_chain
       type(term_instance_t), dimension(:), allocatable :: term
       type(mci_work_t), dimension(:), allocatable :: mci_work
       class(pcm_instance_t), allocatable :: pcm
       class(process_instance_hook_t), pointer :: hook => null ()
     contains
     ⟨Instances: process instance: TBP⟩
    end type process_instance_t
```

Wrapper type for storing pointers to process instance objects in arrays.

⟨*Instances: public*⟩+≡
```
    public :: process_instance_ptr_t
```

⟨*Instances: types*⟩+≡
```
    type :: process_instance_ptr_t
       type(process_instance_t), pointer :: p => null ()
    end type process_instance_ptr_t
```

The process hooks are first-in-last-out list of objects which are evaluated after the phase space and matrixelement are evaluated. It is possible to retrieve the sampler object and read the sampler information.

The hook object are part of the `process_instance` and therefore, share a common lifetime. A data transfer, after the usual lifetime of the `process_instance`, is not provided, as such the finalisation procedure has to take care of this! E.g. write the object to file from which later the collected information can then be retrieved.

⟨*Instances: public*⟩+≡
```
    public :: process_instance_hook_t
```

⟨*Instances: types*⟩+≡
```
    type, abstract :: process_instance_hook_t
       class(process_instance_hook_t), pointer :: next => null ()
     contains
       procedure(process_instance_hook_init), deferred :: init
       procedure(process_instance_hook_final), deferred :: final
       procedure(process_instance_hook_evaluate), deferred :: evaluate
    end type process_instance_hook_t
```

We have to provide a `init`, a `final` procedure and, for after evaluation, the `evaluate` procedure.

The `init` procedures accesses `var_list` and current `instance` object.

⟨*Instances: public*⟩+≡
```
    public :: process_instance_hook_final, process_instance_hook_evaluate
```

⟨*Instances: interfaces*⟩≡
```
    abstract interface
      subroutine process_instance_hook_init (hook, var_list, instance)

The output routine contains a header with the most relevant information about the process, copied from `process_metadata_write`. We mark the active components by an asterisk.

The next section is the MC parameter input. The following sections are written only if the evaluation status is beyond setting the parameters, or if the `verbose` option is set.

Initialization connects the instance with a process. All initial information is transferred from the process object. The process object contains templates for the interaction subobjects (beam and term), but no evaluators. The initialization routine creates evaluators for the matrix element trace, other evaluators are left untouched.

Before we start generating, we double-check if the process library has been updated after the process was initialized (`check_library_sanity`). This may happen if between integration and event generation the library has been recompiled, so all links become broken.

The `instance` object must have the `target` attribute (also in any caller) since the initialization routine assigns various pointers to subobject of `instance`.

⟨*Instances: process instance: TBP*⟩+≡

       deallocate (current)
    end do
    instance%hook => null ()
```

```
      end subroutine process_instance_final
```

Revert the process instance to initial state. We do not deallocate anything, just reset the state index and deactivate all components and terms.

We do not reset the choice of the MCI set i_mci unless this is required explicitly.

⟨*Instances: process instance: TBP*⟩+≡
```
      procedure :: reset => process_instance_reset
```

⟨*Instances: procedures*⟩+≡
```
      subroutine process_instance_reset (instance, reset_mci)
        class(process_instance_t), intent(inout) :: instance
        logical, intent(in), optional :: reset_mci
        integer :: i
        call instance%process%reset_selected_cores ()
        do i = 1, size (instance%term)
           call instance%term(i)%reset ()
        end do
        instance%term%checked = .false.
        instance%term%passed = .false.
        instance%term%k_term%new_seed = .true.
        if (present (reset_mci)) then
           if (reset_mci)  instance%i_mci = 0
        end if
        instance%selected_channel = 0
        instance%evaluation_status = STAT_INITIAL
      end subroutine process_instance_reset
```

Integration and event generation

The sampler test should just evaluate the squared matrix element **n_calls** times, discarding the results, and return. This can be done before integration, e.g., for timing estimates.

⟨*Instances: process instance: TBP*⟩+≡
```
      procedure :: sampler_test => process_instance_sampler_test
```

⟨*Instances: procedures*⟩+≡
```
      subroutine process_instance_sampler_test (instance, i_mci, n_calls)
        class(process_instance_t), intent(inout), target :: instance
        integer, intent(in) :: i_mci
        integer, intent(in) :: n_calls
        integer :: i_mci_work
        i_mci_work = instance%process%get_i_mci_work (i_mci)
        call instance%choose_mci (i_mci_work)
        call instance%reset_counter ()
        call instance%process%sampler_test (instance, n_calls, i_mci_work)
        call instance%process%set_counter_mci_entry (i_mci_work, instance%get_counter ())
      end subroutine process_instance_sampler_test
```

Generate a weighted event. We select one of the available MCI integrators by its index i_mci and thus generate an event for the associated (group of) process

component(s). The arguments exactly correspond to the initializer and finalizer above.

The resulting event is stored in the `process_instance` object, which also holds the workspace of the integrator.

Note: The `process` object contains the random-number state, which changes for each event. Otherwise, all volatile data are inside the `instance` object.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: generate_weighted_event => process_instance_generate_weighted_event
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_generate_weighted_event (instance, i_mci)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_mci
      integer :: i_mci_work
      i_mci_work = instance%process%get_i_mci_work (i_mci)
      call instance%choose_mci (i_mci_work)
      associate (mci_work => instance%mci_work(i_mci_work))
        call instance%process%generate_weighted_event &
           (i_mci_work, mci_work, instance, &
            instance%keep_failed_events ())
      end associate
    end subroutine process_instance_generate_weighted_event
```

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: generate_unweighted_event => process_instance_generate_unweighted_event
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_generate_unweighted_event (instance, i_mci)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_mci
      integer :: i_mci_work
      i_mci_work = instance%process%get_i_mci_work (i_mci)
      call instance%choose_mci (i_mci_work)
      associate (mci_work => instance%mci_work(i_mci_work))
        call instance%process%generate_unweighted_event &
           (i_mci_work, mci_work, instance)
      end associate
    end subroutine process_instance_generate_unweighted_event
```

This replaces the event generation methods for the situation that the process instance object has been filled by other means (i.e., reading and/or recalculating its contents). We just have to fill in missing MCI data, especially the event weight.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: recover_event => process_instance_recover_event
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_recover_event (instance)
      class(process_instance_t), intent(inout) :: instance
      integer :: i_mci
      i_mci = instance%i_mci
      call instance%process%set_i_mci_work (i_mci)
      associate (mci_instance => instance%mci_work(i_mci)%mci)
```

```
            call mci_instance%fetch (instance, instance%selected_channel)
        end associate
    end subroutine process_instance_recover_event
```

Activate the components and terms that correspond to a currently selected MCI
parameter set.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: activate => process_instance_activate
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_activate (instance)

             instance, n_it, n_calls, adapt_grids, adapt_weights, &
             final, pacify, nlo_type = nlo_type)
        call process%set_counter_mci_entry (i_mci_work, instance%get_counter ())
      end associate
```

```
      end subroutine process_instance_integrate
```

Subroutine of the initialization above: initialize the beam and structure-function chain template. We establish pointers to the configuration data, so `beam_config` must have a `target` attribute.

The resulting chain is not used directly for calculation. It will acquire instances which are stored in the process-component instance objects.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: setup_sf_chain => process_instance_setup_sf_chain
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_setup_sf_chain (instance, config)
      class(process_instance_t), intent(inout) :: instance
      type(process_beam_config_t), intent(in), target :: config
      integer :: n_strfun
      n_strfun = config%n_strfun
      if (n_strfun /= 0) then
         call instance%sf_chain%init (config%data, config%sf)
      else
         call instance%sf_chain%init (config%data)
      end if
      if (config%sf_trace) then
         call instance%sf_chain%setup_tracing (config%sf_trace_file)
      end if
    end subroutine process_instance_setup_sf_chain
```

This initialization routine should be called only for process instances which we intend as a source for physical events. It initializes the evaluators in the parton states of the terms. They describe the (semi-)exclusive transition matrix and the distribution of color flow for the partonic process, convoluted with the beam and structure-function chain.

If the model is not provided explicitly, we may use the model instance that belongs to the process. However, an explicit model allows us to override particle settings.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: setup_event_data => process_instance_setup_event_data
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_setup_event_data (instance, model, i_core)
      class(process_instance_t), intent(inout), target :: instance
      class(model_data_t), intent(in), optional, target :: model
      integer, intent(in), optional :: i_core
      class(model_data_t), pointer :: current_model
      integer :: i
      class(prc_core_t), pointer :: core => null ()
      if (present (model)) then
         current_model => model
      else
         current_model => instance%process%get_model_ptr ()
      end if
      do i = 1, size (instance%term)
         associate (term => instance%term(i))
           if (associated (term%config)) then
```

```
              core => instance%process%get_core_term (i)
              call term%setup_event_data (core, current_model)
           end if
        end associate
     end do
     core => null ()
  end subroutine process_instance_setup_event_data
```

Choose a MC parameter set and the corresponding integrator. The choice persists beyond calls of the **reset** method above. This method is automatically called here.

⟨*Instances: process instance: TBP*⟩+≡
```
     procedure :: choose_mci => process_instance_choose_mci
```

⟨*Instances: procedures*⟩+≡
```
     subroutine process_instance_choose_mci (instance, i_mci)
       class(process_instance_t), intent(inout) :: instance
       integer, intent(in) :: i_mci
       instance%i_mci = i_mci
       call instance%reset ()
     end subroutine process_instance_choose_mci
```

Explicitly set a MC parameter set. Works only if we are in initial state. We assume that the length of the parameter set is correct.

After setting the parameters, activate the components and terms that correspond to the chosen MC parameter set.

The **warmup_flag** is used when a dummy phase-space point is computed for the warmup of e.g. OpenLoops helicities. The setting of the the **evaluation_status** has to be avoided then.

⟨*Instances: process instance: TBP*⟩+≡
```
     procedure :: set_mcpar => process_instance_set_mcpar
```

⟨*Instances: procedures*⟩+≡
```
     subroutine process_instance_set_mcpar (instance, x, warmup_flag)
       class(process_instance_t), intent(inout) :: instance
       real(default), dimension(:), intent(in) :: x
       logical, intent(in), optional :: warmup_flag
       logical :: activate
       activate = .true.; if (present (warmup_flag)) activate = .not. warmup_flag
       if (instance%evaluation_status == STAT_INITIAL) then
          associate (mci_work => instance%mci_work(instance%i_mci))
             call mci_work%set (x)
          end associate
          if (activate) call instance%activate ()
       end if
     end subroutine process_instance_set_mcpar
```

Receive the beam momentum/momenta from a source interaction. This applies to a cascade decay process instance, where the 'beam' momentum varies event by event.

The master beam momentum array is contained in the main structure function chain subobject **sf_chain**. The sf-chain instance that reside in the components will take their beam momenta from there.

The procedure transforms the instance status into `STAT_BEAM_MOMENTA`. For process instance with fixed beam, this intermediate status is skipped.

⟨*Instances: process instance: TBP*⟩+≡
```
procedure :: receive_beam_momenta => process_instance_receive_beam_momenta
```

⟨*Instances: procedures*⟩+≡
```
subroutine process_instance_receive_beam_momenta (instance)
  class(process_instance_t), intent(inout) :: instance
  if (instance%evaluation_status >= STAT_INITIAL) then
     call instance%sf_chain%receive_beam_momenta ()
     instance%evaluation_status = STAT_BEAM_MOMENTA
  end if
end subroutine process_instance_receive_beam_momenta
```

Set the beam momentum/momenta explicitly. Otherwise, analogous to the previous procedure.

⟨*Instances: process instance: TBP*⟩+≡
```
procedure :: set_beam_momenta => process_instance_set_beam_momenta
```

⟨*Instances: procedures*⟩+≡
```
subroutine process_instance_set_beam_momenta (instance, p)
  class(process_instance_t), intent(inout) :: instance
  type(vector4_t), dimension(:), intent(in) :: p
  if (instance%evaluation_status >= STAT_INITIAL) then
     call instance%sf_chain%set_beam_momenta (p)
     instance%evaluation_status = STAT_BEAM_MOMENTA
  end if
end subroutine process_instance_set_beam_momenta
```

Recover the initial beam momenta (those in the **sf_chain** component), given a valid (recovered) **sf_chain_instance** in one of the active components. We need to do this only if the lab frame is not the c.m. frame, otherwise those beams would be fixed anyway.

⟨*Instances: process instance: TBP*⟩+≡
```
procedure :: recover_beam_momenta => process_instance_recover_beam_momenta
```

⟨*Instances: procedures*⟩+≡
```
subroutine process_instance_recover_beam_momenta (instance, i_term)
  class(process_instance_t), intent(inout) :: instance
  integer, intent(in) :: i_term
  if (.not. instance%process%lab_is_cm_frame ()) then
     if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
        call instance%term(i_term)%return_beam_momenta ()
     end if
  end if
end subroutine process_instance_recover_beam_momenta
```

Explicitly choose MC integration channel. We assume here that the channel count is identical for all active components.

⟨*Instances: process instance: TBP*⟩+≡
```
procedure :: select_channel => process_instance_select_channel
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_select_channel (instance, channel)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: channel
      instance%selected_channel = channel
    end subroutine process_instance_select_channel
```

First step of process evaluation: set up seed kinematics. That is, for each active process component, compute a momentum array from the MC input parameters.

If `skip_term` is set, we skip the component that accesses this term. We can assume that the associated data have already been recovered, and we are just computing the rest.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: compute_seed_kinematics => &
        process_instance_compute_seed_kinematics
```
⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_compute_seed_kinematics (instance, skip_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in), optional :: skip_term
      integer :: channel, skip_component, i, j
      logical :: success
      integer, dimension(:), allocatable :: i_term
      channel = instance%selected_channel
      if (channel == 0) then
        call msg_bug ("Compute seed kinematics: undefined integration channel")
      end if
      if (present (skip_term)) then
        skip_component = instance%term(skip_term)%config%i_component
      else
        skip_component = 0
      end if
      if (instance%evaluation_status >= STAT_ACTIVATED) then
        success = .true.
        do i = 1, instance%process%get_n_components ()
          if (i == skip_component)  cycle
          if (instance%process%component_is_selected (i)) then
            allocate (i_term (size (instance%process%get_component_i_terms (i))))
            i_term = instance%process%get_component_i_terms (i)
            do j = 1, size (i_term)
              if (instance%term(i_term(j))%k_term%new_seed) then
                call instance%term(i_term(j))%compute_seed_kinematics &
                    (instance%mci_work(instance%i_mci), channel, success)
                call instance%transfer_same_kinematics (i_term(j))
              end if
              if (.not. success)  exit
              call instance%term(i_term(j))%evaluate_projections ()
              call instance%term(i_term(j))%evaluate_radiation_kinematics &
                  (instance%mci_work(instance%i_mci)%get_x_process ())
              call instance%term(i_term(j))%generate_fsr_in ()
              call instance%term(i_term(j))%compute_xi_ref_momenta ()
            end do
          end if
          if (allocated (i_term)) deallocate (i_term)
```

```
            end do
            if (success) then
                instance%evaluation_status = STAT_SEED_KINEMATICS
            else
                instance%evaluation_status = STAT_FAILED_KINEMATICS
            end if
        end if
        associate (mci_work => instance%mci_work(instance%i_mci))
            select type (pcm => instance%pcm)
            class is (pcm_instance_nlo_t)
                call pcm%set_x_rad (mci_work%get_x_process ())
            end select
        end associate
    end subroutine process_instance_compute_seed_kinematics
```

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: get_x_process => process_instance_get_x_process
```

⟨*Instances: procedures*⟩+≡
```
    pure function process_instance_get_x_process (instance) result (x)
      real(default), dimension(:), allocatable :: x
      class(process_instance_t), intent(in) :: instance
      allocate (x(size (instance%mci_work(instance%i_mci)%get_x_process ())))
      x = instance%mci_work(instance%i_mci)%get_x_process ()
    end function process_instance_get_x_process
```

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: get_active_component_type => process_instance_get_active_component_type
```

⟨*Instances: procedures*⟩+≡
```
    pure function process_instance_get_active_component_type (instance) &
            result (nlo_type)
      integer :: nlo_type
      class(process_instance_t), intent(in) :: instance
      nlo_type = instance%process%get_component_nlo_type (instance%i_mci)
    end function process_instance_get_active_component_type
```

Inverse: recover missing parts of the kinematics from the momentum config-
uration, which we know for a single term and component. Given a channel,
reconstruct the MC parameter set.
⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: recover_mcpar => process_instance_recover_mcpar
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_recover_mcpar (instance, i_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_term
      integer :: channel
      if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
          channel = instance%selected_channel
          if (channel == 0) then
              call msg_bug ("Recover MC parameters: undefined integration channel")
          end if
          call instance%term(i_term)%recover_mcpar &
```

```
                (instance%mci_work(instance%i_mci), channel)
        end if
    end subroutine process_instance_recover_mcpar
```

This is part of **recover_mcpar**, extracted for the case when there is no phase space and parameters to recover, but we still need the structure function kinematics for evaluation.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: recover_sfchain => process_instance_recover_sfchain
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_recover_sfchain (instance, i_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_term
      integer :: channel
      if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
         channel = instance%selected_channel
         if (channel == 0) then
            call msg_bug ("Recover sfchain: undefined integration channel")
         end if
         call instance%term(i_term)%recover_sfchain (channel)
      end if
    end subroutine process_instance_recover_sfchain
```

Second step of process evaluation: compute all momenta, for all active components, from the seed kinematics.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: compute_hard_kinematics => &
         process_instance_compute_hard_kinematics
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_compute_hard_kinematics (instance, skip_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in), optional :: skip_term
      integer :: i
      logical :: success
      success = .true.
      if (instance%evaluation_status >= STAT_SEED_KINEMATICS) then
         do i = 1, size (instance%term)
            if (instance%term(i)%active) then
               call instance%term(i)%compute_hard_kinematics (skip_term, success)
               if (.not. success) exit
               !!! Ren scale is zero when this is commented out! Understand!
               if (instance%term(i)%nlo_type == NLO_REAL) &
                    call instance%term(i)%redo_sf_chain (instance%mci_work(instance%i_mci), &
                       instance%selected_channel)
            end if
         end do
         if (success) then
            instance%evaluation_status = STAT_HARD_KINEMATICS
         else
            instance%evaluation_status = STAT_FAILED_KINEMATICS
         end if
      end if
```

```
          end subroutine process_instance_compute_hard_kinematics
```

Inverse: recover seed kinematics. We know the beam momentum configuration
and the outgoing momenta of the effective interaction, for one specific term.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: recover_seed_kinematics => &
        process_instance_recover_seed_kinematics
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_recover_seed_kinematics (instance, i_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_term
      if (instance%evaluation_status >= STAT_EFF_KINEMATICS) &
          call instance%term(i_term)%recover_seed_kinematics ()
    end subroutine process_instance_recover_seed_kinematics
```

Third step of process evaluation: compute the effective momentum configura-
tions, for all active terms, from the hard kinematics.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: compute_eff_kinematics => &
        process_instance_compute_eff_kinematics
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_compute_eff_kinematics (instance, skip_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in), optional :: skip_term
      integer :: i
      if (instance%evaluation_status >= STAT_HARD_KINEMATICS) then
          do i = 1, size (instance%term)
             if (present (skip_term)) then
                if (i == skip_term)  cycle
             end if
             if (instance%term(i)%active) then
                call instance%term(i)%compute_eff_kinematics ()
             end if
          end do
          instance%evaluation_status = STAT_EFF_KINEMATICS
      end if
    end subroutine process_instance_compute_eff_kinematics
```

Inverse: recover the hard kinematics from effective kinematics for one term,
then compute effective kinematics for the other terms.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: recover_hard_kinematics => &
        process_instance_recover_hard_kinematics
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_recover_hard_kinematics (instance, i_term)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_term
      integer :: i
      if (instance%evaluation_status >= STAT_EFF_KINEMATICS) then
          call instance%term(i_term)%recover_hard_kinematics ()
```

```
      do i = 1, size (instance%term)
         if (i /= i_term) then
            if (instance%term(i)%active) then
               call instance%term(i)%compute_eff_kinematics ()
            end if
         end if
      end do
      instance%evaluation_status = STAT_EFF_KINEMATICS
   end if
end subroutine process_instance_recover_hard_kinematics
```

Fourth step of process evaluation: check cuts for all terms. Where sucessful, compute any scales and weights. Otherwise, deactive the term. If any of the terms has passed, set the state to `STAT_PASSED_CUTS`.

The argument `scale_forced`, if present, will override the scale calculation in the term expressions.

⟨*Instances: process instance: TBP*⟩+≡

```
   procedure :: evaluate_expressions => &
        process_instance_evaluate_expressions
```

⟨*Instances: procedures*⟩+≡

```
subroutine process_instance_evaluate_expressions (instance, scale_forced)
  class(process_instance_t), intent(inout) :: instance
  real(default), intent(in), allocatable, optional :: scale_forced
  integer :: i

Fifth step of process evaluation: fill the parameters for the non-selected ,channels, that have not been used for seeding. We should do this after evaluating cuts, since we may save some expensive calculations if the phase space point fails the cuts.

If skip_term is set, we skip the component that accesses this term. We can assume that the associated data have already been recovered, and we are just computing the rest.

Calculates and then saves the ratio of the value of the (rescaled) real structure
function chain of each ISR alpha region over the value of the corresponding un-
derlying born flavor structure. In the case of emitter 0 we also need the rescaled
ratio for emitter 1 and 2 in that region for the (soft-)collinear limits. Altough
this procedure is implying functionality for general structure functions, it should
be reviewed for anything else besides PDFs, as there might be complications in
the details. The general idea of getting the ratio in this way should hold up in

these cases as well, however.

         end do
      end do
      component => null ()
   end select
end subroutine process_instance_set_i_mci_to_real_component
```

Final step of process evaluation: evaluate the matrix elements, and compute
the trace (summed over quantum numbers) for all terms. Finally, sum up the
terms, iterating over all active process components.

If `weight` is provided, we already know the kinematical event weight (the
MCI weight which depends on the kinematics sampling algorithm, but not on
the matrix element), so we do not need to take it from the MCI record.

         instance%weight = sign (1._default, instance%weight)
      end if
    end subroutine process_instance_normalize_weight
```

This is a convenience routine that performs the computations of the steps 1 to
5 in a single step. The arguments are the input for set_mcpar. After this, the
evaluation status should be either STAT_FAILED_KINEMATICS, STAT_FAILED_CUTS
or STAT_EVALUATED_TRACE.

Before calling this, we should call choose_mci.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: evaluate_sqme => process_instance_evaluate_sqme
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_evaluate_sqme (instance, channel, x)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: channel
      real(default), dimension(:), intent(in) :: x

      call instance%compute_other_channels ()
      call instance%evaluate_trace ()
    end subroutine process_instance_evaluate_sqme
```

This is the inverse. Assuming that the final trace evaluator contains a valid mo-
mentum configuration, recover kinematics and recalculate the matrix elements
and their trace.

To be precise, we first recover kinematics for the given term and associated component, then recalculate from that all other terms and active components. The `channel` is not really required to obtain the matrix element, but it allows us to reconstruct the exact MC parameter set that corresponds to the given phase space point.

Before calling this, we should call `choose_mci`.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: recover => process_instance_recover
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_recover &

         call instance%reset_core_kinematics ()
         call instance%evaluate_trace ()
      end if
    end subroutine process_instance_recover
```

The `evaluate` method is required by the `sampler_t` base type of which the process instance is an extension.

The requirement is that after the process instance is evaluated, the integrand, the selected channel, the x array, and the f Jacobian array are exposed by the `sampler_t` object.

We allow for the additional `hook` to be called, if associated, for outlying object to access information from the current state of the `sampler`.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: evaluate => process_instance_evaluate
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_evaluate (sampler, c, x_in, val, x, f)
```

```
      class(process_instance_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(out) :: val
      real(default), dimension(:,:), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
      call sampler%evaluate_sqme (c, x_in)
      if (sampler%is_valid ()) then
         call sampler%fetch (val, x, f)
      end if
      call sampler%record_call ()
      call sampler%evaluate_after_hook ()
   end subroutine process_instance_evaluate
```

The phase-space point is valid if the event has valid kinematics and has passed
the cuts.

⟨*Instances: process instance: TBP*⟩+≡
```
   procedure :: is_valid => process_instance_is_valid
```

⟨*Instances: procedures*⟩+≡
```
   function process_instance_is_valid (sampler) result (valid)
     class(process_instance_t), intent(in) :: sampler
     logical :: valid
     valid = sampler%evaluation_status >= STAT_PASSED_CUTS
   end function process_instance_is_valid
```

Add a `process_instance_hook` object..

⟨*Instances: process instance: TBP*⟩+≡
```
   procedure :: append_after_hook => process_instance_append_after_hook
```

⟨*Instances: procedures*⟩+≡
```
   subroutine process_instance_append_after_hook (sampler, new_hook)
     class(process_instance_t), intent(inout), target :: sampler
     class(process_instance_hook_t), intent(inout), target :: new_hook
     class(process_instance_hook_t), pointer :: last
     if (associated (new_hook%next)) then
        call msg_bug ("process_instance_append_after_hook: reuse of SAME hook object is forbidden."
     end if
     if (associated (sampler%hook)) then
        last => sampler%hook
        do while (associated (last%next))
           last => last%next
        end do
        last%next => new_hook
     else
        sampler%hook => new_hook
     end if
   end subroutine process_instance_append_after_hook
```

Evaluate the after hook as first in, last out.

⟨*Instances: process instance: TBP*⟩+≡
```
   procedure :: evaluate_after_hook => process_instance_evaluate_after_hook
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_evaluate_after_hook (sampler)
      class(process_instance_t), intent(in) :: sampler
      class(process_instance_hook_t), pointer :: current
      current => sampler%hook
      do while (associated(current))
         call current%evaluate (sampler)
         current => current%next
      end do
    end subroutine process_instance_evaluate_after_hook
```

The `rebuild` method should rebuild the kinematics section out of the `x_in` parameter set. The integrand value `val` should not be computed, but is provided as input.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: rebuild => process_instance_rebuild
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_rebuild (sampler, c, x_in, val, x, f)
      class(process_instance_t), intent(inout) :: sampler
      integer, intent(in) :: c
      real(default), dimension(:), intent(in) :: x_in
      real(default), intent(in) :: val
      real(default), dimension(:,:), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
      call msg_bug ("process_instance_rebuild not implemented yet")
      x = 0
      f = 0
    end subroutine process_instance_rebuild
```

This is another method required by the `sampler_t` base type: fetch the data that are relevant for the MCI record.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: fetch => process_instance_fetch
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_fetch (sampler, val, x, f)
      class(process_instance_t), intent(in) :: sampler
      real(default), intent(out) :: val
      real(default), dimension(:,:), intent(out) :: x
      real(default), dimension(:), intent(out) :: f
      integer, dimension(:), allocatable :: i_terms
      integer :: i, i_term_base, cc
      integer :: n_channel

      val = 0
      associate (process => sampler%process)
        FIND_COMPONENT: do i = 1, process%get_n_components ()
          if (sampler%process%component_is_selected (i)) then
             allocate (i_terms (size (process%get_component_i_terms (i))))
             i_terms = process%get_component_i_terms (i)
             i_term_base = i_terms(1)
             associate (k => sampler%term(i_term_base)%k_term)
               n_channel = k%n_channel
```

```
                  do cc = 1, n_channel
                     call k%get_mcpar (cc, x(:,cc))
                  end do
                  f = k%f
                  val = sampler%sqme * k%phs_factor
               end associate
               if (allocated (i_terms)) deallocate (i_terms)
               exit FIND_COMPONENT
            end if
         end do FIND_COMPONENT
      end associate
    end subroutine process_instance_fetch
```

Initialize and finalize event generation for the specified MCI entry.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: init_simulation => process_instance_init_simulation
    procedure :: final_simulation => process_instance_final_simulation
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_init_simulation (instance, i_mci, &
      safety_factor, keep_failed_events)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_mci
      real(default), intent(in), optional :: safety_factor
      logical, intent(in), optional :: keep_failed_events
      call instance%mci_work(i_mci)%init_simulation (safety_factor, keep_failed_events)
    end subroutine process_instance_init_simulation

    subroutine process_instance_final_simulation (instance, i_mci)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: i_mci
      call instance%mci_work(i_mci)%final_simulation ()
    end subroutine process_instance_final_simulation
```

Accessing the process instance

Once the seed kinematics is complete, we can retrieve the MC input parameters
for all channels, not just the seed channel.

