23.2   Transverse momenta

This file contains the module `muli_momentum`. Its purpose is to store the actual value of the evolution parameter p_t^2 in a convenient way. We use the normalized value $p_t^2/p_{t,\max}^2$ for generating the next value of the scale, also need the square root of both p_t^2 and $p_t^2/p_{t,\max}^2$ for other purposes. That's why I store all four combinations together with $p_{t,\max}$ in an array.

23.3   Multi parton interactions

This file contains the module `muli_interactions`. The allowed interactions and their cross sections are defined here. Additionaly, some coordinate transformations which annihilate divergencies of the cross sections are defined. Since the phase space border is hyperbolic, this transformations are also hyperbolic. That's why all interactions are named `x_cart` for cartesian or `x_hyp` for hyperbolic to avoid confusion.

23.4   VEGAS and CUBA integration routines

This file contains the module `muli_cuba`, a wrapper for the CUBA integration
library. Different algorithms and settings have been tried out for the integration,
including VEGAS, and this wrapper has been mainly written for that purpose.

23.5 Trapezoidal integration routines

This file contains the module "**muli_trapezium**". The name is derived from the trapezoidal integration rule. The purpose of this module is to define a binary tree **muli_trapezium_tree_t** which holds a probability function in terms of trapezoidal segments. Its leaves of type **muli_trapezium_list_t** are connected to form a list, so you can either walk the root function back and forth or pick a certain segment in logarithmic time by walking down the tree. All nodes extend **muli_trapezium_t** which holds the actual values. Those are the values of the density function, the integral from this segment to the end of the integration area and a probability function calculated from these values. All values are taken at the upper "right" bound of the segment. Additionally the differences of these values to the values of the left neighbor is stored.

23.6 Fibonacci trees

This file contains the module `muli_fibonacci_tree`. A fibonacci tree is a self-balancing binary tree. "Balanced" means that the depth of the left successor may differ from the depth of the right successor in any node by maximally one. The maximally unbalanced tree is maximally unbalanced in every node. So the number of leaves of a maximally unbalanced fibonacci tree of depth n is precisely the nth fibonacci number.

We use this tree for the adaptive quadrature. In every iteration of the algorithm, we have to pick the segment with largest integration error, cut it into pieces and calculate the new integration error for the pieces. A binary tree is obviuolsy a good choice for soring these segments. The problem is, that we always pick leaves from the same side of the tree. So the tree must decline at one side and grow at the other side. Sorting gets less efficient and finally most of the overall CPU time gets wasted for sorting. This tree outperforms a naive binary tree significantly in this particular job.

23.7   Adaptive Quadrature

This file contains the module `muli_aq` which is an acronym for adaptive quadrature. The abstract type `aq_class` is extended and the deferred procedure `evaluate` is defined. `muli_aq` calls `evaluate` to evaluate the integrand at any point in the given range. We have tried to use a procedure pointer instead of the deferred type-bound procedure, but no compiler was able to handle procedure pointers plus cuba was not able to handle parameters, to wit dimensions of the integrand that should not get integrated. So we switched to this odd way of using inheritance. Meanwhile these problems got solved and we could go for a more straightforward solution, but it works fine as it is.

   `aq_class` uses `muli_trapezium` to approximate the integral. It still has to do the subdivision of segments and has to check whether the precision goal is reached.

   Finally, the result is written do disc using the serialization framework defined in `muli_base`. Since QCD is not expected to change frequently, the only reason to regenerate this function is a change of the used PDF set. Then you can read the integral from disc each time you run a simulation with the same PDF set.

⟨*Muli aq: procedures*⟩+≡

Usually, the tree is sorted by the sum of errors. Now it shall be sorted by the right position. When at least one branch of the tree is itself a tree, i.e. each branch has got at least two leaves, then process each branch and merge the results. Now we got two sorted lists. Which one's leftmost node has got the lowest value of **r_position**? That one shall be the beginning of the merged list **lin_list**. Everything is prepared for the algorithm: **lin_list** is the beginning of the sorted list, **last_node** is its end. **left_node** and **right_node** are the leftmost nodes of the remainders of **left_list** and **right_list**. The latter will get stripped from left to right, until one of them ends. Then, either **left_list**

or `right_list` is completely merged into `lin_list`. The other one gets appended to `lin_list`. In the second part of the big if clause, the tree has got two leaves at most. Is it more than one? There, `fib_tree` is a single leave with an allocated "content" component of type `muli_trapezium_t`. If "content" is not type-compatible with `muli_trapezium_t`, then this whole conversion cannot succeed. We allocate a new node of type `muli_trapezium_list_t`. This list does not contain the content of `fib_tree`, it *is* a copy of the content, for `muli_trapezium_list_t` is an extension of `muli_trapezium_t`. In the next step, each branch of `fib_tree` is a single leave. We could call this soubroutine for each branch, but we do copy and paste for each branch instead. Finally we append one list to the other, the lowest value of `r_position` comes first.

23.8   Integrands for Multiple Interactions

This file contains the module `muli_dsigma`. Its only type `muli_dsigma_t` provides an integrand to `aq_class`. The actual integrand is the normalized differential cross section of a QCD $2 \to 2$ process $1/\sigma_0 \times d^3\sigma/(dp_T^2 dx_1 dx_2)$. We need a root function of this integrand in terms of p_T, so we have to integrate out x_1 and x_2 and have to approximate the root function of the leftover variable p_T. Integration of x_1 and x_2 is done by CUBA, the root function is approximated by `muli_aq`.

23.9 MC Integrations for QCD $2 \to 2$ processes

This file contains the module muli_mcint which is the Monte Carlo generator for QCD $2 \to 2$ interactions at given evolution parameter and given stratus. While muli_t takes care of generating the evolution parameter and the stratus, this module is about bookkeeping the strati and implementing a downstream importance sampling. The evolution parameter is a measure of transferred momentum and a "stratus" is a PDF category or, to be more precise, is whether the incoming partons are gluons or sea quarks or valence quarks.

The importance sampling then subdivides the phase space of variables $\{x_1, x_2, p_T\}$ into n^3 regions such that each region holds approximately n interactions. Thus,

we can generate a phase space point very quickly just by randomly picking a region, randomly picking a point within this region and comparing its exact cross section with the mean cross section for this actual evolution parameter and the actual stratus times the area of the picked phase space region.

The mean values must be generated in the module `muli_dsigma` before and are given to the procedure `sample_inclusive_generate_hit`. Finally the generated subregions should be written to a file via `write_to_marker` and then reused for each later `WHIZARD` run.

The type `sample_inclusive_t` holds the 16 strati, while the type `sample_int_kind_t` represents a single stratus, `sample_3d_t` is the whole $\{x_1, x_2, p_T\}$ phase space for each stratus, `sample_2d_t` is the $\{x_1, x_2\}$ plane with a slice of p_T and `sample_region_t` finally is a phase space region.

23.10 Proton remnants

This file contains the module `muli_remnant`. All bookkeeping of the proton remnants and twin quarks is done here. Furthermore, reweighting of the PDFs to derive remnant PDFs is done here.

23.11   The Multiple Interactions main module

This file contains the module `muli` which is the multiple parton interactions
interface module to `WHIZARD`. `muli` is supposed to run together with initial state
radiation. Both share a momentum evolution variable and compete for beam
momentum, so the generation of this scale variable must be fully transparent
to `WHIZARD`. That is why the corresponding procedures are here, while all other
work like phase space integration, flavor generation and treatment of the beam
remnant is put into `muli_dsigma`, `muli_mcint` and `muli_remnant`, respectively.

`qcd_2_2_t` is a container class for properties of QCD $2 \to 2$ interactions. It
holds a very condensed internal representation and offers a convenient set of
TBP to query all aspects without the burden of the generator internals.

`muli_t` then is an extension of `qcd_2_2_t` that adds generator internals like
random number generator, integrated cross-sections, the actual Monte Carlo
generator for flavor generation and beam remnants in `tao_rnd`, `dsigma`, `samples`
and `beam`, respectively.

This is one more hack. Before merging into the interleaved algorithm, `muli` has only cared for summed cross sections, but not in specific color flows. So two different diagrams with equal cross sections were summed up to diagram kind 1. Now `muli` also generates color flows, so we must devide diagram kind 1 into diagram color kind 0 and diagram color kind 1.

Chapter 24

User Plugin Support

Here we collect interface code that enables the user to inject his own code into the WHIZARD workflow. The code uses data types defined elsewhere, and is referenced in the `eval_trees` module.

These are the modules:

user_code_interface Generic support and specific additions.

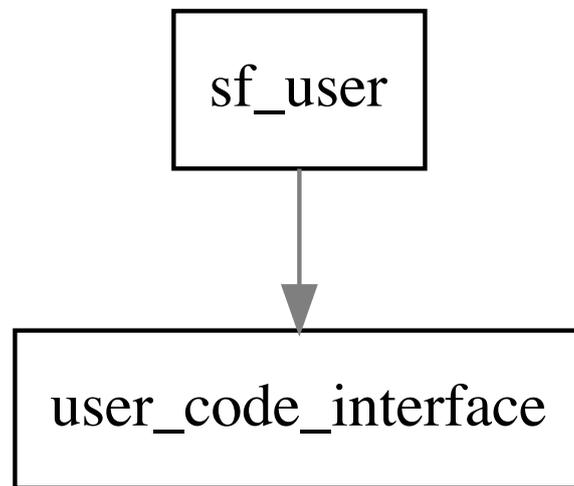
sf_user Handle user-defined structure functions.


Figure 24.1: Module dependencies in `src/user`.

24.1 User Code Interface

⟨user_code_interface.f90⟩≡
  ⟨*File header*⟩

  module user_code_interface

    use iso_c_binding !NODEP!
  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
    use diagnostics
    use c_particles
    use os_interface

  ⟨*Standard module head*⟩

  ⟨*User Code: public*⟩

  ⟨*User Code: variables*⟩

  ⟨*User Code: interfaces*⟩

  contains

  ⟨*User Code: procedures*⟩

  end module user_code_interface

24.1.1 User Code Management

This data structure globally holds the filehandle of the user-code library:

⟨*User Code: public*⟩≡
    public :: has_user_lib

⟨*User Code: variables*⟩≡
    type(dlaccess_t), save :: user_lib_handle
    logical, save :: has_user_lib = .false.
    type(string_t), save :: user

Compile, link and load user code files. Dlopen all user-provided libraries, included the one just compiled (if any).

By default, we are looking for a library `user.so/dylib`. If this is not present, try `user.f90` and compile it. This can be overridden.

In detail: First, compile all sources explicitly specified on the command line. Then collect all libraries specified on the command line, including `user.so` if it was generated. If there is still no code, check for an existing `user.f90` and compile this. Link everything into a `user.la` libtool library. When done, dlopen all libraries that we have so far.

⟨*User Code: public*⟩+≡
    public :: user_code_init

24.1.2 Interfaces for user-defined functions

The following functions represent user-defined real observables. There may be one or two particles as argument, the result is a real value.

⟨User Code: public⟩+≡
```
public :: user_obs_int_unary
public :: user_obs_int_binary
public :: user_obs_real_unary
public :: user_obs_real_binary
```

⟨User Code: interfaces⟩≡
```
abstract interface
   function user_obs_int_unary (prt1) result (ival) bind(C)
     use iso_c_binding !NODEP!
```

3481

```
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1
        integer(c_int) :: ival
      end function user_obs_int_unary
    end interface

    abstract interface
      function user_obs_int_binary (prt1, prt2) result (ival) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1, prt2
        integer(c_int) :: ival
      end function user_obs_int_binary
    end interface

    abstract interface
      function user_obs_real_unary (prt1) result (rval) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1
        real(c_double) :: rval
      end function user_obs_real_unary
    end interface

    abstract interface
      function user_obs_real_binary (prt1, prt2) result (rval) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), intent(in) :: prt1, prt2
        real(c_double) :: rval
      end function user_obs_real_binary
    end interface
```

The following function takes an array of C-compatible particles and return a single value. The particle array represents a subevent. For C interoperability, we have to use an assumed-size array, hence the array size has to be transferred explicitly.

The cut function returns an `int`, which we should interpret as a logical value (nonzero=true).

⟨*User Code: public*⟩+≡
```
    public :: user_cut_fun
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
      function user_cut_fun (prt, n_prt) result (iflag) bind(C)
        use iso_c_binding !NODEP!
        use c_particles !NODEP!
        type(c_prt_t), dimension(*), intent(in) :: prt
        integer(c_int), intent(in) :: n_prt
        integer(c_int) :: iflag
      end function user_cut_fun
    end interface
```

The event-shape function returns a real value.

⟨*User Code: public*⟩+≡
```
    public :: user_event_shape_fun
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
       function user_event_shape_fun (prt, n_prt) result (rval) bind(C)
         use iso_c_binding !NODEP!
         use c_particles !NODEP!
         type(c_prt_t), dimension(*), intent(in) :: prt
         integer(c_int), intent(in) :: n_prt
         real(c_double) :: rval
       end function user_event_shape_fun
    end interface
```

24.1.3   Interfaces for user-defined interactions

The following procedure interfaces pertain to user-defined interactions, e.g., spectra or structure functions.

This subroutine retrieves the basic information for setting up the interaction and event generation. All parameters are `intent(inout)`, so we can provide default values. `n_in` and `n_out` are the number of incoming and outgoing particles, respectively. `n_states` is the total number of distinct states that should be generated (counting all states of the incoming particles). `n_col` is the maximal number of color entries a particle can have. `n_dim` is the number of input parameters, i.e., integration dimensions, that the structure function call requires for computing kinematics and matrix elements. `n_var` is the number of variables (e.g., momentum fractions) that the structure function call has to transfer from the kinematics to the dynamics evaluation.

⟨*User Code: public*⟩+≡
```
    public :: user_int_info
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
       subroutine user_int_info (n_in, n_out, n_states, n_col, n_dim, n_var) &
            bind(C)
         use iso_c_binding !NODEP!
         integer(c_int), intent(inout) :: n_in, n_out, n_states, n_col
         integer(c_int), intent(inout) :: n_dim, n_var
       end subroutine user_int_info
    end interface
```

This subroutine retrieves the settings for the quantum number mask of a given particle index in the interaction. A nonzero value indicates that the corresponding quantum number is to be ignored. The lock index is the index of a particle that the current particle is related to. The relation applies if quantum numbers of one of the locked particles are summed over. (This is intended for helicity.)

⟨*User Code: public*⟩+≡
```
    public :: user_int_mask
```

⟨*User Code: interfaces*⟩+≡

```
abstract interface
  subroutine user_int_mask (i_prt, m_flv, m_hel, m_col, i_lock) bind(C)
    use iso_c_binding !NODEP!
    integer(c_int), intent(in) :: i_prt
    integer(c_int), intent(inout) :: m_flv, m_hel, m_col, i_lock
  end subroutine user_int_mask
end interface
```

This subroutine retrieves the quantum numbers for the particle index `i_prt` in state `i_state`. The `flv` value is a PDG code. The `hel` value is an integer helicity (twice the helicity for fermions). The `col` array is an array which has at most `n_col` entries (see above). All parameters are `intent(inout)` since default values exist. In particular, if a mask entry is set by the previous procedure, the corresponding quantum number is ignored anyway.

⟨*User Code: public*⟩+≡

```
public :: user_int_state
```

⟨*User Code: interfaces*⟩+≡

```
abstract interface
  subroutine user_int_state (i_state, i_prt, flv, hel, col) bind(C)
    use iso_c_binding !NODEP!
    integer(c_int), intent(in) :: i_state, i_prt
    integer(c_int), intent(inout) :: flv, hel
    integer(c_int), dimension(*), intent(inout) :: col
  end subroutine user_int_state
end interface
```

This subroutine takes an array of particle objects with array length `n_in` and an array of input parameters between 0 and 1 with array length `n_dim`. It returns an array of particle objects with array length `n_out`. In addition, it returns an array of internal variables (e.g., momentum fractions, Jacobian) with array length `n_var` that is used by the following subroutine for evaluating the dynamics, i.e., the matrix elements.