Note: We choose the first active component. This makes sense only if the
seed kinematics is identical for all active components.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: get_mcpar => process_instance_get_mcpar
```

⟨*Instances: procedures*⟩+≡
```
    subroutine process_instance_get_mcpar (instance, channel, x)
      class(process_instance_t), intent(inout) :: instance
      integer, intent(in) :: channel
      real(default), dimension(:), intent(out) :: x
      integer :: i
      if (instance%evaluation_status >= STAT_SEED_KINEMATICS) then
         do i = 1, size (instance%term)
            if (instance%term(i)%active) then
               call instance%term(i)%k_term%get_mcpar (channel, x)
```

```
            return
          end if
        end do
        call msg_bug ("Process instance: get_mcpar: no active channels")
      else
        call msg_bug ("Process instance: get_mcpar: no seed kinematics")
      end if
    end subroutine process_instance_get_mcpar
```

Return true if the **sqme** value is known. This also implies that the event is kinematically valid and has passed all cuts.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: has_evaluated_trace => process_instance_has_evaluated_trace
```

⟨*Instances: procedures*⟩+≡
```
    function process_instance_has_evaluated_trace (instance) result (flag)
      class(process_instance_t), intent(in) :: instance
      logical :: flag
      flag = instance%evaluation_status >= STAT_EVALUATED_TRACE
    end function process_instance_has_evaluated_trace
```

Return true if the event is complete. In particular, the event must be kinematically valid, passed all cuts, and the event data have been computed.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: is_complete_event => process_instance_is_complete_event
```

⟨*Instances: procedures*⟩+≡
```
    function process_instance_is_complete_event (instance) result (flag)
      class(process_instance_t), intent(in) :: instance
      logical :: flag
      flag = instance%evaluation_status >= STAT_EVENT_COMPLETE
    end function process_instance_is_complete_event
```

Select the term for the process instance that will provide the basic event record (used in **evt_trivial_make_particle_set**). It might be necessary to write out additional events corresponding to other terms (done in **evt_nlo**).

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: select_i_term => process_instance_select_i_term
```

⟨*Instances: procedures*⟩+≡
```
    function process_instance_select_i_term (instance) result (i_term)

      integer :: i_mci
      i_mci = instance%i_mci
      i_term = instance%process%select_i_term (i_mci)
    end function process_instance_select_i_term
```

Return pointer to the master beam interaction.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: get_beam_int_ptr => process_instance_get_beam_int_ptr
```

⟨*Instances: procedures*⟩+≡
```
    function process_instance_get_beam_int_ptr (instance) result (ptr)
      class(process_instance_t), intent(in), target :: instance
      type(interaction_t), pointer :: ptr
      ptr => instance%sf_chain%get_beam_int_ptr ()
    end function process_instance_get_beam_int_ptr
```

Return pointers to the matrix and flows interactions, given a term index.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: get_trace_int_ptr => process_instance_get_trace_int_ptr
    procedure :: get_matrix_int_ptr => process_instance_get_matrix_int_ptr
    procedure :: get_flows_int_ptr => process_instance_get_flows_int_ptr
```
⟨*Instances: procedures*⟩+≡
```
    function process_instance_get_trace_int_ptr (instance, i_term) result (ptr)
      class(process_instance_t), intent(in), target :: instance
      integer, intent(in) :: i_term
      type(interaction_t), pointer :: ptr
      ptr => instance%term(i_term)%connected%get_trace_int_ptr ()
    end function process_instance_get_trace_int_ptr

    function process_instance_get_matrix_int_ptr (instance, i_term) result (ptr)
      class(process_instance_t), intent(in), target :: instance
      integer, intent(in) :: i_term
      type(interaction_t), pointer :: ptr
      ptr => instance%term(i_term)%connected%get_matrix_int_ptr ()
    end function process_instance_get_matrix_int_ptr

    function process_instance_get_flows_int_ptr (instance, i_term) result (ptr)
      class(process_instance_t), intent(in), target :: instance
      integer, intent(in) :: i_term
      type(interaction_t), pointer :: ptr
      ptr => instance%term(i_term)%connected%get_flows_int_ptr ()
    end function process_instance_get_flows_int_ptr
```

Return the complete account of flavor combinations in the underlying interaction
object, including beams, radiation, and hard interaction.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: get_state_flv => process_instance_get_state_flv
```
⟨*Instances: procedures*⟩+≡
```
    function process_instance_get_state_flv (instance, i_term) result (state_flv)
      class(process_instance_t), intent(in) :: instance
      integer, intent(in) :: i_term
      type(state_flv_content_t) :: state_flv
      state_flv = instance%term(i_term)%connected%get_state_flv ()
    end function process_instance_get_state_flv
```

Return pointers to the parton states of a selected term.

⟨*Instances: process instance: TBP*⟩+≡
```
    procedure :: get_isolated_state_ptr => &
         process_instance_get_isolated_state_ptr

      name = instance%process%get_id ()
    end function process_instance_get_process_name
```

Particle sets

Here we provide two procedures that convert the process instance from/to a particle set. The conversion applies to the trace evaluator which has no quantum-number information, thus it involves only the momenta and the parent-child relations. We keep virtual particles.

If **n_incoming** is provided, the status code of the first **n_incoming** particles will be reset to incoming. Otherwise, they would be classified as virtual.

Nevertheless, it is possible to reconstruct the complete structure from a particle set. The reconstruction implies a re-evaluation of the structure function and matrix-element codes.

The **i_term** index is needed for both input and output, to select among different active trace evaluators.

In both cases, the **instance** object must be properly initialized.

NB: The **recover_beams** option should be used only when the particle set originates from an external event file, and the user has asked for it. It should be switched off when reading from raw event file.

⟨Instances: process instance: TBP⟩+≡
```
    procedure :: get_trace => process_instance_get_trace
    procedure :: set_trace => process_instance_set_trace
```

⟨Instances: procedures⟩+≡
```
    subroutine process_instance_get_trace (instance, pset, i_term, n_incoming)
      class(process_instance_t), intent(in), target :: instance
      type(particle_set_t), intent(out) :: pset
      integer, intent(in) :: i_term
      integer, intent(in), optional :: n_incoming
      type(interaction_t), pointer :: int
      logical :: ok
      int => instance%get_trace_int_ptr (i_term)
      call pset%init (ok, int, int, FM_IGNORE_HELICITY, &
           [0._default, 0._default], .false., .true., n_incoming)
    end subroutine process_instance_get_trace

    subroutine process_instance_set_trace &
         (instance, pset, i_term, recover_beams, check_match)
      class(process_instance_t), intent(inout), target :: instance
      type(particle_set_t), intent(in) :: pset
      integer, intent(in) :: i_term
      logical, intent(in), optional :: recover_beams, check_match
      type(interaction_t), pointer :: int
```

```
      integer :: n_in
      int => instance%get_trace_int_ptr (i_term)
      n_in = instance%process%get_n_in ()
      call pset%fill_interaction (int, n_in, &
           recover_beams = recover_beams, &
           check_match = check_match, &
           state_flv = instance%get_state_flv (i_term))
   end subroutine process_instance_set_trace
```

This procedure allows us to override any QCD setting of the WHIZARD process
and directly set the coupling value that comes together with a particle set.

API: driver for the unit tests below.

⟨*Processes: public test*⟩≡
```
    public :: processes_test
```

⟨*Processes: test driver*⟩≡
```
    subroutine processes_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
```
⟨*Processes: execute tests*⟩
```
    end subroutine processes_test
```

Write an empty process object

The most trivial test is to write an uninitialized process object.

⟨*Processes: execute tests*⟩≡
```
    call test (processes_1, "processes_1", &
```

```
        "write an empty process object", &
        u, results)
```

⟨*Processes: test declarations*⟩≡
```
    public :: processes_1
```

⟨*Processes: tests*⟩≡
```
    subroutine processes_1 (u)
      integer, intent(in) :: u
      type(process_t) :: process

      write (u, "(A)")  "* Test output: processes_1"
      write (u, "(A)")  "*   Purpose: display an empty process object"
      write (u, "(A)")

      call process%write (.false., u)

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: processes_1"

    end subroutine processes_1
```

Initialize a process object

Initialize a process and display it.

⟨*Processes: execute tests*⟩+≡
```
    call test (processes_2, "processes_2", &
        "initialize a simple process object", &
        u, results)
```

⟨*Processes: test declarations*⟩+≡
```
    public :: processes_2
```

⟨*Processes: tests*⟩+≡
```
    subroutine processes_2 (u)
      integer, intent(in) :: u
      type(process_library_t), target :: lib
      type(string_t) :: libname
      type(string_t) :: procname
      type(os_data_t) :: os_data
      type(model_t), target :: model
      type(process_t), allocatable :: process
      class(mci_t), allocatable :: mci_template
      class(phs_config_t), allocatable :: phs_config_template

      write (u, "(A)")  "* Test output: processes_2"
      write (u, "(A)")  "*   Purpose: initialize a simple process object"
      write (u, "(A)")

      write (u, "(A)")  "* Build and load a test library with one process"
      write (u, "(A)")

      libname = "processes2"
      procname = libname
```

```
      call os_data%init ()
      call prc_test_create_library (libname, lib)

      write (u, "(A)")  "* Initialize a process object"
      write (u, "(A)")

      call model%init_test ()

      allocate (process)
      call process%init (procname, lib, os_data, model)
      call process%set_run_id (var_str ("run_2"))
      call process%setup_test_cores ()

      allocate (phs_test_config_t :: phs_config_template)
      call process%init_components (phs_config_template)

      call process%setup_mci (dispatch_mci_empty)

      call process%write (.false., u)

      write (u, "(A)")
      write (u, "(A)")  "* Cleanup"

      call process%final ()
      deallocate (process)

      call model%final ()

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: processes_2"

    end subroutine processes_2
```

Trivial for testing: do not allocate the MCI record.

⟨*Processes: test auxiliary*⟩≡
```
    subroutine dispatch_mci_empty (mci, var_list, process_id, is_nlo)
      class(mci_t), allocatable, intent(out) :: mci
      type(var_list_t), intent(in) :: var_list
      type(string_t), intent(in) :: process_id
      logical, intent(in), optional :: is_nlo
    end subroutine dispatch_mci_empty
```

Compute a trivial matrix element

Initialize a process, retrieve some information and compute a matrix element.

We use the same trivial process as for the previous test. All momentum and state dependence is trivial, so we just test basic functionality.

⟨*Processes: execute tests*⟩+≡
```
    call test (processes_3, "processes_3", &
        "retrieve a trivial matrix element", &
        u, results)
```

⟨*Processes: test declarations*⟩+≡
```
    public :: processes_3
```

⟨*Processes: tests*⟩+≡

Evaluating a process with structure function

Configure structure functions (single-channel) in a process object, create an instance, compute kinematics and evaluate.

Note the order of operations when setting up structure functions and phase space. The beams are first, they determine the `sqrts` value. We can also set up the chain of structure functions. We then configure the phase space. From this, we can obtain information about special configurations (resonances, etc.), which we need for allocating the possible structure-function channels (parameterizations and mappings). Finally, we match phase-space channels onto structure-function channels.

In the current example, this matching is trivial; we only have one structure-function channel.

⟨*Processes: execute tests*⟩+≡
```
      call test (processes_8, "processes_8", &
          "process evaluation with structure functions", &
          u, results)
```

⟨*Processes: test declarations*⟩+≡
```
      public :: processes_8
```

Resonances in Phase Space

This test demonstrates the extraction of the resonance-history set from the
generated phase space. We need a nontrivial process, but no matrix element.
This is provided by the `prc_template` method, using the `SM` model. We also
need the `phs_wood` method, otherwise we would not have resonances in the phase
space configuration.

⟨*Processes: execute tests*⟩+≡

      allocate (mci_none_t :: mci)
    end subroutine dispatch_mci_none
```

Add after evaluate hook(s)

Initialize a process and process instance, add a trivial process hook, choose a sampling point and fill the process instance.

We use the same trivial process as for the previous test. All momentum and state dependence is trivial, so we just test basic functionality.

⟨*Processes: test types*⟩≡
```
    type, extends(process_instance_hook_t) :: process_instance_hook_test_t
      integer :: unit
      character(len=15) :: name
    contains
      procedure :: init => process_instance_hook_test_init
      procedure :: final => process_instance_hook_test_final
      procedure :: evaluate => process_instance_hook_test_evaluate
    end type process_instance_hook_test_t
```

⟨*Processes: test auxiliary*⟩+≡
```
    subroutine process_instance_hook_test_init (hook, var_list, instance)
      class(process_instance_hook_test_t), intent(inout), target :: hook
      type(var_list_t), intent(in) :: var_list
      class(process_instance_t), intent(in), target :: instance
    end subroutine process_instance_hook_test_init

    subroutine process_instance_hook_test_final (hook)
      class(process_instance_hook_test_t), intent(inout) :: hook
    end subroutine process_instance_hook_test_final

    subroutine process_instance_hook_test_evaluate (hook, instance)
      class(process_instance_hook_test_t), intent(inout) :: hook

   call process_instance_hook%final ()
   deallocate (process_instance_hook)

   write (u, "(A)")
   write (u, "(A)")  "* Test output end: processes_19"

 end subroutine processes_19
```

31.12   Process Stacks

For storing and handling multiple processes, we define process stacks. These are
ordinary stacks where new process entries are pushed onto the top. We allow
for multiple entries with identical process ID, but distinct run ID.

The implementation is essentially identical to the `prclib_stacks` module
above. Unfortunately, Fortran supports no generic programming, so we do not
make use of this fact.

When searching for a specific process ID, we will get (a pointer to) the top-
most process entry with that ID on the stack, which was entered last. Usually,
this is the best version of the process (in terms of integral, etc.) Thus the stack
terminology makes sense.

⟨process_stacks.f90⟩≡
  ⟨File header⟩

  module process_stacks

  ⟨Use kinds⟩
  ⟨Use strings⟩
    use io_units
    use format_utils, only: write_separator
    use diagnostics
    use os_interface
    use sm_qcd
    use model_data
    use rng_base
    use variables
    use observables
    use process_libraries
    use process

  ⟨Standard module head⟩

```

⟨*Process stacks: public*⟩

⟨*Process stacks: types*⟩

```
contains
```

⟨*Process stacks: procedures*⟩

```
end module process_stacks
```

31.12.1 The process entry type

A process entry is a process object, augmented by a pointer to the next entry. We do not need specific methods, all relevant methods are inherited.

On higher level, processes should be prepared as process entry objects.

⟨*Process stacks: public*⟩≡
```
    public :: process_entry_t
```

⟨*Process stacks: types*⟩≡
```
    type, extends (process_t) :: process_entry_t
       type(process_entry_t), pointer :: next => null ()
    end type process_entry_t
```

31.12.2 The process stack type

For easy conversion and lookup it is useful to store the filling number in the object. The content is stored as a linked list.

The `var_list` component stores process-specific results, so they can be retrieved as (pseudo) variables.

The process stack can be linked to another one. This allows us to work with stacks of local scope.

⟨*Process stacks: public*⟩+≡
```
    public :: process_stack_t
```

⟨*Process stacks: types*⟩+≡
```
    type :: process_stack_t
       integer :: n = 0
       type(process_entry_t), pointer :: first => null ()
       type(var_list_t), pointer :: var_list => null ()
       type(process_stack_t), pointer :: next => null ()
     contains
     ⟨Process stacks: process stack: TBP⟩
    end type process_stack_t
```

Finalize partly: deallocate the process stack and variable list entries, but keep the variable list as an empty object. This way, the variable list links are kept.

⟨*Process stacks: process stack: TBP*⟩≡
```
    procedure :: clear => process_stack_clear
```

⟨Process stacks: procedures⟩≡

```
subroutine process_stack_clear (stack)
  class(process_stack_t), intent(inout) :: stack
  type(process_entry_t), pointer :: process
  if (associated (stack%var_list)) then
     call stack%var_list%final ()
  end if
  do while (associated (stack%first))
     process => stack%first
     stack%first => process%next
     call process%final ()
     deallocate (process)
  end do
  stack%n = 0
end subroutine process_stack_clear
```

Finalizer. Clear and deallocate the variable list.

⟨Process stacks: process stack: TBP⟩+≡

```
procedure :: final => process_stack_final
```

⟨Process stacks: procedures⟩+≡

```
subroutine process_stack_final (object)
  class(process_stack_t), intent(inout) :: object
  call object%clear ()
  if (associated (object%var_list)) then
     deallocate (object%var_list)
  end if
end subroutine process_stack_final
```

Output. The processes on the stack will be ordered LIFO, i.e., backwards.

⟨Process stacks: process stack: TBP⟩+≡

```
procedure :: write => process_stack_write
```

⟨Process stacks: procedures⟩+≡

```
recursive subroutine process_stack_write (object, unit, pacify)
  class(process_stack_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: pacify
  type(process_entry_t), pointer :: process
  integer :: u
  u = given_output_unit (unit)
  call write_separator (u, 2)
  select case (object%n)
  case (0)
     write (u, "(1x,A)")  "Process stack: [empty]"
     call write_separator (u, 2)
  case default
     write (u, "(1x,A)")  "Process stack:"
     process => object%first
     do while (associated (process))
        call process%write (.false., u, pacify = pacify)
        process => process%next
     end do
  end select
```

```
      if (associated (object%next)) then
         write (u, "(1x,A)")  "[Processes from context environment:]"
         call object%next%write (u, pacify)
      end if
   end subroutine process_stack_write
```

The variable list is printed by a separate routine, since it should be linked to
the global variable list, anyway.

⟨*Process stacks: process stack: TBP*⟩+≡
```
   procedure :: write_var_list => process_stack_write_var_list
```

⟨*Process stacks: procedures*⟩+≡
```
   subroutine process_stack_write_var_list (object, unit)
     class(process_stack_t), intent(in) :: object
     integer, intent(in), optional :: unit
     if (associated (object%var_list)) then
        call var_list_write (object%var_list, unit)
     end if
   end subroutine process_stack_write_var_list
```

Short output.

Since this is a stack, the default output ordering for each stack will be last-
in, first-out. To enable first-in, first-out, which is more likely to be requested,
there is an optional `fifo` argument.

⟨*Process stacks: process stack: TBP*⟩+≡
```
   procedure :: show => process_stack_show
```

⟨*Process stacks: procedures*⟩+≡
```
   recursive subroutine process_stack_show (object, unit, fifo)
     class(process_stack_t), intent(in) :: object
     integer, intent(in), optional :: unit
     logical, intent(in), optional :: fifo
     type(process_entry_t), pointer :: process
     logical :: reverse
     integer :: u, i, j
     u = given_output_unit (unit)
     reverse = .false.;  if (present (fifo))  reverse = fifo
     select case (object%n)
     case (0)
     case default
        if (.not. reverse) then
           process => object%first
           do while (associated (process))
              call process%show (u, verbose=.false.)
              process => process%next
           end do
        else
           do i = 1, object%n
              process => object%first
              do j = 1, object%n - i
                 process => process%next
              end do
              call process%show (u, verbose=.false.)
```

```
            end do
        end if
    end select
    if (associated (object%next))  call object%next%show ()
end subroutine process_stack_show
```

31.12.3   Link

Link the current process stack to a global one.

⟨*Process stacks: process stack: TBP*⟩+≡
```
    procedure :: link => process_stack_link
```

⟨*Process stacks: procedures*⟩+≡
```
    subroutine process_stack_link (local_stack, global_stack)
      class(process_stack_t), intent(inout) :: local_stack
      type(process_stack_t), intent(in), target :: global_stack
      local_stack%next => global_stack
    end subroutine process_stack_link
```

Initialize the process variable list and link the main variable list to it.

⟨*Process stacks: process stack: TBP*⟩+≡
```
    procedure :: init_var_list => process_stack_init_var_list
```

⟨*Process stacks: procedures*⟩+≡
```
    subroutine process_stack_init_var_list (stack, var_list)
      class(process_stack_t), intent(inout) :: stack
      type(var_list_t), intent(inout), optional :: var_list
      allocate (stack%var_list)
      if (present (var_list))  call var_list%link (stack%var_list)
    end subroutine process_stack_init_var_list
```

Link the process variable list to a global variable list.

⟨*Process stacks: process stack: TBP*⟩+≡
```
    procedure :: link_var_list => process_stack_link_var_list
```

⟨*Process stacks: procedures*⟩+≡
```
    subroutine process_stack_link_var_list (stack, var_list)
      class(process_stack_t), intent(inout) :: stack
      type(var_list_t), intent(in), target :: var_list
      call stack%var_list%link (var_list)
    end subroutine process_stack_link_var_list
```

31.12.4   Push

We take a process pointer and push it onto the stack. The previous pointer is nullified. Subsequently, the process is 'owned' by the stack and will be finalized when the stack is deleted.

⟨*Process stacks: process stack: TBP*⟩+≡
```
    procedure :: push => process_stack_push
```

⟨*Process stacks: procedures*⟩+≡
```
subroutine process_stack_push (stack, process)
  class(process_stack_t), intent(inout) :: stack
  type(process_entry_t), intent(inout), pointer :: process
  process%next => stack%first
  stack%first => process
  process => null ()
  stack%n = stack%n + 1
end subroutine process_stack_push
```

Inverse: Remove the last process pointer in the list and return it.

⟨*Process stacks: process stack: TBP*⟩+≡
```
procedure :: pop_last => process_stack_pop_last
```

⟨*Process stacks: procedures*⟩+≡
```
subroutine process_stack_pop_last (stack, process)
  class(process_stack_t), intent(inout) :: stack
  type(process_entry_t), intent(inout), pointer :: process
  type(process_entry_t), pointer :: previous
  integer :: i
  select case (stack%n)
  case (:0)
     process => null ()
  case (1)
     process => stack%first
     stack%first => null ()
     stack%n = 0
  case (2:)
     process => stack%first
     do i = 2, stack%n
        previous => process
        process => process%next
     end do
     previous%next => null ()
     stack%n = stack%n - 1
  end select
end subroutine process_stack_pop_last
```

Initialize process variables for a given process ID, without setting values.

⟨*Process stacks: process stack: TBP*⟩+≡
```
procedure :: init_result_vars => process_stack_init_result_vars
```

⟨*Process stacks: procedures*⟩+≡
```
subroutine process_stack_init_result_vars (stack, id)
  class(process_stack_t), intent(inout) :: stack
  type(string_t), intent(in) :: id
  call var_list_init_num_id (stack%var_list, id)
  call var_list_init_process_results (stack%var_list, id)
end subroutine process_stack_init_result_vars
```

Fill process variables with values. This is executed after the integration pass.
    Note: We set only integral and error. With multiple MCI records possible, the results for **n_calls**, **chi2** etc. are not necessarily unique. (We might set the

4629

efficiency, though.)

⟨*Process stacks: process stack: TBP*⟩+≡

```
procedure :: fill_result_vars => process_stack_fill_result_vars
```

⟨*Process stacks: procedures*⟩+≡

```
subroutine process_stack_fill_result_vars (stack, id)
  class(process_stack_t), intent(inout) :: stack
  type(string_t), intent(in) :: id
  type(process_t), pointer :: process
  process => stack%get_process_ptr (id)
  if (associated (process)) then
     call var_list_init_num_id (stack%var_list, id, process%get_num_id ())
     if (process%has_integral ()) then
        call var_list_init_process_results (stack%var_list, id, &
             integral = process%get_integral (), &
             error = process%get_error ())
     end if
  else
     call msg_bug ("process_stack_fill_result_vars: unknown process ID")
  end if
end subroutine process_stack_fill_result_vars
```

If one of the result variables has a local image in `var_list_local`, update the
value there as well.

⟨*Process stacks: process stack: TBP*⟩+≡

```
procedure :: update_result_vars => process_stack_update_result_vars
```

⟨*Process stacks: procedures*⟩+≡

```
subroutine process_stack_update_result_vars (stack, id, var_list_local)
  class(process_stack_t), intent(inout) :: stack
  type(string_t), intent(in) :: id
  type(var_list_t), intent(inout) :: var_list_local
  call update ("integral(" // id // ")")
  call update ("error(" // id // ")")
contains
  subroutine update (var_name)
    type(string_t), intent(in) :: var_name
    real(default) :: value
    if (var_list_local%contains (var_name, follow_link = .false.)) then
       value = stack%var_list%get_rval (var_name)
       call var_list_local%set_real (var_name, value, is_known = .true.)
    end if
  end subroutine update
end subroutine process_stack_update_result_vars
```

31.12.5 Data Access

Tell if a process exists.

⟨*Process stacks: process stack: TBP*⟩+≡

```
procedure :: exists => process_stack_exists
```

⟨*Process stacks: procedures*⟩+≡
```
    function process_stack_exists (stack, id) result (flag)
      class(process_stack_t), intent(in) :: stack
      type(string_t), intent(in) :: id
      logical :: flag
      type(process_t), pointer :: process
      process => stack%get_process_ptr (id)
      flag = associated (process)
    end function process_stack_exists
```

Return a pointer to a process with specific ID. Look also at a linked stack, if necessary.

⟨*Process stacks: process stack: TBP*⟩+≡
```
    procedure :: get_process_ptr => process_stack_get_process_ptr
```

⟨*Process stacks: procedures*⟩+≡
```
    recursive function process_stack_get_process_ptr (stack, id) result (ptr)
      class(process_stack_t), intent(in) :: stack
      type(string_t), intent(in) :: id
      type(process_t), pointer :: ptr
      type(process_entry_t), pointer :: entry
      ptr => null ()
      entry => stack%first
      do while (associated (entry))
         if (entry%get_id () == id) then
            ptr => entry%process_t
            return
         end if
         entry => entry%next
      end do
      if (associated (stack%next))  ptr => stack%next%get_process_ptr (id)
    end function process_stack_get_process_ptr
```

31.12.6 Unit tests

Test module, followed by the corresponding implementation module.

⟨`process_stacks_ut.f90`⟩≡

```

⟨*Matching base: procedures*⟩

```
end module matching_base
```

32.1 Abstract Matching Type

A matching will need access to the `shower` as well as matrix elements that we currently get over `process_instace`. The `model` is intended for the backup `model_hadrons`.

⟨*Matching base: public*⟩≡
```
    public :: matching_t
```

⟨*Matching base: types*⟩≡
```
    type, abstract :: matching_t
      logical :: is_hadron_collision = .false.
      type(qcd_t) :: qcd
      class(shower_base_t), pointer :: shower => null ()
      type(process_instance_t), pointer :: process_instance => null ()
      class(model_data_t), pointer :: model => null ()
      class(rng_t), allocatable :: rng
      type(string_t) :: process_name
     contains
     ⟨Matching base: matching: TBP⟩
    end type matching_t
```

⟨*Matching base: matching: TBP*⟩≡
```
    procedure (matching_init), deferred :: init
```

⟨*Matching base: interfaces*⟩≡
```
    abstract interface
      subroutine matching_init (matching, var_list, process_name)
        import
        class(matching_t), intent(out) :: matching
        type(var_list_t), intent(in) :: var_list
        type(string_t), intent(in) :: process_name
      end subroutine matching_init
    end interface
```

If we use a polymorphic settings type, this boilerplate wouldn't be necessary but then we introduce `select type` statements all over the place.

⟨*default matching init*⟩≡
```
    type(var_list_t), intent(in) :: var_list
    type(string_t), intent(in) :: process_name
    if (debug_on) call msg_debug (D_MATCHING, "matching_init")
```

```
         call matching%settings%init (var_list)
         matching%process_name = process_name
```

⟨*Matching base: matching: TBP*⟩+≡
```
         procedure (matching_write), deferred :: write
```

⟨*Matching base: interfaces*⟩+≡
```
         abstract interface
            subroutine matching_write (matching, unit)
              import
              class(matching_t), intent(in) :: matching
              integer, intent(in), optional :: unit
            end subroutine matching_write
         end interface
```

32.3   CKKW matching

This module contains the CKKW matching.

The type `ckkw_pseudo_shower_weights_t` gives the (relative) weights for different clusterings of the final particles, as given in Eq. (2.7) of hep-ph/0503281v1. Each particle has a binary labelling (power of 2) (first particle = 1, second particle = 2, third particle = 4, ...). Each recombination therefore corresponds to an integer, that is not a power of 2. Fur multiple subsequent recombinations, no different weights for different sequences of clustering are stored. It is assumed that the weight of a multiply recombined state is a combination of the states with one fewer recombination and that these states' contributions are proportional to their weights. For a $2-> n$ event, the weights array thus has the size $2^{(2+n)-1}$. The `weights_by_type` array gives the weights depending on the type of the particle, the first index is the same as for weights, the second index gives the type of the new mother particle:

0: uncolored (γ, Z, W, Higgs)

1: colored (quark)

2: gluon

3: squark

4: gluino

`alphaS` gives the value for $alpha_s$ used in the generation of the matrix element. This is needed for the reweighting using the values for a running $alpha_s$ at the scales of the clusterings.

32.4   POWHEG

This module generates radiation according to the POWHEG Sudakov form factor

$$\Delta^{f_b}(\Phi_n, p_{\mathrm{T}}) = \prod_{\alpha_r \in \{\alpha_r | f_b\}} \Delta^{f_b}_{\alpha_r}(\Phi_n, p_{\mathrm{T}}), \tag{32.1}$$

with

$$\Delta^{f_b}_{\alpha_r}(\Phi_n, p_{\mathrm{T}}) = \exp\left\{ -\left[\int d\Phi_{\mathrm{rad}}\, \frac{R(\Phi_{n+1})}{B^{f_b}(\Phi_n)}\, \theta(k_{\mathrm{T}}(\Phi_{n+1}) - p_{\mathrm{T}}) \right]^{\bar{\Phi}^{\alpha_r}_n = \Phi_n}_{\alpha_r} \right\} \tag{32.2}$$

We expect that an underlying Born flavor structure f_b has been generated with a probability proportional to its contribution to the $\tilde{B}$ at the given kinematic point.

```

32.4.1 Base types for settings and data

`lambda` enters for now as the lowest scale $2\Lambda^{(5)}_{\overline{\mathrm{MS}}}$ where the radiation α_s^{rad} is still larger than the true α_s.

⟨*POWHEG matching: public*⟩≡
```
    public :: powheg_settings_t
```

⟨*POWHEG matching: types*⟩≡
```
    type :: powheg_settings_t
       real(default) :: pt2_min = zero
       real(default) :: lambda = zero
       integer :: n_init = 0
       integer :: size_grid_xi = 0
```

```
    integer :: size_grid_y = 0
    integer :: upper_bound_func = UBF_SIMPLE
    logical :: rebuild_grids = .false.
    logical :: test_sudakov = .false.
    logical :: disable_sudakov = .false.
    logical :: singular_jacobian = .false.
  contains
  ⟨POWHEG matching: powheg settings: TBP⟩
  end type powheg_settings_t
```

These are the possible values for upper_bound_func and will be used to decide which ubf object is allocated.

⟨*POWHEG matching: parameters*⟩≡

We have to solve the equation

$$\frac{\log \Delta^{(U)}(p_T)}{\log \Delta^{(U)}(p_T^{\max}} = \log \Delta^{(U)}(p_T) = \log r_1$$

iteratively for p_T. If the current emission is not accepted, in the next step it is $\log \Delta^{(U)}(p_T^{\max}) = \log r_1$, so that we have to solve the equation

$$\log \Delta^{(U)}(p_T) = \log r_1 + \log r_2$$

using the second random number r_2.

Simple FSR

This corresponds to Appendix C of 1002.2581

⟨*POWHEG matching: public*⟩+≡
```
public :: sudakov_simple_fsr_t
```

⟨*POWHEG matching: types*⟩+≡
```
type, extends (sudakov_t) :: sudakov_simple_fsr_t
contains
 ⟨POWHEG matching: sudakov simple fsr: TBP⟩
end type sudakov_simple_fsr_t
```

The simplest upper bounding function for final-state radiation is

$$\texttt{upper\_bound\_func} = \frac{U(\xi, y)}{N} = \frac{\alpha_s}{\xi(1-y)} \qquad (32.4)$$

⟨*POWHEG matching: sudakov simple fsr: TBP*⟩≡
```
procedure :: upper_bound_func => sudakov_simple_fsr_upper_bound_func
```

⟨*POWHEG matching: procedures*⟩+≡
```
pure function sudakov_simple_fsr_upper_bound_func (sudakov, xi, y, alpha_s) result (u)
  real(default) :: u
  class(sudakov_simple_fsr_t), intent(in) :: sudakov
  real(default), intent(in) :: xi, y, alpha_s
  u = alpha_s / (xi * (1 - y))
end function sudakov_simple_fsr_upper_bound_func
```

The above upper bounding function corresponds to the transverse momentum scale

$$k_T^2 = \frac{s}{2}\xi^2(1-y). \qquad (32.5)$$

⟨*POWHEG matching: sudakov simple fsr: TBP*⟩+≡
```
procedure :: kt2 => sudakov_simple_fsr_kt2
```

⟨*POWHEG matching: procedures*⟩+≡
```
function sudakov_simple_fsr_kt2 (sudakov, xi, y) result (kt2)
  real(default) :: kt2
  class(sudakov_simple_fsr_t), intent(in) :: sudakov
  real(default), intent(in) :: xi, y
  kt2 = sudakov%phs_fks_generator%real_kinematics%kt2 &
     (sudakov%i_phs, sudakov%associated_emitter (), FSR_SIMPLE, xi, y)
end function sudakov_simple_fsr_kt2
```

For massless emitters, the upper bound on the radiated energy is

$$t_{\max} = \xi_{\max}^2 \hat{s}$$

⟨*POWHEG matching: sudakov simple fsr: TBP*⟩+≡
```
procedure :: kt2_max => sudakov_simple_fsr_kt2_max
```

⟨*POWHEG matching: procedures*⟩+≡
```

  real(default) :: xi_max_extended = 1._default
contains
```
⟨*POWHEG matching: sudakov massive fsr: TBP*⟩
```
end type sudakov_massive_fsr_t
```

During the radiation generation, an alternative expression for $\xi_{\max}$,

$$\xi_{\max} = 1 - \frac{(m + m_{\mathrm{rec}})^2}{q^2},$$

is used, which corresponds to an extenden Dalitz region. Phase space points outside of the original Dalitz region will be vetoed afterwards.

⟨*POWHEG matching: sudakov massive fsr: TBP*⟩≡
```
procedure :: compute_xi_max_extended &
    => sudakov_massive_fsr_compute_xi_max_extended
```

⟨*POWHEG matching: procedures*⟩+≡
```
subroutine sudakov_massive_fsr_compute_xi_max_extended (sudakov, i_phs)
  class(sudakov_massive_fsr_t), intent(inout) :: sudakov

  real(default) :: m, mrec
  real(default) :: q0
  type(vector4_t) :: p
  q0 = sqrt(sudakov%event_deps%s_hat)
  p = sudakov%event_deps%p_born_lab%get_momentum (1, sudakov%associated_emitter())
  m = p**1
  mrec = sqrt ((q0 - p%p(0))**2 - p%p(1)**2 - p%p(2)**2 - p%p(3)**2)
  sudakov%xi_max_extended = one - (m + mrec)**2 / q0**2
end subroutine sudakov_massive_fsr_compute_xi_max_extended
```

For massive emitters, the radiation variable ξ is constructed as follows. First,

$$\xi_{\min}(k_T^2) = \frac{\sqrt{k_T^2 \left(k_T^2 z_2^2 + 8\bar{p}^0 q(1 - z_2)\right)} - k_T^2 z_2}{2q^2(1 - z_2)} \tag{32.7}$$

is computed. Then ξ_1 is computed according to the same equation with $z_2 \leftrightarrow z_1$. Finally, ξ is generated according to

$$\xi = \frac{1}{q^2} \exp\left[\log\left(\xi_{\min}q^2 - k_T^2\right) + r \log\frac{\xi_m q^2 - k_T^2}{\xi_{\min}q^2 - k_T^2} + k_T^2\right], \tag{32.8}$$

where $\xi_m = \min(\xi_{\max}, \xi_1)$.

Generation algorithm and grid initialization

compute_sqme_real is the projected real matrix element $R_{\alpha_r} = S_{\alpha_r} R$ whereby the current α_r is implied by the emitter. Furthermore, it is multiplied by the Jacobian.

For each underlying Born f_b, there is a number of radiation regions. A radiation region rr may correspond multiple α_rs. The phase space only depends upon the radiation region kinematics rr and not on the specific α_r. α_r can be picked in the set $\{\alpha_r|f_b, \mathrm{rr}\}$ proportional to their R_{α_r}. For now, we simplify things though and just work with the α_r.

The following is valid for one underlying Born.

32.4.4 α_s and its reweighting

The main point to ensure here is that the simple fixed-flavor-1-loop expression α_s^{rad} is larger than the more accurate α_s such that we can use a reweighting veto and use α_s^{rad} for the generation of the emission. This can be done by setting

$$\alpha_s^{\mathrm{rad}}(\mu_0) = \alpha_s(\mu_0) \tag{32.13}$$

whereby μ_0^2 is the `scale_to_relate2` that is taken to be $p_{T,\min}^2$.

Copy momenta from `event_deps` to `real_kinematics`. So far this is only valid
if the center-of-mass system is equal to the lab frame, i.e. for FSR processes
without beamstrahlung or structure functions.

32.4.5 POWHEG hook

We provide a POWHEG hook to be called by `process_instance_evaluate` to prefill the adaptation grid.

We store the actual `powheg` object, which does the computations.

⟨*POWHEG matching: public*⟩+≡
```
    public :: powheg_matching_hook_t
```

⟨*POWHEG matching: types*⟩+≡
```
    type, extends(process_instance_hook_t) :: powheg_matching_hook_t
      type(string_t) :: process_name
      type(powheg_matching_t) :: powheg
    contains
      ⟨POWHEG matching: powheg matching hook: TBP⟩
    end type powheg_matching_hook_t
```

Init the hook. The init procedure will be called in `setup_process`, after everything is set up.

Additionally, we have to include `var_list` in order to retrieve the grid size in `xi` and `y`.

⟨*POWHEG matching: powheg matching hook: TBP*⟩≡
```
procedure :: init => powheg_matching_hook_init
```

⟨*POWHEG matching: procedures*⟩+≡
```
subroutine powheg_matching_hook_init (hook, var_list, instance)
   class(powheg_matching_hook_t), intent(inout), target :: hook
   type(var_list_t), intent(in) :: var_list
   class(process_instance_t), intent(in), target :: instance
   if (debug_on) call msg_debug (D_MATCHING, "powheg_matching_hook_init")
   hook%process_name = instance%get_process_name ()
   call hook%powheg%init (var_list, hook%process_name)
   hook%powheg%qcd = instance%get_qcd ()
   call hook%powheg%connect (instance)
   hook%powheg%process_deps%cm_frame = &
         hook%powheg%process_instance%is_cm_frame (1)
   call hook%powheg%prepare_for_events ()
 end subroutine powheg_matching_hook_init
```

We save the filled grid to file, such that in can be retrieved later on. The hook object will be deallocated, when the instance gets deallocated.

⟨*POWHEG matching: powheg matching hook: TBP*⟩+≡
```

```

Chapter 33

Event Implementation

With a process object and the associated methods at hand, we can generate events for elementary processes and, by subsequent transformation, for complete physical processes.

We have the following modules:

event_transforms Abstract base type for transforming a physical process with process instance and included evaluators, etc., into a new object. The following modules extend this base type.

resonance_insertion Insert a resonance history into an event record, based on kinematical and matrix-element information.

recoil_kinematics Common kinematics routines for the ISR and EPA handlers.

isr_photon_handler Transform collinear kinematics, as it results from applying ISR radiation, to non-collinear kinematics with a reasonable transverse-momentum distribution of the radiated photons, and also of the recoiling partonic event.

epa_beam_handler For photon-initiated processes where the effective photon approximation is used in integration, to add in beam-particle recoil. Analogous to the ISR handler.

decays Combine the elementary process with elementary decay processes and thus transform the elementary event into a decayed event, still at the parton level.

showers Create QED/QCD showers out of the partons that are emitted by elementary processes. This should be interleaved with showering of radiated particles (structure functions) and multiple interactions.

hadrons (not implemented yet) Apply hadronization to the partonic events, interleaved with hadron decays. (The current setup relies on hadronizing partonic events externally.)

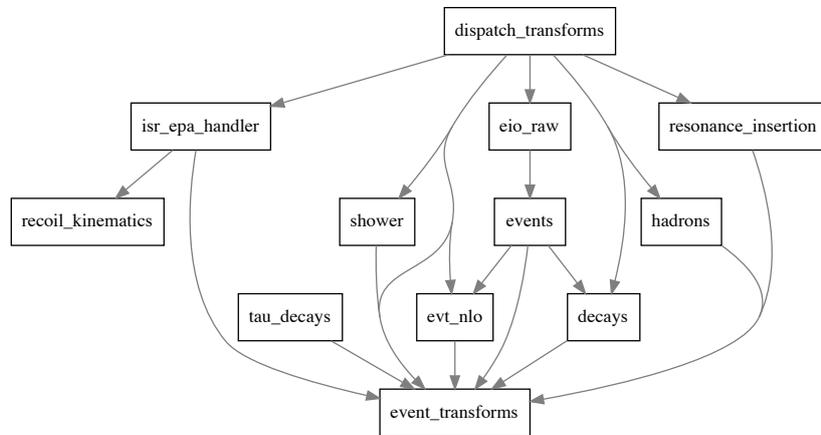
tau_decays (not implemented yet) Let τ leptons decay taking full spin correlations into account.


Figure 33.1: Module dependencies in `src/transforms`.

evt_nlo Handler for fixed-order NLO events.

events Combine all pieces to generate full events.

eio_raw Raw I/O for complete events.

33.1 Abstract Event Transforms

⟨`event_transforms.f90`⟩≡
  ⟨*File header*⟩

contains
```

⟨*Event transforms: procedures*⟩

```
end module event_transforms
```

33.1.1 Abstract base type

Essentially, all methods are abstract, but some get minimal base versions. We know that there will be a random-number generator at top level, and that we will relate to an elementary process.

The model is stored separately. It may contain modified setting that differ from the model instance stored in the process object.

Each event transform contains a particle set that it can fill for further use. There is a flag that indicates this.

We will collect event transforms in a list, therefore we include `previous` and `next` pointers.

⟨*Event transforms: public*⟩≡
```
    public :: evt_t
```

⟨*Event transforms: types*⟩≡
```
    type, abstract :: evt_t
       type(process_t), pointer :: process => null ()
       type(process_instance_t), pointer :: process_instance => null ()
       class(model_data_t), pointer :: model => null ()
       class(rng_t), allocatable :: rng
       integer :: rejection_count = 0
       logical :: particle_set_exists = .false.
       type(particle_set_t) :: particle_set
       class(evt_t), pointer :: previous => null ()
       class(evt_t), pointer :: next => null ()
       real(default) :: weight = 0._default
       logical :: only_weighted_events = .false.
     contains
     ⟨Event transforms: evt: TBP⟩
    end type evt_t
```

Finalizer. In any case, we finalize the r.n.g. The process instance is a pointer and should not be finalized here.

⟨*Event transforms: evt: TBP*⟩≡
```
    procedure :: final => evt_final
    procedure :: base_final => evt_final
```

⟨*Event transforms: procedures*⟩≡
```
    subroutine evt_final (evt)
      class(evt_t), intent(inout) :: evt
      if (allocated (evt%rng))  call evt%rng%final ()
```

```
      if (evt%particle_set_exists) &
           call evt%particle_set%final ()
    end subroutine evt_final
```

Print out the type of the evt.

⟨Event transforms: evt: TBP⟩+≡
```
    procedure (evt_write_name), deferred :: write_name
```

⟨Event transforms: interfaces⟩≡
```
    abstract interface
       subroutine evt_write_name (evt, unit)
         import
         class(evt_t), intent(in) :: evt
         integer, intent(in), optional :: unit
       end subroutine evt_write_name
    end interface
```

⟨Event transforms: evt: TBP⟩+≡
```
    procedure (evt_write), deferred :: write
```

⟨Event transforms: interfaces⟩+≡
```
    abstract interface
       subroutine evt_write (evt, unit, verbose, more_verbose, testflag)
         import
         class(evt_t), intent(in) :: evt
         integer, intent(in), optional :: unit
         logical, intent(in), optional :: verbose, more_verbose, testflag
       end subroutine evt_write
    end interface
```

Output. We can print r.n.g. info.

⟨Event transforms: evt: TBP⟩+≡
```
    procedure :: base_write => evt_base_write
```

⟨Event transforms: procedures⟩+≡
```
    subroutine evt_base_write (evt, unit, testflag, show_set)
      class(evt_t), intent(in) :: evt
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag, show_set
      integer :: u
      logical :: show
      u = given_output_unit (unit)
      show = .true.;  if (present (show_set))  show = show_set
      if (associated (evt%process)) then
         write (u, "(3x,A,A,A)")   "Associated process: '", &
               char (evt%process%get_id ()), "'"
      end if
      if (allocated (evt%rng)) then
         call evt%rng%write (u, 1)
         write (u, "(3x,A,I0)")   "Number of tries = ", evt%rejection_count
      end if
      if (show) then
         if (evt%particle_set_exists) then
            call write_separator (u)
```

```
            call evt%particle_set%write (u, testflag = testflag)
          end if
        end if
      end subroutine evt_base_write
```

Connect the transform with a process instance (and thus with the associated process). Use this to allocate the master random-number generator.

This is not an initializer; we may initialize the transform by implementation-specific methods.

⟨*Event transforms: evt: TBP*⟩+≡
```
      procedure :: connect => evt_connect
      procedure :: base_connect => evt_connect
```

⟨*Event transforms: procedures*⟩+≡
```
      subroutine evt_connect (evt, process_instance, model, process_stack)
        class(evt_t), intent(inout), target :: evt
        type(process_instance_t), intent(in), target :: process_instance
        class(model_data_t), intent(in), target :: model
        type(process_stack_t), intent(in), optional :: process_stack
        evt%process => process_instance%process
        evt%process_instance => process_instance
        evt%model => model
        call evt%process%make_rng (evt%rng)
      end subroutine evt_connect
```

Reset internal state.

⟨*Event transforms: evt: TBP*⟩+≡
```
      procedure :: reset => evt_reset
      procedure :: base_reset => evt_reset
```

⟨*Event transforms: procedures*⟩+≡
```
      subroutine evt_reset (evt)
        class(evt_t), intent(inout) :: evt
        evt%rejection_count = 0
        call evt%particle_set%final ()
        evt%particle_set_exists = .false.
      end subroutine evt_reset
```

Prepare for a new event: reset internal state, if necessary. We provide MCI and term index of the parent process.

⟨*Event transforms: evt: TBP*⟩+≡
```
      procedure (evt_prepare_new_event), deferred :: prepare_new_event
```

⟨*Event transforms: interfaces*⟩+≡
```
      interface
        subroutine evt_prepare_new_event (evt, i_mci, i_term)
          import
          class(evt_t), intent(inout) :: evt
          integer, intent(in) :: i_mci, i_term
        end subroutine evt_prepare_new_event
      end interface
```

Generate a weighted event, using a valid initiator event in the process instance, and the random-number generator. The returned event probability should be a number between zero and one that we can use for rejection.

⟨*Event transforms: evt: TBP*⟩+≡
```
    procedure (evt_generate_weighted), deferred :: generate_weighted
```

⟨*Event transforms: interfaces*⟩+≡
```
    abstract interface
       subroutine evt_generate_weighted (evt, probability)
         import
         class(evt_t), intent(inout) :: evt
         real(default), intent(inout) :: probability
       end subroutine evt_generate_weighted
    end interface
```

The unweighted event generation routine is actually implemented. It uses the random-number generator for simple rejection. Of course, the implementation may override this and implement a different way of generating an unweighted event.

⟨*Event transforms: evt: TBP*⟩+≡
```
    procedure :: generate_unweighted => evt_generate_unweighted
    procedure :: base_generate_unweighted => evt_generate_unweighted
```

⟨*Event transforms: procedures*⟩+≡
```
    subroutine evt_generate_unweighted (evt)
      class(evt_t), intent(inout) :: evt
      real(default) :: p, x
      evt%rejection_count = 0
      REJECTION: do
         evt%rejection_count = evt%rejection_count + 1
         call evt%generate_weighted (p)
         if (signal_is_pending ())  return
         call evt%rng%generate (x)
         if (x < p)  exit REJECTION
      end do REJECTION
    end subroutine evt_generate_unweighted
```

Make a particle set. This should take the most recent evaluator (or whatever stores the event), factorize the density matrix if necessary, and store as a particle set.

If applicable, the factorization should make use of the `factorization_mode` and `keep_correlations` settings.

The values **r**, if set, should control the factorization in more detail, e.g., bypassing the random-number generator.

⟨*Event transforms: evt: TBP*⟩+≡
```
    procedure (evt_make_particle_set), deferred :: make_particle_set
```

⟨*Event transforms: interfaces*⟩+≡
```
    interface
       subroutine evt_make_particle_set &
            (evt, factorization_mode, keep_correlations, r)
         import
         class(evt_t), intent(inout) :: evt
```

```
           integer, intent(in) :: factorization_mode
           logical, intent(in) :: keep_correlations
           real(default), dimension(:), intent(in), optional :: r
         end subroutine evt_make_particle_set
       end interface
```

Copy an existing particle set into the event record. This bypasses all methods
to evaluate the internal state, but may be sufficient for further processing.

⟨*Event transforms: evt: TBP*⟩+≡
```
       procedure :: set_particle_set => evt_set_particle_set
```

⟨*Event transforms: procedures*⟩+≡
```
       subroutine evt_set_particle_set (evt, particle_set, i_mci, i_term)
         class(evt_t), intent(inout) :: evt
         type(particle_set_t), intent(in) :: particle_set
         integer, intent(in) :: i_term, i_mci
         call evt%prepare_new_event (i_mci, i_term)
         evt%particle_set = particle_set
         evt%particle_set_exists = .true.
       end subroutine evt_set_particle_set
```

This procedure can help in the previous task, if the particles are available in
the form of an interaction object. (We need two interactions, one with color
summed over, and one with the probability distributed among flows.)

   We use the two values from the random number generator for factorizing the
state. For testing purposes, we can provide those numbers explicitly.

⟨*Event transforms: evt: TBP*⟩+≡
```
       procedure :: factorize_interactions => evt_factorize_interactions
```

⟨*Event transforms: procedures*⟩+≡
```
       subroutine evt_factorize_interactions &
           (evt, int_matrix, int_flows, factorization_mode, &
           keep_correlations, r, qn_select)
         class(evt_t), intent(inout) :: evt
         type(interaction_t), intent(in), target :: int_matrix, int_flows
         integer, intent(in) :: factorization_mode
         logical, intent(in) :: keep_correlations
         real(default), dimension(:), intent(in), optional :: r
         type(quantum_numbers_t), dimension(:), intent(in), optional :: qn_select
         real(default), dimension(2) :: x
         if (present (r)) then
            if (size (r) == 2) then
               x = r
            else
               call msg_bug ("event factorization: size of r array must be 2")
            end if
         else
            call evt%rng%generate (x)
         end if
         call evt%particle_set%init (evt%particle_set_exists, &
              int_matrix, int_flows, factorization_mode, x, &
              keep_correlations, keep_virtual=.true., qn_select = qn_select)
         evt%particle_set_exists = .true.
```

```
          end subroutine evt_factorize_interactions
```

⟨*Event transforms: public*⟩+≡
```
    public :: make_factorized_particle_set
```

⟨*Event transforms: procedures*⟩+≡
```
    subroutine make_factorized_particle_set (evt, factorization_mode, &
          keep_correlations, r, ii_term, qn_select)
      class(evt_t), intent(inout) :: evt
      integer, intent(in) :: factorization_mode
      logical, intent(in) :: keep_correlations
      real(default), dimension(:), intent(in), optional :: r
      integer, intent(in), optional :: ii_term
      type(quantum_numbers_t), dimension(:), intent(in), optional :: qn_select
      integer :: i_term
      type(interaction_t), pointer :: int_matrix, int_flows
      if (evt%process_instance%is_complete_event ()) then
         if (present (ii_term)) then
            i_term = ii_term
         else
            i_term = evt%process_instance%select_i_term ()
         end if
         int_matrix => evt%process_instance%get_matrix_int_ptr (i_term)
         int_flows  => evt%process_instance%get_flows_int_ptr (i_term)
         call evt%factorize_interactions (int_matrix, int_flows, &
              factorization_mode, keep_correlations, r, qn_select)
         call evt%tag_incoming ()
      else
         call msg_bug ("Event factorization: event is incomplete")
      end if
    end subroutine make_factorized_particle_set
```

Mark the incoming particles as incoming in the particle set. This is necessary
because in the interaction objects they are usually marked as virtual.

In the inquiry functions we set the term index to one; the indices of beams
and incoming particles should be identical for all process terms.

We use the initial elementary process for obtaining the indices. Thus, we
implicitly assume that the beam and incoming indices stay the same across event
transforms. If this is not true for a transform (say, MPI), it should override this
method.

⟨*Event transforms: evt: TBP*⟩+≡
```
    procedure :: tag_incoming => evt_tag_incoming
```

⟨*Event transforms: procedures*⟩+≡
```
    subroutine evt_tag_incoming (evt)
      class(evt_t), intent(inout) :: evt
      integer :: i_term, n_in
      integer, dimension(:), allocatable :: beam_index, in_index
      n_in = evt%process%get_n_in ()
      i_term = 1
      allocate (beam_index (n_in))
      call evt%process_instance%get_beam_index (i_term, beam_index)
      call evt%particle_set%reset_status (beam_index, PRT_BEAM)
```

```
    allocate (in_index (n_in))
    call evt%process_instance%get_in_index (i_term, in_index)
    call evt%particle_set%reset_status (in_index, PRT_INCOMING)
end subroutine evt_tag_incoming
```

33.1.2 Implementation: Trivial transform

This transform contains just a pointer to process and process instance. The
`generate` methods do nothing.

⟨*Event transforms: public*⟩+≡
```
    public :: evt_trivial_t
```

⟨*Event transforms: types*⟩+≡
```
    type, extends (evt_t) :: evt_trivial_t
     contains
    ⟨Event transforms: evt trivial: TBP⟩
    end type evt_trivial_t
```

⟨*Event transforms: evt trivial: TBP*⟩≡
```
    procedure :: write_name => evt_trivial_write_name
```

⟨*Event transforms: procedures*⟩+≡
```
    subroutine evt_trivial_write_name (evt, unit)
      class(evt_trivial_t), intent(in) :: evt
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A)")  "Event transform: trivial (hard process)"
    end subroutine evt_trivial_write_name
```

The finalizer is trivial. Some output:

⟨*Event transforms: evt trivial: TBP*⟩+≡
```
    procedure :: write => evt_trivial_write
```

⟨*Event transforms: procedures*⟩+≡
```
    subroutine evt_trivial_write (evt, unit, verbose, more_verbose, testflag)
      class(evt_trivial_t), intent(in) :: evt
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose, more_verbose, testflag
      integer :: u
      u = given_output_unit (unit)
      call write_separator (u, 2)
      call evt%write_name (u)
      call write_separator (u)
      call evt%base_write (u, testflag = testflag)
    end subroutine evt_trivial_write
```

Nothing to do here:

⟨*Event transforms: evt trivial: TBP*⟩+≡
```
    procedure :: prepare_new_event => evt_trivial_prepare_new_event
```

⟨*Event transforms: procedures*⟩+≡
```
    subroutine evt_trivial_prepare_new_event (evt, i_mci, i_term)
      class(evt_trivial_t), intent(inout) :: evt
      integer, intent(in) :: i_mci, i_term
      call evt%reset ()
    end subroutine evt_trivial_prepare_new_event
```

The weighted generator is, surprisingly, trivial.

⟨*Event transforms: evt trivial: TBP*⟩+≡
```
    procedure :: generate_weighted => evt_trivial_generate_weighted
```

⟨*Event transforms: procedures*⟩+≡
```
    subroutine evt_trivial_generate_weighted (evt, probability)
      class(evt_trivial_t), intent(inout) :: evt
      real(default), intent(inout) :: probability
      probability = 1
    end subroutine evt_trivial_generate_weighted
```

This routine makes a particle set, using the associated process instance as-is.

⟨*Event transforms: evt trivial: TBP*⟩+≡
```
    procedure :: make_particle_set => evt_trivial_make_particle_set
```

33.2.7 Hadronization Event Transform

This is the type for the hadronization event transform. It does not depend on
the specific hadronization implementation of `hadrons_t`.

⟨*Hadrons: public*⟩+≡
```
    public :: evt_hadrons_t
```
⟨*Hadrons: types*⟩+≡
```
    type, extends (evt_t) :: evt_hadrons_t
       class(hadrons_t), allocatable :: hadrons
       type(model_t), pointer :: model_hadrons => null()
       type(qcd_t) :: qcd
       logical :: is_first_event
     contains
```
⟨*Hadrons: evt hadrons: TBP*⟩

```
      end type evt_hadrons_t
```

Initialize the parameters. The `model_hadrons` is supposed to be the SM variant that contains all hadrons that may be generated in the shower.

⟨*Hadrons: evt hadrons: TBP*⟩≡
```
    procedure :: init => evt_hadrons_init
```

⟨*Hadrons: procedures*⟩+≡
```
    subroutine evt_hadrons_init (evt, model_hadrons)
      class(evt_hadrons_t), intent(out) :: evt
      type(model_t), intent(in), target :: model_hadrons
      evt%model_hadrons => model_hadrons
      evt%is_first_event = .true.
    end subroutine evt_hadrons_init
```

⟨*Hadrons: evt hadrons: TBP*⟩+≡
```
    procedure :: write_name => evt_hadrons_write_name
```

⟨*Hadrons: procedures*⟩+≡
```
    subroutine evt_hadrons_write_name (evt, unit)
      class(evt_hadrons_t), intent(in) :: evt
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A)")  "Event transform: hadronization"
    end subroutine evt_hadrons_write_name
```

Output.

⟨*Hadrons: evt hadrons: TBP*⟩+≡
```
    procedure :: write => evt_hadrons_write
```

⟨*Hadrons: procedures*⟩+≡
```
    subroutine evt_hadrons_write (evt, unit, verbose, more_verbose, testflag)
      class(evt_hadrons_t), intent(in) :: evt
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose, more_verbose, testflag
      integer :: u
      u = given_output_unit (unit)
      call write_separator (u, 2)
      call evt%write_name (u)
      call write_separator (u)
      call evt%base_write (u, testflag = testflag, show_set = .false.)

      call msg_fatal ("Hadronization without shower is not supported")
    end if
  end associate
  evt%is_first_event = .false.
end subroutine evt_hadrons_first_event
```

Here we take the particle set from the previous event transform and apply the hadronization. The result is stored in the `evt%hadrons` object. We always return a probability of unity as we don't have the analytic weight of the hadronization. Invalid events have to be discarded by the caller which is why we mark the particle set as invalid.

⟨Hadrons: evt hadrons: TBP⟩+≡

```
procedure :: generate_weighted => evt_hadrons_generate_weighted
```

⟨Hadrons: procedures⟩+≡

```
subroutine evt_hadrons_generate_weighted (evt, probability)
  class(evt_hadrons_t), intent(inout) :: evt
  real(default), intent(inout) :: probability
  logical :: valid
  if (signal_is_pending ())  return
  evt%particle_set = evt%previous%particle_set
  if (evt%is_first_event) then
    call evt%first_event ()
  end if
  call evt%hadrons%hadronize (evt%particle_set, valid)
  probability = 1
  evt%particle_set_exists = valid
end subroutine evt_hadrons_generate_weighted
```

The factorization parameters are irrelevant.