⟨*User Code: public*⟩+≡

```
public :: user_int_kinematics
```

⟨*User Code: interfaces*⟩+≡

```
abstract interface
  subroutine user_int_kinematics (prt_in, rval, prt_out, xval) bind(C)
    use iso_c_binding !NODEP!
    use c_particles !NODEP!
    type(c_prt_t), dimension(*), intent(in) :: prt_in
    real(c_double), dimension(*), intent(in) :: rval
    type(c_prt_t), dimension(*), intent(inout) :: prt_out
    real(c_double), dimension(*), intent(out) :: xval
  end subroutine user_int_kinematics
end interface
```

This subroutine takes the array of variables (e.g., momentum fractions) with length `n_var` which has been generated by the previous subroutine and a real variable, the energy scale of the event. It returns an array of matrix-element

values, one entry for each quantum state `n_states`. The ordering of matrix elements must correspond to the ordering of states.

⟨*User Code: public*⟩+≡
```
    public :: user_int_evaluate
```

⟨*User Code: interfaces*⟩+≡
```
    abstract interface
       subroutine user_int_evaluate (xval, scale, fval) bind(C)
         use iso_c_binding !NODEP!
         real(c_double), dimension(*), intent(in) :: xval
         real(c_double), intent(in) :: scale
         real(c_double), dimension(*), intent(out) :: fval
       end subroutine user_int_evaluate
    end interface
```

24.2   User Plugin for Structure Functions

This variant gives access to user-defined structure functions or spectra.

24.2.1   The module

⟨`sf_user.f90`⟩≡
  ⟨*File header*⟩

```
  module sf_user

    use, intrinsic :: iso_c_binding !NODEP!
```
  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
```
    use io_units
    use format_defs, only: FMT_17
    use diagnostics
    use c_particles
    use lorentz
    use subevents
    use user_code_interface
    use pdg_arrays
    use model_data
    use flavors
    use helicities
    use colors
    use quantum_numbers
    use state_matrices
    use polarizations
    use interactions
    use sf_aux
    use sf_base
```

  ⟨*Standard module head*⟩

  ⟨*SF user: public*⟩

⟨*SF user: types*⟩

```
contains
```

⟨*SF user: procedures*⟩

```
end module sf_user
```

24.2.2   The user structure function data block

The data block holds the procedure pointers that are used for retrieving static information, as well as the actual evaluation.

⟨*SF user: public*⟩≡
```
    public :: user_data_t
```

⟨*SF user: types*⟩≡
```
    type, extends(sf_data_t) :: user_data_t
      private
      type(string_t) :: name
      integer :: n_in
      integer :: n_out
      integer :: n_tot
      integer :: n_states
      integer :: n_col
      integer :: n_dim
      integer :: n_var
      integer, dimension(2) :: pdg_in
      class(model_data_t), pointer :: model => null ()
      procedure(user_int_info), nopass, pointer :: info => null ()
      procedure(user_int_mask), nopass, pointer :: mask => null ()
      procedure(user_int_state), nopass, pointer :: state => null ()
      procedure(user_int_kinematics), nopass, pointer :: kinematics => null ()
      procedure(user_int_evaluate), nopass, pointer :: evaluate => null ()
     contains
     ⟨SF user: user data: TBP⟩
    end type user_data_t
```

Assign procedure pointers from a dynamically loaded library, given the specified `name`.

We have to distinguish three cases: (1) Both beams are affected, and the user spectrum implements both beams. There is a single data object. (2) Both beams are affected, and the user spectrum applies to single beams. Fill two different objects. (3) A single beam is affected.

⟨*SF User: public*⟩≡
```
    public :: sf_user_data_init
```

⟨*SF User: procedures*⟩≡
```
    subroutine sf_user_data_init (data, name, flv, model)

```

24.2.3   The interaction

We fill the interaction by looking up the table of states using the interface functions.

For particles which have a known flavor (as indicated by the mask), we compute the mass squared, so we can use it for the invariant mass of the particle objects.

     !!! if (np == 1)  pdg_out(n+np) = PHOTON
```

```
    end subroutine user_data_get_pdg_out
```

24.2.4   The user structure function

For maximal flexibility, user structure functions separate kinematics from dynamics just as the PDF interface does. (JRR: Ok, I guess this now done for all structure functions, right?) We create c_prt_t particle objects from the incoming momenta (all other quantum numbers are irrelevant) and call the user-supplied kinematics function to compute the outgoing momenta, along with other variables that will be needed for matrix element evaluation. If known, we use the mass squared computed above. !!! JRR: WK please check (#529) I don't know actually whether this really fits into the setup done by WK.

⟨*SF user: types*⟩+≡
```
    !!! JRR: WK please check (#529)
    type, extends (sf_int_t) :: user_t
      type(user_data_t), pointer :: data => null ()
      real(default) :: x = 0
      real(default) :: q = 0
     contains
```
⟨*SF user: user: TBP*⟩
```
    end type user_t
```

Type string: display the name of the user structure function.

⟨*SF user: user: TBP*⟩+≡
```
    procedure :: type_string => user_type_string
```

⟨*SF user: procedures*⟩+≡
```
    function user_type_string (object) result (string)
      class(user_t), intent(in) :: object

   else
      write (u, "(1x,A)")  "User structure function data: [undefined]"
   end if
 end subroutine user_write
```

24.2.5   Kinematics

Set kinematics. If `map` is unset, the r and x values coincide, and the Jacobian $f(r)$ is trivial.

If `map` is set, we are asked to provide an efficient mapping. For the test case, we set $x = r^2$ and consequently $f(r) = 2r$.

⟨*SF user: user: TBP*⟩+≡
```
    procedure :: complete_kinematics => user_complete_kinematics
```

⟨*SF user: procedures*⟩+≡
```
    subroutine user_complete_kinematics (sf_int, x, xb, f, r, rb, map)
      !!! JRR: WK please check (#529)
      !!! This cannot be correct, as the CIRCE1 structure function has
      !!! twice the variables (2->4 instead of 1->2 splitting)
      class(user_t), intent(inout) :: sf_int
      real(default), dimension(:), intent(out) :: x
      real(default), dimension(:), intent(out) :: xb
      real(default), intent(out) :: f
      real(default), dimension(:), intent(in) :: r
      real(default), dimension(:), intent(in) :: rb
      logical, intent(in) :: map
      if (map) then
         call msg_fatal ("User structure function: map flag not supported")
      else
         x(1) = r(1)
         xb(1)= rb(1)
         f = 1
      end if
      call sf_int%split_momentum (x, xb)
      select case (sf_int%status)
      case (SF_DONE_KINEMATICS)
         sf_int%x = x(1)

        fc = fval
        call sf_int%set_matrix_element (fc)
      end associate
      sf_int%status = SF_EVALUATED
    end subroutine user_apply
```

Chapter 25

BLHA Interface

The code in this chapter implements support for the BLHA record that communicates data for NLO processes.

These are the modules:

blha_config

blha_interface

blha_driver

25.1   Module definition

These modules implement the communication with one loop matrix element providers according to the Binoth LesHouches Accord Interface. The actual matrix element(s) are loaded as a dynamic library.

This module defines the common OLP-interfaces defined through the Binoth Les-Houches accord.

Computes a virtual matrix element from an interface to an external one-loop
provider. The output of blha_olp_eval2 is an array of dimension(4), corre-
sponding to the ϵ^2-, ϵ^1- and ϵ^0-poles of the virtual matrix element at position
r(1:3) and the Born matrix element at position r(4). The matrix element is
rejected if its accuracy is larger than the maximal allowed accuracy. OpenLoops
includes a factor of 1 / n_hel in the amplitudes, which we have to undo if polar-
ized matrix elements are requested (GoSam does not support polarized matrix
elements).

In general, the BLHA consits of a virtual matrix element and n_{sub} subtraction terms. The subtractions terms can be pure Born matrix elements (to be used in collinear subtraction or in internal color-correlation), color-correlated matrix elements or spin-correlated matrix elements. The numbers should be ordered in such a way that $\mathcal{V}_{\mathrm{fin}}$ is first, followed by the pure Born, the color-correlated

3526

and the spin-correlated matrix elements. This repeats n_{flv} times. Let ν_i be the position of the *ith* virtual matrix element. The next $\mathcal{V}_{\mathrm{fin}}$ is at position $\nu_i = \nu_{i-1} + n_{\mathrm{sub}} + 1$. Obviously, $\nu_1 = 1$. This allows us to determine the virtual matrix element positions using the recursive function implemented below.

25.2 Configuration

Parameters to enumerate the different options in the order.

⟨*BLHA config: parameters*⟩≡

```
integer, public, parameter :: &
     BLHA_CT_QCD = 1, BLHA_CT_EW = 2, BLHA_CT_QED = 3, BLHA_CT_OTHER = 4
integer, public, parameter :: &
     BLHA_IRREG_CDR = 1, BLHA_IRREG_DRED = 2, BLHA_IRREG_THV = 3, &
     BLHA_IRREG_MREG = 4, BLHA_IRREG_OTHER = 5
integer, public, parameter :: &
     BLHA_MPS_ONSHELL = 1, BLHA_MPS_OTHER = 2
integer, public, parameter :: &
     BLHA_MODE_GOSAM = 1, BLHA_MODE_FEYNARTS = 2, BLHA_MODE_GENERIC = 3, &
     BLHA_MODE_OPENLOOPS = 4
integer, public, parameter :: &
     BLHA_VERSION_1 = 1, BLHA_VERSION_2 = 2
integer, public, parameter :: &
     BLHA_AMP_LOOP = 1, BLHA_AMP_COLOR_C = 2, BLHA_AMP_SPIN_C = 3, &
     BLHA_AMP_TREE = 4, BLHA_AMP_LOOPINDUCED = 5
integer, public, parameter :: &
     BLHA_EW_QED = 0, &
     BLHA_EW_GF = 1, BLHA_EW_MZ = 2, BLHA_EW_MSBAR = 3, &
     BLHA_EW_0 = 4, BLHA_EW_RUN = 5
integer, public, parameter :: &
     BLHA_WIDTH_COMPLEX = 1, BLHA_WIDTH_FIXED = 2, &
     BLHA_WIDTH_RUNNING = 3, BLHA_WIDTH_POLE = 4, &
     BLHA_WIDTH_DEFAULT = 5
```

Those are the default pdg codes for massive particles in BLHA programs

⟨*BLHA config: parameters*⟩+≡

```
integer, parameter, public :: OLP_N_MASSIVE_PARTICLES = 12
integer, dimension(OLP_N_MASSIVE_PARTICLES), public :: &
  OLP_MASSIVE_PARTICLES = [5, -5, 6, -6, 13, -13, 15, -15, 23, 24, -24, 25]
integer, parameter :: OLP_HEL_UNPOLARIZED = 0
```

The user might provide an extra command string for OpenLoops to apply special
libraries instead of the default ones, such as signal-only amplitudes for off-shell

top production. We check in this subroutine that the provided string is valid
and print out the possible options to ease the user's memory.

⟨*BLHA config: parameters*⟩+≡

```
integer, parameter :: N_KNOWN_SPECIAL_OL_METHODS = 3
```

⟨*BLHA config: procedures*⟩≡