⟨Hadrons: evt hadrons: TBP⟩+≡

```

33.3.1 Resonance-Insertion Event Transform

This is the type for the event transform that applies resonance insertion. The resonance history set describe the resonance histories that we may consider. There is a process library with process objects that correspond to the resonance histories. Library creation, compilation etc. is done outside the scope of this module.

⟨*Resonance insertion: public*⟩≡
  ```
    public :: evt_resonance_t
```

⟨*Resonance insertion: types*⟩≡
  ```
    type, extends (evt_t) :: evt_resonance_t
      type(resonance_history_set_t), dimension(:), allocatable :: res_history_set
      integer, dimension(:), allocatable :: index_offset
      integer :: selected_component = 0
      type(string_t) :: libname
      type(string_t), dimension(:), allocatable :: proc_id
```

```
    real(default) :: on_shell_limit = 0
    real(default) :: on_shell_turnoff = 0
    real(default) :: background_factor = 1
    logical :: selector_active = .false.
    type(selector_t) :: selector
    integer :: selected_history = 0
    type(process_instance_ptr_t), dimension(:), allocatable :: instance
  contains
  ⟨Resonance insertion: evt resonance: TBP⟩
  end type evt_resonance_t
```

⟨*Resonance insertion: evt resonance: TBP*⟩≡
```
    procedure :: write_name => evt_resonance_write_name
```

⟨*Resonance insertion: procedures*⟩≡
```
    subroutine evt_resonance_write_name (evt, unit)
      class(evt_resonance_t), intent(in) :: evt
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A)")  "Event transform: resonance insertion"
    end subroutine evt_resonance_write_name
```

Output.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: write => evt_resonance_write
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_write (evt, unit, verbose, more_verbose, testflag)
      class(evt_resonance_t), intent(in) :: evt
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose, more_verbose, testflag
      integer :: u, i
      u = given_output_unit (unit)
      call write_separator (u, 2)
      call evt%write_name (u)
      call write_separator (u, 2)
      write (u, "(1x,A,A,A)")  "Process library = '", char (evt%libname), "'"
      if (allocated (evt%res_history_set)) then
         do i = 1, size (evt%res_history_set)
            if (i == evt%selected_component) then
               write (u, "(1x,A,I0,A)")  "Component #", i, ": *"
            else
               write (u, "(1x,A,I0,A)")  "Component #", i, ":"
            end if

      if (allocated (evt%instance)) then
         write (u, "(1x,A)")  "Subprocess instances: allocated"
      else
         write (u, "(1x,A)")  "Subprocess instances: not allocated"
      end if
```

```
      if (evt%particle_set_exists) then
         if (evt%selected_history > 0) then
            write (u, "(1x,A,I0)")  "Selected: resonance history #", &
                 evt%selected_history
         else
            write (u, "(1x,A)")  "Selected: no resonance history"
         end if
      else
         write (u, "(1x,A)")  "Selected: [none]"
      end if
      write (u, "(1x,A,1x," // FMT_12 // ")")  &
           "On-shell limit    =", evt%on_shell_limit
      write (u, "(1x,A,1x," // FMT_12 // ")")  &
           "On-shell turnoff  =", evt%on_shell_turnoff
      write (u, "(1x,A,1x," // FMT_12 // ")")  &
           "Background factor =", evt%background_factor
      call write_separator (u)
      if (evt%selector_active) then
         write (u, "(2x)", advance="no")
         call evt%selector%write (u, testflag=testflag)
         call write_separator (u)
      end if
      call evt%base_write (u, testflag = testflag, show_set = .false.)
      call write_separator (u)
      if (evt%particle_set_exists) then
         call evt%particle_set%write &
              (u, summary = .true., compressed = .true., testflag = testflag)
         call write_separator (u)
      end if
    end subroutine evt_resonance_write
```

33.3.2   Set contained data

Insert the resonance data, in form of a pre-generated resonance history set.
Accumulate the number of histories for each set, to initialize an array of index
offsets for lookup.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: set_resonance_data => evt_resonance_set_resonance_data
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_set_resonance_data (evt, res_history_set)
      class(evt_resonance_t), intent(inout) :: evt
      type(resonance_history_set_t), dimension(:), intent(in) :: res_history_set
      integer :: i
      evt%res_history_set = res_history_set
      allocate (evt%index_offset (size (evt%res_history_set)), source = 0)
      do i = 2, size (evt%res_history_set)
         evt%index_offset(i) = &
              evt%index_offset(i-1) + evt%res_history_set(i-1)%get_n_history ()
      end do
    end subroutine evt_resonance_set_resonance_data
```

Set the library that contains the resonant subprocesses.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
procedure :: set_library => evt_resonance_set_library
```

⟨*Resonance insertion: procedures*⟩+≡
```
subroutine evt_resonance_set_library (evt, libname)
  class(evt_resonance_t), intent(inout) :: evt
  type(string_t), intent(in) :: libname
  evt%libname = libname
end subroutine evt_resonance_set_library
```

Assign pointers to subprocess instances. Once a subprocess has been selected, the instance is used for generating the particle set with valid quantum-number assignments, ready for resonance insertion.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
procedure :: set_subprocess_instances &
    => evt_resonance_set_subprocess_instances
```

⟨*Resonance insertion: procedures*⟩+≡
```
subroutine evt_resonance_set_subprocess_instances (evt, instance)
  class(evt_resonance_t), intent(inout) :: evt
  type(process_instance_ptr_t), dimension(:), intent(in) :: instance
  evt%instance = instance
end subroutine evt_resonance_set_subprocess_instances
```

Set the on-shell limit, the relative distance from a resonance that is still considered to be on-shell. The probability for being considered on-shell can be reduced by the turnoff parameter below. For details, see the `resonances` module.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
procedure :: set_on_shell_limit => evt_resonance_set_on_shell_limit
```

⟨*Resonance insertion: procedures*⟩+≡
```
subroutine evt_resonance_set_on_shell_limit (evt, on_shell_limit)
  class(evt_resonance_t), intent(inout) :: evt
  real(default), intent(in) :: on_shell_limit
  evt%on_shell_limit = on_shell_limit
end subroutine evt_resonance_set_on_shell_limit
```

Set the Gaussian on-shell turnoff parameter, the width of the weighting factor for the resonance squared matrix element. If the resonance is off shell, this factor reduces the weight of the matrix element in the selector, such that the probability for considered resonant is reduced. The factor is applied only if the offshellness is less than the `on_shell_limit` above. For details, see the `resonances` module.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
procedure :: set_on_shell_turnoff => evt_resonance_set_on_shell_turnoff
```

⟨*Resonance insertion: procedures*⟩+≡
```
subroutine evt_resonance_set_on_shell_turnoff (evt, on_shell_turnoff)
  class(evt_resonance_t), intent(inout) :: evt
  real(default), intent(in) :: on_shell_turnoff
  evt%on_shell_turnoff = on_shell_turnoff
end subroutine evt_resonance_set_on_shell_turnoff
```

Reweight (suppress) the background contribution if there is a resonance history that applies. The event will be registered as background if there is no applicable resonance history, or if the background configuration has been selected based on (reweighted) squared matrix elements.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: set_background_factor => evt_resonance_set_background_factor
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_set_background_factor (evt, background_factor)
      class(evt_resonance_t), intent(inout) :: evt
      real(default), intent(in) :: background_factor
      evt%background_factor = background_factor
    end subroutine evt_resonance_set_background_factor
```

33.3.3 Selector

Manually import a random-number generator object. This should be done only for testing purposes. The standard procedure is to **connect** a process to an event transform; this will create an appropriate **rng** from the RNG factory in the process object.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: import_rng => evt_resonance_import_rng
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_import_rng (evt, rng)
      class(evt_resonance_t), intent(inout) :: evt
      class(rng_t), allocatable, intent(inout) :: rng
      call move_alloc (from = rng, to = evt%rng)
    end subroutine evt_resonance_import_rng
```

We use a standard selector object to choose from the available resonance histories. If the selector is inactive, we do not insert resonances.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: write_selector => evt_resonance_write_selector
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_write_selector (evt, unit, testflag)
      class(evt_resonance_t), intent(in) :: evt
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag
      integer :: u
      u = given_output_unit (unit)
      if (evt%selector_active) then
         call evt%selector%write (u, testflag)
      else
         write (u, "(1x,A)")  "Selector: [inactive]"
      end if
    end subroutine evt_resonance_write_selector
```

The selector is initialized with relative weights of histories which need not be normalized. Channels with weight zero are ignored.

The `offset` will normally be -1, so we count from zero, and zero is a valid result from the selector. Selecting the zero entry implies no resonance insertion. However, this behavior is not hard-coded here (without offset, no resonance is not possible as a result).

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: init_selector => evt_resonance_init_selector
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_init_selector (evt, weight, offset)
      class(evt_resonance_t), intent(inout) :: evt
      real(default), dimension(:), intent(in) :: weight
      integer, intent(in), optional :: offset
      if (any (weight > 0)) then
         call evt%selector%init (weight, offset = offset)
         evt%selector_active = .true.
      else
         evt%selector_active = .false.
      end if
    end subroutine evt_resonance_init_selector
```

Return all selector weights, for inspection. Note that the index counts from zero.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: get_selector_weights => evt_resonance_get_selector_weights
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_get_selector_weights (evt, weight)
      class(evt_resonance_t), intent(in) :: evt
      real(default), dimension(0:), intent(out) :: weight
      integer :: i
      do i = 0, ubound (weight,1)
         weight(i) = evt%selector%get_weight (i)
      end do
    end subroutine evt_resonance_get_selector_weights
```

33.3.4 Runtime calculations

Use the associated master process instance and the subprocess instances to distribute the current momentum set, then compute the squared matrix elements weights for all subprocesses.

NOTE: Procedures in this subsection are not covered by unit tests in this module, but by unit tests of the `restricted_subprocesses` module.

Fill the particle set, so the momentum configuration can be used by the subprocess instances. The standard workflow is to copy from the previous particle set.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: fill_momenta => evt_resonance_fill_momenta
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_fill_momenta (evt)
      class(evt_resonance_t), intent(inout) :: evt
      integer :: i, n
      if (associated (evt%previous)) then
         evt%particle_set = evt%previous%particle_set
      else if (associated (evt%process_instance)) then
         ! this branch only for unit test
         call evt%process_instance%get_trace &
              (evt%particle_set, i_term=1, n_incoming=evt%process%get_n_in ())
      end if
    end subroutine evt_resonance_fill_momenta
```

Return the indices of those subprocesses which can be considered on-shell. The result depends on the stored particle set (outgoing momenta) and on the on-shell limit value.

The index `evt%selected_component` identifies the particular history set that corresponds to the given process component. Recall that process components may have different external particles, so they have distinct history sets.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: determine_on_shell_histories &
         => evt_resonance_determine_on_shell_histories
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_determine_on_shell_histories &
         (evt, index_array)
      class(evt_resonance_t), intent(in) :: evt
      integer, dimension(:), allocatable, intent(out) :: index_array
      integer :: i
      i = evt%selected_component
      call evt%res_history_set(i)%determine_on_shell_histories &
           (evt%particle_set%get_outgoing_momenta (), &
           evt%on_shell_limit, &
           index_array)
    end subroutine evt_resonance_determine_on_shell_histories
```

Evaluate selected subprocesses. (In actual operation, the ones that have been tagged as on-shell.)

We assume that the MCI, term, and channel indices for the subprocesses can all be set to 1.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: evaluate_subprocess => evt_resonance_evaluate_subprocess
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_evaluate_subprocess (evt, index_array)
      class(evt_resonance_t), intent(inout) :: evt
      integer, dimension(:), intent(in) :: index_array
      integer :: k, i
      if (allocated (evt%instance)) then
         do k = 1, size (index_array)
            i = index_array(k)
            associate (instance => evt%instance(i)%p)
              call instance%choose_mci (1)
```

```
                    call instance%set_trace (evt%particle_set, 1, check_match=.false.)
                    call instance%recover (channel = 1, i_term = 1, &
                         update_sqme = .true., recover_phs = .false.)
                end associate
            end do
        end if
    end subroutine evt_resonance_evaluate_subprocess
```

Return the current squared matrix-element value of the master process, and of
the selected resonant subprocesses, respectively.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: get_master_sqme => evt_resonance_get_master_sqme
    procedure :: get_subprocess_sqme => evt_resonance_get_subprocess_sqme
```

⟨*Resonance insertion: procedures*⟩+≡
```
    function evt_resonance_get_master_sqme (evt) result (sqme)
      class(evt_resonance_t), intent(in) :: evt
      real(default) :: sqme
      sqme = evt%process_instance%get_sqme ()
    end function evt_resonance_get_master_sqme

    subroutine evt_resonance_get_subprocess_sqme (evt, sqme, index_array)
      class(evt_resonance_t), intent(in) :: evt
      real(default), dimension(:), intent(out) :: sqme
      integer, dimension(:), intent(in), optional :: index_array
      integer :: k, i
      if (present (index_array)) then
         sqme = 0
         do k = 1, size (index_array)
            call get_sqme (index_array(k))
         end do
      else
         do i = 1, size (evt%instance)
            call get_sqme (i)
         end do
      end if
    contains
      subroutine get_sqme (i)
        integer, intent(in) :: i
        associate (instance => evt%instance(i)%p)
          sqme(i) = instance%get_sqme ()
        end associate
      end subroutine get_sqme
    end subroutine evt_resonance_get_subprocess_sqme
```

Apply a turnoff factor for off-shell kinematics to the `sqme` values. The `sqme`
array indices are offset from the resonance history set entries.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: apply_turnoff_factor => evt_resonance_apply_turnoff_factor
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_apply_turnoff_factor (evt, sqme, index_array)
      class(evt_resonance_t), intent(in) :: evt
      real(default), dimension(:), intent(inout) :: sqme
```

```
      integer, dimension(:), intent(in) :: index_array
      integer :: k, i_res, i_prc
      do k = 1, size (index_array)
         i_res = evt%selected_component
         i_prc = index_array(k) + evt%index_offset(i_res)
         sqme(i_prc) = sqme(i_prc) &
              * evt%res_history_set(i_res)%evaluate_gaussian &
              &  (evt%particle_set%get_outgoing_momenta (), &
              &   evt%on_shell_turnoff, index_array(k))
      end do
   end subroutine evt_resonance_apply_turnoff_factor
```

We use the calculations of resonant matrix elements to determine probabilities for all applicable resonance configurations. This method combines the steps implemented above.

First, we determine the selected process component.

TODO: the version below selects the first component which is found active. This make sense only for standard LO process components, where exactly one component corresponds to a MCI set.

For the selected process component, we query the kinematics and determine the applicable resonance histories. We collect squared matrix elements for those resonance histories and compare them to the master-process squared matrix element.

The result is the probability for each resonance history together with the probability for non-resonant background (zeroth entry). The latter is defined as the difference between the complete process result and the sum of the resonances, ignoring the possibility for interference. If the complete process result is actually undershooting the sum of resonances, we nevertheless count the background with positive probability.

When looking up the subprocess sqme, we must add the index_offset to the resulting array, since the indices returned by the individual history set all count from one, while the subprocess instances that belong to process components are collected in one flat array.

After determining matrix elements and background, we may reduce the weight of the matrix elements in the selector by applying a turnoff factor.

The factor background_factor indicates whether to include the background contribution at all, as long as there is a nonvanishing resonance contribution. Note that instead of setting background to zero, we just multiply it by a very small number. This ensures that indices are assigned correctly, and that background will eventually be selected if smooth turnoff is chosen.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
   procedure :: compute_probabilities => evt_resonance_compute_probabilities
```

⟨*Resonance insertion: procedures*⟩+≡
```
   subroutine evt_resonance_compute_probabilities (evt)
     class(evt_resonance_t), intent(inout) :: evt
     integer, dimension(:), allocatable :: index_array
     real(default) :: sqme_master, sqme_sum, sqme_bg
     real(default), dimension(:), allocatable :: sqme_res
     integer :: n, ic
     if (.not. associated (evt%process_instance))  return
```

```
n = size (evt%instance)
call evt%select_component (0)
FIND_ACTIVE_COMPONENT: do ic = 1, evt%process%get_n_components ()
   if (evt%process%component_is_selected (ic)) then
      call evt%select_component (ic)
      exit FIND_ACTIVE_COMPONENT
   end if
end do FIND_ACTIVE_COMPONENT
if (evt%selected_component > 0) then
   call evt%determine_on_shell_histories (index_array)
else
   allocate (index_array (0))
end if
call evt%evaluate_subprocess &
     (index_array + evt%index_offset(evt%selected_component))
allocate (sqme_res (n), source = 0._default)
call evt%get_subprocess_sqme &
     (sqme_res, index_array + evt%index_offset(evt%selected_component))
sqme_master = evt%get_master_sqme ()
sqme_sum = sum (sqme_res)
sqme_bg = abs (sqme_master - sqme_sum)
if (evt%on_shell_turnoff > 0) then
   call evt%apply_turnoff_factor (sqme_res, index_array)
end if
if (any (sqme_res > 0)) then
   sqme_bg = sqme_bg * evt%background_factor
end if
call evt%init_selector ([sqme_bg, sqme_res], offset = -1)
end subroutine evt_resonance_compute_probabilities
```

Set the selected component (unit tests).

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
procedure :: select_component => evt_resonance_select_component
```

⟨*Resonance insertion: procedures*⟩+≡
```
subroutine evt_resonance_select_component (evt, i_component)
  class(evt_resonance_t), intent(inout) :: evt
  integer, intent(in) :: i_component
  evt%selected_component = i_component
end subroutine evt_resonance_select_component
```

33.3.5 Sanity check

Check the color assignment, which may be wrong for the inserted resonances. Delegated to the particle-set component. Return offending particle indices and, optionally, particles as arrays.

This is done in a unit test. The current algorithm, i.e., selecting the color assignment from the resonant-subprocess instance, should not generate invalid color assignments.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
procedure :: find_prt_invalid_color => evt_resonance_find_prt_invalid_color
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_find_prt_invalid_color (evt, index, prt)
      class(evt_resonance_t), intent(in) :: evt
      integer, dimension(:), allocatable, intent(out) :: index
      type(particle_t), dimension(:), allocatable, intent(out), optional :: prt
      if (evt%particle_set_exists) then
         call evt%particle_set%find_prt_invalid_color (index, prt)
      else
         allocate (prt (0))
      end if
    end subroutine evt_resonance_find_prt_invalid_color
```

33.3.6 API implementation

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: prepare_new_event => evt_resonance_prepare_new_event
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_prepare_new_event (evt, i_mci, i_term)
      class(evt_resonance_t), intent(inout) :: evt

      call evt%reset ()
    end subroutine evt_resonance_prepare_new_event
```

Select one of the histories, based on the momentum array from the current particle set. Compute the probabilities for all resonant subprocesses and initialize the selector accordingly. Then select one resonance history, or none.

⟨*Resonance insertion: evt resonance: TBP*⟩+≡
```
    procedure :: generate_weighted => evt_resonance_generate_weighted
```

⟨*Resonance insertion: procedures*⟩+≡
```
    subroutine evt_resonance_generate_weighted (evt, probability)
      class(evt_resonance_t), intent(inout) :: evt
      real(default), intent(inout) :: probability
      call evt%fill_momenta ()
      call evt%compute_probabilities ()
      call evt%selector%generate (evt%rng, evt%selected_history)
      probability = 1
    end subroutine evt_resonance_generate_weighted
```

Here take the current particle set and insert resonance intermediate states if applicable. The resonance history has already been chosen by the generator above. If no resonance history applies, just retain the particle set.

If a resonance history applies, we factorize the exclusive interaction of the selected (resonance-process) process instance. With a temporary particle set prt_set as workspace, we the insert the resonances, reinstate parent-child relations and set colors and momenta for the resonances. The temporary is then copied back.

Taking the event data from the resonant subprocess instead of the master process, guarantees that all flavor, helicity, and color assignments are valid for the selected resonance history. Note that the transform may thus choose

a quantum-number combination that is different from the one chosen by the master process.

The i_term value for the selected subprocess instance is always 1. We support only LO process. For those, the master process may have several terms (= components) that correspond to different external states. The subprocesses are distinct, each one corresponds to a definite master component, and by itself it consists of a single component/term.

However, if the selector chooses resonance history #0, i.e., no resonance, we just copy the particle set from the previous (i.e., trivial) event transform and ignore all subprocess data.

  ⟨*Recoil kinematics: parameters*⟩

  ⟨*Recoil kinematics: types*⟩

```
  contains
```

⟨*Recoil kinematics: procedures*⟩

```
  end module recoil_kinematics
```

33.4.1 ϕ sampler

This is trivial. Generate an azimuthal angle, given a $(0, 1)$ RNG parameter.

⟨*Recoil kinematics: procedures*⟩≡

```
    elemental subroutine generate_phi_recoil (r, phi)
      real(default), intent(in) :: r
      real(default), intent(out) :: phi

      phi = r * twopi

    end subroutine generate_phi_recoil
```

33.4.2 Q^2 sampler

The dynamics of factorization suggests to generate a flat Q^2 distribution from a (random) number, event by event.

At the lowest momentum transfer values, the particle (electron) mass sets a smooth cutoff. The formula can produce Q values below the electron mass, down to zero, but with a power distribution that eventually evolves into the expected logarithmic distribution for $Q^2 > m^2$.

We are talking about the absolute value here, so all Q^2 values are positive. For the actual momentum transfer, $q^2 = -Q^2$.

⟨*Recoil kinematics: public*⟩≡

```
    public :: generate_q2_recoil
```

⟨*Recoil kinematics: procedures*⟩+≡

```
    elemental subroutine generate_q2_recoil (s, x_bar, q2_max, m2, r, q2)
      real(default), intent(in) :: s
      real(default), intent(in) :: q2_max
      real(default), intent(in) :: x_bar
      real(default), intent(in) :: m2
      real(default), intent(in) :: r
      real(default), intent(out) :: q2

      real(default) :: q2_max_evt

      q2_max_evt = q2_max_event (s, x_bar, q2_max)

      q2 = m2 * (exp (r * log (1 + (q2_max_evt / m2))) - 1)

    end subroutine generate_q2_recoil
```

The Q distribution is cut off from above by the kinematic limit, which depends on the energy that is available for the radiated photon, or by a user-defined cutoff – whichever is less. The kinematic limit fits the formulas for recoil momenta

(see below), and it also implicitly enters the ISR collinear structure function, so the normalization of the distribution should be correct.

⟨*Recoil kinematics: procedures*⟩+≡

```
elemental function q2_max_event (s, x_bar, q2_max) result (q2)
  real(default), intent(in) :: s
  real(default), intent(in) :: x_bar
  real(default), intent(in) :: q2_max
  real(default) :: q2

  q2 = min (x_bar * s, q2_max)

end function q2_max_event
```

33.4.3 Kinematics functions

Given values for energies, $Q_{1,2}^2$, azimuthal angle, compute the matching polar angle of the radiating particle. The subroutine returns $\sin\theta$ and $\cos\theta$.

⟨*Recoil kinematics: procedures*⟩+≡

```
subroutine polar_angles (s, xb, rho, ee, q2, sin_th, cos_th, ok)
  real(default), intent(in) :: s
  real(default), intent(in) :: xb
  real(default), intent(in) :: rho
  real(default), dimension(2), intent(in) :: ee
  real(default), dimension(2), intent(in) :: q2
  real(default), dimension(2), intent(out) :: sin_th
  real(default), dimension(2), intent(out) :: cos_th
  logical, intent(out) :: ok

  real(default), dimension(2) :: sin2_th_2

  sin2_th_2 = q2 / (ee * rho * xb * s)

  if (all (sin2_th_2 <= 1)) then
     sin_th = 2 * sqrt (sin2_th_2 * (1 - sin2_th_2))
     cos_th = 1 - 2 * sin2_th_2
     ok = .true.
  else
     sin_th = 0
     cos_th = 1
     ok = .false.
  end if

end subroutine polar_angles
```

Compute the acollinearity parameter λ from azimuthal and polar angles. The result is a number between 0 and 1.

⟨*Recoil kinematics: procedures*⟩+≡

```
function lambda_factor (sin_th, cos_th, cphi) result (lambda)
  real(default), dimension(2), intent(in) :: sin_th
  real(default), dimension(2), intent(in) :: cos_th
  real(default), intent(in) :: cphi
```

```
      real(default) :: lambda

      lambda = (1 - cos_th(1) * cos_th(2) - cphi * sin_th(1) * sin_th(2)) / 2

    end function lambda_factor
```

Compute the factor that rescales photon energies, such that the radiation angles match the kinematics parameters.

For small values of $\bar{x}/\cosh\eta$, we have to use the Taylor expansion if we do not want to lose precision. The optional argument allows for a unit test that compares exact and approximate.

⟨*Recoil kinematics: procedures*⟩+≡

```
    function scale_factor (che, lambda, xb0, approximate) result (rho)
      real(default), intent(in) :: che
      real(default), intent(in) :: lambda
      real(default), intent(in) :: xb0
      logical, intent(in), optional :: approximate
      real(default) :: rho

      real(default), parameter :: &
           e0 = (100 * epsilon (1._default)) ** (0.3_default)
      logical :: approx

      if (present (approximate)) then
         approx = approximate
      else
         approx = (xb0/che) < e0
      end if

      if (approx) then
         rho = 1 - lambda * (xb0/(2*che)) * (1 + (1-lambda) * (xb0/che))
      else
         rho =  (che / ((1-lambda)*xb0)) &
           * (1 - sqrt (1 - 2 * (1-lambda) * (xb0/che) &
           &    + (1-lambda) * (xb0 / che)**2))
      end if

    end function scale_factor
```

The code snippet below is not used anywhere, but may be manually inserted in a unit test to numerically verify the approximation above.

⟨*Recoil kinematics: extra test code*⟩≡

```
      write (u, "(A)")
      write (u, "(A)") "*** Table: scale factor calculation"
      write (u, "(A)")

      lambda = 0.25_default
      write (u, FMT1)  "lambda =", lambda

      che = 4._default
      write (u, FMT1)  "che    =", che

      write (u, "(A)")  "   x0     rho(exact)    rho(approx)    rho(chosen)"
```

```
      xb0 = 1._default
      do i = 1, 30
         xb0 = xb0 / 10
         write (u, FMT4)  xb0, &
              scale_factor (che, lambda, xb0, approximate=.false.), &
              scale_factor (che, lambda, xb0, approximate=.true.), &
              scale_factor (che, lambda, xb0)
      end do
```

Compute the current values for the $x_{1,2}$ parameters, given the updated scale factor ρ and the collinear parameters.

⟨*Recoil kinematics: procedures*⟩+≡
```
   subroutine scaled_x (rho, ee, xb0, x, xb)
     real(default), intent(in) :: rho
     real(default), dimension(2), intent(in) :: ee
     real(default), intent(in) :: xb0
     real(default), dimension(2), intent(out) :: x
     real(default), dimension(2), intent(out) :: xb

     xb = rho * ee * xb0
     x = 1 - xb

   end subroutine scaled_x
```

33.4.4 Iterative solution of kinematics constraints

Find a solution of the kinematics constraints. We know the parameters appropriate for collinear kinematics $\sqrt{s}$, $x_{1,2}^c$. We have picked values vor the momentum transfer $Q_{1,2}$ and the azimuthal angles $\phi_{1,2}$. The solution consists of modified energy fractions $x_{1,2}$ and polar angles $\theta_{1,2}$.

If the computation fails, which can happen for large momentum transfer, the flag ok will indicate this.

    end subroutine recoil_momenta
```

Compute the Lorentz transformation that we can use to transform any outgoing momenta into the new c.m. system of the incoming partons. Not relying on the previous calculations, we determine the transformation that transforms the original collinear partons into their c.m. system, and then transform this to the new c.m. system.

⟨*Recoil kinematics: public*⟩+≡
```
    public :: recoil_transformation
```

⟨*Recoil kinematics: procedures*⟩+≡

  sqrts = (p(1) + p(2)) ** 1
  lt = boost (p(1) + p(2), sqrts)

end subroutine initial_transformation
```

33.4.5 Generate recoil event

Combine the above kinematics calculations. First generate azimuthal angles and momentum transfer, solve kinematics and compute momenta for the radiated photons and the on-shell projected, recoiling partons.

If `ok` is false, the data point has failed and we should repeat the procedure for a new set of RNG parameters `r`.

⟨*Recoil kinematics: public*⟩+≡
```

33.5 Transverse momentum for the ISR and EPA approximations

The ISR and EPA handler takes an event with a single radiated collinear particle (photon for ISR, beam particle for EPA) for each beam, respectively, and inserts transverse momentum for both. The four-particle kinematics allows us to generate Q^2 and azimuthal angles independently, without violating energy-momentum conservation. The Q^2 distribution is logarithmic, as required by the effective particle approximation, and reflected in the inclusive ISR/EPA structure functions. We also conserve the invariant mass of the partonic systm after radiation. The total transverse-momentum kick is applied in form of a Lorentz transformation to the elementary process, both in- and out-particles. In fact, the incoming partons (beam particle for ISR, photon for EPA) which would be virtual space-like in the exact kinematics configuration, are replaced by on-shell incoming partons, such that energy, momentum, and invariant mass $\sqrt{\hat{s}}$ are conserved.

Regarding kinematics, we treat all particles as massless. The beam-particle

mass only appears as the parameter `isr_mass` or `epa_mass`, respectively, and cuts off the logarithmic distribution. The upper cutoff is `isr_q_max` (`epa_q_max`), which defaults to the available energy $\sqrt{s}$.

The only differences between ISR and EPA, in this context, are the particle types, and an extra $\bar{x}$ factor in the lower cutoff for EPA, see below.

33.5.1 Event transform type

Convention: `beam` are the incoming partons before ISR – not necessarily the actual beams, need not be in c.m. frame. `radiated` are the radiated particles (photon for ISR), and `parton` are the remainders which initiate the elementary process. These particles are copied verbatim from the event record, and must be collinear.

The kinematical parameters are `sqrts` = invariant mass of the `beam` particles, `q_max` and `m` determining the Q^2 distribution, and `xc`/`xcb` as the energy fraction (complement) of the partons, relative to the beams.

Transformations: `lti` is the Lorentz transformation that would boosts `pi` (c.m. frame) back to the original `beam` momenta (lab frame). `lto` is the recoil transformation, transforming the partons after ISR from the collinear frame to the recoiling frame. `lt` is the combination of both, which is to be applied to all particles after the hard interaction.

Momenta: `pi` are the beams transformed to their common c.m. frame. `ki` and `qi` are the photon/parton momenta in the `pi` c.m. frame. `km` and `qm` are the photon/parton momenta with the Q distribution applied, and finally `qo` are the partons `qm` projected on-shell.

33.5.5 Initialization

Manually import a random-number generator object. This should be done only for testing purposes. The standard procedure is to `connect` a process to an event transform; this will create an appropriate **rng** from the RNG factory in the process object.

⟨*ISR/EPA handler: evt isr: TBP*⟩+≡
```
    procedure :: import_rng => evt_isr_epa_import_rng
```

⟨*ISR/EPA handler: procedures*⟩+≡
```
    subroutine evt_isr_epa_import_rng (evt, rng)
      class(evt_isr_epa_t), intent(inout) :: evt
      class(rng_t), allocatable, intent(inout) :: rng
      call move_alloc (from = rng, to = evt%rng)
    end subroutine evt_isr_epa_import_rng
```

Set constant kinematics limits and initialize for ISR. Note that `sqrts` is used only as the fallback value for `q_max`. The actual `sqrts` value for the transform object is inferred from the incoming particles, event by event.

⟨*ISR/EPA handler: evt isr: TBP*⟩+≡
```
procedure :: set_data_isr => evt_isr_epa_set_data_isr
```

⟨*ISR/EPA handler: procedures*⟩+≡
```
subroutine evt_isr_epa_set_data_isr (evt, sqrts, q_max, m)
  class(evt_isr_epa_t), intent(inout) :: evt
  real(default), intent(in) :: sqrts
  real(default), intent(in) :: q_max
  real(default), intent(in) :: m
  if (sqrts <= 0) then
     call msg_fatal ("ISR handler: sqrts value must be positive")
  end if
  if (q_max <= 0 .or. q_max > sqrts) then
     evt%isr_q_max = sqrts
  else
     evt%isr_q_max = q_max
  end if
  if (m > 0) then
     evt%isr_mass = m
  else
     call msg_fatal ("ISR handler: ISR_mass value must be positive")
  end if
  evt%isr_active = .true.
end subroutine evt_isr_epa_set_data_isr
```

Set constant kinematics limits and initialize for EPA. Note that `sqrts` is used only as the fallback value for `q_max`. The actual `sqrts` value for the transform object is inferred from the incoming particles, event by event.

⟨*ISR/EPA handler: evt isr: TBP*⟩+≡
```
procedure :: set_data_epa => evt_isr_epa_set_data_epa
```

⟨*ISR/EPA handler: procedures*⟩+≡
```
subroutine evt_isr_epa_set_data_epa (evt, sqrts, q_max, m)
  class(evt_isr_epa_t), intent(inout) :: evt
  real(default), intent(in) :: sqrts
  real(default), intent(in) :: q_max
  real(default), intent(in) :: m
  if (sqrts <= 0) then
     call msg_fatal ("EPA handler: sqrts value must be positive")
  end if
  if (q_max <= 0 .or. q_max > sqrts) then
     evt%epa_q_max = sqrts
  else
     evt%epa_q_max = q_max
  end if
  if (m > 0) then
     evt%epa_mass = m
  else
     call msg_fatal ("EPA handler: EPA_mass value must be positive")
  end if
  evt%epa_active = .true.
```

```
      end subroutine evt_isr_epa_set_data_epa
```

33.5.6   Fetch event data

Identify the radiated particles and the recoil momenta in the particle set. Without much sophistication, start from the end and find particles with the "remnant" status. Their parents should point to the recoiling parton. If successful, set the particle indices in the `evt` object, for further processing.

⟨*ISR/EPA handler: evt isr: TBP*⟩+≡
```
      procedure, private :: identify_radiated
```

⟨*ISR/EPA handler: procedures*⟩+≡
```
    subroutine identify_radiated (evt)
      class(evt_isr_epa_t), intent(inout) :: evt
      integer :: i, k
      k = 2
      FIND_LAST_RADIATED: do i = evt%particle_set%get_n_tot (), 1, -1
         associate (prt => evt%particle_set%prt(i))
           if (prt%is_beam_remnant ()) then
              evt%i_radiated(k) = i
              evt%radiated(k) = prt
              k = k - 1
              if (k == 0)  exit FIND_LAST_RADIATED
           end if
         end associate
      end do FIND_LAST_RADIATED
      if (k /= 0)  call err_count
    contains
      subroutine err_count

        call msg_bug ("ISR/EPA handler: non-positive energy in splitting")
      end subroutine err_energy
    end subroutine infer_x
```

33.5.7   Two-parton recoil

For transforming partons into recoil momenta, we make use of the routines in the `recoil_kinematics` module. In addition to the collinear momenta, we use the x energy fractions, and four numbers from the RNG.

There is one subtle difference w.r.t. ISR case: the EPA mass parameter is multiplied by the energy fraction x, separately for each beam. This is the effective lower Q cutoff.

For certain kinematics, close to the $Q_{\max}$ endpoint, this may fail, and `ok` is set to false. In that case, we should generate new recoil momenta for the same event. This is handled by the generic unweighting procedure.

⟨*ISR/EPA handler: evt isr: TBP*⟩+≡

```
      procedure, private :: generate_recoil => evt_generate_recoil
```

⟨*ISR/EPA handler: procedures*⟩+≡

```
    subroutine evt_generate_recoil (evt, ok)
      class(evt_isr_epa_t), intent(inout) :: evt
      logical, intent(out) :: ok
      real(default), dimension(4) :: r
      real(default), dimension(2) :: m
      integer :: i
      call evt%rng%generate (r)
      do i = 1, 2
         select case (evt%rad_mode(i))
         case (BEAM_RAD_ISR);  m(i) = evt%m(i)
         case (BEAM_RAD_EPA);  m(i) = evt%xc(i) * evt%m(i)
         case default;         m(i) = 0
         end select
      end do
      call generate_recoil (evt%sqrts, evt%q_max, m, evt%xc, evt%xcb, r, &
           evt%km, evt%qm, evt%qo, ok)
    end subroutine evt_generate_recoil
```

Replace the collinear radiated (incoming) parton momenta by the momenta
that we have generated, respectively. Recall that the recoil has been applied
in the c.m. system of the partons before ISR, so we apply the stored Lorentz
transformation to boost them to the lab frame.

⟨*ISR/EPA handler: evt isr: TBP*⟩+≡

```
    procedure, private :: replace_radiated
    procedure, private :: replace_partons
```

⟨*ISR/EPA handler: procedures*⟩+≡

```
    subroutine replace_radiated (evt)
      class(evt_isr_epa_t), intent(inout) :: evt
      integer :: i
      do i = 1, 2
         associate (prt => evt%particle_set%prt(evt%i_radiated(i)))
           call prt%set_momentum (evt%lti * evt%km(i))
         end associate
      end do
    end subroutine replace_radiated

    subroutine replace_partons (evt)
      class(evt_isr_epa_t), intent(inout) :: evt
      integer :: i
      do i = 1, 2
         associate (prt => evt%particle_set%prt(evt%i_parton(i)))
           call prt%set_momentum (evt%lti * evt%qo(i))
         end associate
      end do
    end subroutine replace_partons
```

33.5.8 Transform the event

Knowing the new incoming partons for the elementary process, we can make use of another procedure in `recoil_kinematics` to determine the Lorentz transformation that transforms the collinear frame into the frame with transverse momentum. We apply this transformation, recursively, to all particles that originate from those incoming partons in the original particle set.

We have to allow for the pre-ISR partons being not in their common c.m. frame. Taking into account non-commutativity, we actually have to first transform the outgoing particles to that c.m. frame, then apply the recoil transformation, then boost back to the lab frame.

The `mask` keep track of particles that we transform, just in case the parent-child tree is multiply connected.

⟨*ISR/EPA handler: evt isr: TBP*⟩+≡

```
  procedure :: transform_outgoing => evt_transform_outgoing
```

⟨*ISR/EPA handler: procedures*⟩+≡

```
  subroutine evt_transform_outgoing (evt)

```

33.5.9 Implemented methods

Here we take the particle set from the previous event transform and copy it, then generate the transverse momentum for the radiated particles and for the incoming partons. If this fails (rarely, for large p_T), return zero for the probability, to trigger another try.

NOTE: The boost for the initial partonic system, if not in the c.m. frame, has not been implemented yet.

⟨*ISR/EPA handler: evt isr: TBP*⟩+≡

```
          procedure :: generate_weighted => &
              evt_isr_epa_generate_weighted
```

⟨*ISR/EPA handler: procedures*⟩+≡

```
      subroutine evt_isr_epa_generate_weighted (evt, probability)
        class(evt_isr_epa_t), intent(inout) :: evt
        real(default), intent(inout) :: probability
        logical :: valid
        call evt%particle_set%final ()
        evt%particle_set = evt%previous%particle_set
        evt%particle_set_exists = .true.

Beam pair with recoil

Handle beams resulting from the EPA approximation. This test invokes the two-beam recoil mechanism. Both beam remnants acquire transverse momentum, the photon momenta recoil, such that total energy-momentum is conserved, and all outgoing beam remnants and photons are on-shell (massless).

⟨*ISR/EPA handler: execute EPA tests*⟩+≡

33.6.1 Final-State Particle Configuration

A final-state particle may be either stable or unstable. Here is an empty abstract
type as the parent of both, with holds just the flavor information.

⟨*Decays: types*⟩≡
```
    type, abstract :: any_config_t
       private
     contains
     ⟨Decays: any config: TBP⟩
    end type any_config_t
```

Finalizer, depends on the implementation.

⟨*Decays: any config: TBP*⟩≡
```
    procedure (any_config_final), deferred :: final
```

⟨*Decays: interfaces*⟩≡
```
    interface
       subroutine any_config_final (object)
         import
         class(any_config_t), intent(inout) :: object
       end subroutine any_config_final
    end interface
```

The output is also deferred:

⟨*Decays: any config: TBP*⟩+≡
```
    procedure (any_config_write), deferred :: write
```

⟨*Decays: interfaces*⟩+≡
```
    interface
       subroutine any_config_write (object, unit, indent, verbose)
         import
         class(any_config_t), intent(in) :: object
         integer, intent(in), optional :: unit, indent
         logical, intent(in), optional :: verbose
       end subroutine any_config_write
    end interface
```

This is a container for a stable or unstable particle configurator. We need this
wrapper for preparing arrays that mix stable and unstable particles.

⟨*Decays: types*⟩+≡
```
    type :: particle_config_t
       private
       class(any_config_t), allocatable :: c
    end type particle_config_t
```

33.6.2   Final-State Particle

In theory, for the particle instance we only need to consider the unstable case.
However, it is more straightforward to treat configuration and instance on the
same footing, and to introduce a wrapper for particle objects as above. This
also works around a compiler bug in gfortran.

⟨*Decays: types*⟩+≡
```
    type, abstract :: any_t
       private
     contains
     ⟨Decays: any: TBP⟩
    end type any_t
```

Finalizer, depends on the implementation.

⟨*Decays: any: TBP*⟩≡
```
    procedure (any_final), deferred :: final
```

⟨*Decays: interfaces*⟩+≡
```
    interface
       subroutine any_final (object)
         import
         class(any_t), intent(inout) :: object
       end subroutine any_final
    end interface
```

The output is also deferred:

⟨*Decays: any: TBP*⟩+≡
```
    procedure (any_write), deferred :: write
```

⟨*Decays: interfaces*⟩+≡
```
    interface
       subroutine any_write (object, unit, indent)
         import
```

```
      class(any_t), intent(in) :: object
      integer, intent(in), optional :: unit, indent
    end subroutine any_write
  end interface
```

This is a container for a stable or unstable outgoing particle. We need this wrapper for preparing arrays that mix stable and unstable particles.

⟨*Decays: types*⟩+≡
```
    type :: particle_out_t
      private
      class(any_t), allocatable :: c
    end type particle_out_t
```

33.6.3 Decay Term Configuration

A decay term is a distinct final state, corresponding to a process term. Each decay process may give rise to several terms with, possibly, differing flavor content.

⟨*Decays: types*⟩+≡
```
    type :: decay_term_config_t
      private
      type(particle_config_t), dimension(:), allocatable :: prt
     contains
     ⟨Decays: decay term config: TBP⟩
    end type decay_term_config_t
```

Finalizer, recursive.

⟨*Decays: decay term config: TBP*⟩≡
```
    procedure :: final => decay_term_config_final
```

⟨*Decays: procedures*⟩≡
```
    recursive subroutine decay_term_config_final (object)
      class(decay_term_config_t), intent(inout) :: object
      integer :: i
      if (allocated (object%prt)) then
         do i = 1, size (object%prt)
            if (allocated (object%prt(i)%c))  call object%prt(i)%c%final ()
         end do
      end if
    end subroutine decay_term_config_final
```

Output, with optional indentation

⟨*Decays: decay term config: TBP*⟩+≡
```
    procedure :: write => decay_term_config_write
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_term_config_write (object, unit, indent, verbose)
      class(decay_term_config_t), intent(in) :: object
      integer, intent(in), optional :: unit, indent
      logical, intent(in), optional :: verbose
      integer :: i, j, u, ind
```

```
      logical :: verb
      u = given_output_unit (unit)
      ind = 0;  if (present (indent))  ind = indent
      verb = .true.;  if (present (verbose))  verb = verbose
      call write_indent (u, ind)
      write (u, "(1x,A)", advance="no")  "Final state:"
      do i = 1, size (object%prt)
         select type (prt_config => object%prt(i)%c)
         type is (stable_config_t)
            write (u, "(1x,A)", advance="no") &
                 char (prt_config%flv(1)%get_name ())
            do j = 2, size (prt_config%flv)
               write (u, "(':',A)", advance="no") &
                    char (prt_config%flv(j)%get_name ())
            end do
         type is (unstable_config_t)
            write (u, "(1x,A)", advance="no") &
                 char (prt_config%flv%get_name ())
         end select
      end do
      write (u, *)
      if (verb) then
         do i = 1, size (object%prt)
            call object%prt(i)%c%write (u, ind)
         end do
      end if
    end subroutine decay_term_config_write
```

Initialize, given a set of flavors. For each flavor, we must indicate whether the particle is stable. The second index of the flavor array runs over alternatives for each decay product; alternatives are allowed only if the decay product is itself stable.

⟨*Decays: decay term config: TBP*⟩+≡
```
    procedure :: init => decay_term_config_init
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_term_config_init &

        end select
     end do
   end subroutine decay_term_config_compute
```

33.6.4 Decay Term

A decay term instance is selected when we generate an event for the associated process instance. When evaluated, it triggers further decays down the chain.

Only unstable products are allocated as child particles.

⟨*Decays: types*⟩+≡
```
   type :: decay_term_t
     private
     type(decay_term_config_t), pointer :: config => null ()
     type(particle_out_t), dimension(:), allocatable :: particle_out
    contains
     ⟨Decays: decay term: TBP⟩
   end type decay_term_t
```

Finalizer.

⟨*Decays: decay term: TBP*⟩≡
```
   procedure :: final => decay_term_final
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_term_final (object)
      class(decay_term_t), intent(inout) :: object
      integer :: i
      if (allocated (object%particle_out)) then
         do i = 1, size (object%particle_out)
            call object%particle_out(i)%c%final ()
         end do
      end if
    end subroutine decay_term_final
```

Output.

⟨*Decays: decay term: TBP*⟩+≡
```
    procedure :: write => decay_term_write
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_term_write (object, unit, indent)
      class(decay_term_t), intent(in) :: object
      integer, intent(in), optional :: unit, indent
      integer :: i, u, ind
      u = given_output_unit (unit)
      ind = 0;  if (present (indent))  ind = indent
      call object%config%write (u, ind, verbose = .false.)
      do i = 1, size (object%particle_out)
         call object%particle_out(i)%c%write (u, ind)
      end do
    end subroutine decay_term_write
```

Recursively write the embedded process instances.

⟨*Decays: decay term: TBP*⟩+≡
```
    procedure :: write_process_instances => decay_term_write_process_instances
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_term_write_process_instances (term, unit, verbose)
      class(decay_term_t), intent(in) :: term
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      integer :: i
      do i = 1, size (term%particle_out)
         select type (unstable => term%particle_out(i)%c)
         type is (unstable_t)
            call unstable%write_process_instances (unit, verbose)
         end select
      end do
    end subroutine decay_term_write_process_instances
```

Initialization, using the configuration object. We allocate particle objects in parallel to the particle configuration objects which we use to initialize them, one at a time.

⟨*Decays: decay term: TBP*⟩+≡
```
    procedure :: init => decay_term_init
```

⟨*Decays: procedures*⟩+≡
```
recursive subroutine decay_term_init (term, config)
  class(decay_term_t), intent(out) :: term
  type(decay_term_config_t), intent(in), target :: config
  integer :: i
  term%config => config
  allocate (term%particle_out (size (config%prt)))

        end select
     end do
   end subroutine decay_term_generate
```

33.6.5   Decay Root Configuration

At the root of a decay chain, there is a parent process. The decay root stores a pointer to the parent process and the set of decay configurations.

⟨*Decays: public*⟩≡
```
   public :: decay_root_config_t
```

⟨*Decays: types*⟩+≡

```
type :: decay_root_config_t
   private
   type(string_t) :: process_id
   type(process_t), pointer :: process => null ()
   class(model_data_t), pointer :: model => null ()
   type(decay_term_config_t), dimension(:), allocatable :: term_config
 contains
 ⟨Decays: decay root config: TBP⟩
 end type decay_root_config_t
```

The finalizer is recursive since there may be cascade decays.

⟨*Decays: decay root config: TBP*⟩≡

```
procedure :: final => decay_root_config_final
```

⟨*Decays: procedures*⟩+≡

```
recursive subroutine decay_root_config_final (object)
  class(decay_root_config_t), intent(inout) :: object
  integer :: i
  if (allocated (object%term_config)) then
     do i = 1, size (object%term_config)
        call object%term_config(i)%final ()
     end do
  end if
end subroutine decay_root_config_final
```

The output routine is also recursive, and it contains an adjustable indentation.

⟨*Decays: decay root config: TBP*⟩+≡

```
procedure :: write => decay_root_config_write
procedure :: write_header => decay_root_config_write_header
procedure :: write_terms => decay_root_config_write_terms
```

⟨*Decays: procedures*⟩+≡

```
recursive subroutine decay_root_config_write (object, unit, indent, verbose)
  class(decay_root_config_t), intent(in) :: object
  integer, intent(in), optional :: unit, indent
  logical, intent(in), optional :: verbose
  integer :: u, ind
  u = given_output_unit (unit)
  ind = 0;  if (present (indent))  ind = indent
  call write_indent (u, ind)
  write (u, "(1x,A)")  "Final-state decay tree:"
  call object%write_header (unit, indent)
  call object%write_terms (unit, indent, verbose)
end subroutine decay_root_config_write

subroutine decay_root_config_write_header (object, unit, indent)
  class(decay_root_config_t), intent(in) :: object
  integer, intent(in), optional :: unit, indent
  integer :: u, ind
  u = given_output_unit (unit)
  ind = 0;  if (present (indent))  ind = indent
  call write_indent (u, ind)
  if (associated (object%process)) then
```

```
          write (u, 3)  "process ID      =", char (object%process_id), "*"
        else
          write (u, 3)  "process ID      =", char (object%process_id)
        end if
  3    format (3x,A,2(1x,A))
      end subroutine decay_root_config_write_header

      recursive subroutine decay_root_config_write_terms &
          (object, unit, indent, verbose)
        class(decay_root_config_t), intent(in) :: object
        integer, intent(in), optional :: unit, indent
        logical, intent(in), optional :: verbose
        integer :: i, u, ind
        logical :: verb
        u = given_output_unit (unit)
        ind = 0;  if (present (indent))  ind = indent
        verb = .true.;  if (present (verbose))  verb = verbose
        if (verb .and. allocated (object%term_config)) then
          do i = 1, size (object%term_config)
            call object%term_config(i)%write (u, ind + 1)
          end do
        end if
      end subroutine decay_root_config_write_terms
```

Initialize for a named process and (optionally) a pre-determined number of terms.

⟨*Decays: decay root config: TBP*⟩+≡

```
      procedure :: init => decay_root_config_init
```

⟨*Decays: procedures*⟩+≡

```
      subroutine decay_root_config_init (decay, model, process_id, n_terms)
        class(decay_root_config_t), intent(out) :: decay
        class(model_data_t), intent(in), target :: model
        type(string_t), intent(in) :: process_id
        integer, intent(in), optional :: n_terms
        decay%model => model
        decay%process_id = process_id
        if (present (n_terms)) then
          allocate (decay%term_config (n_terms))
        end if
      end subroutine decay_root_config_init
```

Declare a decay term, given an array of flavors.

⟨*Decays: decay root config: TBP*⟩+≡

```
      procedure :: init_term => decay_root_config_init_term
```

⟨*Decays: procedures*⟩+≡

```
      recursive subroutine decay_root_config_init_term &
          (decay, i, flv, stable, model, process_stack, var_list)
        class(decay_root_config_t), intent(inout) :: decay
        integer, intent(in) :: i
        type(flavor_t), dimension(:,:), intent(in) :: flv
        logical, dimension(:), intent(in) :: stable
        class(model_data_t), intent(in), target :: model
```

```
        type(process_stack_t), intent(in), optional :: process_stack
        type(var_list_t), intent(in), optional, target :: var_list
        call decay%term_config(i)%init (flv, stable, model, process_stack, var_list)
      end subroutine decay_root_config_init_term
```

Connect the decay root configuration with a process object (which should represent the parent process). This includes initialization, therefore intent(out).

The flavor state is retrieved from the process term object. However, we have to be careful: the flavor object points to the model instance that is stored in the process object. This model instance may not contain the current setting for unstable particles and decay. Therefore, we assign the model directly.

If the process_instance argument is provided, we use this for the flavor state. This applies to the decay root only, where the process can be entangled with a beam setup, and the latter contains beam remnants as further outgoing particles. These must be included in the set of outgoing flavors, since the decay application is also done on the connected state.

Infer stability from the particle properties, using the first row in the set of flavor states. For unstable particles, we look for decays, recursively, available from the process stack (if present).

For the unstable particles, we have to check whether their masses match between the production and the decay. Fortunately, both versions are available for comparison.

The optional var_list argument may override integral/error values for decay processes.

⟨*Decays: decay root config: TBP*⟩+≡
```
      procedure :: connect => decay_root_config_connect
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_root_config_connect &
        (decay, process, model, process_stack, process_instance, var_list)
      class(decay_root_config_t), intent(out) :: decay
      type(process_t), intent(in), target :: process
      class(model_data_t), intent(in), target :: model
      type(process_stack_t), intent(in), optional :: process_stack
      type(process_instance_t), intent(in), optional, target :: process_instance
      type(var_list_t), intent(in), optional, target :: var_list
      type(connected_state_t), pointer :: connected_state
      type(interaction_t), pointer :: int
      type(flavor_t), dimension(:,:), allocatable :: flv

      stable = flv(:,1)%is_stable ()
      call check_masses ()
      call decay%init_term (i, flv, stable, model, process_stack, var_list)
      deallocate (flv, stable, m_prod, m_dec)
    end do
    decay%process => process
  contains
    subroutine check_masses ()
      integer :: i
      logical :: ok
      ok = .true.
      do i = 1, size (m_prod)
        if (.not. stable(i)) then
          if (.not. nearly_equal (m_prod(i), m_dec(i))) then
            write (msg_buffer, "(A,A,A)")  "particle '", &
                char (flv(i,1)%get_name ()), "':"
            call msg_message
            write (msg_buffer, &
                "(2x,A,1x," // FMT_15 // ",3x,A,1x," // FMT_15 // ")") &
                "m_prod =", m_prod(i), "m_dec =", m_dec(i)
            call msg_message
            ok = .false.
          end if
        end if
      end do
      if (.not. ok)  call msg_fatal &
          ("Particle mass mismatch between production and decay")
    end subroutine check_masses
  end subroutine decay_root_config_connect
```

Recursively compute widths, errors, and branching ratios.

⟨*Decays: decay root config: TBP*⟩+≡
```
    procedure :: compute => decay_root_config_compute
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_root_config_compute (decay)
      class(decay_root_config_t), intent(inout) :: decay
      integer :: i
      do i = 1, size (decay%term_config)
        call decay%term_config(i)%compute ()
      end do
    end subroutine decay_root_config_compute
```

33.6.6 Decay Root Instance

This is the common parent type for decay and decay root. The process instance
points to the parent process. The model pointer is separate because particle

settings may be updated w.r.t. the parent process object.

⟨*Decays: types*⟩+≡
```
    type, abstract :: decay_gen_t
       private
       type(decay_term_t), dimension(:), allocatable :: term
       type(process_instance_t), pointer :: process_instance => null ()
       integer :: selected_mci = 0
       integer :: selected_term = 0
     contains
     ⟨Decays: decay gen: TBP⟩
    end type decay_gen_t
```

The decay root represents the parent process. When an event is generated, the generator selects the term to which the decay chain applies (if possible).

The process instance is just a pointer.

⟨*Decays: public*⟩+≡
```
    public :: decay_root_t
```

⟨*Decays: types*⟩+≡
```
    type, extends (decay_gen_t) :: decay_root_t
       private
       type(decay_root_config_t), pointer :: config => null ()
     contains
     ⟨Decays: decay root: TBP⟩
    end type decay_root_t
```

The finalizer has to recursively finalize the terms, but we can skip the process instance which is not explicitly allocated.

⟨*Decays: decay gen: TBP*⟩≡
```
    procedure :: base_final => decay_gen_final
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_gen_final (object)
      class(decay_gen_t), intent(inout) :: object
      integer :: i
      if (allocated (object%term)) then
         do i = 1, size (object%term)
            call object%term(i)%final ()
         end do
      end if
    end subroutine decay_gen_final
```

No extra finalization for the decay root.

⟨*Decays: decay root: TBP*⟩≡
```
    procedure :: final => decay_root_final
```

⟨*Decays: procedures*⟩+≡
```
    subroutine decay_root_final (object)
      class(decay_root_t), intent(inout) :: object
      call object%base_final ()
    end subroutine decay_root_final
```

Output.

⟨*Decays: decay root: TBP*⟩+≡
```
    procedure :: write => decay_root_write
```

⟨*Decays: procedures*⟩+≡
```
    subroutine decay_root_write (object, unit)
      class(decay_root_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      if (associated (object%config)) then
         call object%config%write (unit, verbose = .false.)
      else
         write (u, "(1x,A)")  "Final-state decay tree: [not configured]"
      end if
      if (object%selected_mci > 0) then
         write (u, "(3x,A,I0)")  "Selected MCI    = ", object%selected_mci
      else
         write (u, "(3x,A)")  "Selected MCI    = [undefined]"
      end if
      if (object%selected_term > 0) then
         write (u, "(3x,A,I0)")  "Selected term   = ", object%selected_term
         call object%term(object%selected_term)%write (u, 1)
      else
         write (u, "(3x,A)")  "Selected term   = [undefined]"
      end if
    end subroutine decay_root_write
```

Write the process instances, recursively.

⟨*Decays: decay gen: TBP*⟩+≡
```
    procedure :: write_process_instances => decay_gen_write_process_instances
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_gen_write_process_instances (decay, unit, verbose)
      class(decay_gen_t), intent(in) :: decay
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      logical :: verb
      verb = .true.;  if (present (verbose))  verb = verbose
      if (associated (decay%process_instance)) then
         if (verb) then
            call decay%process_instance%write (unit)
         else
            call decay%process_instance%write_header (unit)
         end if
      end if
      if (decay%selected_term > 0) then
         call decay%term(decay%selected_term)%write_process_instances (unit, verb)
      end if
    end subroutine decay_gen_write_process_instances
```

Generic initializer. All can be done recursively.

⟨*Decays: decay gen: TBP*⟩+≡
```
    procedure :: base_init => decay_gen_init
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_gen_init (decay, term_config)
      class(decay_gen_t), intent(out) :: decay
      type(decay_term_config_t), dimension(:), intent(in), target :: term_config
      integer :: i
      allocate (decay%term (size (term_config)))
      do i = 1, size (decay%term)
         call decay%term(i)%init (term_config(i))
      end do
    end subroutine decay_gen_init
```

Specific initializer. We assign the configuration object, which should correspond
to a completely initialized decay configuration tree. We also connect to an
existing process instance. Then, we recursively link the child interactions to the
parent process.

⟨*Decays: decay root: TBP*⟩+≡
```
    procedure :: init => decay_root_init
```

⟨*Decays: procedures*⟩+≡
```
    subroutine decay_root_init (decay_root, config, process_instance)
      class(decay_root_t), intent(out) :: decay_root
      type(decay_root_config_t), intent(in), target :: config
      type(process_instance_t), intent(in), target :: process_instance
      call decay_root%base_init (config%term_config)
      decay_root%config => config
      decay_root%process_instance => process_instance
      call decay_root%make_term_rng (config%process)
      call decay_root%link_term_interactions ()
    end subroutine decay_root_init
```

Explicitly set/get mci and term indices. (Used in unit test.)

⟨*Decays: decay gen: TBP*⟩+≡
```
    procedure :: set_mci => decay_gen_set_mci
    procedure :: set_term => decay_gen_set_term
    procedure :: get_mci => decay_gen_get_mci
    procedure :: get_term => decay_gen_get_term
```

⟨*Decays: procedures*⟩+≡
```
    subroutine decay_gen_set_mci (decay, i)
      class(decay_gen_t), intent(inout) :: decay
      integer, intent(in) :: i
      decay%selected_mci = i
    end subroutine decay_gen_set_mci

    subroutine decay_gen_set_term (decay, i)
      class(decay_gen_t), intent(inout) :: decay
      integer, intent(in) :: i
      decay%selected_term = i
    end subroutine decay_gen_set_term

    function decay_gen_get_mci (decay) result (i)
      class(decay_gen_t), intent(inout) :: decay
      integer :: i
      i = decay%selected_mci
```

```
      end function decay_gen_get_mci

      function decay_gen_get_term (decay) result (i)
        class(decay_gen_t), intent(inout) :: decay
        integer :: i
        i = decay%selected_term
      end function decay_gen_get_term
```

Implement random-number generators for unstable decay selection in all terms. This is not recursive.

We also make use of the fact that `process` is a pointer; the (state of the RNG factory inside the) target process will be modified by the rng-spawning method, but not the pointer.

⟨*Decays: decay gen: TBP*⟩+≡
```
      procedure :: make_term_rng => decay_gen_make_term_rng
```

⟨*Decays: procedures*⟩+≡
```
      subroutine decay_gen_make_term_rng (decay, process)
        class(decay_gen_t), intent(inout) :: decay
        type(process_t), intent(in), pointer :: process
        integer :: i
        do i = 1, size (decay%term)
           call decay%term(i)%make_rng (process)
        end do
      end subroutine decay_gen_make_term_rng
```

Recursively link interactions of the enclosed decay terms to the corresponding terms in the current process instance.

Note: A bug in nagfor requires the extra `i_term` variable.

⟨*Decays: decay gen: TBP*⟩+≡
```
      procedure :: link_term_interactions => decay_gen_link_term_interactions
```

⟨*Decays: procedures*⟩+≡
```
      recursive subroutine decay_gen_link_term_interactions (decay)
        class(decay_gen_t), intent(inout) :: decay
        integer :: i, i_term
        type(interaction_t), pointer :: trace
        associate (instance => decay%process_instance)
          do i = 1, size (decay%term)
             i_term = i
             trace => instance%get_trace_int_ptr (i_term)
             call decay%term(i_term)%link_interactions (trace)
          end do
        end associate
      end subroutine decay_gen_link_term_interactions
```

Select a decay chain: decay modes and process components.

⟨*Decays: decay root: TBP*⟩+≡
```
      procedure :: select_chain => decay_root_select_chain
```

⟨*Decays: procedures*⟩+≡
```
      subroutine decay_root_select_chain (decay_root)
        class(decay_root_t), intent(inout) :: decay_root
```

```
      if (decay_root%selected_term > 0) then
         call decay_root%term(decay_root%selected_term)%select_chain ()
      else
         call msg_bug ("Decays: no term selected for parent process")
      end if
   end subroutine decay_root_select_chain
```

Generate a decay tree, i.e., for the selected term in the parent process, recursively generate a decay event for all unstable particles.

Factor out the trace of the connected state of the parent process. This trace should not be taken into account for unweighting the decay chain, since it was already used for unweighting the parent event, or it determines the overall event weight.

⟨*Decays: decay root: TBP*⟩+≡
```
   procedure :: generate => decay_root_generate
```

⟨*Decays: procedures*⟩+≡
```
   subroutine decay_root_generate (decay_root)
     class(decay_root_t), intent(inout) :: decay_root
     type(connected_state_t), pointer :: connected_state
     if (decay_root%selected_term > 0) then
        connected_state => decay_root%process_instance%get_connected_state_ptr &
             (decay_root%selected_term)
        call connected_state%normalize_matrix_by_trace ()
        call decay_root%term(decay_root%selected_term)%generate ()
     else
        call msg_bug ("Decays: no term selected for parent process")
     end if
   end subroutine decay_root_generate
```

33.6.7   Decay Configuration

A decay configuration describes a distinct decay mode of a particle. Each decay mode may include several terms, which correspond to the terms in the associated process. In addition to the base type, the decay configuration object contains the integral of the parent process and the selector for the MCI group inside this process.

The flavor component should be identical to the flavor component of the parent particle (`unstable` object).

⟨*Decays: types*⟩+≡
```
   type, extends (decay_root_config_t) :: decay_config_t
     private
     type(flavor_t) :: flv
     real(default) :: weight = 0
     real(default) :: integral = 0
     real(default) :: abs_error = 0
     real(default) :: rel_error = 0
     type(selector_t) :: mci_selector
   contains
   ⟨Decays: decay config: TBP⟩
   end type decay_config_t
```

4836

The output routine extends the decay-root writer by listing numerical component values.

⟨*Decays: decay config: TBP*⟩≡
```
    procedure :: write => decay_config_write
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_config_write (object, unit, indent, verbose)
      class(decay_config_t), intent(in) :: object
      integer, intent(in), optional :: unit, indent
      logical, intent(in), optional :: verbose
      integer :: u, ind
      u = given_output_unit (unit)
      ind = 0;  if (present (indent))  ind = indent
      call write_indent (u, ind)
      write (u, "(1x,A)")  "Decay:"
      call object%write_header (unit, indent)
      call write_indent (u, ind)
      write (u, 2)  "branching ratio =", object%weight * 100
      call write_indent (u, ind)
      write (u, 1)  "partial width  =", object%integral
      call write_indent (u, ind)
      write (u, 1)  "error (abs)    =", object%abs_error
      call write_indent (u, ind)
      write (u, 1)  "error (rel)    =", object%rel_error
  1   format (3x,A,ES19.12)
  2   format (3x,A,F11.6,1x,'%')
      call object%write_terms (unit, indent, verbose)
    end subroutine decay_config_write
```

Connect a decay configuration with a process object (which should represent the decay). This includes initialization, therefore intent(out). We first connect the process itself, then do initializations that are specific for this decay.

Infer stability from the particle properties, using the first row in the set of flavor states. Once we can deal with predetermined decay chains, they should be used instead.

If there is an optional `var_list`, check if the stored values for the decay partial width and error have been overridden there.

⟨*Decays: decay config: TBP*⟩+≡
```
    procedure :: connect => decay_config_connect
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_config_connect &
        (decay, process, model, process_stack, process_instance, var_list)
      class(decay_config_t), intent(out) :: decay
      type(process_t), intent(in), target :: process
      class(model_data_t), intent(in), target :: model
      type(process_stack_t), intent(in), optional :: process_stack
      type(process_instance_t), intent(in), optional, target :: process_instance
      type(var_list_t), intent(in), optional, target :: var_list
      real(default), dimension(:), allocatable :: integral_mci
      type(string_t) :: process_id
      integer :: i, n_mci
      call decay%decay_root_config_t%connect &
          (process, model, process_stack, var_list=var_list)
```