```
subroutine check_extra_cmd (extra_cmd)
  type(string_t), intent(in) :: extra_cmd
  type(string_t), dimension(N_KNOWN_SPECIAL_OL_METHODS) :: known_methods
  integer :: i
  logical :: found
  known_methods(1) = 'top'
  known_methods(2) = 'not'
  known_methods(3) = 'stop'
  if (extra_cmd == var_str ("")) return
  found = .false.
  do i = 1, N_KNOWN_SPECIAL_OL_METHODS
     found = found .or. &
          (extra_cmd == var_str ('extra approx ') // known_methods(i))
  end do
  if (.not. found) &
    call msg_fatal ("The given extra OpenLoops method is not kown ", &
       [var_str ("Available commands are: "), &
        var_str ("extra approx top (only WbWb signal),"), &
        var_str ("extra approx stop (only WbWb singletop),"), &
        var_str ("extra approx not (no top in WbWb).")])
end subroutine check_extra_cmd
```

This type contains the pdg code of the particle to be written in the process spec-
ification string and an optional additional information about the polarization of
the particles. Note that the output can only be processed by OpenLoops.

⟨*BLHA config: types*⟩≡

Chapter 26

GoSam Interface

The code in this chapter makes amplitudes accessible to `WHIZARD` that are generated and computed by the GoSam package.

These are the modules:

loop_archive Provide some useful extra functionality.

prc_gosam The actual interface, following the `WHIZARD` conventions for matrix-element generator methods.

Figure 26.1: Module dependencies in `src/gosam`.

26.1 Gosam Interface

The BLHA-interface conventions require the quantity $S_{ij} = \langle M_{i,+}|T_i T_j|M_{i,-}\rangle$ to be produced, where i is the position of the splitting gluon. However, $\tilde{M} = \langle M_{i,-}|M_{i,+}\rangle$ is needed. This can be obtained using color conservation, $\sum_j T_j|M\rangle = 0$, so that

$$\sum_{j \neq i} S_{ij} = -\langle M_{i,+}|T_i^2|M_{i,-}\rangle = -C_A\langle M_{i,+}|M_{i,-}\rangle = -C_A\tilde{M}^*$$

According to BLHA conventions, the real part of S_{ij} is located at positions $2i + 2nj$ in the output array, where n denotes the number of external particles and the enumeration of particles starts at zero. The subsequent position, i.e. $2i + 2nj + 1$ is designated to the imaginary part of S_{ij}. Note that, since the first array position is 1, the implemented position association deviates from the above one in the addition of 1.

Computes a spin-correlated matrix element from an interface to an external one-loop provider. The output of `blha_olp_eval2` is an array of `dimension(16)`. The current interface does not give out an accuracy, so that `bad_point` is always `.false.`. OpenLoops includes a factor of 1 / `n_hel` in the amplitudes, which we have to undo if polarized matrix elements are requested.

Chapter 28

FKS Subtraction Scheme

The code in this chapter implements the FKS subtraction scheme for use with `WHIZARD`.

These are the modules:

fks_regions Given a process definition, identify singular regions in the associated phase space.

virtual Handle the virtual correction matrix element.

real_subtraction Handle the real-subtraction matrix element.

nlo_data Manage the subtraction objects.

This chapter deals with next-to-leading order contributions to cross sections. Basically, there are three major issues to be adressed: The creation of the $N+1$-particle flavor structure, the construction of the $N+1$-particle phase space and the actual calculation of the real- and virtual-subtracted matrix elements. The first is dealt with using the `auto_components` class, and it will be shown that the second and third issue are connected in FKS subtraction.

28.1 Brief outline of FKS subtraction

In the current state, this discussion is only concerned with lepton collisions. For hadron collisions, renormalization of parton distributions has to be taken into account. Further, for QCD corrections, initial-state radiation is necessarily present. However, most quantities have so far been only constructed for final-state emissions

The aim is to calculate the next-to-leading order cross section according to

$$d\sigma_{\mathrm{NLO}} = \mathcal{B} + \mathcal{V} + \mathcal{R}d\Phi_{\mathrm{rad}}.$$

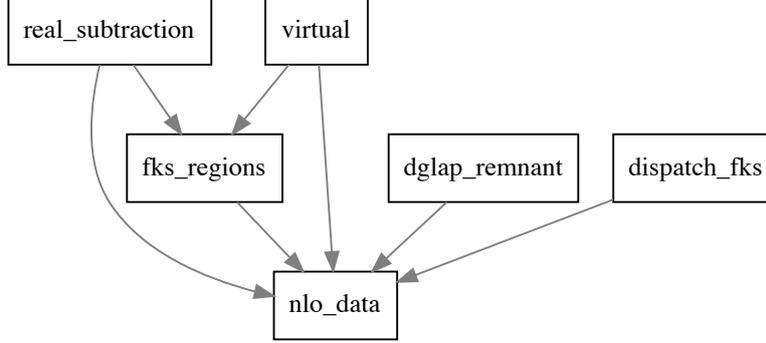
Analytically, the divergences, in terms of poles in the complex quantity $\varepsilon = 2 - d/2$, cancel. However, this is in general only valid in an arbitrary, comlex number of dimensions. This is, roughly, the content of the KLN-theorem. `WHIZARD`, as any other numerical program, is confined to four dimensions. We will assume


Figure 28.1: Module dependencies in `src/fks`.

that the KLN-theorem is valid and that there exist subtraction terms $\mathcal{C}$ such that

$$d\sigma_{\mathrm{NLO}} = \mathcal{B} + \underbrace{\mathcal{V} + \mathcal{C}}_{\text{finite}} + \underbrace{\mathcal{R} - \mathcal{C}}_{\text{finite}},$$

i.e. the subtraction terms correspond to the divergent limits of the real and virtual matrix element.

Because $\mathcal{C}$ subtracts the divergences of $\mathcal{R}$ as well as those of $\mathcal{V}$, it suffices to consider one of them, so we focus on $\mathcal{R}$. For this purpose, $\mathcal{R}$ is rewritten,

$$\mathcal{R} = \frac{1}{\xi^2}\frac{1}{1-y}\left(\xi^2(1-y)\mathcal{R}\right) = \frac{1}{\xi^2}\frac{1}{1-y}\tilde{\mathcal{R}},$$

with $\xi = \left(2k_{\mathrm{rad}}^0\right)/\sqrt{s}$ and $y = \cos\theta$, where k_{rad}^0 denotes the energy of the radiated parton and θ is the angle between emitter and radiated parton. $\tilde{\mathcal{R}}$ is finite, therefore the whole singularity structure is contained in the prefactor $\xi^{-2}(1-y)^{-1}$. Combined with the d-dimensional phase space element,

$$\frac{d^{d-1}k}{2k^0(2\pi)^{d-1}} = \frac{s^{1-\varepsilon}}{(4\pi)^{d-1}}\xi^{1-2\varepsilon}\left(1-y^2\right)^{-\varepsilon}d\xi dy d\Omega^{d-2},$$

this yields

$$d\Phi_{\mathrm{rad}}\mathcal{R} = dy(1-y)^{-1-\varepsilon}d\xi\xi^{-1-2\varepsilon}\tilde{R}.$$

This can further be rewritten in terms of plus-distributions,

$$\xi^{-1-2\varepsilon} = -\frac{1}{2\varepsilon}\delta(\xi) + \left(\frac{1}{\xi}\right)_+ - 2\varepsilon\left(\frac{\log\xi}{\xi}\right)_+ + \mathcal{O}(\varepsilon^2),$$

$$(1-y)^{-1-\varepsilon} = -\frac{2^{-\varepsilon}}{\varepsilon}\delta(1-y) + \left(\frac{1}{1-y}\right)_+ - \varepsilon\left(\frac{1}{1-y}\right)_+\log(1-y) + \mathcal{O}(\varepsilon^2),$$

3588

(imagine that all this is written inside of integrals, which are spared for ease of notation) such that

$$
d\Phi_{\mathrm{rad}}\mathcal{R} = -\frac{1}{2\varepsilon}dy(1-y)^{-1-\varepsilon}\tilde{R}(0,y) - d\xi\left[\frac{2^{-\varepsilon}}{\varepsilon}\left(\frac{1}{\xi}\right)_+ - 2\left(\frac{\log\xi}{\xi}\right)_+\right]\tilde{R}(\xi,1)
$$
$$
+ dy d\xi\left(\frac{1}{\xi}\right)_+\left(\frac{1}{1-y}\right)_+\tilde{R}(\xi,y) + \mathcal{O}(\varepsilon).
$$

The summand in the second line is of order $\mathcal{O}(1)$ and is the only one to repro-duce $\mathcal{R}(\xi,y)$. It thus constitutes the sum of the real matrix element and the corresponding counterterms. The first summand consequently consists of the subtraction terms to the virtual matrix elements. Above formula thus allows to calculate all quantities to render the matrix elements finite.

4	[-11,11,2,-2,2,-2]	5	(5,6)

Table 28.1: List of singular regions. The particles are represented by their PDG codes. The third column contains the emitter for the specific singular region. For the process involving an additional gluon, the gluon can either be emitted from one of the quarks or from the first gluon. Each emitter yields the same list of fundamental tuples, five in total. The last singular region corresponds to the process where the gluon splits up into two quarks. Here, there is only one fundamental tuple, corresponding to a singular configuration of the momenta of the additional quarks.

28.2   Identifying singular regions

In the FKS subtraction scheme, the phase space is decomposed into disjoint singular regions, such that

$$\sum_i \mathcal{S}_i + \sum_{ij} \mathcal{S}_{ij} = 1. \tag{28.1}$$

The quantities $\mathcal{S}_i$ and $\mathcal{S}_{ij}$ are functions of phase space corresponding to a pair of particles indices which can make up a divergent phase space region. We call such an index pair a fundamental tuple. For example, the process $e^+ e^- \to u \bar{u} g$ has two singular regions, $(3, 5)$ and $(4, 5)$, indicating that the gluon can be soft or collinear with respect to either the quark or the anti-quark. Therefore, the functions S_{ij} have to be chosen in such a way that their contribution makes up most of (28.1) in phase-space configurations where (final-state) particle j is collinear to particle i or/and particle j is soft. The functions S_i is the corresponding quantity for initial-state divergences.

As a singular region we understand the collection of real flavor structures associated with an emitter and a list of all possible fundamental tuples. As an example, consider the process $e^+ e^- \to u \bar{u} g$. At next-to-leading order, processes with an additionally radiated particle have to be considered. In this case, these are $e^+ e^- \to u \bar{u}, g g$, and $e^+ e^- \to u \bar{u} u \bar{u}$ (or the same process with any other quark). Table 28.1 sums up all possible singular regions for this problem.

Thus, during the preparation of a NLO-calculation, the possible singular regions have to be identified. `fks_regions.f90` deals with this issue.

Determines the splitting type for ISR. There are four different types of splittings relevant here: $g \to gg$ tagged V_TO_VV, $g \to qq$ tagged V_TO_FF, $q \to qg$ tagged F_TO_FV and $q \to gq$ tagged F_TO_VF. The latter two need to be considered separately for ISR as they differ with respect to which particle enters the hard process. A splitting F_TO_FV may lead to soft divergences while F_TO_VF does not.

We also want to emphasize that the splitting type naming convention for ISR names the splittings considering backwards evolution. So in the splitting V_TO_FF, it is the *gluon* that enteres the hard process!

Special treatment here is required if emitter 0 is assigned. This is the case only when a gluon was radiated from any of the IS particles. In this case, both splittings are soft divergent so we can equivalently choose 1 or 2 as the emitter here even if both have different flavors.

Returns `true` if the two particles at position `i` and `j` in the flavor array can originate from the same splitting. For this purpose, the function first checks whether the splitting is allowed at all. If this is the case, the emitter is removed from the flavor array. If the resulting array is equivalent to the Born flavor structure `flv_born`, the pair is accepted as a valid splitting.

We first check whether the splitting is possible. The array `flv_orig` contains all particles which share a vertex with the particles at position `i` and `j`. If any of these particles belongs to the initial state, a PDG-ID flip is necessary to correctly recognize the vertex. If its size is equal to zero, no splitting is possible and the subroutine is exited. Otherwise, we loop over all possible underlying Born flavor structures and check if any of them equals the actual underlying Born flavor structure. For a quark emitting a gluon, `flv_orig` contains the PDG code of the anti-quark. To be on the safe side, a second array is created, which contains both the positively and negatively signed PDG codes. Then, the origial tuple (i, j) is removed from the real flavor structure and the particles in `flv_orig2` are inserted. If the resulting Born configuration is equal to the underlying Born configuration, up to a permutation of final-state particles, the tuple (i, j) is accepted as valid.

A singular region is a partition of phase space which is associated with an individual emitter and, if relevant, resonance. It is associated with an α_r- and resonance-index, with a real flavor structure and its underlying Born flavor structure. To compute the FKS weights, it is relevant to know all the other particle indices which can result in a divergent phase space configuration, which are collected in the `ftuples`-array.

Some singular regions might behave physically identical. E.g. a real flavor structure associated with three-jet production is $[11, -11, 0, 2 - 2, 0]$. Here, there are two possible `ftuples` which contribute to the same $u \to ug$ splitting, namely $(3, 4)$ and $(4, 6)$. The resulting singular regions will be identical. To avoid this, one singular region is associated with the multiplicity factor `mult`. When computing the subtraction terms for each singular region, the result is then simply multiplied by this factor.

The `double_fsr`-flag indicates whether the singular region should also be supplied by a symmetry factor, explained below.

In case of a $g \to gg$ splitting, the factor

$$\frac{2E_{\mathrm{em}}}{E_{\mathrm{em}} + E_{\mathrm{rad}}}$$

is multiplied to the real matrix element. This way, the symmetry of the splitting is used and only one singular region has to be taken into account. However, the factor ensures that there is only a soft singularity if the radiated parton becomes soft.

So far, we have only created singular regions for a non-resonant case. When
resonance mappings are required, we have more singular regions, since they
must now be identified by their emitter-resonance pair index, where the emitter
must be compatible with the resonance.

This subroutine splits up the ftuple-list of the singular regions into interference-
free lists, i.e. lists which only contain the same emitter. This is relevant for
factorized NLO calculations. In the current implementation, it is hand-tailored
for the threshold computation, but should be generalized further in the future.

This subroutine starts with a specification of N- and $N + 1$-particle configurations, **flst_born** and **flst_real**, saved in **reg_data**. From these, it creates a list of fundamental tuples, a list of emitters and a list containing the $N + 1$-particle configuration, rearranged in such a way that the emitter-radiation pair is last (**flst_alr**). For the $e^+ e^- \rightarrow u \bar{u} g$- example, the generated objects are shown in table 28.2. Note that at this point, **flst_alr** is arranged in such a way that the emitter can only be equal to $n_{legs} - 1$ for final-state radiation or 0, 1, or 2 for initial-state radiation. Further, it occurs that regions can be equivalent. For example in table 28.2 the regions corresponding to **alr = 1** and **alr = 3** as well as **alr = 2** and **alr = 4** describe the same physics and are therefore equivalent.

Computes the d_{ij}-quantities defined als follows:

$$d_{0i} = \left[E_i^2 \left(1 - y_i\right)\right]^{p_1}$$
$$, d_{1i} = \left[2E_i^2 \left(1 - y_i\right)\right]^{p_1}$$
$$, d_{2i} = \left[2E_i^2 \left(1 + y_i\right)\right]^{p_1}$$

,

for initial state regions and

$$d_{ij} = \left[2(k_i \cdot k_j)\frac{E_i E_j}{(E_i + E_j)^2}\right]^{p_2}$$

for final state regions. The exponents p_1 and p_2 can be used for tuning the efficiency of the mapping and are set to 1 per default.

end function fks_mapping_default_svalue
```

In the soft limit, our treatment of the divergences requires a modification of
the mapping functions. Recall that there, the ratios of the d-functions must
approach either 1 or 0. This means

$$\frac{d_{lm}}{d_{0m}} = \frac{(2k_l \cdot k_m)\left[E_l E_m/(E_l + E_m)^2\right]}{E_m^2(1 - y^2)} \stackrel{k_m = E_m \hat{k}}{=} \frac{E_l E_m^2}{(E_l + E_m)^2} \frac{2k_l \cdot \hat{k}}{E_m^2(1 - y^2)} \stackrel{E_m \to 0}{=} \frac{2}{k_l \cdot \hat{k}}(1 - y^2)E_l,$$

where we have written the gluon momentum in terms of the soft momentum $\hat{k}$.
In the same limit

$$\frac{d_{lm}}{d_{nm}} = \frac{k_l \cdot \hat{k}}{k_n \cdot \hat{k}} \frac{E_n}{E_l}.$$

From these equations we can deduce the soft limit of d:

$$d_0^{\text{soft}} = 1 - y^2,$$
$$d_1^{\text{soft}} = 2(1 - y),$$
$$d_2^{\text{soft}} = 2(1 + y),$$
$$d_i^{\text{soft}} = \frac{2k_i \cdot \hat{k}}{E_i}.$$

The $d_{ij,k}$-functions for the resonance mapping are basically the same as in the default case, but the kinematical values here must be evaluated in the resonance frame of reference. The energy of parton i in a given resonance frame with momentum p_{res} is

$$E_i = \frac{p_i^0 \cdot p_{res}}{m_{res}}.$$

However, since the expressions only depend on ratios of four-momenta, we leave out the denominator because it will cancel out anyway.

The virtual subtraction terms contain Casimir operators and derived constants, listed below:

$$C(q) = C(\bar{q}) = C_F, \tag{28.2}$$

$$C(g) = C_A, \tag{28.3}$$

$$\gamma(q) = \gamma(\bar{q}) = \frac{3}{2} C_F, \tag{28.4}$$

$$\gamma(g) = \frac{11}{6} C_A - \frac{2}{3} T_F N_f, \tag{28.5}$$

$$\gamma'(q) = \gamma'(\bar{q}) = \left(\frac{13}{2} - \frac{2\pi^2}{3} \right) C_F, \tag{28.6}$$

$$\gamma'(g) = \left(\frac{67}{9} - \frac{2\pi^2}{3} \right) C_A - \frac{23}{9} T_F N_f. \tag{28.7}$$

For uncolored particles, `virtual_init_constants` sets C, γ and γ' to zero.

The virtual-subtracted matrix element is given by the equation

$$\mathcal{V} = \frac{\alpha_s}{2\pi} \left(\mathcal{Q}\mathcal{B} + \sum \mathcal{I}_{ij}\mathcal{B}_{ij} + \mathcal{V}_{fin} \right), \tag{28.8}$$

The expressions for $\mathcal{Q}$ can be found in equations 28.9 and 28.11. The expressions for $\mathcal{I}_{ij}$ can be found in equations (28.13), (28.14), (28.29), depending on whether the particles involved in the radiation process are massive or massless.

```

The collinear limit of $\tilde{\mathcal{R}}$ can be integrated over the radiation degrees of freedom, giving the collinear contribution to the virtual component. Its general structure is $\mathcal{Q} \cdot \mathcal{B}$. The initial-state contribution to $\mathcal{Q}$ is simply given by

$$\mathcal{Q} = -\log \frac{\mu_F^2}{Q^2} \left(\gamma(\mathcal{I}_1) + 2C(\mathcal{I}_1)\log(\xi_{\text{cut}}) + \gamma(\mathcal{I}_2) + 2C(\mathcal{I}_2)\log(\xi_{\text{cut}}) \right), \quad (28.9)$$

where Q^2 is the Ellis-Sexton scale and γ is as in eqns. 28.4 and 28.5. virtual_evaluate_initial_state computes this quantity. The loop over the initial-state particles is only executed if we are dealing with a scattering process, because for decays there are no virtual initial-initial interactions.

⟨*virtual: virtual: TBP*⟩+≡
```
    procedure :: evaluate_initial_state => virtual_evaluate_initial_state
```

⟨*virtual: procedures*⟩+≡
```
    subroutine virtual_evaluate_initial_state (virt, i_flv, QB)
      class(virtual_t), intent(inout) :: virt
      integer, intent(in) :: i_flv
      real(default), intent(inout), dimension(:) :: QB
      integer :: i
      if (virt%n_in == 2) then
         do i = 1, virt%n_in
            QB(i_flv) = QB(i_flv) - (virt%gamma_0 (i, i_flv) + two * virt%c_flv(i, i_flv) &
                * log (virt%settings%fks_template%xi_cut)) &
```

```
                  * log(virt%fac_scale**2 / virt%es_scale2) * virt%sqme_born (i_flv)
            end do
        end if
    end subroutine virtual_evaluate_initial_state
```

Same as above, but for final-state particles. The collinear limit for final-state particles follows from the integral

$$I_{+,\alpha_r} = \int d\Phi_{n+1} \frac{\xi_+^{-1-2\epsilon}}{\xi^{-1-2\epsilon}} \mathcal{R}_{\alpha_r}.$$

We can distinguish three situations:

1. α_r contains a massive emitter. In this case, no collinear subtraction terms is required and the integral above irrelevant.

2. α_r contains a massless emitter, but resonances are not taken into account in the subtraction. Here, $\xi_{max} = \frac{2E_{em}}{\sqrt{s}}$ is the upper bound on ξ.

3. α_r contains a massless emitter and resonance-aware subtraction is used. Here, $\xi_{max} = \frac{2E_{em}}{\sqrt{k_{res}^2}}$.

Before version 2.4, only situations 1 and 2 were covered. The difference between situation 2 and 3 comes from the expansion of the plus-distribution in the integral above,

$$\xi_+^{-1-2\epsilon} = \xi^{-1-2\epsilon} + \frac{1}{2\epsilon}\delta(\xi) = \xi_{max}^{-1-2\epsilon}\left[(1-z)^{-1-2\epsilon} + \frac{\xi_{max}^{2\epsilon}}{2\epsilon}\delta(1-z)\right].$$

The expression from the standard FKS literature is given by $\mathcal{Q}$ is given by

$$\mathcal{Q} = \sum_{k=n_{in}}^{n_L^{(B)}} \left[\gamma'(\mathcal{I}_k) - \log\frac{s\delta_o}{2Q^2}\left(\gamma(\mathcal{I}_k) - 2C(\mathcal{I}_k)\log\frac{2E_k}{\xi_{\text{cut}}\sqrt{s}}\right) \right.$$
$$\left. + 2C(\mathcal{I}_k)\left(\log^2\frac{2E_k}{\sqrt{s}} - \log^2\xi_{\text{cut}}\right) - 2\gamma(\mathcal{I}_k)\log\frac{2E_k}{\sqrt{s}}\right]. \tag{28.10}$$

$n_L^{(B)}$ is the number of legs at Born level. Here, ξ_{max} is implicitly present in the ratios in the logarithms. Using the resonance-aware ξ_{max} yields

$$\mathcal{Q} = \sum_{k=n_{in}}^{n_L^{(B)}} \left[\gamma'(\mathcal{I}_k) + 2\left(\log\frac{\sqrt{s}}{2E_{em}} + \log\xi_{max}\right)\left(\log\frac{\sqrt{s}}{2E_{em}} + \log\xi_{max} + \log\frac{Q^2}{s}\right)C(\mathcal{I}_k)\right.$$
$$\left. + 2\log\xi_{max}\left(\log\xi_{max} - \log\frac{Q^2}{k_{res}^2}\right)C(\mathcal{I}_k) + \left(\log\frac{Q^2}{k_{res}^2} - 2\log\xi_{max}\right)\gamma(\mathcal{I}_k)\right]. \tag{28.11}$$

Equation 28.11 leads to 28.10 with the substitutions $\xi_{max} \to \frac{2E_{em}}{\sqrt{s}}$ and $k_{res}^2 \to s$. `virtual_compute_collinear_contribution` only implements the second one.

The following code implements the $\mathcal{I}_{ij}$-function. The complete formulas can be found in arXiv:0908.4272 (A.1-A.17) and are also discussed in arXiv:1002.2581 in Appendix A. The implementation may differ in the detail from the formulas presented in the above paper. The parameter ξ_{cut} is unphysically and cancels with appropriate factors in the real subtraction. We keep the additional parameter for debug usage. The implemented formulas are then defined as follows:

massless-massless case $p^2 = 0, k^2 = 0$,

$$
\begin{aligned}
\mathcal{I}_{ij} = {} & \frac{1}{2} \log^2 \frac{\xi_{\text{cut}}^2 s}{Q^2} + \log \frac{\xi_{\text{cut}}^2 s}{Q^2} \log \frac{k_i k_j}{2 E_i E_j} - \mathrm{Li}_2 \left(\frac{\mathrm{k_i k_j}}{2 \mathrm{E_i E_j}} \right) \\
& + \frac{1}{2} \log^2 \frac{k_i k_j}{2 E_i E_j} - \log \left(1 - \frac{k_i k_j}{2 E_i E_j} \right) \log \frac{k_i k_j}{2 E_i E_j}.
\end{aligned}
\tag{28.13}
$$

massive-massive case $p^2 \neq 0, k^2 \neq 0$,

$$
\mathcal{I}_{ij} = \frac{1}{2} I_0(k_i, k_j) \log \frac{\xi_{\text{cut}}^2 s}{Q^2} - \frac{1}{2} I_\epsilon(k_i, k_j)
\tag{28.14}
$$

with

$$
I_0(k_i, k_j) = \frac{1}{\beta} \log \frac{1 + \beta}{1 - \beta}, \qquad \beta = \sqrt{1 - \frac{k_i^2 k_j^2}{(k_i \cdot k_j)^2}}
\tag{28.15}
$$

and a rather involved expression for I_ϵ:

$$
I_\epsilon(k_i, k_j) = (K(z_j) - K(z_i)) \frac{1 - \vec{\beta}_i \cdot \vec{\beta}_j}{\sqrt{a(1 - b)}},
\tag{28.16}
$$

$$
\vec{\beta}_i = \frac{\vec{k}_i}{k_i^0},
\tag{28.17}
$$

$$
a = \beta_i^2 + \beta_j^2 - 2 \vec{\beta}_i \cdot \vec{\beta}_j,
\tag{28.18}
$$

$$
x_i = \frac{\beta_i^2 - \vec{\beta}_i \cdot \vec{\beta}_j}{a},
\tag{28.19}
$$

$$
x_j = \frac{\beta_j^2 - \vec{\beta}_i \cdot \vec{\beta}_j}{a} = 1 - x_j,
\tag{28.20}
$$

$$
b = \frac{\beta_i^2 \beta_j^2 - (\vec{\beta}_i \cdot \vec{\beta}_j)^2}{a},
\tag{28.21}
$$

$$
c = \sqrt{\frac{b}{4a}},
\tag{28.22}
$$

$$
z_+ = \frac{1 + \sqrt{1 - b}}{\sqrt{b}},
\tag{28.23}
$$

$$
z_- = \frac{1 - \sqrt{1 - b}}{\sqrt{b}},
\tag{28.24}
$$

$$
z_i = \frac{\sqrt{x_i^2 + 4c^2} - x_i}{2c},
\tag{28.25}
$$

$$
z_j = \frac{\sqrt{x_j^2 + 4c^2} + x_j}{2c},
\tag{28.26}
$$

$$
K(z) = -\frac{1}{2} \log^2 \frac{(z - z_-)(z_+ - z)}{(z_+ + z)(z_- + z)} - 2 Li_2 \left(\frac{2 z_-(z_+ - z)}{(z_+ - z_-)(z_- + z)} \right)
\tag{28.27}
$$

$$
- 2 Li_2 \left(-\frac{2 z_+(z_- + z)}{(z_+ - z_-)(z_+ - z)} \right)
\tag{28.28}
$$

massless-massive case $p^2 = 0, k^2 \neq 0$,

$$\mathcal{I}_{ij} = \frac{1}{2}\left[\frac{1}{2}\log^2\frac{\xi_{\text{cut}}^2 s}{Q^2} - \frac{\pi^2}{6}\right] + \frac{1}{2}I_0(k_i, k_j)\log\frac{\xi_{\text{cut}}^2 s}{Q^2} - \frac{1}{2}I_\epsilon(k_i, k_j) \quad (28.29)$$

with

$$I_0(p, k) = \log\frac{(\hat{p}\cdot\hat{k})^2}{\hat{k}^2}, \qquad\qquad\qquad (28.30)$$

$$I_\varepsilon(p, k) = -2\left[\frac{1}{4}\log^2\frac{1-\beta}{1+\beta} + \log\frac{\hat{p}\cdot\hat{k}}{1+\beta}\log\frac{\hat{p}\cdot\hat{k}}{1-\beta} + \text{Li}_2\left(1 - \frac{\hat{p}\cdot\hat{k}}{1+\beta}\right) + \text{Li}_2\left(1 - \frac{\hat{p}\cdot\hat{k}}{1-\beta}\right)\right],$$
$$(28.31)$$

using

$$\hat{p} = \frac{p}{p^0}, \quad \hat{k} = \frac{k}{k^0}, \quad \beta = \frac{|\vec{k}|}{k_0}, \qquad (28.32)$$

$$\text{Li}_2(1 - \text{x}) + \text{Li}_2(1 - \text{x}^{-1}) = -\frac{1}{2}\log^2\text{x}. \qquad (28.33)$$

In the soft limit, the real matrix element behaves as

$$
\mathcal{R}_{\text{soft}} = 4\pi\alpha_s \left[\sum_{i \neq j} \mathcal{B}_{ij} \frac{k_i \cdot k_j}{(k_i \cdot k)(k_j \cdot k)} - \mathcal{B} \sum_i \frac{k_i^2}{(k_i \cdot k)^2} C_i \right] ,
$$

where k denotes the momentum of the emitted parton. The quantity $\mathcal{B}_{ij}$ is called the color-correlated Born matrix element defined as

$$
\mathcal{B}_{ij} = \frac{1}{2s} \sum_{\substack{colors \\ spins}} \mathcal{M}_{\{c_k\}} \left(\mathcal{M}_{\{c_k\}}^\dagger \right)_{\substack{c_i \to c_i' \\ c_j \to c_j'}} T_{c_i,c_i'}^a T_{c_j,c_j'}^a .

The treatment of the momentum k follows the discussion about the soft limit of the partition functions (ref????). The parton momentum is pulled out, $k = E\hat{k}$. In fact, we will substitute $\hat{k}$ for k throughout the code, because the energy will factor out of the equation when the soft $\mathcal{S}$-function is multiplied. The soft momentum is a unit vector, because $k^2 = \left(k^0\right)^2 - \left(k^0\right)^2 \hat{\vec{k}}^2 = 0$.

The soft momentum is constructed by first creating a unit vector parallel to the emitter's Born momentum. This unit vector is then rotated about the corresponding angles y and ϕ.

```

The soft vector for the real mismatch is basically the same as for usual FSR, except for the scaling with the total gluon energy. Moreover, the resulting vector is rotated into the frame where the 3-axis points along the direction of the emitter. This is necessary because in the collinear limit, the approximation

$$k_i = \frac{k_i^0}{\bar{k}_j^0}\bar{k}_j = \frac{\xi\sqrt{s}}{2\bar{k}_j^0}\bar{k}_j$$

is used. The collinear limit is not included in the soft mismatch yet, but we keep the rotation for future usage here already (the performance loss is negligible).

```

Computation of the soft limit of R_α. Note that what we are actually integrating (in the case of final-state radiation) is the quantity $f(0, y)/\xi$, where

$$f(\xi, y) = \frac{J(\xi, y, \phi)}{\xi} \xi^2 R_\alpha.$$

J/ξ is computed by the phase space generator. The additional factor of ξ^{-1} is supplied in the $\texttt{evaluate\_region\_fsr}$-routine. Thus, we are left with a factor of ξ^2. A look on the expression for the soft limit of R_α below reveals that we are factoring out the gluon energy E_i in the denominator. Therefore, we have a factor $\xi^2/E_i^2 = q^2/4$.

Note that the same routine is used also for the computation of the soft mismatch. There, the gluon energy is not factored out from the soft vector, so that we are left with the ξ^2-factor, which will eventually be cancelled out again. So, we just multiply with 1. Both cases are distinguished by the flag $\texttt{xi2\_expanded}$.

We have to multiply this with $\xi^2(1-y)$. Further, when applying the soft $\mathcal{S}$-function, the energy of the radiated particle is factored out. Thus we have $\xi^2/E_{em}^2(1-y) = 4/q_0^2(1-y)$. Computes the quantity $\mathcal{K}_{ij} = \frac{k_i \cdot k_j}{(k_i \cdot k)(k_j \cdot k)}$.

  coll_sub%CF = CF
  coll_sub%TR = TR
end subroutine coll_subtraction_set_parameters
```

This subroutine computes the collinear limit of $g^\alpha(\xi, y)$ introduced in eq. 28.34. Care is given to also enable the usage for the soft-collinear limit. This, we write all formulas in terms of soft-finite quantities.

We have to compute

$$\frac{J(\Phi_n, \xi, y, \phi)}{\xi} \left[(1-y)\xi^2 \mathcal{R}^\alpha(\Phi_{n+1}) \right]|_{y=1}.$$

The Jacobian J is proportional to ξ, due to the $d^3 k_{n+1}/k_{n+1}^0$ factor in the integration measure. It cancels the factor of ξ in the denominator. The remaining part of the Jacobian is multiplied in `evaluate_region_fsr` and is not relevant here. Inserting the splitting functions exemplarily for $q \to qg$ yields

$$g^\alpha = \frac{8\pi\alpha_s}{k_{\text{em}}^2} C_F(1-y)\xi^2 \frac{1 + (1-z)^2}{z} \mathcal{B},$$

where we have chosen $z = E_{\text{rad}}/\bar{E}_{\text{em}}$ and $\bar{E}_{\text{em}}$ denotes the emitter energy in the Born frame. The collinear final state imposes $\bar{k}_n = k_n + k_{n+1}$ for the connection between Φ_n- and Φ_{n+1}-phasepace and we get $1 - z = E_{\text{em}}/\bar{E}_{\text{em}}$. The denominator can be rewritten by the constraint $\bar{k}_n^2 = (k_n + k_{n+1})^2 = 0$ to

$$k_{\text{em}}^2 = 2E_{\text{rad}}E_{\text{em}}(1-y)$$

which cancels the $(1-y)$ factor in the numerator, thus showing that the whole expression is indeed collinear-finite. We can further transform

$$E_{\text{rad}}E_{\text{em}} = z(1-z)\bar{E}_{\text{em}}^2$$

so that in total we have

$$g^\alpha = \frac{4\pi\alpha_s}{1-z} \frac{1}{\bar{k}_{\text{em}}^2} C_F \left(\frac{\xi}{z}\right)^2 (1 + (1-z)^2)\mathcal{B}$$

Follow up calculations give us

$$g^{\alpha,g\to gg} = \frac{4\pi\alpha_s}{1-z}\frac{1}{\bar{k}_{\mathrm{em}}^2}C_{\mathrm{A}}\frac{\xi}{z}\left\{2\left(\frac{z}{1-z}\xi + \frac{1-z}{\frac{z}{\xi}}\right)\mathcal{B} + 4\xi z(1-z)\hat{k}_\perp^\mu\hat{k}_\perp^\nu\mathcal{B}_{\mu\nu}\right\},$$

$$g^{\alpha,g\to qq} = \frac{4\pi\alpha_s}{1-z}\frac{1}{\bar{k}_{\mathrm{em}}^2}T_{\mathrm{R}}\frac{\xi}{z}\left\{\xi\mathcal{B} - 4\xi z(1-z)\hat{k}_\perp^\mu\hat{k}_\perp^\nu\mathcal{B}_{\mu\nu}\right\}.$$

The ratio z/ξ is finite in the soft limit

$$\frac{z}{\xi} = \frac{q^0}{2\bar{E}_{\mathrm{em}}}$$

so that ξ does not appear explicitly in the computation.