```
    process_id = process%get_id ()
    if (process%cm_frame ()) then
        call msg_fatal ("Decay process " // char (process_id) &
             // ": unusable because rest frame is fixed.")
    end if
    decay%integral = process%get_integral ()
    decay%abs_error = process%get_error ()
    if (present (var_list)) then
        call update (decay%integral, "integral(" // process_id // ")")
        call update (decay%abs_error, "error(" // process_id // ")")
    end if
    n_mci = process%get_n_mci ()
    allocate (integral_mci (n_mci))
    do i = 1, n_mci
        integral_mci(i) = process%get_integral_mci (i)
    end do
    call decay%mci_selector%init (integral_mci)
  contains
    subroutine update (var, var_name)
      real(default), intent(inout) :: var
      type(string_t), intent(in) :: var_name
      if (var_list%contains (var_name)) then
          var = var_list%get_rval (var_name)
      end if
    end subroutine update
  end subroutine decay_config_connect
```

Set the flavor entry, which repeats the flavor of the parent unstable particle.

⟨*Decays: decay config: TBP*⟩+≡
```
    procedure :: set_flv => decay_config_set_flv
```

⟨*Decays: procedures*⟩+≡
```
    subroutine decay_config_set_flv (decay, flv)
      class(decay_config_t), intent(inout) :: decay
      type(flavor_t), intent(in) :: flv
      decay%flv = flv
    end subroutine decay_config_set_flv
```

Compute embedded branchings and the relative error. This method does not apply to the decay root.

⟨*Decays: decay config: TBP*⟩+≡
```
    procedure :: compute => decay_config_compute
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_config_compute (decay)
      class(decay_config_t), intent(inout) :: decay
      call decay%decay_root_config_t%compute ()
      if (.not. vanishes (decay%integral)) then
          decay%rel_error = decay%abs_error / decay%integral
      else
          decay%rel_error = 0
      end if
    end subroutine decay_config_compute
```

33.6.8 Decay Instance

The decay contains a collection of terms. One of them is selected when the decay is evaluated. This is similar to the decay root, but we implement it independently.

The process instance object is allocated via a pointer, so it automatically behaves as a target.

⟨*Decays: types*⟩+≡
```
type, extends (decay_gen_t) :: decay_t
  private
  type(decay_config_t), pointer :: config => null ()
  class(rng_t), allocatable :: rng
 contains
 ⟨Decays: decay: TBP⟩
end type decay_t
```

The finalizer is recursive.

⟨*Decays: decay: TBP*⟩≡
```
procedure :: final => decay_final
```

⟨*Decays: procedures*⟩+≡
```
recursive subroutine decay_final (object)
  class(decay_t), intent(inout) :: object
  integer :: i
  call object%base_final ()
  do i = 1, object%config%process%get_n_mci ()
     call object%process_instance%final_simulation (i)
  end do
  call object%process_instance%final ()
  deallocate (object%process_instance)
end subroutine decay_final
```

Output.

⟨*Decays: decay: TBP*⟩+≡
```
procedure :: write => decay_write
```

⟨*Decays: procedures*⟩+≡
```
recursive subroutine decay_write (object, unit, indent, recursive)
  class(decay_t), intent(in) :: object
  integer, intent(in), optional :: unit, indent, recursive
  integer :: u, ind
  u = given_output_unit (unit)
  ind = 0;  if (present (indent))  ind = indent
  call object%config%write (unit, indent, verbose = .false.)
  if (allocated (object%rng)) then
     call object%rng%write (u, ind + 1)
  end if
  call write_indent (u, ind)
  if (object%selected_mci > 0) then
     write (u, "(3x,A,I0)")  "Selected MCI   = ", object%selected_mci
  else
     write (u, "(3x,A)")  "Selected MCI   = [undefined]"
  end if
  call write_indent (u, ind)
```

4839

```
      if (object%selected_term > 0) then
         write (u, "(3x,A,I0)")  "Selected term  = ", object%selected_term
         call object%term(object%selected_term)%write (u, ind + 1)
      else
         write (u, "(3x,A)")  "Selected term  = [undefined]"
      end if
   end subroutine decay_write
```

Initializer. Base initialization is done recursively. Then, we prepare the current process instance and allocate a random-number generator for term selection. For all unstable particles, we also allocate a r.n.g. as spawned by the current process.

⟨*Decays: decay: TBP*⟩+≡
```
    procedure :: init => decay_init
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_init (decay, config)
      class(decay_t), intent(out) :: decay
      type(decay_config_t), intent(in), target :: config
      integer :: i
      call decay%base_init (config%term_config)
      decay%config => config
      allocate (decay%process_instance)
      call decay%process_instance%init (decay%config%process)
      call decay%process_instance%setup_event_data (decay%config%model)
      do i = 1, decay%config%process%get_n_mci ()
         call decay%process_instance%init_simulation (i)
      end do
      call decay%config%process%make_rng (decay%rng)
      call decay%make_term_rng (decay%config%process)
    end subroutine decay_init
```

Link interactions to the parent process. `i_prt` is the index of the current outgoing particle in the parent interaction, for which we take the trace evaluator. We link it to the beam particle in the beam interaction of the decay process instance. Then, repeat the procedure for the outgoing particles.

⟨*Decays: decay: TBP*⟩+≡
```
    procedure :: link_interactions => decay_link_interactions
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_link_interactions (decay, i_prt, trace)
      class(decay_t), intent(inout) :: decay
      integer, intent(in) :: i_prt
      type(interaction_t), intent(in), target :: trace
      type(interaction_t), pointer :: beam_int
      integer :: n_in, n_vir
      beam_int => decay%process_instance%get_beam_int_ptr ()
      n_in = trace%get_n_in ()
      n_vir = trace%get_n_vir ()
      call beam_int%set_source_link (1, trace, &
           n_in + n_vir + i_prt)
      call decay%link_term_interactions ()
    end subroutine decay_link_interactions
```

Determine a decay chain. For each unstable particle we select one of the possible decay modes, and for each decay process we select one of the possible decay MCI components, calling the random-number generators. We do not generate momenta, yet.

⟨*Decays: decay: TBP*⟩+≡
```
procedure :: select_chain => decay_select_chain
```

⟨*Decays: procedures*⟩+≡
```
recursive subroutine decay_select_chain (decay)
  class(decay_t), intent(inout) :: decay
  real(default) :: x
  integer :: i
  call decay%rng%generate (x)
  decay%selected_mci = decay%config%mci_selector%select (x)
  call decay%process_instance%choose_mci (decay%selected_mci)
  decay%selected_term = decay%process_instance%select_i_term ()
  do i = 1, size (decay%term)
     call decay%term(i)%select_chain ()
  end do
end subroutine decay_select_chain
```

Generate a decay. We first receive the beam momenta from the parent process (assuming that this is properly linked), then call the associated process object for a new event.

Factor out the trace of the helicity density matrix of the isolated state (the one that will be used for the decay chain). The trace is taken into account for unweighting the individual decay event and should therefore be ignored for unweighting the correlated decay chain afterwards.

⟨*Decays: decay: TBP*⟩+≡
```
procedure :: generate => decay_generate
```

⟨*Decays: procedures*⟩+≡
```
recursive subroutine decay_generate (decay)
  class(decay_t), intent(inout) :: decay
  type(isolated_state_t), pointer :: isolated_state
  integer :: i
  call decay%process_instance%receive_beam_momenta ()
  call decay%process_instance%generate_unweighted_event (decay%selected_mci)
  if (signal_is_pending ())  return
  call decay%process_instance%evaluate_event_data ()
  isolated_state => &
       decay%process_instance%get_isolated_state_ptr (decay%selected_term)
  call isolated_state%normalize_matrix_by_trace ()
  do i = 1, size (decay%term)
     call decay%term(i)%generate ()
     if (signal_is_pending ())  return
  end do
end subroutine decay_generate
```

33.6.9 Stable Particles

This is a stable particle. The flavor can be ambiguous (e.g., partons).

⟨*Decays: types*⟩+≡
```
type, extends (any_config_t) :: stable_config_t
  private
  type(flavor_t), dimension(:), allocatable :: flv
 contains
 ⟨Decays: stable config: TBP⟩
end type stable_config_t
```

The finalizer is empty:

⟨*Decays: stable config: TBP*⟩≡
```
procedure :: final => stable_config_final
```

⟨*Decays: procedures*⟩+≡
```
subroutine stable_config_final (object)
  class(stable_config_t), intent(inout) :: object
end subroutine stable_config_final
```

Output.

⟨*Decays: stable config: TBP*⟩+≡
```
procedure :: write => stable_config_write
```

⟨*Decays: procedures*⟩+≡
```
recursive subroutine stable_config_write (object, unit, indent, verbose)
  class(stable_config_t), intent(in) :: object
  integer, intent(in), optional :: unit, indent
  logical, intent(in), optional :: verbose
  integer :: u, i, ind
  u = given_output_unit (unit)
  ind = 0;  if (present (indent))  ind = indent
  call write_indent (u, ind)
  write (u, "(1x,'+',1x,A)", advance = "no")  "Stable:"
  write (u, "(1x,A)", advance = "no")  char (object%flv(1)%get_name ())
  do i = 2, size (object%flv)
     write (u, "(':',A)", advance = "no") &
           char (object%flv(i)%get_name ())
  end do
  write (u, *)
end subroutine stable_config_write
```

Initializer. We are presented with an array of flavors, but there may be double entries which we remove, so we store only the distinct flavors.

⟨*Decays: stable config: TBP*⟩+≡
```
procedure :: init => stable_config_init
```

⟨*Decays: procedures*⟩+≡
```
subroutine stable_config_init (config, flv)
  class(stable_config_t), intent(out) :: config
  type(flavor_t), dimension(:), intent(in) :: flv
  integer, dimension (size (flv)) :: pdg
  logical, dimension (size (flv)) :: mask
  integer :: i
  pdg = flv%get_pdg ()
  mask(1) = .true.
  forall (i = 2 : size (pdg))
```

```
       mask(i) = all (pdg(i) /= pdg(1:i-1))
    end forall
    allocate (config%flv (count (mask)))
    config%flv = pack (flv, mask)
 end subroutine stable_config_init
```

Here is the corresponding object instance. Except for the pointer to the configuration, there is no content.

⟨*Decays: types*⟩+≡
```
type, extends (any_t) :: stable_t
   private
   type(stable_config_t), pointer :: config => null ()
 contains
 ⟨Decays: stable: TBP⟩
end type stable_t
```

The finalizer does nothing.

⟨*Decays: stable: TBP*⟩≡
```
procedure :: final => stable_final
```

⟨*Decays: procedures*⟩+≡
```
subroutine stable_final (object)
  class(stable_t), intent(inout) :: object
end subroutine stable_final
```

We can delegate output to the configuration object.

⟨*Decays: stable: TBP*⟩+≡
```
procedure :: write => stable_write
```

⟨*Decays: procedures*⟩+≡
```
subroutine stable_write (object, unit, indent)
  class(stable_t), intent(in) :: object
  integer, intent(in), optional :: unit, indent
  call object%config%write (unit, indent)
end subroutine stable_write
```

Initializer: just assign the configuration.

⟨*Decays: stable: TBP*⟩+≡
```
procedure :: init => stable_init
```

⟨*Decays: procedures*⟩+≡
```
subroutine stable_init (stable, config)
  class(stable_t), intent(out) :: stable
  type(stable_config_t), intent(in), target :: config
  stable%config => config
end subroutine stable_init
```

33.6.10 Unstable Particles

A branching configuration enables us to select among distinct decay modes of a particle. We store the particle flavor (with its implicit link to a model), an array of decay configurations, and a selector object.

The total width, absolute and relative error are stored as `integral`, `abs_error`, and `rel_error`, respectively.

The flavor must be unique in this case.

⟨*Decays: public*⟩+≡
```
    public :: unstable_config_t
```

⟨*Decays: types*⟩+≡
```
    type, extends (any_config_t) :: unstable_config_t
      private
      type(flavor_t) :: flv
      real(default) :: integral = 0
      real(default) :: abs_error = 0
      real(default) :: rel_error = 0
      type(selector_t) :: selector
      type(decay_config_t), dimension(:), allocatable :: decay_config
    contains
    ⟨Decays: unstable config: TBP⟩
    end type unstable_config_t
```

Finalizer. The branching configuration can be a recursive structure.

⟨*Decays: unstable config: TBP*⟩≡
```
    procedure :: final => unstable_config_final
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine unstable_config_final (object)
      class(unstable_config_t), intent(inout) :: object
      integer :: i
      if (allocated (object%decay_config)) then
         do i = 1, size (object%decay_config)
            call object%decay_config(i)%final ()
         end do
      end if
    end subroutine unstable_config_final
```

Output. Since this may be recursive, we include indentation.

⟨*Decays: unstable config: TBP*⟩+≡
```
    procedure :: write => unstable_config_write
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine unstable_config_write (object, unit, indent, verbose)
      class(unstable_config_t), intent(in) :: object
      integer, intent(in), optional :: unit, indent
      logical, intent(in), optional :: verbose
      integer :: u, i, ind
      logical :: verb
      u = given_output_unit (unit)
      ind = 0;  if (present (indent))  ind = indent
      verb = .true.;  if (present (verbose))  verb = verbose
      call write_indent (u, ind)
      write (u, "(1x,'+',1x,A,1x,A)")  "Unstable:", &
           char (object%flv%get_name ())
      call write_indent (u, ind)
      write (u, 1)  "total width =", object%integral
      call write_indent (u, ind)
```

4844

```
      write (u, 1)  "error (abs) =", object%abs_error
      call write_indent (u, ind)
      write (u, 1)  "error (rel) =", object%rel_error
  1   format (5x,A,ES19.12)
      if (verb .and. allocated (object%decay_config)) then
         do i = 1, size (object%decay_config)
            call object%decay_config(i)%write (u, ind + 1)
         end do
      end if
    end subroutine unstable_config_write
```

Initializer. For the unstable particle, the flavor is unique.

⟨*Decays: unstable config: TBP*⟩+≡

```
    procedure :: init => unstable_config_init
```

⟨*Decays: procedures*⟩+≡

```
    subroutine unstable_config_init (unstable, flv, set_decays, model)
      class(unstable_config_t), intent(out) :: unstable
      type(flavor_t), intent(in) :: flv
      logical, intent(in), optional :: set_decays
      class(model_data_t), intent(in), optional, target :: model
      type(string_t), dimension(:), allocatable :: decay
      unstable%flv = flv
      if (present (set_decays)) then
         call unstable%flv%get_decays (decay)
         call unstable%init_decays (decay, model)
      end if
    end subroutine unstable_config_init
```

Further initialization: determine the number of decay modes. We can assume
that the flavor of the particle has been set already.

If the process stack is given, we can delve recursively into actually assigning
decay processes. Otherwise, we just initialize with decay process names.

⟨*Decays: unstable config: TBP*⟩+≡

```
    procedure :: init_decays => unstable_config_init_decays
```

⟨*Decays: procedures*⟩+≡

```
    recursive subroutine unstable_config_init_decays &
         (unstable, decay_id, model, process_stack, var_list)
      class(unstable_config_t), intent(inout) :: unstable
      type(string_t), dimension(:), intent(in) :: decay_id
      class(model_data_t), intent(in), target :: model
      type(process_stack_t), intent(in), optional :: process_stack
      type(var_list_t), intent(in), optional :: var_list
      integer :: i
      allocate (unstable%decay_config (size (decay_id)))
      do i = 1, size (decay_id)
         associate (decay => unstable%decay_config(i))
           if (present (process_stack)) then
              call decay%connect (process_stack%get_process_ptr (decay_id(i)), &
                   model, process_stack, var_list=var_list)
           else
              call decay%init (model, decay_id(i))
           end if
```

```
      call decay%set_flv (unstable%flv)
   end associate
end do
end subroutine unstable_config_init_decays
```

Explicitly connect a specific decay with a process. This is used only in unit tests.

⟨*Decays: unstable config: TBP*⟩+≡
```
procedure :: connect_decay => unstable_config_connect_decay
```

⟨*Decays: procedures*⟩+≡
```
subroutine unstable_config_connect_decay (unstable, i, process, model)
  class(unstable_config_t), intent(inout) :: unstable
  integer, intent(in) :: i
  type(process_t), intent(in), target :: process
  class(model_data_t), intent(in), target :: model
  associate (decay => unstable%decay_config(i))
    call decay%connect (process, model)
  end associate
end subroutine unstable_config_connect_decay
```

Compute the total width and branching ratios, initializing the decay selector.

⟨*Decays: unstable config: TBP*⟩+≡
```
procedure :: compute => unstable_config_compute
```

⟨*Decays: procedures*⟩+≡
```
recursive subroutine unstable_config_compute (unstable)
  class(unstable_config_t), intent(inout) :: unstable
  integer :: i
  do i = 1, size (unstable%decay_config)
    call unstable%decay_config(i)%compute ()
  end do
  unstable%integral = sum (unstable%decay_config%integral)
  if (unstable%integral <= 0) then
    call unstable%write ()
    call msg_fatal ("Decay configuration: computed total width is zero")
  end if
  unstable%abs_error = sqrt (sum (unstable%decay_config%abs_error ** 2))
  unstable%rel_error = unstable%abs_error / unstable%integral
  call unstable%selector%init (unstable%decay_config%integral)
  do i = 1, size (unstable%decay_config)
    unstable%decay_config(i)%weight &
         = unstable%selector%get_weight (i)
  end do
end subroutine unstable_config_compute
```

Now we define the instance of an unstable particle.

    end subroutine unstable_generate
```

33.6.11 Decay Chain

While the decay configuration tree and the decay tree are static entities (during a simulation run), the decay chain is dynamically generated for each event. The reason is that with the possibility of several decay modes for each particle, and several terms for each process, the total number of distinct decay chains is not under control.

Each entry in the decay chain is a connected parton state. The origin of the chain is a connected state in the parent process (not part of the chain itself). For each decay, mode and term chosen, we convolute this with the isolated (!) state of the current decay, to generate a new connected state. We accumulate this chain by recursively traversing the allocated decay tree. Whenever a particle decays, it becomes virtual and is replaced by its decay product, while all other particles stay in the parton state as spectators.

Technically, we implement the decay chain as a stack structure and include information from the associated decay object for easier debugging. This is a decay chain entry:

⟨*Decays: types*⟩+≡
```
    type, extends (connected_state_t) :: decay_chain_entry_t
      private
      integer :: index = 0
      type(decay_config_t), pointer :: config => null ()
      integer :: selected_mci = 0
      integer :: selected_term = 0
      type(decay_chain_entry_t), pointer :: previous => null ()
    end type decay_chain_entry_t
```

This is the complete chain; we need just a pointer to the last entry. We also include a pointer to the master process instance, which serves as the seed for the decay chain.

The evaluator `correlated_trace` traces over all quantum numbers for the final spin-correlated (but color-summed) evaluator of the decay chain. This allows us to compute the probability for a momentum configuration, given that all individual density matrices (of the initial process and the subsequent decays) have been normalized to one.

Note: This trace is summed over color, so color is treated exactly when computing spin correlations. However, we do not keep non-diagonal color correlations. When an event is accepted, we compute probabilities for all color states and can choose one of them.

⟨*Decays: public*⟩+≡
```
public :: decay_chain_t
```

⟨*Decays: types*⟩+≡
```
type :: decay_chain_t
  private
  type(process_instance_t), pointer :: process_instance => null ()
  integer :: selected_term = 0
  type(evaluator_t) :: correlated_trace
  type(decay_chain_entry_t), pointer :: last => null ()
 contains
 ⟨Decays: decay chain: TBP⟩
end type decay_chain_t
```

The finalizer recursively deletes and deallocates the entries.

⟨*Decays: decay chain: TBP*⟩≡
```
procedure :: final => decay_chain_final
```

⟨*Decays: procedures*⟩+≡
```
subroutine decay_chain_final (object)
  class(decay_chain_t), intent(inout) :: object
  type(decay_chain_entry_t), pointer :: entry
  do while (associated (object%last))
    entry => object%last
    object%last => entry%previous
    call entry%final ()
    deallocate (entry)
  end do
  call object%correlated_trace%final ()
end subroutine decay_chain_final
```

Doing output recursively allows us to display the chain in chronological order.

⟨*Decays: decay chain: TBP*⟩+≡
```
procedure :: write => decay_chain_write
```

⟨*Decays: procedures*⟩+≡
```
subroutine decay_chain_write (object, unit)
  class(decay_chain_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
```

```
      call write_separator (u, 2)
      write (u, "(1x,A)")  "Decay chain:"
      call write_entries (object%last)
      call write_separator (u, 2)
      write (u, "(1x,A)")  "Evaluator (correlated trace of the decay chain):"
      call write_separator (u)
      call object%correlated_trace%write (u)
      call write_separator (u, 2)
    contains
      recursive subroutine write_entries (entry)
        type(decay_chain_entry_t), intent(in), pointer :: entry
        if (associated (entry)) then
           call write_entries (entry%previous)
           call write_separator (u, 2)
           write (u, "(1x,A,I0)")  "Decay #", entry%index
           call entry%config%write_header (u)
           write (u, "(3x,A,I0)")  "Selected MCI   = ", entry%selected_mci
           write (u, "(3x,A,I0)")  "Selected term  = ", entry%selected_term
           call entry%config%term_config(entry%selected_term)%write (u, indent=1)
           call entry%write (u)
        end if
      end subroutine write_entries
    end subroutine decay_chain_write
```

Build a decay chain, recursively following the selected decays and terms in a decay tree. Before start, we finalize the chain, deleting any previous contents.

⟨*Decays: decay chain: TBP*⟩+≡
```
    procedure :: build => decay_chain_build
```

⟨*Decays: procedures*⟩+≡
```
    subroutine decay_chain_build (chain, decay_root)
      class(decay_chain_t), intent(inout), target :: chain
      type(decay_root_t), intent(in) :: decay_root
      type(quantum_numbers_mask_t), dimension(:), allocatable :: qn_mask
      type(interaction_t), pointer :: int_last_decay
      call chain%final ()
      if (decay_root%selected_term > 0) then
         chain%process_instance => decay_root%process_instance
         chain%selected_term = decay_root%selected_term
         call chain%build_term_entries (decay_root%term(decay_root%selected_term))
      end if
      int_last_decay => chain%last%get_matrix_int_ptr ()
      allocate (qn_mask (int_last_decay%get_n_tot ()))
      call qn_mask%init (mask_f = .true., mask_c = .true., mask_h = .true.)
      call chain%correlated_trace%init_qn_sum (int_last_decay, qn_mask)
    end subroutine decay_chain_build
```

Build the entries that correspond to a decay term. We have to scan all unstable particles.

⟨*Decays: decay chain: TBP*⟩+≡
```
    procedure :: build_term_entries => decay_chain_build_term_entries
```

⟨*Decays: procedures*⟩+≡
```
    recursive subroutine decay_chain_build_term_entries (chain, term)
```

```
class(decay_chain_t), intent(inout) :: chain
type(decay_term_t), intent(in) :: term
integer :: i
do i = 1, size (term%particle_out)
   select type (unstable => term%particle_out(i)%c)
   type is (unstable_t)
      if (unstable%selected_decay > 0) then
         call chain%build_decay_entries &
              (unstable%decay(unstable%selected_decay))
      end if
   end select
end do
end subroutine decay_chain_build_term_entries
```

Build the entries that correspond to a specific decay. The decay term should have been determined, so we allocate a decay chain entry and fill it, then proceed to child decays.

For the first entry, we convolute the connected state of the parent process instance with the isolated state of the current decay (which does not contain an extra beam entry for the parent). For subsequent entries, we take the previous entry as first factor.

In principle, each chain entry (as a parton state) is capable of holding a subevent object and associated expressions. We currently do not make use of that feature.

Before generating the decays, factor out the trace of the helicity density matrix of the parent parton state. This trace has been used for unweighting the original event (unweighted case) or it determines the overall weight, so it should not be taken into account in the decay chain generation.

⟨*Decays: decay chain: TBP*⟩+≡
```
procedure :: build_decay_entries => decay_chain_build_decay_entries
```

⟨*Decays: procedures*⟩+≡
```
recursive subroutine decay_chain_build_decay_entries (chain, decay)
  class(decay_chain_t), intent(inout) :: chain
  type(decay_t), intent(in) :: decay
  type(decay_chain_entry_t), pointer :: entry
  type(connected_state_t), pointer :: previous_state
  type(isolated_state_t), pointer :: current_decay
  type(helicity_t) :: hel
  type(quantum_numbers_t) :: qn_filter_conn
  allocate (entry)
  if (associated (chain%last)) then
     entry%previous => chain%last
     entry%index = entry%previous%index + 1
     previous_state => entry%previous%connected_state_t
  else
     entry%index = 1
     previous_state => &
          chain%process_instance%get_connected_state_ptr (chain%selected_term)
  end if
  entry%config => decay%config
  entry%selected_mci = decay%selected_mci
  entry%selected_term = decay%selected_term
```

```
        current_decay => decay%process_instance%get_isolated_state_ptr &
            (decay%selected_term)
        call entry%setup_connected_trace &
            (current_decay, previous_state%get_trace_int_ptr (), resonant=.true.)
        if (entry%config%flv%has_decay_helicity ()) then
            call hel%init (entry%config%flv%get_decay_helicity ())
            call qn_filter_conn%init (hel)
            call entry%setup_connected_matrix &
                (current_decay, previous_state%get_matrix_int_ptr (), &
                resonant=.true., qn_filter_conn = qn_filter_conn)
            call entry%setup_connected_flows &
                (current_decay, previous_state%get_flows_int_ptr (), &
                resonant=.true., qn_filter_conn = qn_filter_conn)
        else
            call entry%setup_connected_matrix &
                (current_decay, previous_state%get_matrix_int_ptr (), &
                resonant=.true.)
            call entry%setup_connected_flows &
                (current_decay, previous_state%get_flows_int_ptr (), &
                resonant=.true.)
        end if
        chain%last => entry
        call chain%build_term_entries (decay%term(decay%selected_term))
    end subroutine decay_chain_build_decay_entries
```

Recursively fill the decay chain with momenta and evaluate the matrix elements. Since all evaluators should have correct source entries at this point, momenta are automatically retrieved from the appropriate process instance.

Like we did above for the parent process, factor out the trace for each subsequent decay (the helicity density matrix in the isolated state, which is taken for the convolution).

⟨*Decays: decay chain: TBP*⟩+≡
```
    procedure :: evaluate => decay_chain_evaluate
```

⟨*Decays: procedures*⟩+≡
```
    subroutine decay_chain_evaluate (chain)
      class(decay_chain_t), intent(inout) :: chain
      call evaluate (chain%last)
      call chain%correlated_trace%receive_momenta ()
      call chain%correlated_trace%evaluate ()
    contains
      recursive subroutine evaluate (entry)
        type(decay_chain_entry_t), intent(inout), pointer :: entry
        if (associated (entry)) then
            call evaluate (entry%previous)
            call entry%receive_kinematics ()
            call entry%evaluate_trace ()
            call entry%evaluate_event_data ()
        end if
      end subroutine evaluate
    end subroutine decay_chain_evaluate
```

Return the probability of a decay chain. This is given as the trace of the density

matrix with intermediate helicity correlations, normalized by the product of the uncorrelated density matrix traces. This works only if an event has been evaluated and the `correlated_trace` evaluator is filled. By definition, this evaluator has only one matrix element, and this must be real.

⟨*Decays: decay chain: TBP*⟩+≡
```
procedure :: get_probability => decay_chain_get_probability
```

⟨*Decays: procedures*⟩+≡
```
function decay_chain_get_probability (chain) result (x)
  class(decay_chain_t), intent(in) :: chain
  real(default) :: x
  x = real (chain%correlated_trace%get_matrix_element (1))
end function decay_chain_get_probability
```

33.6.12 Decay as Event Transform

The `evt_decay` object combines decay configuration, decay tree, and chain in a single object, as an implementation of the `evt` (event transform) abstract type.

The `var_list` may be a pointer to the user variable list, which could contain overridden parameters for the decay processes.

⟨*Decays: public*⟩+≡
```
public :: evt_decay_t
```

⟨*Decays: types*⟩+≡
```
type, extends (evt_t) :: evt_decay_t
  private
  type(decay_root_config_t) :: decay_root_config
  type(decay_root_t) :: decay_root
  type(decay_chain_t) :: decay_chain
  type(var_list_t), pointer :: var_list => null ()
 contains
 ⟨Decays: evt decay: TBP⟩
end type evt_decay_t
```

⟨*Decays: evt decay: TBP*⟩≡
```
procedure :: write_name => evt_decay_write_name
```

⟨*Decays: procedures*⟩+≡
```
subroutine evt_decay_write_name (evt, unit)
  class(evt_decay_t), intent(in) :: evt
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)")  "Event transform: partonic decays"
end subroutine evt_decay_write_name
```

Output. We display the currently selected decay tree, which includes configuration data, and the decay chain, i.e., the evaluators.