The argumentation above is valid for $q \to qg$–splittings, but the general factorization is valid for general splittings, also for those involving spin correlations and QED splittings. Note that care has to be given to the definition of z. Further, we have factored out a factor of z to include in the ratio z/ξ, which has to be taken into account in the implementation of the splitting functions.

⟨*real subtraction: coll sub: TBP*⟩+≡
```
    procedure :: compute_fsr => coll_subtraction_compute_fsr
```

⟨*real subtraction: procedures*⟩+≡
```
    function coll_subtraction_compute_fsr &
       (coll_sub, emitter, flst, p_res, p_born, sqme_born, mom_times_sqme_spin_c, &

      flv_rad = flst(nlegs); flv_em = flst(emitter)
      q0 = p_res**1
      p0 = p_res * p_born(emitter) / q0
      !!! Here, z corresponds to 1-z in the formulas of arXiv:1002.2581;
      !!! the integrand is symmetric under this variable change
      z_o_xi = q0 / (two * p0)
      z = xi * z_o_xi; onemz = one - z
      if (is_gluon (flv_em) .and. is_gluon (flv_rad)) then
         sqme = coll_sub%CA * ( two * ( z / onemz * xi + onemz / z_o_xi ) * sqme_born &
              + four * xi * z * onemz * mom_times_sqme_spin_c )
      else if (is_fermion (flv_em) .and. is_fermion (flv_rad)) then
         sqme = coll_sub%TR * xi * (sqme_born - four * z * onemz * mom_times_sqme_spin_c)
      else if (is_fermion (flv_em) .and. is_massless_vector (flv_rad)) then
         sqme = sqme_born * coll_sub%CF * (one + onemz**2) / z_o_xi
      else
         sqme = zero
```

```
      end if
      sqme = sqme / (p0**2 * onemz * z_o_xi)
      sqme = sqme * four * pi * alpha_coupling
      if (double_fsr) sqme = sqme * onemz * two
   end function coll_subtraction_compute_fsr
```

Like in the context of `coll_subtraction_compute_fsr` we compute the quantity

$$\frac{J(\Phi_n, \xi, y, \phi)}{\xi} \left[(1-y)\xi^2 \mathcal{R}^\alpha(\Phi_{n+1}) \right] |_{y=1},$$

and, additionally the anti-collinear case with $y = +1$, which, however, is completely analogous. Again, the Jacobian is proportional to ξ, so we drop the J/ξ factor. Note that it is important to take into account this missing factor of ξ in the computation of the Jacobian during phase-space generation both for fixed-beam and structure ISR. We consider only a $q \to qg$ splitting arguing that other splittings are identical in terms of the factors which cancel. It is given by

$$g^\alpha = \frac{8\pi\alpha_s}{-k_{\rm em}^2} C_F (1-y)\xi^2 \frac{1+z^2}{1-z} \mathcal{B}.$$

Note the negative sign of $k_{\rm em}^2$ to compensate the negative virtuality of the initial-state emitter. For ISR, z is defined with respect to the emitter energy entering the hard interaction, i.e.

$$z = \frac{E_{\rm beam} - E_{\rm rad}}{E_{\rm beam}} = 1 - \frac{E_{\rm rad}}{E_{\rm beam}}.$$

Because $E_{\rm rad} = E_{\rm beam} \cdot \xi$, it is $z = 1 - \xi$. The factor $k_{\rm em}^2$ in the denonimator is rewritten as

$$k_{\rm em}^2 = (p_{\rm beam} - p_{\rm rad})^2 = -2p_{\rm beam} \cdot p_{\rm rad} = -2E_{\rm beam}E_{\rm rad}(1-y) = -2E_{\rm beam}^2(1-z)(1-y).$$

This leads to the cancellation of the $(1-y)$ factors and one of the two factors of ξ in the numerator. Further rewriting to

$$E_{\rm beam}E_{\rm rad} = E_{\rm beam}^2(1-z)$$

cancels another factor of ξ. We thus end up with

$$g^\alpha = \frac{4\pi\alpha_s}{E_{\rm beam}^2} C_F \left(1+z^2\right) \mathcal{B},$$

which is soft-finite. Now what about this boosting to the other beam?

Note that here in `compute_isr`, `sqme_born` is supposed to be the squared Born matrix element convoluted with the real PDF.

28.5.4 The real contribution to the cross section

In each singular region α, the real contribution to σ is given by the second summand of eqn. **??**,

$$\sigma_{\text{real}}^{\alpha} = \int d\Phi_n \int_0^{2\pi} d\phi \int_{-1}^{1} dy \int_0^{\xi_{\text{max}}} d\xi \left(\frac{1}{\xi}\right)_+ \left(\frac{1}{1-y}\right)_+ \underbrace{\frac{J(\Phi_n, \xi, y, \phi)}{\xi} \left[(1-y)\xi^2 \mathcal{R}^{\alpha}(\Phi_{n+1})\right]}_{g^{\alpha}(\xi, y)}.$$

(28.34)

Writing out the plus-distribution and introducing $\tilde{\xi} = \xi/\xi_{\text{max}}$ to set the upper integration limit to 1, this turns out to be equal to

$$\sigma_{\text{real}}^{\alpha} = \int d\Phi_n \int_0^{2\pi} d\phi \int_{-1}^{1} \frac{dy}{1-y} \left\{ \int_0^1 d\tilde{\xi} \left[\frac{g^{\alpha}(\tilde{\xi}\xi_{\text{max}}, y)}{\tilde{\xi}} - \underbrace{\frac{g^{\alpha}(0, y)}{\tilde{\xi}}}_{\text{soft}} - \underbrace{\frac{g^{\alpha}(\tilde{\xi}\xi_{\text{max}}, 1)}{\tilde{\xi}}}_{\text{coll.}} + \underbrace{\frac{g^{\alpha}(0, 1)}{\tilde{\xi}}}_{\text{coll.+soft}} \right] \right.$$

$$\left. + \left[\log \xi_{\text{max}}(y) g^{\alpha}(0, y) - \log \xi_{\text{max}}(1) g^{\alpha}(0, 1)\right] \right\}.$$

(28.35)

This formula is implemented in `compute_sqme_real_fin`

This subroutine computes the finite part of the real matrix element in an individual singular region. First, the radiation variables are fetched and $\mathcal{R}$ is multiplied by the appropriate S_α-factors, region multiplicities and double-FSR factors. Then, it computes the soft, collinear, soft-collinear and remnant matrix elements and supplies the corresponding factor $1/\xi/(1-y)$ as well as the corresponding jacobians.

For final state radiation, the subtraction remnant cross section is

$$\sigma_{\text{remn}} = (\sigma_{\text{soft}} - \sigma_{\text{soft-coll}}) \log(\xi_{\max}\xi_{\text{cut}})) \cdot \tilde{\xi}. \qquad (28.36)$$

We use the already computed `sqme_soft` and `sqme_cs` with a factor of $\tilde{\xi}$ which we have to compensate.

This subroutine evaluates the soft and collinear subtraction terms for ISR. References:

- arXiv:0709.2092, sec. 2.4.2

- arXiv:0908.4272, sec. 4.2

For the collinear terms, the procedure is as follows:

If the emitter is 0, then a gluon was radiated from one of the incoming partons. Gluon emissions require two counter terms: One for emission in the direction of the first incoming parton $\oplus$ and a second for emission in the direction of the second incoming parton $\ominus$ because in both cases, there are divergent diagrams contributing to the matrix element. So in this case both, `sqme_coll_plus` and `sqme_coll_minus`, are non-zero.

If the emitter is 1 or 2, then a quark was emitted instead of a gluon. This only leads to a divergence collinear to the emitter because for anti-collinear quark emission, there are simply no divergent diagrams in the same region as two collinear quarks that cannot originate in the same splitting are non-divergent. This means that in case the emitter is 1, we need non-zero `sqme_coll_plus` and in case the emitter is 2, we need non-zero `sqme_coll_minus`.

At this point, we want to remind ourselves that in case of initial state divergences, y is just the polar angle, so the `sqme_coll_minus` terms are there to counter emissions in the direction of the second incoming parton $\ominus$ and **not** to counter in general anti-collinear divergences.

This is basically the part of the real Jacobian corresponding to

$$\frac{q^2}{8(2\pi)^3}.$$

We interpret it as the additional phase space factor of the real component, to
be more consistent with the evaluation of the Born phase space.

Computes the soft subtraction term. If there is an initial state emission having a soft divergence, then a gluon has to have been emitted. A gluon can always be emitted from both IS partons and thus, we can take the sf_factor for emitter 0 in this case. Be aware that this approach will not work for *pe* collisions.

```

Computes the soft-collinear subtraction term. For alpha regions with emitter 0, this routine is called with `em == 1` and `em == 2` separately. To still be able to use the unrescaled pdf factors stored in `sf_factors(alr, 0)` in this case, we need to differentiate between `em` and `em_pdf`.

28.7 Contribution of divergencies due to PDF Evolution

References:

- arXiv:hep-ph/9512328, (2.1)-(2.5), (4.29)-(4.53)

- arXiv:0709.2092, (2.102)-(2.106)

The parton distrubition densities have to be evaluated at NLO, too. The NLO PDF evolution is given by

$$f(\bar{x}) = \int_0^1 \int_0^1 dx dz f(x) \Gamma(z) \delta(\bar{x} - xz), \qquad (28.37)$$

where Γ are the DGLAP evolution kernels for an $a \to d$ splitting,

$$\Gamma_a^{(d)} = \delta_{ad} \delta(1-x) - \frac{\alpha_s}{2\pi} \left(\frac{1}{\epsilon} P_{ad}(x,0) - K_{ad}(x) \right) + \mathcal{O}(\alpha_s^2). \qquad (28.38)$$

K_{ad} is a renormalization scheme matching factor, which is exactly zero in $\overline{\text{MS}}$. Let the leading-order hadronic cross section be given by

$$d\sigma^{(0)}(s) = \int dx_\oplus dx_\ominus f_\oplus(x_\oplus) f_\ominus(x_\ominus) d\tilde{\sigma}^{(0)}(x_\oplus x_\ominus s), \qquad (28.39)$$

then the NLO hadronic cross section is

$$d\sigma^{(1)}(s) = \int dx_\oplus dx_\ominus dz_\oplus dz_\ominus f_\oplus(x_\oplus) f_\ominus(x_\ominus) \underbrace{\Gamma_\oplus(z_\oplus) \Gamma_\ominus(z_\ominus) d\tilde{\sigma}^{(1)}(z_\oplus z_\ominus s)}_{d\hat{\sigma}^{(1)}}. \qquad (28.40)$$

$d\hat{\sigma}$ is called the subtracted partonic cross section. Expanding in α_s we find

$$d\hat{\sigma}_{ab}^{(0)}(k_1, k_2) = d\tilde{\sigma}_{ab}^{(0)}(k_1, k_2), \qquad (28.41)$$

$$d\hat{\sigma}_{ab}^{(1)}(k_1, k_2) = d\tilde{\sigma}_{ab}^{(1)}(k_1, k_2) \qquad (28.42)$$

$$+ \frac{\alpha_s}{2\pi} \sum_d \int dx \left(\frac{1}{\epsilon} P_{da}(x,0) - K_{da}(x) \right) d\tilde{\sigma}_{db}^{(0)}(xk_1, k_2) \qquad (28.43)$$

$$+ \frac{\alpha_s}{2\pi} \sum_d \int \left(\frac{1}{\epsilon} P_{db}(x,0) - K_{db}(x) \right) d\tilde{\sigma}_{ad}^{(0)}(k_1, xk_2). \qquad (28.44)$$

$$= d\tilde{\sigma}_{ab}^{(1)} + d\tilde{\sigma}_{ab}^{(cnt,+)} + d\tilde{\sigma}_{ab}^{(cnt,-)} \qquad (28.45)$$

Let us now turn to the soft-subtracted real part of the cross section. For ease of notation, it is constrained to one singular region,

$$d\sigma_\alpha^{(in)} = \left[\left(\frac{1}{\xi} \right)_c - 2\epsilon \left(\frac{\log \xi}{\xi} \right)_c \right] (1-y^2) \xi^2 \mathcal{R}_\alpha \mathcal{S}_\alpha$$

$$\times \frac{1}{2(2\pi)^{3-2\epsilon}} \left(\frac{\sqrt{s}}{2} \right)^{2-2\epsilon} (1-y^2)^{-1-\epsilon} d\phi d\xi dy d\Omega^{2-2\epsilon},$$

where we regularize collinear divergencies using the identity

$$\left(1-y^2\right)^{-1-\epsilon} = -\frac{2^{-\epsilon}}{2\epsilon}\left(\delta(1-y) + \delta(1+y)\right) + \underbrace{\frac{1}{2}\left[\left(\frac{1}{1-y}\right)_c + \left(\frac{1}{1+y}\right)_c\right]}_{\mathcal{P}(y)}.$$

This enables us to split the cross section into a finite and a singular part. The latter can further be separated into a contribution of the incoming and of the outgoing particles,

$$d\sigma_\alpha^{(in)} = d\sigma_\alpha^{(in,+)} + d\sigma_\alpha^{(in,-)} + d\sigma_\alpha^{(in,f)}.$$

They are given by

$$d\sigma_\alpha^{(in,f)} = \mathcal{P}(y)\left[\left(\frac{1}{\xi}\right)_c - 2\epsilon\left(\frac{\log\xi}{\xi}\right)_c\right]\frac{1}{2(2\pi)^{3-2\epsilon}}\left(\frac{\sqrt{s}}{2}\right)^{2-2\epsilon}$$
$$\times (1-y^2)\xi^2\mathcal{R}_\alpha\mathcal{S}_\alpha d\phi d\xi dy d\Omega^{2-2\epsilon} \tag{28.46}$$

and

$$d\sigma_\alpha^{(in,\pm)} = -\frac{2^{-\epsilon}}{2\epsilon}\delta(1\mp y)\left[\left(\frac{1}{\xi}\right)_c - 2\epsilon\left(\frac{\log\xi}{\xi}\right)_c\right]$$
$$\times \frac{1}{2(2\pi)^{3-2\epsilon}}\left(\frac{\sqrt{s}}{2}\right)^{2-2\epsilon}(1-y^2)\xi^2\mathcal{R}_\alpha\mathcal{S}_\alpha d\phi d\xi dy d\Omega^{2-2\epsilon}. \tag{28.47}$$

Equation 28.46 is the contribution to the real cross section which is computed in `evaluate_region_isr`. It is regularized both in the soft and collinear limit via the plus distributions. Equation 28.47 is a different contribution. It is only present exactly in the collinear limit, due to the delta function. The divergences present in this term do not completely cancel out divergences in the virtual matrix element, because the beam axis is distinguished. Thus, the conditions in which the KLN theorem applies are not met. To see this, we carry out the collinear limit, obtaining

$$\lim_{y\to 1}(1-y^2)\xi^2\mathcal{R}_\alpha = 8\pi\alpha_s\mu^{2\epsilon}\left(\frac{2}{\sqrt{s}}\right)^2\xi P^<(1-\xi,\epsilon)\mathcal{R}_\alpha,$$

with the Altarelli-Parisi splitting kernel for $z < 1$, $P^<(z,\epsilon)$. Moreover, $\lim_{\vec{k}\|\vec{k}_1} d\phi = d\phi_3$ violates spatial averaging. The integration over the spherical angle $d\Omega$ can be carried out easily, yielding a factor of $2\pi^{1-\epsilon}/\Gamma(1-\epsilon)$. This allows us to redefine ϵ,

$$\frac{1}{\epsilon} - \gamma_E + \log(4\pi) \to \frac{1}{\epsilon}. \tag{28.48}$$

Coming back to $d\tilde{\sigma}_{ab}^{(cnt,+)}$ in order to make a connection to $d\sigma_\alpha^{(in,+)}$, we relate $P_{ab}(z,0)$ to $P_{ab}^<(z,0)$ via the equation

$$P_{ab}(z,0) = (1-z)P_{ab}^<(z,0)\left(\frac{1}{1-z}\right)_+ + \gamma(a)\delta_{ab}\delta(1-z),$$

which yields

$$d\tilde{\sigma}_\alpha^{(cnt,+)} = \frac{\alpha_s}{2\pi}\sum_d\left\{-K_{da}(1-\xi) + \frac{1}{\epsilon}\left[\left(\frac{1}{\xi}\right)_+ \xi P_{da}^<(1-\xi,0) + \delta_{da}\delta(\xi)\gamma(d)\right]\right\}\mathcal{R}_\alpha\mathcal{S}_\alpha d\phi d\xi dy. \tag{28.49}$$

This term has the same pole structure as eqn. 28.47. This makes clear that the quantity

$$d\hat{\sigma}^{(in,+)} = d\tilde{\sigma}^{(in,+)} + d\tilde{\sigma}^{(cnt,+)} \qquad (28.50)$$

has no collinear poles. Therefore, our task is to add up eqns. 28.47 and 28.49 in order to compute the finite remainder. This is the integrand which is evaluated in the `dglap_remnant` component.

So, we have to perform an expansion of $d\hat{\sigma}^{(in,+)}$ in ϵ. Hereby, we must not neglect the implicit ϵ-dependence of $P^<$, which leads to additional terms involving the first derivative,

$$P_{ab}^<(z, \epsilon) = P_{ab}^<(z, 0) + \epsilon \frac{\partial P_{ab}^<(z, \epsilon)}{\partial \epsilon}|_{\epsilon=0} + \mathcal{O}(\alpha_s^2).$$

This finally gives us the equation for the collinear remnant. Note that there is still one soft $1/\epsilon$-pole, which cancels out with the corresponding expression in the soft-virtual terms.

$$
\begin{aligned}
d\hat{\sigma}^{(in,+)} = {}& \frac{\alpha_s}{2\pi} \frac{1}{\epsilon} \gamma(a) \mathcal{R}_\alpha \mathcal{S}_\alpha \\
& + \frac{\alpha_s}{2\pi} \sum_d \left\{ (1-z) P_{da}^<(z, 0) \left[\left(\frac{1}{1-z} \right)_c \log \frac{s\delta_I}{2\mu^2} + 2 \left(\frac{\log(1-z)}{1-z} \right)_c \right] \right. \\
& \left. - (1-z) \frac{\partial P_{da}^<(z, \epsilon)}{\partial \epsilon} \left(\frac{1}{1-z} \right)_c - K_{da}(z) \right\} \mathcal{R}_\alpha \mathcal{S}_\alpha d\phi d\xi dy \qquad (28.51)
\end{aligned}

Evaluates formula 28.51. Note that, as also in the case for the real subtraction, we have to take into account an additional term, occuring because the integral the plus distribution is evaluated over is not constrained on the interval $[0, 1]$. Explicitly, this means (see JHEP 06(2010)043, (4.11)-(4.12))

$$\int_{\bar{x}_\oplus}^1 dz \left(\frac{1}{1-z}\right)_{\xi_{\mathrm{cut}}} = \log\frac{1-\bar{x}_\oplus}{\xi_{\mathrm{cut}}} f(1) + \int_{\bar{x}_\oplus}^1 \frac{f(z)-f(1)}{1-z}, \qquad (28.52)$$

$$\int_{\bar{x}_\oplus}^1 dz \left(\frac{\log(1-z)}{1-z}\right)_{\xi_{\mathrm{cut}}} f(z) = \frac{1}{2}\left(\log^2(1-\bar{x}_\oplus) - \log^2(\xi_{\mathrm{cut}})\right) f(1) + \int_{\bar{x}_\oplus}^1 \frac{\log(1-z)[f(z)-f(1)]}{1-z},$$
$$(28.53)$$

and the same of course for $\bar{x}_\ominus$. These two terms are stored in the `plus_dist_remnant` variable below.

Chapter 29

Model Handling and Features

These modules deal with process definitions and physics models.

These modules use the `model_data` methods to automatically generate process definitions.

auto_components Generic process-definition generator. We can specify a basic process or initial particle(s) and some rules to extend this process, given a model definition with particle names and vertex structures.

radiation_generator Applies the generic generator to the specific problem of generating NLO corrections in a restricted setup.

Model construction:

eval_trees Implementation of the generic `expr_t` type for the concrete evaluation of expressions that access user variables.

This module is actually part of the Sindarin language implementation, and should be moved elsewhere. Currently, the `models` module relies on it.

models Extends the `model_data_t` structure by user-variable objects for easy access, and provides the means to read a model definition from file.

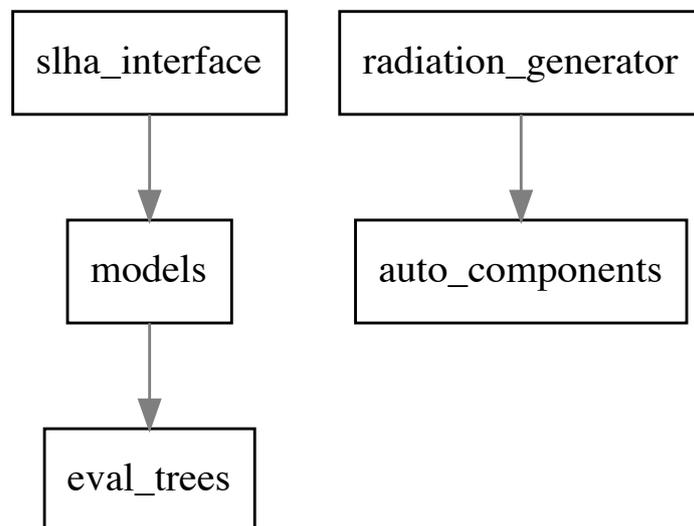
slha_interface Read/write a SUSY model in the standardized SLHA format. The format defines fields and parameters, but no vertices.


Figure 29.1: Module dependencies in `src/model_features`.

29.1 Automatic generation of process components

This module provides the functionality for automatically generating radiation corrections or decays, provided as lists of PDG codes.

29.1.1 Constraints: Abstract types

An abstract type that denotes a constraint on the automatically generated states. The concrete objects are applied as visitor objects at certain hooks during the splitting algorithm.

⟨*Auto components: types*⟩≡
    type, abstract :: split_constraint_t
    contains
    ⟨*Auto components: split constraint: TBP*⟩
    end type split_constraint_t

By default, all checks return true.

⟨*Auto components: split constraint: TBP*⟩≡
    procedure :: check_before_split => split_constraint_check_before_split
    procedure :: check_before_insert => split_constraint_check_before_insert
    procedure :: check_before_record => split_constraint_check_before_record

⟨*Auto components: procedures*⟩≡
```
    subroutine split_constraint_check_before_split (c, table, pl, k, passed)
      class(split_constraint_t), intent(in) :: c
      class(ps_table_t), intent(in) :: table
      type(pdg_list_t), intent(in) :: pl
      integer, intent(in) :: k
      logical, intent(out) :: passed
      passed = .true.
    end subroutine split_constraint_check_before_split

    subroutine split_constraint_check_before_insert (c, table, pa, pl, passed)
      class(split_constraint_t), intent(in) :: c
      class(ps_table_t), intent(in) :: table
      type(pdg_array_t), intent(in) :: pa
      type(pdg_list_t), intent(inout) :: pl
      logical, intent(out) :: passed
      passed = .true.
    end subroutine split_constraint_check_before_insert

    subroutine split_constraint_check_before_record (c, table, pl, n_loop, passed)
      class(split_constraint_t), intent(in) :: c
      class(ps_table_t), intent(in) :: table
      type(pdg_list_t), intent(in) :: pl
      integer, intent(in) :: n_loop
      logical, intent(out) :: passed
      passed = .true.
    end subroutine split_constraint_check_before_record
```

A transparent wrapper, so we can collect constraints of different type.

⟨*Auto components: types*⟩+≡
```
    type :: split_constraint_wrap_t
       class(split_constraint_t), allocatable :: c
    end type split_constraint_wrap_t
```

A collection of constraints.

⟨*Auto components: public*⟩≡
```
    public :: split_constraints_t
```

⟨*Auto components: types*⟩+≡
```
    type :: split_constraints_t
       class(split_constraint_wrap_t), dimension(:), allocatable :: cc
     contains
```
⟨*Auto components: split constraints: TBP*⟩
```
    end type split_constraints_t
```

Initialize the constraints set with a specific number of elements.

⟨*Auto components: split constraints: TBP*⟩≡
```
    procedure :: init => split_constraints_init
```

⟨*Auto components: procedures*⟩+≡
```
    subroutine split_constraints_init (constraints, n)
      class(split_constraints_t), intent(out) :: constraints
      integer, intent(in) :: n
```

3770

```
      allocate (constraints%cc (n))
    end subroutine split_constraints_init
```

Set a constraint.

⟨*Auto components: split constraints: TBP*⟩+≡
```
    procedure :: set => split_constraints_set
```

⟨*Auto components: procedures*⟩+≡
```
    subroutine split_constraints_set (constraints, i, c)
      class(split_constraints_t), intent(inout) :: constraints
      integer, intent(in) :: i
      class(split_constraint_t), intent(in) :: c
      allocate (constraints%cc(i)%c, source = c)
    end subroutine split_constraints_set
```

Apply checks.

check_before_split is applied to the particle list that we want to split.

check_before_insert is applied to the particle list pl that is to replace the particle pa that is split. This check may transform the particle list.

check_before_record is applied to the complete new particle list that results from splitting before it is recorded.

⟨*Auto components: split constraints: TBP*⟩+≡
```
    procedure :: check_before_split  => split_constraints_check_before_split
    procedure :: check_before_insert => split_constraints_check_before_insert
    procedure :: check_before_record => split_constraints_check_before_record
```

⟨*Auto components: procedures*⟩+≡
```
    subroutine split_constraints_check_before_split &
        (constraints, table, pl, k, passed)

      if (.not. passed)  return
    end do
  end subroutine split_constraints_check_before_record
```

29.1.2 Specific constraints

Number of particles

Specific constraint: The number of particles plus the number of loops, if any, must remain less than the given limit. Note that the number of loops is defined only when we are recording the entry.

⟨*Auto components: types*⟩+≡
```
    type, extends (split_constraint_t) :: constraint_n_tot
      private
      integer :: n_max = 0
    contains
      procedure :: check_before_split => constraint_n_tot_check_before_split
      procedure :: check_before_record => constraint_n_tot_check_before_record
    end type constraint_n_tot
```

⟨*Auto components: public*⟩+≡
```
    public :: constrain_n_tot
```

⟨*Auto components: procedures*⟩+≡
```
    function constrain_n_tot (n_max) result (c)
      integer, intent(in) :: n_max
      type(constraint_n_tot) :: c
      c%n_max = n_max
    end function constrain_n_tot

    subroutine constraint_n_tot_check_before_split (c, table, pl, k, passed)
      class(constraint_n_tot), intent(in) :: c
      class(ps_table_t), intent(in) :: table
      type(pdg_list_t), intent(in) :: pl
      integer, intent(in) :: k
      logical, intent(out) :: passed
      passed = pl%get_size () < c%n_max
    end subroutine constraint_n_tot_check_before_split
```

```
      subroutine constraint_n_tot_check_before_record (c, table, pl, n_loop, passed)
        class(constraint_n_tot), intent(in) :: c
        class(ps_table_t), intent(in) :: table
        type(pdg_list_t), intent(in) :: pl
        integer, intent(in) :: n_loop
        logical, intent(out) :: passed
        passed = pl%get_size () + n_loop <= c%n_max
      end subroutine constraint_n_tot_check_before_record
```

Number of loops

Specific constraint: The number of loops is limited, independent of the total number of particles.

⟨*Auto components: types*⟩+≡

```
      type, extends (split_constraint_t) :: constraint_n_loop
        private
        integer :: n_loop_max = 0
      contains

```

Particles allowed in splitting

Specific constraint: The entries in the particle list ready for insertion are matched to a given list of particle patterns. If a match occurs, the entry is replaced by the corresponding pattern. If there is no match, the check fails. If a massless gauge boson splitting is detected, the splitting partners are checked against a list of excluded particles. If a match occurs, the check fails.

⟨*Auto components: types*⟩+≡

```

      type(pdg_array_t), intent(in) :: pa
      type(pdg_list_t), intent(inout) :: pl
      logical, intent(out) :: passed
      call pl%match_replace (c%pl_match, passed)
    end subroutine constraint_insert_check_before_insert
```

Particles required in final state

Specific constraint: The entries in the recorded state must be a superset of the
entries in the given list (for instance, the lowest-order state).

⟨*Auto components: types*⟩+≡
```
    type, extends (split_constraint_t) :: constraint_require
      private
      type(pdg_list_t) :: pl
    contains
      procedure :: check_before_record => constraint_require_check_before_record
    end type constraint_require
```

We check the current state by matching all particle entries against the stored
particle list, and crossing out the particles in the latter list when a match is
found. The constraint passed if all entries have been crossed out.

   For an `if_table` in particular, we check the final state only.

⟨*Auto components: public*⟩+≡
```
    public :: constrain_require
```

⟨*Auto components: procedures*⟩+≡
```
    function constrain_require (pl) result (c)
      type(pdg_list_t), intent(in) :: pl
      type(constraint_require) :: c
      c%pl = pl
    end function constrain_require

    subroutine constraint_require_check_before_record &
        (c, table, pl, n_loop, passed)
      class(constraint_require), intent(in) :: c
```

```
      class(ps_table_t), intent(in) :: table
      type(pdg_list_t), intent(in) :: pl
      integer, intent(in) :: n_loop
      logical, intent(out) :: passed
      logical, dimension(:), allocatable :: mask
      integer :: i, k, n_in
      select type (table)
      type is (if_table_t)
         if (table%proc_type > 0) then
            select case (table%proc_type)
            case (PROC_DECAY)
               n_in = 1
            case (PROC_SCATTER)
               n_in = 2
            end select
         else
            call msg_fatal ("Neither a decay nor a scattering process")
         end if
      class default
         n_in = 0
      end select
      allocate (mask (c%pl%get_size ()), source = .true.)
      do i = n_in + 1, pl%get_size ()
         k = c%pl%find_match (pl%get (i), mask)
         if (k /= 0)  mask(k) = .false.
      end do
      passed = .not. any (mask)
    end subroutine constraint_require_check_before_record
```

Radiation

Specific constraint: We have radiation pattern if the original particle matches
an entry in the list of particles that should replace it. The constraint prohibits
this situation.

⟨*Auto components: public*⟩+≡
```
    public :: constrain_radiation
```

⟨*Auto components: types*⟩+≡
```
    type, extends (split_constraint_t) :: constraint_radiation
      private
    contains

           constraint_radiation_check_before_insert
    end type constraint_radiation
```

⟨*Auto components: procedures*⟩+≡
```
    function constrain_radiation () result (c)
      type(constraint_radiation) :: c
    end function constrain_radiation

    subroutine constraint_radiation_check_before_insert (c, table, pa, pl, passed)
      class(constraint_radiation), intent(in) :: c
```