⟨*Decays: evt decay: TBP*⟩+≡
```
procedure :: write => evt_decay_write
```

⟨*Decays: procedures*⟩+≡
```
    subroutine evt_decay_write (evt, unit, verbose, more_verbose, testflag)
      class(evt_decay_t), intent(in) :: evt
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose, more_verbose, testflag
      logical :: verb, verb2
      integer :: u
      u = given_output_unit (unit)
      verb = .true.;  if (present (verbose))  verb = verbose
      verb2 = .false.;  if (present (more_verbose))  verb2 = more_verbose
      call write_separator (u, 2)
      call evt%write_name (u)
      call write_separator (u, 2)
      call evt%base_write (u, testflag = testflag)
      if (associated (evt%var_list)) then
         call write_separator (u)
         write (u, "(1x,A)")  "Variable list for simulation: &
              &[associated, not shown]"
      end if
      if (verb) then
         call write_separator (u)
         call evt%decay_root%write (u)
         if (verb2) then
            call evt%decay_chain%write (u)
            call evt%decay_root%write_process_instances (u, verb)
         end if
      else
         call write_separator (u, 2)
      end if
    end subroutine evt_decay_write
```

Set the pointer to a user variable list.

⟨*Decays: evt decay: TBP*⟩+≡
```
    procedure :: set_var_list => evt_decay_set_var_list
```

⟨*Decays: procedures*⟩+≡
```
    subroutine evt_decay_set_var_list (evt, var_list)
      class(evt_decay_t), intent(inout) :: evt
      type(var_list_t), intent(in), target :: var_list
      evt%var_list => var_list
    end subroutine evt_decay_set_var_list
```

Connect with a process instance and process. This initializes the decay configuration. The process stack is used to look for process objects that implement daughter decays.

When all processes are assigned, configure the decay tree instance, using the decay tree configuration. First obtain the branching ratios, then allocate the decay tree. This is done once for all events.

⟨*Decays: evt decay: TBP*⟩+≡
```
    procedure :: connect => evt_decay_connect
```

⟨*Decays: procedures*⟩+≡
```
    subroutine evt_decay_connect (evt, process_instance, model, process_stack)
```

```
class(evt_decay_t), intent(inout), target :: evt
type(process_instance_t), intent(in), target :: process_instance
class(model_data_t), intent(in), target :: model
type(process_stack_t), intent(in), optional :: process_stack
call evt%base_connect (process_instance, model)
if (associated (evt%var_list)) then
   call evt%decay_root_config%connect (process_instance%process, &
        model, process_stack, process_instance, evt%var_list)
else
   call evt%decay_root_config%connect (process_instance%process, &
        model, process_stack, process_instance)
end if
call evt%decay_root_config%compute ()
call evt%decay_root%init (evt%decay_root_config, evt%process_instance)
end subroutine evt_decay_connect
```

Prepare a new event: Select a decay chain and build the corresponding chain object.

⟨*Decays: evt decay: TBP*⟩+≡
```
procedure :: prepare_new_event => evt_decay_prepare_new_event
```

⟨*Decays: procedures*⟩+≡
```
subroutine evt_decay_prepare_new_event (evt, i_mci, i_term)
  class(evt_decay_t), intent(inout) :: evt
  integer, intent(in) :: i_mci, i_term
  call evt%reset ()
  evt%decay_root%selected_mci = i_mci
  evt%decay_root%selected_term = i_term
  call evt%decay_root%select_chain ()
  call evt%decay_chain%build (evt%decay_root)
end subroutine evt_decay_prepare_new_event
```

Generate a weighted event and assign the resulting weight (probability). We use a chain initialized by the preceding subroutine, fill it with momenta and evaluate.

⟨*Decays: evt decay: TBP*⟩+≡
```
procedure :: generate_weighted => evt_decay_generate_weighted
```

⟨*Decays: procedures*⟩+≡
```
subroutine evt_decay_generate_weighted (evt, probability)
  class(evt_decay_t), intent(inout) :: evt
  real(default), intent(inout) :: probability

end subroutine evt_shower_first_event
```

Here we take the particle set from the previous event transform (assuming that there is always one) and apply the shower algorithm. The result is stored in the event transform of the current object. We always return a probability of unity as we don't have the analytic weight of the combination of shower, MLM matching and hadronization. A subdivision into multiple event transformations is under construction. Invalid or vetoed events have to be discarded by the caller which is why we mark the particle set as invalid. This procedure directly

takes the (MLM) matching into account.

33.9 Fixed Order NLO Events

This section deals with the generation of weighted event samples which take into account next-to-leading order corrections. An approach generating unweighted events is not possible here, because negative weights might occur due to subtraction. Note that the events produced this way are not physical in the sense that they will not keep NLO-accuracy when interfaced to a parton shower. They are rather useful for theoretical consistency checks and a fast estimate of NLO effects.

We generate NLO events in the following way: First, the integration is carried out using the complete divergence-subtracted NLO matrix element. In the subsequent simulation, N-particle kinematics are generated using $\mathcal{B} + \mathcal{V} + \mathcal{C}$ as weight. After that, the program loops over all singular regions and for each of them generates an event with $N + 1$-particle kinematics. The weight for those events corresponds to the real matrix element $\mathcal{R}^\alpha$ evaluated at the α-region's emitter's phase space point, multiplied with S_α. This procedure is implemented using the `evt_nlo` transform.

This event transformation is for the generation of fixed-order NLO events. It takes an event with Born kinematics and creates $N_\alpha + 1$ modified weighted events. The first one has Born kinematics and its weight is the sum of Born, Real and subtraction matrix elements. The other N_α events have a weight which is equal to the real matrix element, evaluated with the phase space corresponding to the emitter of the α-region. All NLO event objects share the same event transformation. For this reason, we save the particle set of the current α-region in the array `particle_set_radiated`. Otherwise it would be unretrievable if the usual particle set of the event object was used.@

The event transform has a variable which counts the number of times it has already been called for one generation point. If i_evaluation is zero, this means that evt_nlo_generate is called for the first time, so that the generation of an N-particle event is required. In all other cases, emission events are generated. Note that for the first event, the computed weights are added to probability, which at this point is equal to $\mathcal{B} + \mathcal{V}$, whereas for all other runs probability is replaced. To keep $< \sum w_i > = N \times \sigma$ as it is for weighted LO events, we have to multiply by $N_{\mathrm{phs}} + 1$ since the cross section is distributed over the real and Born subevents.

33.10.1   Event configuration

The parameters govern the transformation of an event to a particle set.

The `safety_factor` reduces the acceptance probability for unweighting. If greater than one, excess events become less likely, but the reweighting efficiency also drops.

The `sigma` and `n` values, if nontrivial, allow for reweighting the events according to the requested `norm_mode`.

Various `parse_node_t` objects are taken from the SINDARIN input. They encode expressions that apply to the current event. The workspaces for evaluating those expressions are set up in the `event_expr_t` objects. Note that these are really pointers, so the actual nodes are not stored inside the event object.

⟨*Events: types*⟩≡
```

33.10.2 The event type

This is the concrete implementation of the `generic_event_t` core that is defined
above in the `event_base` module. The core manages the main (dressed) particle
set pointer and the current values for weights and sqme. The implementation
adds configuration data, expressions, process references, and event transforms.

Each event refers to a single elementary process. This process may be dressed
by a shower, a decay chain etc. We maintain pointers to a process instance.

A list of event transforms (class `evt_t`) transform the connected interactions of the process instance into the final particle set. In this list, the first transform is always the trivial one, which just factorizes the process instance. Subsequent transforms may apply decays, etc. The `particle_set` pointer identifies the particle set that we want to be analyzed and returned by the event, usually the last one.

Squared matrix element and weight values: when reading events from file, the `ref` value is the number in the file, while the `prc` value is the number that we calculate from the momenta in the file, possibly with different parameters. When generating events the first time, or if we do not recalculate, the numbers should coincide. Furthermore, the array of `alt` values is copied from an array of alternative event records. These values should represent calculated values.

The `sqme` and `weight` values mirror corresponding values in the `expr` subobject. The idea is that when generating or reading events, the event record is filled first, then the `expr` object acquires copies. These copies are used for writing events and as targets for pointer variables in the analysis expression.

All data that involve user-provided expressions (selection, reweighting, analysis) are handled by the `expr` subobject. In particular, evaluating the event-selection expression sets the `passed` flag. Furthermore, the `expr` subobject collects data that can be used in the analysis and should be written to file, including copies of `sqme` and `weight`.

```

Output.
    The event index is written in the header, it should coincide with the event_index
variable that can be used in selection and analysis.

Particle set: this is a pointer to one of the event transforms, so it should
suffice to print the latter.

33.10.3   Initialization

Initialize: set configuration parameters, using a variable list. We do not call this `init`, because this method name will be used by a type extension.

The default normalization is `NORM_SIGMA`, since the default generation mode is weighted.

For unweighted events, we may want to a apply a safety factor to event rejection. (By default, this factor is unity and can be ignored.)

We also allocate the trivial event transform, which is always the first one.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: basic_init => event_init
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_init (event, var_list, n_alt)
      class(event_t), intent(out) :: event
      type(var_list_t), intent(in), optional :: var_list
      integer, intent(in), optional :: n_alt
      type(string_t) :: norm_string, mode_string
      logical :: polarized_events
      if (present (n_alt)) then
         call event%base_init (n_alt)
         call event%expr%init (n_alt)
      else
         call event%base_init (0)
      end if
      if (present (var_list)) then
         event%config%unweighted = var_list%get_lval (&
              var_str ("?unweighted"))
         norm_string = var_list%get_sval (&
              var_str ("$sample_normalization"))
         event%config%norm_mode = &
              event_normalization_mode (norm_string, event%config%unweighted)
         polarized_events = &
              var_list%get_lval (var_str ("?polarized_events"))
         if (polarized_events) then
            mode_string = &
                 var_list%get_sval (var_str ("$polarization_mode"))
            select case (char (mode_string))
            case ("ignore")
               event%config%factorization_mode = FM_IGNORE_HELICITY
            case ("helicity")
               event%config%factorization_mode = FM_SELECT_HELICITY
            case ("factorized")
```

```
              event%config%factorization_mode = FM_FACTOR_HELICITY
          case ("correlated")
              event%config%factorization_mode = FM_CORRELATED_HELICITY
          case default
              call msg_fatal ("Polarization mode " &
                   // char (mode_string) // " is undefined")
          end select
        else
           event%config%factorization_mode = FM_IGNORE_HELICITY
        end if
        event%config%colorize_subevt = &
             var_list%get_lval (var_str ("?colorize_subevt"))
        if (event%config%unweighted) then
           event%config%safety_factor = var_list%get_rval (&
                var_str ("safety_factor"))
        end if
     else
        event%config%norm_mode = NORM_SIGMA
     end if
     allocate (evt_trivial_t :: event%transform_first)
     event%transform_last => event%transform_first
  end subroutine event_init
```

Set the `sigma` and `n` values in the configuration record that determine non-standard event normalizations. If these numbers are not set explicitly, the default value for both is unity, and event renormalization has no effect.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: set_sigma => event_set_sigma
    procedure :: set_n => event_set_n
```

⟨*Events: procedures*⟩+≡
```
    elemental subroutine event_set_sigma (event, sigma)
      class(event_t), intent(inout) :: event
      real(default), intent(in) :: sigma
      event%config%sigma = sigma
    end subroutine event_set_sigma

    elemental subroutine event_set_n (event, n)
      class(event_t), intent(inout) :: event
      integer, intent(in) :: n
      event%config%n = n
    end subroutine event_set_n
```

Append an event transform (decays, etc.). The transform is not yet connected to a process. The transform is then considered to belong to the event object, and will be finalized together with it. The original pointer is removed.

We can assume that the trivial transform is already present in the event object, at least.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: import_transform => event_import_transform
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_import_transform (event, evt)
```

```
      class(event_t), intent(inout) :: event
      class(evt_t), intent(inout), pointer :: evt
      event%transform_last%next => evt
      evt%previous => event%transform_last
      event%transform_last => evt
      evt => null ()
    end subroutine event_import_transform
```

We link the event to an existing process instance. This includes the variable list, which is linked to the process variable list. Note that this is not necessarily identical to the variable list used for event initialization.

The variable list will contain pointers to **event** subobjects, therefore the **target** attribute.

Once we have a process connected, we can use it to obtain an event generator instance.

The model and process stack may be needed by event transforms. The current model setting may be different from the model in the process (regarding unstable particles, etc.). The process stack can be used for assigning extra processes that we need for the event transforms.

⟨*Events: event: TBP*⟩+≡
```
      procedure :: connect => event_connect
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_connect (event, process_instance, model, process_stack)
      class(event_t), intent(inout), target :: event
      type(process_instance_t), intent(in), target :: process_instance
      class(model_data_t), intent(in), target :: model
      type(process_stack_t), intent(in), optional :: process_stack
      type(string_t) :: id
      integer :: num_id
      class(evt_t), pointer :: evt
      event%process => process_instance%process
      event%instance => process_instance
      id = event%process%get_id ()
      if (id /= "")  call event%expr%set_process_id (id)
      num_id = event%process%get_num_id ()
      if (num_id /= 0)  call event%expr%set_process_num_id (num_id)
      call event%expr%setup_vars (event%process%get_sqrts ())
      call event%expr%link_var_list (event%process%get_var_list_ptr ())
      call event%process%make_rng (event%rng)
      evt => event%transform_first
      do while (associated (evt))
         call evt%connect (process_instance, model, process_stack)
         evt => evt%next
      end do
    end subroutine event_connect
```

Set the parse nodes for the associated expressions, individually. The parse-node pointers may be null.

⟨*Events: event: TBP*⟩+≡
```
      procedure :: set_selection => event_set_selection
      procedure :: set_reweight => event_set_reweight
      procedure :: set_analysis => event_set_analysis
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_set_selection (event, ef_selection)
      class(event_t), intent(inout) :: event
      class(expr_factory_t), intent(in) :: ef_selection
      allocate (event%config%ef_selection, source = ef_selection)
    end subroutine event_set_selection

    subroutine event_set_reweight (event, ef_reweight)
      class(event_t), intent(inout) :: event
      class(expr_factory_t), intent(in) :: ef_reweight
      allocate (event%config%ef_reweight, source = ef_reweight)
    end subroutine event_set_reweight

    subroutine event_set_analysis (event, ef_analysis)
      class(event_t), intent(inout) :: event
      class(expr_factory_t), intent(in) :: ef_analysis
      allocate (event%config%ef_analysis, source = ef_analysis)
    end subroutine event_set_analysis
```

Create evaluation trees from the parse trees. The `target` attribute is required because the expressions contain pointers to event subobjects.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: setup_expressions => event_setup_expressions
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_setup_expressions (event)
      class(event_t), intent(inout), target :: event
      call event%expr%setup_selection (event%config%ef_selection)
      call event%expr%setup_analysis (event%config%ef_analysis)
      call event%expr%setup_reweight (event%config%ef_reweight)
      call event%expr%colorize (event%config%colorize_subevt)
    end subroutine event_setup_expressions
```

33.10.4 Evaluation

To fill the `particle_set`, i.e., the event record proper, we have to apply all event transforms in order. The last transform should fill its associated particle set, factorizing the state matrix according to the current settings. There are several parameters in the event configuration that control this.

We always fill the particle set for the first transform (the hard process) and the last transform, if different from the first (the fully dressed process).

Each event transform is an event generator of its own. We choose to generate an *unweighted* event for each of them, even if the master event is assumed to be weighted. Thus, the overall event weight is the one of the hard process only. (There may be more options in future extensions.)

We can generate the two random numbers that the factorization needs. For testing purpose, we allow for providing them explicitly, as an option.

⟨*Events: event: TBP*⟩+≡
```

         end subroutine print_transform_name_if_debug
       end subroutine event_evaluate_transforms
```

Set / increment the event index for the current event. There is no condition for this to happen. The event index is actually stored in the subevent expression, because this allows us to access it in subevent expressions as a variable.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: set_index => event_set_index
    procedure :: increment_index => event_increment_index
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_set_index (event, index)
      class(event_t), intent(inout) :: event
      integer, intent(in) :: index
      call event%expr%set_event_index (index)
    end subroutine event_set_index

    subroutine event_increment_index (event, offset)
      class(event_t), intent(inout) :: event
      integer, intent(in), optional :: offset
      call event%expr%increment_event_index (offset)
    end subroutine event_increment_index
```

Evaluate the event-related expressions, given a valid `particle_set`. If `update_sqme` is set, we use the process instance for the `sqme_prc` value. The `sqme_ref` value is always taken from the event record.

4914

Note: without the explicit `particle_set` pointer, some gfortran 4.8 version corrupts its memory.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: evaluate_expressions => event_evaluate_expressions
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_evaluate_expressions (event)
      class(event_t), intent(inout) :: event
      type(particle_set_t), pointer :: particle_set
      if (event%has_valid_particle_set ()) then

      call event%expr%reset_event_index ()
    end subroutine event_reset_index
```

33.10.6 Squared Matrix Element and Weight

Transfer the result of the process instance calculation to the event record header.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: import_instance_results => event_import_instance_results
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_import_instance_results (event)
      class(event_t), intent(inout) :: event
      if (associated (event%instance)) then
         if (event%instance%has_evaluated_trace ()) then
            call event%set ( &
                 sqme_prc = event%instance%get_sqme (), &
                 weight_prc = event%instance%get_weight (), &
                 excess_prc = event%instance%get_excess (), &
                 n_dropped = event%instance%get_n_dropped () &
                 )
         end if
      end if
    end subroutine event_import_instance_results
```

Duplicate the instance result / the reference result in the event record.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: accept_sqme_ref => event_accept_sqme_ref
    procedure :: accept_sqme_prc => event_accept_sqme_prc
    procedure :: accept_weight_ref => event_accept_weight_ref
    procedure :: accept_weight_prc => event_accept_weight_prc
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_accept_sqme_ref (event)
      class(event_t), intent(inout) :: event
      if (event%sqme_ref_is_known ()) then
         call event%set (sqme_prc = event%get_sqme_ref ())
      end if
    end subroutine event_accept_sqme_ref

    subroutine event_accept_sqme_prc (event)
      class(event_t), intent(inout) :: event
      if (event%sqme_prc_is_known ()) then
         call event%set (sqme_ref = event%get_sqme_prc ())
```

```
      end if
    end subroutine event_accept_sqme_prc

    subroutine event_accept_weight_ref (event)
      class(event_t), intent(inout) :: event
      if (event%weight_ref_is_known ()) then
         call event%set (weight_prc = event%get_weight_ref ())
      end if
    end subroutine event_accept_weight_ref

    subroutine event_accept_weight_prc (event)
      class(event_t), intent(inout) :: event
      if (event%weight_prc_is_known ()) then
         call event%set (weight_ref = event%get_weight_prc ())
      end if
    end subroutine event_accept_weight_prc
```

Update the weight normalization, just after generation. Unweighted and weighted events are generated with a different default normalization. The intended normalization is stored in the configuration record.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: update_normalization => event_update_normalization
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_update_normalization (event, mode_ref)
      class(event_t), intent(inout) :: event
      integer, intent(in), optional :: mode_ref
      integer :: mode_old
      real(default) :: weight, excess
      if (present (mode_ref)) then
         mode_old = mode_ref
      else if (event%config%unweighted) then
         mode_old = NORM_UNIT
      else
         mode_old = NORM_SIGMA
      end if
      weight = event%get_weight_prc ()
      call event_normalization_update (weight, &
           event%config%sigma, event%config%n, &
           mode_new = event%config%norm_mode, &
           mode_old = mode_old)
      call event%set_weight_prc (weight)
      excess = event%get_excess_prc ()
      call event_normalization_update (excess, &
           event%config%sigma, event%config%n, &
           mode_new = event%config%norm_mode, &
           mode_old = mode_old)
      call event%set_excess_prc (excess)
    end subroutine event_update_normalization
```

The event is complete if it has a particle set plus valid entries for the sqme and weight values.

⟨*Events: event: TBP*⟩+≡

```
      procedure :: check => event_check
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_check (event)
      class(event_t), intent(inout) :: event
      event%is_complete = event%has_valid_particle_set () &
           .and. event%sqme_ref_is_known () &
           .and. event%sqme_prc_is_known () &
           .and. event%weight_ref_is_known () &
           .and. event%weight_prc_is_known ()
      if (event%get_n_alt () /= 0) then
         event%is_complete = event%is_complete &
              .and. event%sqme_alt_is_known () &
              .and. event%weight_alt_is_known ()
      end if
    end subroutine event_check
```

33.10.7   Generation

Assuming that we have a valid process associated to the event, we generate an event. We complete the event data, then factorize the spin density matrix and transfer it to the particle set.

When done, we retrieve squared matrix element and weight. In case of explicit generation, the reference values coincide with the process values, so we accept the latter.

The explicit random number argument r should be generated by a random-number generator. It is taken for the factorization algorithm, bypassing the event-specific random-number generator. This is useful for deterministic testing.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: generate => event_generate
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_generate (event, i_mci, r, i_nlo)
      class(event_t), intent(inout) :: event
      integer, intent(in) :: i_mci
      real(default), dimension(:), intent(in), optional :: r
      integer, intent(in), optional :: i_nlo
      logical :: generate_new
      generate_new = .true.
      if (present (i_nlo)) generate_new = (i_nlo == 1)
      if (generate_new) call event%reset_contents ()
      event%selected_i_mci = i_mci
      if (event%config%unweighted) then
         call event%instance%generate_unweighted_event (i_mci)
         if (signal_is_pending ()) return
         call event%instance%evaluate_event_data ()
         call event%instance%normalize_weight ()
      else
         if (generate_new) &
            call event%instance%generate_weighted_event (i_mci)
         if (signal_is_pending ()) return
         call event%instance%evaluate_event_data ()
      end if
```

```
        event%selected_channel = event%instance%get_channel ()
        call event%import_instance_results ()
        call event%accept_sqme_prc ()
        call event%update_normalization ()
        call event%accept_weight_prc ()
        call event%evaluate_transforms (r)
        if (signal_is_pending ())  return
        call event%check ()
    end subroutine event_generate
```

Get a copy of the particle set belonging to the hard process.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: get_hard_particle_set => event_get_hard_particle_set
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_get_hard_particle_set (event, pset)
      class(event_t), intent(in) :: event
      type(particle_set_t), intent(out) :: pset
      class(evt_t), pointer :: evt
      evt => event%transform_first
      pset = evt%particle_set
    end subroutine event_get_hard_particle_set
```

33.10.8   Recovering an event

Select MC group, term, and integration channel.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: select => event_select
```

⟨*Events: procedures*⟩+≡
```
    subroutine event_select (event, i_mci, i_term, channel)
      class(event_t), intent(inout) :: event
      integer, intent(in) :: i_mci, i_term, channel
      if (associated (event%instance)) then
         event%selected_i_mci = i_mci
         event%selected_i_term = i_term
         event%selected_channel = channel
      else
         event%selected_i_mci = 0
         event%selected_i_term = 0
         event%selected_channel = 0
      end if
    end subroutine event_select
```

Copy a particle set into the event record.

We deliberately use the first (the trivial) transform for this, i.e., the hard process. The event reader may either read in the transformed event separately, or apply all event transforms to the hard particle set to (re)generate a fully dressed event.

Since this makes all subsequent event transforms invalid, we call `reset` on them.

⟨*Events: event: TBP*⟩+≡

```
        procedure :: set_hard_particle_set => event_set_hard_particle_set
```
⟨*Events: procedures*⟩+≡
```
    subroutine event_set_hard_particle_set (event, particle_set)
      class(event_t), intent(inout) :: event
      type(particle_set_t), intent(in) :: particle_set
      class(evt_t), pointer :: evt
      evt => event%transform_first
      call evt%set_particle_set (particle_set, &
           event%selected_i_mci, event%selected_i_term)
      call event%link_particle_set (evt%particle_set)
      evt => evt%next
      do while (associated (evt))
         call evt%reset ()
         evt => evt%next
      end do
    end subroutine event_set_hard_particle_set
```

Set the α_s value that should be used in a recalculation. This should be called only if we explicitly want to override the QCD setting of the process core.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: set_alpha_qcd_forced => event_set_alpha_qcd_forced
```
⟨*Events: procedures*⟩+≡
```
    subroutine event_set_alpha_qcd_forced (event, alpha_qcd)
      class(event_t), intent(inout) :: event
      real(default), intent(in) :: alpha_qcd
      if (allocated (event%alpha_qcd_forced)) then
         event%alpha_qcd_forced = alpha_qcd
      else
         allocate (event%alpha_qcd_forced, source = alpha_qcd)
      end if
    end subroutine event_set_alpha_qcd_forced
```

Analogously, for the common scale. This forces also renormalization and factorization scale.

⟨*Events: event: TBP*⟩+≡
```
    procedure :: set_scale_forced => event_set_scale_forced
```
⟨*Events: procedures*⟩+≡
```
    subroutine event_set_scale_forced (event, scale)
      class(event_t), intent(inout) :: event
      real(default), intent(in) :: scale
      if (allocated (event%scale_forced)) then
         event%scale_forced = scale
      else
         allocate (event%scale_forced, source = scale)
      end if
    end subroutine event_set_scale_forced
```

Here we try to recover an event from the `particle_set` subobject and recalculate the structure functions and matrix elements. We have the appropriate `process` object and an initialized `process_instance` at hand, so beam and configuration data are known. From the `particle_set`, we get the momenta.

The quantum-number information may be incomplete, e.g., helicity information may be partial or absent. We recover the event just from the momentum configuration.

We do not transfer the matrix element from the process instance to the event record, as we do when generating an event. The event record may contain the matrix element as read from file, and the current calculation may use different parameters. We thus can compare old and new values.

The event `weight` may also be known already. If yes, we pass it to the `evaluate_event_data` procedure. It should already be normalized. If we have an `weight_factor` value, we obtain the event weight by multiplying the computed `sqme` by this factor. Otherwise, we make use of the MCI setup (which should be valid then) to compute the event weight, and we should normalize the result just as when generating events.

Evaluating event expressions must also be done separately.

If `recover_phs` is set (and false), do not attempt any phase-space calculation, including MCI evaluation. Useful if we need only matrix elements.

⟨*Events: event: TBP*⟩+≡
```

```

4923

Return the current values of indices: the MCI group of components, the term index (different terms corresponding, potentially, to different effective kinematics), and the MC integration channel. The `i_mci` call is delegated to the current process instance.

⟨*Events: event: TBP*⟩+≡
```
procedure :: get_i_mci => event_get_i_mci
procedure :: get_i_term => event_get_i_term
procedure :: get_channel => event_get_channel
```

⟨*Events: procedures*⟩+≡
```
function event_get_i_mci (event) result (i_mci)
  class(event_t), intent(in) :: event
  integer :: i_mci
  i_mci = event%selected_i_mci
end function event_get_i_mci

function event_get_i_term (event) result (i_term)
  class(event_t), intent(in) :: event
  integer :: i_term
  i_term = event%selected_i_term
end function event_get_i_term

function event_get_channel (event) result (channel)
  class(event_t), intent(in) :: event
  integer :: channel
  channel = event%selected_channel
end function event_get_channel
```

This flag tells us whether the event consists just of a hard process (i.e., holds at most the first, trivial transform), or is a dressed events with additional transforms.

⟨*Events: event: TBP*⟩+≡
```
procedure :: has_transform => event_has_transform
```

⟨*Events: procedures*⟩+≡
```
function event_has_transform (event) result (flag)
  class(event_t), intent(in) :: event
  logical :: flag
  if (associated (event%transform_first)) then
     flag = associated (event%transform_first%next)
  else
     flag = .false.
  end if
end function event_has_transform
```

Return the currently selected normalization mode, or alternate normalization mode.

⟨*Events: event: TBP*⟩+≡
```

33.11 Raw Event I/O

The raw format is for internal use only. All data are stored unformatted, so they can be efficiently be re-read on the same machine, but not necessarily on another machine.

This module explicitly depends on the events module which provides the concrete implementation of event_base. The other I/O formats access only the methods that are defined in event_base.

```

33.11.1 File Format Version

This is the current default file version.

⟨EIO raw: parameters⟩≡
```
    integer, parameter :: CURRENT_FILE_VERSION = 2
```

The user may change this number; this should force some compatibility mode for reading and writing. In any case, the file version stored in a event file that we read has to match the expected file version.

History of version numbers:

1. Format for WHIZARD 2.2.0 to 2.2.3. No version number stored in the raw file.

2. Format from 2.2.4 on. File contains version number. The file contains the transformed particle set (if applicable) after the hard-process particle set.

33.11.2 Type

Note the file version number. The default may be reset during initialization, which should enforce some compatibility mode.

```

Output an event. Write first the event indices, then weight and squared matrix element, then the particle set.

We always write the particle set of the hard process. (Note: this should be reconsidered.) We do make a physical copy.

On output, we write the `prc` values for weight and sqme, since these are the values just computed. On input, we store the values as `ref` values. The

4943

caller can then decide whether to recompute values and thus obtain distinct `prc` values, or just accept them.

The `passed` flag is not written. This allow us to apply different selection criteria upon rereading.

Chapter 34

Integration and Simulation

34.1   User-controlled File I/O

The SINDARIN language includes commands that write output to file (input
may be added later). We identify files by their name, and manage the unit
internally. We need procedures for opening, closing, and printing files.

⟨user_files.f90⟩≡
  ⟨*File header*⟩

  ```
  module user_files
  ```

  ⟨*Use strings*⟩
  ```
    use io_units
    use diagnostics
    use ifiles
    use analysis
  ```

  ⟨*Standard module head*⟩

  ⟨*User files: public*⟩

  ⟨*User files: types*⟩

  ⟨*User files: interfaces*⟩

  ```
  contains
  ```

  ⟨*User files: procedures*⟩

  ```
  end module user_files
  ```

34.1.1   The file type

This is a type that describes an open user file and its properties. The entry is
part of a doubly-linked list.

⟨*User files: types*⟩≡

```
type :: file_t
   private
   type(string_t) :: name
   integer :: unit = -1
   logical :: reading = .false.
   logical :: writing = .false.
   type(file_t), pointer :: prev => null ()
   type(file_t), pointer :: next => null ()
end type file_t
```

The initializer opens the file.

⟨*User files: procedures*⟩≡
```
subroutine file_init (file, name, action, status, position)
  type(file_t), intent(out) :: file
  type(string_t), intent(in) :: name
  character(len=*), intent(in) :: action, status, position
  file%unit = free_unit ()
  file%name = name
  open (unit = file%unit, file = char (file%name), &
        action = action, status = status, position = position)
  select case (action)
  case ("read")
     file%reading = .true.
  case ("write")
     file%writing = .true.
  case ("readwrite")
     file%reading = .true.
     file%writing = .true.
  end select
end subroutine file_init
```

The finalizer closes it.

⟨*User files: procedures*⟩+≡
```
subroutine file_final (file)
  type(file_t), intent(inout) :: file
  close (unit = file%unit)
  file%unit = -1
end subroutine file_final
```

Check if a file is open with correct status.