```
      class(ps_table_t), intent(in) :: table
      type(pdg_array_t), intent(in) :: pa
      type(pdg_list_t), intent(inout) :: pl
      logical, intent(out) :: passed
      passed = .not. (pl .match. pa)
    end subroutine constraint_radiation_check_before_insert
```

Mass sum

Specific constraint: The sum of masses within the particle list must be smaller than a given limit. For in/out state combinations, we check initial and final state separately.

If we specify `margin` in the initialization, the sum must be strictly less than the limit minus the given margin (which may be zero). If not, equality is allowed.

⟨*Auto components: public*⟩+≡
```
    public :: constrain_mass_sum
```

⟨*Auto components: types*⟩+≡
```
    type, extends (split_constraint_t) :: constraint_mass_sum

    end do
  end subroutine constraint_coupling_check_before_insert
```

29.1.3 Tables of states

Automatically generate a list of possible process components for a given initial
set (a single massive particle or a preset list of states).

The set of process components are generated by recursive splitting, applying
constraints on the fly that control and limit the process. The generated states
are accumulated in a table that we can read out after completion.

⟨*Auto components: types*⟩+≡
```
    type, extends (pdg_list_t) :: ps_entry_t
       integer :: n_loop = 0
       integer :: n_rad = 0
       type(ps_entry_t), pointer :: previous => null ()
       type(ps_entry_t), pointer :: next => null ()
    end type ps_entry_t
```

⟨*Auto components: parameters*⟩≡
```
    integer, parameter :: PROC_UNDEFINED = 0
    integer, parameter :: PROC_DECAY = 1
    integer, parameter :: PROC_SCATTER = 2
```

This is the wrapper type for the decay tree for the list of final states and the
final array. First, an abstract base type:

⟨*Auto components: public*⟩+≡
```
    public :: ps_table_t
```

⟨*Auto components: types*⟩+≡
```
    type, abstract :: ps_table_t
      private
      class(model_data_t), pointer :: model => null ()
      logical :: loops = .false.
      type(ps_entry_t), pointer :: first => null ()
      type(ps_entry_t), pointer :: last => null ()
      integer :: proc_type
    contains
    ⟨Auto components: ps table: TBP⟩
    end type ps_table_t
```

The extensions: one for decay, one for generic final states. The decay-state table stores the initial particle. The final-state table is indifferent, and the initial/final state table treats the first two particles in its list as incoming antiparticles.

⟨*Auto components: public*⟩+≡
```
    public :: ds_table_t
    public :: fs_table_t
    public :: if_table_t
```

⟨*Auto components: types*⟩+≡
```
    type, extends (ps_table_t) :: ds_table_t
       private
       integer :: pdg_in = 0
     contains
     ⟨Auto components: ds table: TBP⟩
    end type ds_table_t

    type, extends (ps_table_t) :: fs_table_t
     contains
     ⟨Auto components: fs table: TBP⟩
    end type fs_table_t

    type, extends (fs_table_t) :: if_table_t
     contains
     ⟨Auto components: if table: TBP⟩
    end type if_table_t
```

Finalizer: we must deallocate the embedded list.

⟨*Auto components: ps table: TBP*⟩≡
```
    procedure :: final => ps_table_final
```

⟨*Auto components: procedures*⟩+≡
```
    subroutine ps_table_final (object)
      class(ps_table_t), intent(inout) :: object
      type(ps_entry_t), pointer :: current
      do while (associated (object%first))
         current => object%first
         object%first => current%next
         deallocate (current)
      end do
      nullify (object%last)
    end subroutine ps_table_final
```

Write the table. A base writer for the body and specific writers for the headers.

⟨*Auto components: ps table: TBP*⟩+≡
```
    procedure :: base_write => ps_table_base_write
    procedure (ps_table_write), deferred :: write
```

⟨*Auto components: interfaces*⟩≡
```
    interface
       subroutine ps_table_write (object, unit)
         import
         class(ps_table_t), intent(in) :: object
         integer, intent(in), optional :: unit
       end subroutine ps_table_write
    end interface
```

⟨Auto components: ds table: TBP⟩≡
```
procedure :: write => ds_table_write
```

⟨Auto components: fs table: TBP⟩≡
```
procedure :: write => fs_table_write
```

⟨Auto components: if table: TBP⟩≡
```
procedure :: write => if_table_write
```

The first n_in particles will be replaced by antiparticles in the output, and we write an arrow if n_in is present.

⟨Auto components: procedures⟩+≡
```
subroutine ps_table_base_write (object, unit, n_in)
  class(ps_table_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer, intent(in), optional :: n_in
  integer, dimension(:), allocatable :: pdg
  type(ps_entry_t), pointer :: entry
  type(field_data_t), pointer :: prt
  integer :: u, i, j, n0
  u = given_output_unit (unit)
  entry => object%first
  do while (associated (entry))
     write (u, "(2x)", advance = "no")
     if (present (n_in)) then
        do i = 1, n_in
           write (u, "(1x)", advance = "no")

  table%loops = .true.
end subroutine ps_table_enable_loops
```

29.1.4   Top-level methods

Create a table for a single-particle decay. Construct all possible final states from a single particle with PDG code pdg_in. The construction is limited by the given constraints.

⟨*Auto components: ds table: TBP*⟩+≡
```
procedure :: make => ds_table_make
```

⟨*Auto components: procedures*⟩+≡
```
subroutine ds_table_make (table, model, pdg_in, constraints)
  class(ds_table_t), intent(out) :: table
  class(model_data_t), intent(in), target :: model
  integer, intent(in) :: pdg_in
  type(split_constraints_t), intent(in) :: constraints
  type(pdg_list_t) :: pl_in
  type(pdg_list_t), dimension(0) :: pl
  call table%init (model, pl, constraints)
  table%pdg_in = pdg_in
  call pl_in%init (1)
  call pl_in%set (1, [pdg_in])
  call table%split (pl_in, 0, constraints)
end subroutine ds_table_make
```

Split all entries in a growing table, starting from a table that may already contain states. Add and record split states on the fly.

⟨*Auto components: fs table: TBP*⟩+≡
```
procedure :: radiate => fs_table_radiate
```

⟨*Auto components: procedures*⟩+≡
```
subroutine fs_table_radiate (table, constraints, do_not_check_regular)
  class(fs_table_t), intent(inout) :: table
  type(split_constraints_t) :: constraints
```

```
      logical, intent(in), optional :: do_not_check_regular
      type(ps_entry_t), pointer :: current
      current => table%first
      do while (associated (current))
         call table%split (current, 0, constraints, record = .true., &
               do_not_check_regular = do_not_check_regular)
         current => current%next
      end do
   end subroutine fs_table_radiate
```

29.1.5 Splitting algorithm

Recursive splitting. First of all, we record the current `pdg_list` in the table, subject to `constraints`, if requested. We also record copies of the list marked as loop corrections.

When we record a particle list, we sort it first.

If there is room for splitting, We take a PDG array list and the index of an element, and split this element in all possible ways. The split entry is inserted into the list, which we split further.

The recursion terminates whenever the split array would have a length greater than $n_{\max}$.

⟨*Auto components: ps table: TBP*⟩+≡
```
      procedure :: split => ps_table_split
```

⟨*Auto components: procedures*⟩+≡
```
      recursive subroutine ps_table_split (table, pl, n_rad, constraints, &
            record, do_not_check_regular)
        class(ps_table_t), intent(inout) :: table
        class(pdg_list_t), intent(in) :: pl
        integer, intent(in) :: n_rad
        type(split_constraints_t), intent(in) :: constraints
        logical, intent(in), optional :: record, do_not_check_regular
        integer :: n_loop, i

                     end if
                  end do SCAN_VERTICES
               end if
            end do
         end subroutine ps_table_split
```

The worker part: insert the list of particles found by vertex matching in place
of entry `i` in the PDG list. Then split/record further.

The **n_in** parameter tells the replacement routine to insert the new particles
after entry **n_in**. Otherwise, they follow index `i`.

⟨*Auto components: ps table: TBP*⟩+≡

```
         procedure :: insert => ps_table_insert
```

⟨*Auto components: procedures*⟩+≡

```
         recursive subroutine ps_table_insert &

                     ok = all (size_replaced(:n_in) == size(:n_in))
                  end associate
               end if
            end if
         end if
       end function is_colored_isr
   end subroutine ps_table_insert
```

Special case: If we are splitting an initial particle, there is slightly more to do.
We loop over the particles from the vertex match and replace the initial particle
by each of them in turn. The remaining particles must be appended after the
second initial particle, so they will end up in the out state. This is done by
providing the n_in argument to the base method as an optional argument.

Note that we must call the base-method procedure explicitly, so the `table`
argument keeps its dynamic type as `if_table` inside this procedure.

⟨*Auto components: if table: TBP*⟩+≡

```

```

Record an entry: insert into the list. Check the ordering and insert it at the correct place, unless it is already there.

We record an array only if its mass sum is less than the total available energy. This restriction is removed by setting constrained to false.

29.1.6 Tools

Compute the mass sum for a PDG list object, counting the entries with indices
between (including) n1 and n2. Rely on the requirement that if an entry is a
PDG array, this array must be degenerate in mass.

⟨*Auto components: procedures*⟩+≡
```
    function mass_sum (pl, n1, n2, model) result (m)
      type(pdg_list_t), intent(in) :: pl
      integer, intent(in) :: n1, n2
      class(model_data_t), intent(in), target :: model
      integer, dimension(:), allocatable :: pdg
      real(default) :: m
      type(field_data_t), pointer :: prt
      integer :: i
      m = 0
      do i = n1, n2
         pdg = pl%get (i)
         prt => model%get_field_ptr (pdg(1))
         m = m + prt%get_mass ()
      end do
    end function mass_sum
```

Invert a PDG array, replacing particles by antiparticles. This depends on the
model.

⟨*Auto components: procedures*⟩+≡
```
    function invert_pdg_array (pa, model) result (pa_inv)
      type(pdg_array_t), intent(in) :: pa
      class(model_data_t), intent(in), target :: model
      type(pdg_array_t) :: pa_inv
      type(field_data_t), pointer :: prt
      integer :: i, pdg
      pa_inv = pa
      do i = 1, pa_inv%get_length ()
         pdg = pa_inv%get (i)
         prt => model%get_field_ptr (pdg)
         if (prt%has_antiparticle ())  call pa_inv%set (i, -pdg)
      end do
    end function invert_pdg_array
```

29.1.7 Access results

Return the number of generated decays.

    end function reshuffle_list_get
```

We need to reset the `reshuffle_list` in order to deal with subsequent usages of the `radiation_generator`. Below is obviously the lazy and dirty solution. Otherwise, we would have to equip this auxiliary type with additional information about `last` and `previous` pointers. Considering that at most n_{legs} integers are saved in the lists, and that the subroutine is only called during the initialization phase (more precisely: at the moment only in the `radiation_generator` unit tests), I think this quick fix is justified.

29.3 Sindarin Expression Implementation

This module defines expressions of all kinds, represented in a tree structure, for repeated evaluation. This provides an implementation of the `expr_base` abstract type.

We have two flavors of expressions: one with particles and one without particles. The latter version is used for defining cut/selection criteria and for online analysis.

```

29.3.1 Tree nodes

The evaluation tree consists of branch nodes (unary and binary) and of leaf nodes, originating from a common root. The node object should be polymorphic. For the time being, polymorphism is emulated here. This means that we have to maintain all possibilities that the node may hold, including associated procedures as pointers.

The following parameter values characterize the node. Unary and binary operators have sub-nodes. The other are leaf nodes. Possible leafs are literal constants or named-parameter references.

⟨*Eval trees: types*⟩≡
```
    integer, parameter :: EN_UNKNOWN = 0, EN_UNARY = 1, EN_BINARY = 2
    integer, parameter :: EN_CONSTANT = 3, EN_VARIABLE = 4
    integer, parameter :: EN_CONDITIONAL = 5, EN_BLOCK = 6
    integer, parameter :: EN_RECORD_CMD = 7
    integer, parameter :: EN_OBS1_INT = 11, EN_OBS2_INT = 12
    integer, parameter :: EN_OBS1_REAL = 21, EN_OBS2_REAL = 22
    integer, parameter :: EN_UOBS1_INT = 31, EN_UOBS2_INT = 32
    integer, parameter :: EN_UOBS1_REAL = 41, EN_UOBS2_REAL = 42
    integer, parameter :: EN_PRT_FUN_UNARY = 101, EN_PRT_FUN_BINARY = 102
    integer, parameter :: EN_EVAL_FUN_UNARY = 111, EN_EVAL_FUN_BINARY = 112
    integer, parameter :: EN_LOG_FUN_UNARY = 121, EN_LOG_FUN_BINARY = 122
    integer, parameter :: EN_INT_FUN_UNARY = 131, EN_INT_FUN_BINARY = 132
    integer, parameter :: EN_REAL_FUN_UNARY = 141, EN_REAL_FUN_BINARY = 142
    integer, parameter :: EN_FORMAT_STR = 161
```

This is exported only for use within unit tests.

```

Branch nodes

Initialize a branch node, sub-nodes are given.

⟨*Eval trees: procedures*⟩+≡

```
subroutine eval_node_init_branch (node, tag, result_type, arg1, arg2)
  type(eval_node_t), intent(out) :: node
  type(string_t), intent(in) :: tag
  integer, intent(in) :: result_type
  type(eval_node_t), intent(in), target :: arg1
  type(eval_node_t), intent(in), target, optional :: arg2
  if (present (arg2)) then
     node%type = EN_BINARY
  else
     node%type = EN_UNARY
  end if
  node%tag = tag
  node%result_type = result_type
  call eval_node_allocate_value (node)
  node%arg1 => arg1
  if (present (arg2))  node%arg2 => arg2
end subroutine eval_node_init_branch
```

Allocate the node value according to the result type.

⟨*Eval trees: procedures*⟩+≡

```
subroutine eval_node_allocate_value (node)
  type(eval_node_t), intent(inout) :: node
  select case (node%result_type)
  case (V_LOG);  allocate (node%lval)
  case (V_INT);  allocate (node%ival)
  case (V_REAL); allocate (node%rval)
  case (V_CMPLX); allocate (node%cval)
  case (V_PDG);  allocate (node%aval)
  case (V_SEV);  allocate (node%pval)
     call subevt_init (node%pval)
  case (V_STR);  allocate (node%sval)
  end select
  allocate (node%value_is_known)
  node%value_is_known = .false.
end subroutine eval_node_allocate_value
```

Initialize a block node which contains, in addition to the expression to be evaluated, a variable definition. The result type is not yet assigned, because we can compile the enclosed expression only after the var list is set up.

Note that the node always allocates a new variable list and appends it to the current one. Thus, if the variable redefines an existing one, it only shadows it but does not reset it. Any side-effects are therefore absent and need not be undone outside the block.

If the flag **new** is set, a variable is (re)declared. This must not be done for intrinsic variables. Vice versa, if the variable is not existent, the **new** flag is required.

⟨*Eval trees: procedures*⟩+≡

```
subroutine eval_node_init_block (node, name, type, var_def, var_list)
```

```
   type(eval_node_t), intent(out), target :: node

      end select
   end if
 end subroutine eval_node_init_block
```

Complete block initialization by assigning the expression to evaluate to `arg0`.

⟨*Eval trees: procedures*⟩+≡
```
   subroutine eval_node_set_expr (node, arg, result_type)
     type(eval_node_t), intent(inout) :: node
```

```
      type(eval_node_t), intent(in), target :: arg
      integer, intent(in), optional :: result_type
      if (present (result_type)) then
         node%result_type = result_type
      else
         node%result_type = arg%result_type
      end if
      call eval_node_allocate_value (node)
      node%arg0 => arg
   end subroutine eval_node_set_expr
```

Initialize a conditional. There are three branches: the condition (evaluates to logical) and the two alternatives (evaluate both to the same arbitrary type).

⟨*Eval trees: procedures*⟩+≡
```
   subroutine eval_node_init_conditional (node, result_type, cond, arg1, arg2)
      type(eval_node_t), intent(out) :: node
      integer, intent(in) :: result_type
      type(eval_node_t), intent(in), target :: cond, arg1, arg2
      node%type = EN_CONDITIONAL
      node%tag = "cond"
      node%result_type = result_type
      call eval_node_allocate_value (node)
      node%arg0 => cond
      node%arg1 => arg1
      node%arg2 => arg2
   end subroutine eval_node_init_conditional
```

Initialize a recording command (which evaluates to a logical constant). The first branch is the ID of the analysis object to be filled, the optional branches 1 to 4 are the values to be recorded.