⟨*User files: procedures*⟩+≡
```
function file_is_open (file, action) result (flag)
  logical :: flag
  type(file_t), intent(in) :: file
  character(*), intent(in) :: action
  select case (action)
  case ("read")
     flag = file%reading
  case ("write")
     flag = file%writing
  case ("readwrite")
     flag = file%reading .and. file%writing
```

```
      case default
         call msg_bug ("Checking file '" // char (file%name) &
               // "': illegal action specifier")
      end select
   end function file_is_open
```

Return the unit number of a file for direct access. It should be checked first whether the file is open.

⟨*User files: procedures*⟩+≡
```
   function file_get_unit (file) result (unit)
     integer :: unit
     type(file_t), intent(in) :: file
     unit = file%unit
   end function file_get_unit
```

Write to the file. Error if in wrong mode. If there is no string, just write an empty record. If there is a string, respect the `advancing` option.

⟨*User files: procedures*⟩+≡
```
   subroutine file_write_string (file, string, advancing)
     type(file_t), intent(in) :: file
     type(string_t), intent(in), optional :: string
     logical, intent(in), optional :: advancing
     if (file%writing) then
        if (present (string)) then
           if (present (advancing)) then
              if (advancing) then
                 write (file%unit, "(A)")  char (string)
              else
                 write (file%unit, "(A)", advance="no")  char (string)
              end if
           else
              write (file%unit, "(A)")  char (string)
           end if
        else
           write (file%unit, *)
        end if
     else
        call msg_error ("Writing to file: File '" // char (file%name) &
              // "' is not open for writing.")
     end if
   end subroutine file_write_string
```

Write a whole ifile, line by line.

⟨*User files: procedures*⟩+≡
```
   subroutine file_write_ifile (file, ifile)
     type(file_t), intent(in) :: file
     type(ifile_t), intent(in) :: ifile
     type(line_p) :: line
     call line_init (line, ifile)
     do while (line_is_associated (line))
        call file_write_string (file, line_get_string_advance (line))
     end do
```

```
      end subroutine file_write_ifile
```

Write an analysis object (or all objects) to an open file.

⟨*User files: procedures*⟩+≡
```
    subroutine file_write_analysis (file, tag)
      type(file_t), intent(in) :: file
      type(string_t), intent(in), optional :: tag
      if (file%writing) then
         if (present (tag)) then
            call analysis_write (tag, unit = file%unit)
         else
            call analysis_write (unit = file%unit)
         end if
      else
         call msg_error ("Writing analysis to file: File '" // char (file%name) &
               // "' is not open for writing.")
      end if
    end subroutine file_write_analysis
```

34.1.2 The file list

We maintain a list of all open files and their attributes. The list must be doubly-
linked because we may delete entries.

⟨*User files: public*⟩≡
```
    public :: file_list_t
```

⟨*User files: types*⟩+≡
```
    type :: file_list_t
       type(file_t), pointer :: first => null ()
       type(file_t), pointer :: last => null ()
    end type file_list_t
```

There is no initialization routine, but a finalizer which deletes all:

⟨*User files: public*⟩+≡
```
    public :: file_list_final
```

⟨*User files: procedures*⟩+≡
```
    subroutine file_list_final (file_list)
      type(file_list_t), intent(inout) :: file_list
      type(file_t), pointer :: current
      do while (associated (file_list%first))
         current => file_list%first
         file_list%first => current%next
         call file_final (current)
         deallocate (current)
      end do
      file_list%last => null ()
    end subroutine file_list_final
```

Find an entry in the list. Return null pointer on failure.

⟨*User files: procedures*⟩+≡

```fortran
function file_list_get_file_ptr (file_list, name) result (current)
  type(file_t), pointer :: current
  type(file_list_t), intent(in) :: file_list
  type(string_t), intent(in) :: name
  current => file_list%first
  do while (associated (current))
     if (current%name == name)  return
     current => current%next
  end do
end function file_list_get_file_ptr
```

Check if a file is open, public version:

⟨*User files: public*⟩+≡

```fortran
public :: file_list_is_open
```

⟨*User files: procedures*⟩+≡

```fortran
function file_list_is_open (file_list, name, action) result (flag)
  logical :: flag
  type(file_list_t), intent(in) :: file_list
  type(string_t), intent(in) :: name
  character(len=*), intent(in) :: action
  type(file_t), pointer :: current
  current => file_list_get_file_ptr (file_list, name)
  if (associated (current)) then
     flag = file_is_open (current, action)
  else
     flag = .false.
  end if
end function file_list_is_open
```

Return the unit number for a file. It should be checked first whether the file is open.

⟨*User files: public*⟩+≡

```fortran
public :: file_list_get_unit
```

⟨*User files: procedures*⟩+≡

```fortran
function file_list_get_unit (file_list, name) result (unit)
  integer :: unit
  type(file_list_t), intent(in) :: file_list
  type(string_t), intent(in) :: name
  type(file_t), pointer :: current
  current => file_list_get_file_ptr (file_list, name)
  if (associated (current)) then
     unit = file_get_unit (current)
  else
     unit = -1
  end if
end function file_list_get_unit
```

Append a new file entry, i.e., open this file. Error if it is already open.

⟨*User files: public*⟩+≡

```fortran
public :: file_list_open
```

⟨User files: procedures⟩+≡
```
    subroutine file_list_open (file_list, name, action, status, position)
      type(file_list_t), intent(inout) :: file_list
      type(string_t), intent(in) :: name
      character(len=*), intent(in) :: action, status, position
      type(file_t), pointer :: current
      if (.not. associated (file_list_get_file_ptr (file_list, name))) then
         allocate (current)
         call msg_message ("Opening file '" // char (name) // "' for output")
         call file_init (current, name, action, status, position)
         if (associated (file_list%last)) then
            file_list%last%next => current
            current%prev => file_list%last
         else
            file_list%first => current
         end if
         file_list%last => current
      else
         call msg_error ("Opening file: File '" // char (name) &
               // "' is already open.")
      end if
    end subroutine file_list_open
```

Delete a file entry, i.e., close this file. Error if it is not open.

⟨User files: public⟩+≡
```
    public :: file_list_close
```
⟨User files: procedures⟩+≡
```
    subroutine file_list_close (file_list, name)
      type(file_list_t), intent(inout) :: file_list
      type(string_t), intent(in) :: name
      type(file_t), pointer :: current
      current => file_list_get_file_ptr (file_list, name)
      if (associated (current)) then
         if (associated (current%prev)) then
            current%prev%next => current%next
         else
            file_list%first => current%next
         end if
         if (associated (current%next)) then
            current%next%prev => current%prev
         else
            file_list%last => current%prev
         end if
         call msg_message ("Closing file '" // char (name) // "' for output")
         call file_final (current)
         deallocate (current)
      else
         call msg_error ("Closing file: File '" // char (name) &
               // "' is not open.")
      end if
    end subroutine file_list_close
```

Write a string to file. Error if it is not open.

⟨*User files: public*⟩+≡
```
    public :: file_list_write
```

⟨*User files: interfaces*⟩≡
```
    interface file_list_write
       module procedure file_list_write_string
       module procedure file_list_write_ifile
    end interface
```

⟨*User files: procedures*⟩+≡
```
    subroutine file_list_write_string (file_list, name, string, advancing)
      type(file_list_t), intent(in) :: file_list
      type(string_t), intent(in) :: name
      type(string_t), intent(in), optional :: string
      logical, intent(in), optional :: advancing
      type(file_t), pointer :: current
      current => file_list_get_file_ptr (file_list, name)
      if (associated (current)) then
         call file_write_string (current, string, advancing)
      else
         call msg_error ("Writing to file: File '" // char (name) &

34.2.1 Strategy for models and variables

The program manages its data via a main **rt_data_t** object. During program flow, various commands create and use local **rt_data_t** objects. Those transient blocks contain either pointers to global object or local copies which are deleted after use.

Each **rt_data_t** object contains a variable list component. This lists holds (local copies of) all kinds of intrinsic or user-defined variables. The variable list is linked to the variable list contained in the local process library. This, in turn, is linked to the variable list of the **rt_data_t** context, and so on.

A variable lookup will thus be recursively delegated to the linked variable lists, until a match is found. When modifying a variable which is not yet local, the program creates a local copy and uses this afterwards. Thus, when the local **rt_data_t** object is deleted, the context value is recovered.

Models are kept in a model list which is separate from the variable list. Otherwise, they are treated in a similar manner: the local list is linked to the context model list. Model lookup is thus recursively delegated. When a model or any part of it is modified, the model is copied to the local **rt_data_t** object, so the context model is not modified. Commands such as **integrate** will create their own copy of the current model (and of the current variable list) at the point where they are executed.

When a model is encountered for the first time, it is read from file. The reading is automatically delegated to the global context. Thus, this master copy survives until the main **rt_data_t** object is deleted, at program completion.

If there is a currently active model, its variable list is linked to the main variable list. Variable lookups will then start from the model variable list. When the current model is switched, the new active model will get this link instead. Consequently, a change to the current model is kept as long as this model has a local copy; it survives local model switches. On the other hand, a parameter change in the current model doesn't affect any other model, even if the parameter name is identical.

34.2.2 Container for parse nodes

The runtime data set contains a bunch of parse nodes (chunks of code that have not been compiled into evaluation trees but saved for later use). We collect them here.

This implementation has the useful effect that an assignment between two objects of this type will establish a pointer-target relationship for all components.

⟨*RT data: types*⟩≡
```
type :: rt_parse_nodes_t
  type(parse_node_t), pointer :: cuts_lexpr => null ()
  type(parse_node_t), pointer :: scale_expr => null ()
  type(parse_node_t), pointer :: fac_scale_expr => null ()
  type(parse_node_t), pointer :: ren_scale_expr => null ()
  type(parse_node_t), pointer :: weight_expr => null ()
  type(parse_node_t), pointer :: selection_lexpr => null ()
  type(parse_node_t), pointer :: reweight_expr => null ()
  type(parse_node_t), pointer :: analysis_lexpr => null ()
  type(parse_node_p), dimension(:), allocatable :: alt_setup
contains
⟨RT data: rt parse nodes: TBP⟩
end type rt_parse_nodes_t
```

Clear individual components. The parse nodes are nullified. No finalization needed since the pointer targets are part of the global parse tree.

⟨*RT data: rt parse nodes: TBP*⟩≡
```
procedure :: clear => rt_parse_nodes_clear
```

⟨RT data: procedures⟩≡

```
subroutine rt_parse_nodes_clear (rt_pn, name)
  class(rt_parse_nodes_t), intent(inout) :: rt_pn
  type(string_t), intent(in) :: name
  select case (char (name))
  case ("cuts")
     rt_pn%cuts_lexpr => null ()
  case ("scale")
     rt_pn%scale_expr => null ()
  case ("factorization_scale")
     rt_pn%fac_scale_expr => null ()
  case ("renormalization_scale")
     rt_pn%ren_scale_expr => null ()
  case ("weight")
     rt_pn%weight_expr => null ()
  case ("selection")
     rt_pn%selection_lexpr => null ()
  case ("reweight")
     rt_pn%reweight_expr => null ()
  case ("analysis")
     rt_pn%analysis_lexpr => null ()
  end select
end subroutine rt_parse_nodes_clear
```

Output for the parse nodes.

⟨RT data: rt parse nodes: TBP⟩+≡

```
procedure :: write => rt_parse_nodes_write
```

⟨RT data: procedures⟩+≡

```
subroutine rt_parse_nodes_write (object, unit)
  class(rt_parse_nodes_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit)
  call wrt ("Cuts", object%cuts_lexpr)
  call write_separator (u)
  call wrt ("Scale", object%scale_expr)
  call write_separator (u)
  call wrt ("Factorization scale", object%fac_scale_expr)
  call write_separator (u)
  call wrt ("Renormalization scale", object%ren_scale_expr)
  call write_separator (u)
  call wrt ("Weight", object%weight_expr)

      case ("scale")
         pn => rt_pn%scale_expr
      case ("factorization_scale")
         pn => rt_pn%fac_scale_expr
      case ("renormalization_scale")
         pn => rt_pn%ren_scale_expr
      case ("weight")
         pn => rt_pn%weight_expr
      case ("selection")
         pn => rt_pn%selection_lexpr
      case ("reweight")
         pn => rt_pn%reweight_expr
      case ("analysis")
         pn => rt_pn%analysis_lexpr
      end select
      if (associated (pn)) then
         write (u, "(A,1x,A,1x,A)")  "Expression:", char (name), "(parse tree):"
         call parse_node_write_rec (pn, u)
      else
         write (u, "(A,1x,A,A)")  "Expression:", char (name), ": [undefined]"
      end if
```

```
            end subroutine rt_parse_nodes_show
```

34.2.3   The data type

This is a big data container which contains everything that is used and modified during the command flow. A local copy of this can be used to temporarily override defaults. The data set is transparent.

⟨*RT data: public*⟩≡
```
    public :: rt_data_t
```

⟨*RT data: types*⟩+≡
```
    type :: rt_data_t
       type(lexer_t), pointer :: lexer => null ()
       type(rt_data_t), pointer :: context => null ()
       type(string_t), dimension(:), allocatable :: export
       type(var_list_t) :: var_list
       type(iterations_list_t) :: it_list
       type(os_data_t) :: os_data
       type(model_list_t) :: model_list
       type(model_t), pointer :: model => null ()
       logical :: model_is_copy = .false.
       type(model_t), pointer :: preload_model => null ()
       type(model_t), pointer :: fallback_model => null ()
       type(prclib_stack_t) :: prclib_stack
       type(process_library_t), pointer :: prclib => null ()
       type(beam_structure_t) :: beam_structure
       type(rt_parse_nodes_t) :: pn
       type(process_stack_t) :: process_stack
       type(string_t), dimension(:), allocatable :: sample_fmt

           defined=.false., descriptions=.true., ascii_output=ao)
    end subroutine rt_data_show_description_of_string
```

34.2.5   Clear

The `clear` command can remove the contents of various subobjects. The objects
themselves should stay.

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: clear_beams => rt_data_clear_beams
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_clear_beams (global)
      class(rt_data_t), intent(inout) :: global
      call global%beam_structure%final_sf ()
      call global%beam_structure%final_pol ()
      call global%beam_structure%final_mom ()
    end subroutine rt_data_clear_beams
```

34.2.6   Initialization

Initialize runtime data. This defines special variables such as `sqrts`, and should
be done only for the instance that is actually global. Local copies will inherit
the special variables.

   We link the global variable list to the process stack variable list, so the latter
is always available (and kept global).

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: global_init => rt_data_global_init
```

⟨*RT data: procedures*⟩+≡
```
subroutine rt_data_global_init (global, paths, logfile)
  class(rt_data_t), intent(out), target :: global
  type(paths_t), intent(in), optional :: paths
  type(string_t), intent(in), optional :: logfile
  integer :: seed
  call global%os_data%init (paths)
  if (present (logfile)) then
     global%logfile = logfile
  else
     global%logfile = ""
  end if
  allocate (global%out_files)
  call system_clock (seed)
  call global%var_list%init_defaults (seed, paths)
  call global%init_pointer_variables ()
  call global%process_stack%init_var_list (global%var_list)
end subroutine rt_data_global_init
```

34.2.7   Local copies

This is done at compile time when a local copy of runtime data is needed:
Link the variable list and initialize all derived parameters. This allows for
synchronizing them with local variable changes without affecting global data.

Also re-initialize pointer variables, so they point to local copies of their
targets.

⟨*RT data: rt data: TBP*⟩+≡
```
procedure :: local_init => rt_data_local_init
```

⟨*RT data: procedures*⟩+≡
```
subroutine rt_data_local_init (local, global, env)
  class(rt_data_t), intent(inout), target :: local
  type(rt_data_t), intent(in), target :: global
  integer, intent(in), optional :: env
  local%context => global
  call local%process_stack%link (global%process_stack)
  call local%process_stack%init_var_list (local%var_list)
  call local%process_stack%link_var_list (global%var_list)
  call local%var_list%append_string (var_str ("$model_name"), &
       var_str (""), intrinsic=.true.)
  call local%init_pointer_variables ()
  local%fallback_model => global%fallback_model
  local%os_data = global%os_data
  local%logfile = global%logfile
  call local%model_list%link (global%model_list)
  local%model => global%model
  if (associated (local%model)) then
     call local%model%link_var_list (local%var_list)
  end if
  if (allocated (global%event_callback)) then
     allocate (local%event_callback, source = global%event_callback)
  end if
```

```
    end subroutine rt_data_local_init
```

These variables point to objects which get local copies:

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: init_pointer_variables => rt_data_init_pointer_variables
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_init_pointer_variables (local)
      class(rt_data_t), intent(inout), target :: local
      logical, target, save :: known = .true.
      call local%var_list%append_string_ptr (var_str ("$fc"), &
           local%os_data%fc, known, intrinsic=.true., &
           description=var_str('This string variable gives the ' // &
           '\ttt{Fortran} compiler used within \whizard. It can ' // &
           'only be accessed, not set by the user. (cf. also ' // &
           '\ttt{\$fcflags})'))
      call local%var_list%append_string_ptr (var_str ("$fcflags"), &
           local%os_data%fcflags, known, intrinsic=.true., &
           description=var_str('This string variable gives the ' // &
           'compiler flags for the \ttt{Fortran} compiler used ' // &
           'within \whizard. It can only be accessed, not set by ' // &
           'the user. (cf. also \ttt{\$fc})'))
    end subroutine rt_data_init_pointer_variables
```

This is done at execution time: Copy data, transfer pointers. `local` has intent(inout) because its local variable list has already been prepared by the previous routine.

To be pedantic, the local pointers to model and library should point to the entries in the local copies. (However, as long as these are just shallow copies with identical content, this is actually irrelevant.)

The process library and process stacks behave as global objects. The copies of the process library and process stacks should be shallow copies, so the contents stay identical. Since objects may be pushed on the stack in the local environment, upon restoring the global environment, we should reverse the assignment. Then the added stack elements will end up on the global stack. (This should be reconsidered in a parallel environment.)

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: activate => rt_data_activate
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_activate (local)
      class(rt_data_t), intent(inout), target :: local
      class(rt_data_t), pointer :: global
      global => local%context
      if (associated (global)) then
         local%lexer => global%lexer
         call global%copy_globals (local)
         local%os_data = global%os_data
         local%logfile = global%logfile
         if (associated (global%prclib)) then
            local%prclib => &
                 local%prclib_stack%get_library_ptr (global%prclib%get_name ())
         end if
```

```
        call local%import_values ()
        call local%process_stack%link (global%process_stack)
        local%it_list = global%it_list
        local%beam_structure = global%beam_structure
        local%pn = global%pn
        if (allocated (local%sample_fmt))  deallocate (local%sample_fmt)
        if (allocated (global%sample_fmt)) then
           allocate (local%sample_fmt (size (global%sample_fmt)), &
                source = global%sample_fmt)
        end if
        local%out_files => global%out_files
        local%model => global%model
        local%model_is_copy = .false.
     else if (.not. associated (local%model)) then
        local%model => local%preload_model
        local%model_is_copy = .false.
     end if
     if (associated (local%model)) then
        call local%model%link_var_list (local%var_list)
        call local%var_list%set_string (var_str ("$model_name"), &
             local%model%get_name (), is_known = .true.)
     else
        call local%var_list%set_string (var_str ("$model_name"), &
             var_str (""), is_known = .false.)
     end if
   end subroutine rt_data_activate
```

Restore the previous state of data, without actually finalizing the local environment. We also clear the local process stack. Some local modifications (model list and process library stack) are communicated to the global context, if there is any.

If the `keep_local` flag is set, we want to retain current settings in the local environment. In particular, we create an instance of the currently selected model (which thus becomes separated from the model library!). The local variables are also kept.

⟨*RT data: rt data: TBP*⟩+≡
```
     procedure :: deactivate => rt_data_deactivate
```

⟨*RT data: procedures*⟩+≡
```
   subroutine rt_data_deactivate (local, global, keep_local)
     class(rt_data_t), intent(inout), target :: local
     class(rt_data_t), intent(inout), optional, target :: global
     logical, intent(in), optional :: keep_local
     type(string_t) :: local_model, local_scheme
     logical :: same_model, delete
     delete = .true.;  if (present (keep_local))  delete = .not. keep_local
     if (present (global)) then
        if (associated (global%model) .and. associated (local%model)) then
           local_model = local%model%get_name ()
           if (global%model%has_schemes ()) then
              local_scheme = local%model%get_scheme ()
              same_model = &
                   global%model%matches (local_model, local_scheme)
```

```
         else
            same_model = global%model%matches (local_model)
         end if
      else
         same_model = .false.
      end if
      if (delete) then
         call local%process_stack%clear ()
         call local%unselect_model ()
         call local%unset_values ()
      else if (associated (local%model)) then
         call local%ensure_model_copy ()
      end if
      if (.not. same_model .and. associated (global%model)) then
         if (global%model%has_schemes ()) then
            call msg_message ("Restoring model '" // &
                 char (global%model%get_name ()) // "', scheme '" // &
                 char (global%model%get_scheme ())) // "'")
         else
            call msg_message ("Restoring model '" // &
                 char (global%model%get_name ())) // "'")
         end if
      end if
      if (associated (global%model)) then
         call global%model%link_var_list (global%var_list)
      end if
      call global%restore_globals (local)
   else
      call local%unselect_model ()
   end if
 end subroutine rt_data_deactivate
```

This imports the global objects for which local modifications should be kept. Currently, this is only the process library stack.

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: copy_globals => rt_data_copy_globals
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_copy_globals (global, local)
      class(rt_data_t), intent(in) :: global
      class(rt_data_t), intent(inout) :: local
      local%prclib_stack = global%prclib_stack
    end subroutine rt_data_copy_globals
```

This restores global objects for which local modifications should be kept. May also modify (remove) the local objects.

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: restore_globals => rt_data_restore_globals
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_restore_globals (global, local)
      class(rt_data_t), intent(inout) :: global
      class(rt_data_t), intent(inout) :: local
      global%prclib_stack = local%prclib_stack
```

```
      call local%handle_exports (global)
    end subroutine rt_data_restore_globals
```

34.2.8   Exported objects

Exported objects are transferred to the global state when a local environment
is closed. (For the top-level global data set, there is no effect.)

The current implementation handles only the `results` object, which resolves
to the local process stack. The stack elements are appended to the global stack
without modification, the local stack becomes empty.

Write names of objects to be exported:

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: write_exports => rt_data_write_exports
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_write_exports (rt_data, unit)
      class(rt_data_t), intent(in) :: rt_data
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit)
      do i = 1, rt_data%get_n_export ()
         write (u, "(A)")  char (rt_data%export(i))
      end do
    end subroutine rt_data_write_exports
```

The number of entries in the export list.

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: get_n_export => rt_data_get_n_export
```

⟨*RT data: procedures*⟩+≡
```
    function rt_data_get_n_export (rt_data) result (n)
      class(rt_data_t), intent(in) :: rt_data
      integer :: n
      if (allocated (rt_data%export)) then
         n = size (rt_data%export)
      else
         n = 0
      end if
    end function rt_data_get_n_export
```

Return a specific export Append new names to the export list. If a duplicate
occurs, do not transfer it.

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: append_exports => rt_data_append_exports
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_append_exports (rt_data, export)
      class(rt_data_t), intent(inout) :: rt_data
      type(string_t), dimension(:), intent(in) :: export
      logical, dimension(:), allocatable :: mask
      type(string_t), dimension(:), allocatable :: tmp
      integer :: i, j, n
```

```
if (.not. allocated (rt_data%export))  allocate (rt_data%export (0))
n = size (rt_data%export)
allocate (mask (size (export)), source=.false.)
do i = 1, size (export)
   mask(i) = all (export(i) /= rt_data%export) &
        .and. all (export(i) /= export(:i-1))
end do
if (count (mask) > 0) then
   allocate (tmp (n + count (mask)))
   tmp(1:n) = rt_data%export(:)
   j = n
   do i = 1, size (export)
      if (mask(i)) then
         j = j + 1
         tmp(j) = export(i)
      end if
   end do
   call move_alloc (from=tmp, to=rt_data%export)
end if
end subroutine rt_data_append_exports
```

Transfer export-objects from the `local` rt data to the `global` rt data, as far as supported.

⟨*RT data: rt data: TBP*⟩+≡
```
procedure :: handle_exports => rt_data_handle_exports
```

⟨*RT data: procedures*⟩+≡
```
subroutine rt_data_handle_exports (local, global)
  class(rt_data_t), intent(inout), target :: local
  class(rt_data_t), intent(inout), target :: global
  type(string_t) :: export
  integer :: i
  if (local%get_n_export () > 0) then
     do i = 1, local%get_n_export ()
        export = local%export(i)
        select case (char (export))
        case ("results")
           call msg_message ("Exporting integration results &
                &to outer environment")
           call local%transfer_process_stack (global)
        case default
           call msg_bug ("handle exports: '" &
                // char (export) // "' unsupported")
        end select
     end do
  end if
end subroutine rt_data_handle_exports
```

Export the process stack. One-by-one, take the last process from the local stack and push it on the global stack. Also handle the corresponding result variables: append if the process did not exist yet in the global stack, otherwise update.

TODO: result variables don't work that way yet, require initialization in the global variable list.

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: transfer_process_stack => rt_data_transfer_process_stack
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_transfer_process_stack (local, global)
      class(rt_data_t), intent(inout), target :: local
      class(rt_data_t), intent(inout), target :: global
      type(process_entry_t), pointer :: process
      type(string_t) :: process_id
      do
         call local%process_stack%pop_last (process)
         if (.not. associated (process))  exit
         process_id = process%get_id ()
         call global%process_stack%push (process)
         call global%process_stack%fill_result_vars (process_id)
         call global%process_stack%update_result_vars &
               (process_id, global%var_list)
      end do
    end subroutine rt_data_transfer_process_stack
```

34.2.9   Finalization

Finalizer for the variable list and the structure-function list. This is done only for the global RT dataset; local copies contain pointers to this and do not need a finalizer.

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: final => rt_data_global_final
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_global_final (global)
      class(rt_data_t), intent(inout) :: global
      call global%process_stack%final ()
      call global%prclib_stack%final ()
      call global%model_list%final ()
      call global%var_list%final (follow_link=.false.)
      if (associated (global%out_files)) then
         call file_list_final (global%out_files)
         deallocate (global%out_files)
      end if
    end subroutine rt_data_global_final
```

The local copy needs a finalizer for the variable list, which consists of local copies. This finalizer is called only when the local environment is finally discarded. (Note that the process stack should already have been cleared after execution, which can occur many times for the same local environment.)

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: local_final => rt_data_local_final
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_local_final (local)
      class(rt_data_t), intent(inout) :: local
      call local%process_stack%clear ()
      call local%model_list%final ()
```

```
        call local%var_list%final (follow_link=.false.)
      end subroutine rt_data_local_final
```

34.2.10 Model Management

Read a model, so it becomes available for activation. No variables or model copies, this is just initialization.

If this is a local environment, the model will be automatically read into the global context.

⟨*RT data: rt data: TBP*⟩+≡
```
      procedure :: read_model => rt_data_read_model
```

⟨*RT data: procedures*⟩+≡
```
      subroutine rt_data_read_model (global, name, model, scheme)
        class(rt_data_t), intent(inout) :: global
        type(string_t), intent(in) :: name
        type(string_t), intent(in), optional :: scheme
        type(model_t), pointer, intent(out) :: model
        type(string_t) :: filename
        filename = name // ".mdl"
        call global%model_list%read_model &
             (name, filename, global%os_data, model, scheme)
      end subroutine rt_data_read_model
```

Read a UFO model. Create it on the fly if necessary.

⟨*RT data: rt data: TBP*⟩+≡
```
      procedure :: read_ufo_model => rt_data_read_ufo_model
```

⟨*RT data: procedures*⟩+≡
```
      subroutine rt_data_read_ufo_model (global, name, model, ufo_path)
        class(rt_data_t), intent(inout) :: global
        type(string_t), intent(in) :: name
        type(model_t), pointer, intent(out) :: model
        type(string_t), intent(in), optional :: ufo_path
        type(string_t) :: filename
        filename = name // ".ufo.mdl"
        call global%model_list%read_model &
             (name, filename, global%os_data, model, ufo=.true., ufo_path=ufo_path)
      end subroutine rt_data_read_ufo_model
```

Initialize the fallback model. This model is used whenever the current model does not describe all physical particles (hadrons, mainly). It is not supposed to be modified, and the pointer should remain linked to this model.

⟨*RT data: rt data: TBP*⟩+≡
```
      procedure :: init_fallback_model => rt_data_init_fallback_model
```

⟨*RT data: procedures*⟩+≡
```
      subroutine rt_data_init_fallback_model (global, name, filename)
        class(rt_data_t), intent(inout) :: global
        type(string_t), intent(in) :: name, filename
        call global%model_list%read_model &
             (name, filename, global%os_data, global%fallback_model)
```

```
              end subroutine rt_data_init_fallback_model
```

Activate a model: assign the current-model pointer and set the model name in
the variable list. If necessary, read the model from file. Link the global variable
list to the model variable list.

⟨*RT data: rt data: TBP*⟩+≡
```
    procedure :: select_model => rt_data_select_model
```

⟨*RT data: procedures*⟩+≡
```
    subroutine rt_data_select_model (global, name, scheme, ufo, ufo_path)
      class(rt_data_t), intent(inout), target :: global
      type(string_t), intent(in) :: name
      type(string_t), intent(in), optional :: scheme
      logical, intent(in), optional :: ufo
      type(string_t), intent(in), optional :: ufo_path
      logical :: same_model, ufo_model
      ufo_model = .false.;  if (present (ufo))  ufo_model = ufo
      if (associated (global%model)) then
         same_model = global%model%matches (name, scheme, ufo)
      else
         same_model = .false.
      end if
      if (.not. same_model) then
         global%model => global%model_list%get_model_ptr (name, scheme, ufo)
         if (.not. associated (global%model)) then
            if (ufo_model) then
               call global%read_ufo_model (name, global%model, ufo_path)
            else
               call global%read_model (name, global%model)
            end if
            global%model_is_copy = .false.
         else if (associated (global%context)) then
            global%model_is_copy = &
                 global%model_list%model_exists (name, scheme, ufo, &
                 follow_link=.false.)
         else
            global%model_is_copy = .false.
         end if
      end if
      if (associated (global%model)) then
         call global%model%link_var_list (global%var_list)
         call global%var_list%set_string (var_str ("$model_name"), &
              name, is_known = .true.)
         if (global%model%is_ufo_model ()) then
            call msg_message ("Switching to model '" // char (name) // "' " &
                 // "(generated from UFO source)")
         else if (global%model%has_schemes ()) then
            call msg_message ("Switching to model '" // char (name) // "', " &
                 // "scheme '" // char (global%model%get_scheme ()) // "'")
         else
            call msg_message ("Switching to model '" // char (name) // "'")
         end if
      else
         call global%var_list%set_string (var_str ("$model_name"), &
```