If the event-weight pointer is null, we record values with unit weight. Otherwise, we use the value pointed to as event weight.

There can be up to four arguments which represent x, y, Δy, Δx. Therefore, this is the only node type that may fill four sub-nodes.

⟨*Eval trees: procedures*⟩+≡
```
   subroutine eval_node_init_record_cmd &
       (node, event_weight, id, arg1, arg2, arg3, arg4)
      type(eval_node_t), intent(out) :: node
      real(default), pointer :: event_weight
      type(eval_node_t), intent(in), target :: id
      type(eval_node_t), intent(in), optional, target :: arg1, arg2, arg3, arg4
      call eval_node_init_log (node, .true.)
      node%type = EN_RECORD_CMD
      node%rval => event_weight
      node%tag = "record_cmd"
      node%arg0 => id
      if (present (arg1)) then
         node%arg1 => arg1
         if (present (arg2)) then
            node%arg2 => arg2
            if (present (arg3)) then
               node%arg3 => arg3
```

```
                if (present (arg4)) then
                    node%arg4 => arg4
                end if
            end if
        end if
    end if
    end subroutine eval_node_init_record_cmd
```

Initialize a node for operations on subevents. The particle lists (one or two) are
inserted as **arg1** and **arg2**. We allocated particle pointers as temporaries for
iterating over particle lists. The procedure pointer which holds the function to
evaluate for the subevents (e.g., combine, select) is also initialized.

⟨Eval trees: procedures⟩+≡

```
    subroutine eval_node_init_prt_fun_unary (node, arg1, name, proc)

  node%tag = name
  node%result_type = V_STR
  call eval_node_allocate_value (node)
  node%arg0 => fmt
  node%arg1 => arg
  allocate (node%ival)
  node%ival = n_args
end subroutine eval_node_init_format_string
```

If particle functions depend upon a condition (or an expression is evaluated), the observables that can be evaluated for the given particles have to be thrown on the local variable stack. This is done here. Each observable is initialized with the particle pointers which have been allocated for the node.

The integer variable that is referred to by the `Index` pseudo-observable is always known when it is referred to.

⟨*Eval trees: procedures*⟩+≡
```
subroutine eval_node_set_observables (node, var_list)
  type(eval_node_t), intent(inout) :: node
  type(var_list_t), intent(in), target :: var_list
  logical, save, target :: known = .true.
  allocate (node%var_list)
  call node%var_list%link (var_list)
  allocate (node%index, source = 0)
  call var_list_append_int_ptr &
       (node%var_list, var_str ("Index"), node%index, known, intrinsic=.true.)
  if (.not. associated (node%prt2)) then
     call var_list_set_observables_unary &
          (node%var_list, node%prt1)
```

```
        else
           call var_list_set_observables_binary &
                (node%var_list, node%prt1, node%prt2)
        end if
      end subroutine eval_node_set_observables
```

Output

⟨*Eval trees: eval node: TBP*⟩+≡

         end if
      end select
    end subroutine eval_node_write_rec
```

29.3.2 Operation types

For the operations associated to evaluation tree nodes, we define abstract interfaces for all cases.

Particles/subevents are transferred by-reference, to avoid unnecessary copying. Therefore, subroutines instead of functions. (Furthermore, the function version of unary_prt triggers an obscure bug in nagfor 5.2(649) [invalid C code].)

⟨Eval trees: interfaces⟩≡

```
    abstract interface
        logical function unary_log (arg)
          import eval_node_t
          type(eval_node_t), intent(in) :: arg
        end function unary_log
    end interface
    abstract interface
        integer function unary_int (arg)
          import eval_node_t
          type(eval_node_t), intent(in) :: arg
        end function unary_int
    end interface
    abstract interface
        real(default) function unary_real (arg)
          import default
          import eval_node_t
          type(eval_node_t), intent(in) :: arg
        end function unary_real
    end interface
    abstract interface
        complex(default) function unary_cmplx (arg)
          import default
          import eval_node_t
          type(eval_node_t), intent(in) :: arg
        end function unary_cmplx
    end interface
    abstract interface
        subroutine unary_pdg (pdg_array, arg)
          import pdg_array_t
          import eval_node_t
          type(pdg_array_t), intent(out) :: pdg_array
          type(eval_node_t), intent(in) :: arg
        end subroutine unary_pdg

```

29.3.3 Specific operators

Our expression syntax contains all Fortran functions that make sense. These functions have to be provided in a form that they can be used in procedures pointers, and have the abstract interfaces above. For some intrinsic functions, we could use specific versions provided by Fortran directly. However, this has two drawbacks: (i) We should work with the values instead of the eval-nodes as argument, which complicates the interface; (ii) more importantly, the `default` real type need not be equivalent to double precision. This would, at least, introduce system dependencies. Finally, for operators there are no specific versions.

Therefore, we write wrappers for all possible functions, at the expense of some overhead.

Binary numerical functions

⟨*Eval trees: procedures*⟩+≡
```
    integer function add_ii (en1, en2) result (y)
      type(eval_node_t), intent(in) :: en1, en2
      y = en1%ival + en2%ival
    end function add_ii
    real(default) function add_ir (en1, en2) result (y)
      type(eval_node_t), intent(in) :: en1, en2
      y = en1%ival + en2%rval
    end function add_ir
    complex(default) function add_ic (en1, en2) result (y)

      logical :: lval
      type(eval_node_t), intent(in) :: en1
      type(eval_node_t), intent(inout) :: en0
      integer :: i, n
      n = subevt_get_length (en1%pval)
      lval = .false.
      do i = 1, n
         en0%index = i
```

```
      en0%prt1 = subevt_get_prt (en1%pval, i)
      call eval_node_evaluate (en0)
      lval = en0%lval
      if (lval)  exit
   end do
end function any_p

function no_p (en1, en0) result (lval)
  logical :: lval
  type(eval_node_t), intent(in) :: en1
  type(eval_node_t), intent(inout) :: en0
  integer :: i, n
  n = subevt_get_length (en1%pval)
  lval = .true.
  do i = 1, n
     en0%index = i
     en0%prt1 = subevt_get_prt (en1%pval, i)
     call eval_node_evaluate (en0)
     lval = .not. en0%lval
     if (lval)  exit
  end do
end function no_p
```

This is the interface to user-supplied observables. The node `en0` evaluates to a string that indicates the procedure name. We search for the procedure in the dynamic library and load it into the procedure pointer which is then called. `en1` is the subevent on which the external code operates. The external function returns a `c_int`, which we translate into a real value.

⟨*Eval trees: procedures*⟩+≡

```
    function user_obs_int_p (en0, prt1) result (ival)
      integer :: ival

         type(string_t) :: name
         procedure(user_event_shape_fun), pointer :: user_event_shape
         if (.not. present (en0))  call msg_bug &
              ("user_event_shape called without procedure name")
         call eval_node_evaluate (en0)
         select case (en0%result_type)
         case (V_STR);  name = en0%sval
         case default
            call msg_bug ("user_event_shape: procedure name must be a string")
            name = ""
         end select
         call c_f_procpointer (user_code_find_proc (name), user_event_shape)
         rval = user_event_shape (c_prt (en1%pval), &
                                  int (subevt_get_length (en1%pval), kind=c_int))
       end subroutine user_event_shape_a
```

Binary particle-list functions

This joins two subevents, stored in the evaluation nodes en1 and en2. If en0 is
also present, it amounts to a logical test returning true or false for every pair
of particles. A particle of the second list gets a mask entry only if it passes the
test for all particles of the first list.

⟨*Eval trees: procedures*⟩+≡
```
       subroutine join_pp (subevt, en1, en2, en0)
         type(subevt_t), intent(inout) :: subevt
         type(eval_node_t), intent(in) :: en1, en2
         type(eval_node_t), intent(inout), optional :: en0
         logical, dimension(:), allocatable :: mask2
         integer :: i, j, n1, n2
         n1 = subevt_get_length (en1%pval)
         n2 = subevt_get_length (en2%pval)
```

```
      allocate (mask2 (n2))
      mask2 = .true.
      if (present (en0)) then
         do i = 1, n1
            en0%index = i
            en0%prt1 = subevt_get_prt (en1%pval, i)
            do j = 1, n2
               en0%prt2 = subevt_get_prt (en2%pval, j)
               call eval_node_evaluate (en0)
               mask2(j) = mask2(j) .and. en0%lval
            end do
         end do
      end if
      call subevt_join (subevt, en1%pval, en2%pval, mask2)
   end subroutine join_pp
```

Combine two subevents, i.e., make a list of composite particles built from all
possible particle pairs from the two lists. If en0 is present, create a mask which
is true only for those pairs that pass the test.

⟨*Eval trees: procedures*⟩+≡
```
   subroutine combine_pp (subevt, en1, en2, en0)
     type(subevt_t), intent(inout) :: subevt
     type(eval_node_t), intent(in) :: en1, en2
     type(eval_node_t), intent(inout), optional :: en0
     logical, dimension(:,:), allocatable :: mask12
     integer :: i, j, n1, n2
     n1 = subevt_get_length (en1%pval)
     n2 = subevt_get_length (en2%pval)
     if (present (en0)) then
        allocate (mask12 (n1, n2))
        do i = 1, n1
           en0%index = i
           en0%prt1 = subevt_get_prt (en1%pval, i)
           do j = 1, n2
              en0%prt2 = subevt_get_prt (en2%pval, j)
              call eval_node_evaluate (en0)
              mask12(i,j) = en0%lval
           end do
        end do
        call subevt_combine (subevt, en1%pval, en2%pval, mask12)
     else
        call subevt_combine (subevt, en1%pval, en2%pval)
     end if
   end subroutine combine_pp
```

Combine all particles of the first argument. If en0 is present, create a mask
which is true only for those particles that pass the test w.r.t. all particles in the
second argument. If en0 is absent, the second argument is ignored.

⟨*Eval trees: procedures*⟩+≡
```
   subroutine collect_pp (subevt, en1, en2, en0)
     type(subevt_t), intent(inout) :: subevt
     type(eval_node_t), intent(in) :: en1, en2
     type(eval_node_t), intent(inout), optional :: en0
```

```
      logical, dimension(:), allocatable :: mask1
      integer :: i, j, n1, n2
      n1 = subevt_get_length (en1%pval)
      n2 = subevt_get_length (en2%pval)
      allocate (mask1 (n1))
      mask1 = .true.
      if (present (en0)) then
         do i = 1, n1
            en0%index = i
            en0%prt1 = subevt_get_prt (en1%pval, i)
            do j = 1, n2
               en0%prt2 = subevt_get_prt (en2%pval, j)
               call eval_node_evaluate (en0)
               mask1(i) = mask1(i) .and. en0%lval
            end do
         end do
      end if
      call subevt_collect (subevt, en1%pval, mask1)
   end subroutine collect_pp
```

Select all particles of the first argument. If `en0` is present, create a mask which
is true only for those particles that pass the test w.r.t. all particles in the
second argument. If `en0` is absent, the second argument is ignored, and the first
argument is transferred unchanged. (This case is not very useful, of course.)

⟨*Eval trees: procedures*⟩+≡

```
   subroutine select_pp (subevt, en1, en2, en0)
      type(subevt_t), intent(inout) :: subevt
      type(eval_node_t), intent(in) :: en1, en2
      type(eval_node_t), intent(inout), optional :: en0
      logical, dimension(:), allocatable :: mask1
      integer :: i, j, n1, n2
      n1 = subevt_get_length (en1%pval)
      n2 = subevt_get_length (en2%pval)
      allocate (mask1 (n1))
      mask1 = .true.
      if (present (en0)) then
         do i = 1, n1
            en0%index = i
            en0%prt1 = subevt_get_prt (en1%pval, i)
            do j = 1, n2
               en0%prt2 = subevt_get_prt (en2%pval, j)
               call eval_node_evaluate (en0)
               mask1(i) = mask1(i) .and. en0%lval
            end do
         end do
      end if
      call subevt_select (subevt, en1%pval, mask1)
   end subroutine select_pp
```

Sort the first subevent according to the result of evaluating `en0`. From the
second subevent, only the first element is taken as reference. If `en0` is absent,
we sort by default method (PDG code, particles before antiparticles).

⟨*Eval trees: procedures*⟩+≡

```
subroutine sort_pp (subevt, en1, en2, en0)
  type(subevt_t), intent(inout) :: subevt
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout), optional :: en0

         end do
      end do LOOP1
   end subroutine eval_pp
```

This is the interface to user-supplied observables. The node `en0` evaluates to a string that indicates the procedure name. We search for the procedure in the dynamic library and load it into the procedure pointer which is then called. `en1` is the subevent on which the external code operates. The external function returns a `c_int`, which we translate into a real value.

```

The following function returns an integer value, namely the number of valid particle-pairs from both lists for which the condition is true. Invalid pairs (with

common `src` entry) are ignored. If there is no condition, it returns the number of valid particle pairs.

A function would be more natural. Making it a subroutine avoids another compiler bug (internal error in nagfor 5.2 (649)). (See the interface `binary_num`.)

⟨*Eval trees: procedures*⟩+≡
```
subroutine count_pp (ival, en1, en2, en0)
  integer, intent(out) :: ival
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout), optional :: en0
  integer :: i, j, n1, n2, count
  n1 = subevt_get_length (en1%pval)
  n2 = subevt_get_length (en2%pval)
  if (present (en0)) then
     count = 0
     do i = 1, n1
        en0%index = i
        en0%prt1 = subevt_get_prt (en1%pval, i)
        do j = 1, n2
           en0%prt2 = subevt_get_prt (en2%pval, j)
           if (are_disjoint (en0%prt1, en0%prt2)) then
              call eval_node_evaluate (en0)
              if (en0%lval)  count = count + 1
           end if
        end do
     end do
  else
     count = 0
     do i = 1, n1
        do j = 1, n2
           if (are_disjoint (subevt_get_prt (en1%pval, i), &
                             subevt_get_prt (en2%pval, j))) then
              count = count + 1
           end if
        end do
     end do
  end if
  ival = count
end subroutine count_pp
```

⟨*Eval trees: procedures*⟩+≡
```
subroutine select_pdg_ca (subevt, en1, en2, en0)
  type(subevt_t), intent(inout) :: subevt
  type(eval_node_t), intent(in) :: en1, en2
  type(eval_node_t), intent(inout), optional :: en0
  if (present (en0)) then
     call subevt_select_pdg_code (subevt, en1%aval, en2%pval, en0%ival)
  else
     call subevt_select_pdg_code (subevt, en1%aval, en2%pval)
  end if
end subroutine select_pdg_ca
```

Binary string functions

Currently, the only string operation is concatenation.

⟨*Eval trees: procedures*⟩+≡

```
subroutine concat_ss (string, en1, en2)
  type(string_t), intent(out) :: string
  type(eval_node_t), intent(in) :: en1, en2
  string = en1%sval // en2%sval
end subroutine concat_ss
```

29.3.4   Compiling the parse tree

The evaluation tree is built recursively by following a parse tree. Evaluate an expression. The requested type is given as an optional argument; default is numeric (integer or real).

⟨*Eval trees: procedures*⟩+≡

```
recursive subroutine eval_node_compile_genexpr &
    (en, pn, var_list, result_type)
  type(eval_node_t), pointer :: en
  type(parse_node_t), intent(in) :: pn
  type(var_list_t), intent(in), target :: var_list
  integer, intent(in), optional :: result_type
  if (debug_active (D_MODEL_F)) then
     print *, "read genexpr";  call parse_node_write (pn)
  end if
  if (present (result_type)) then
     select case (result_type)
     case (V_INT, V_REAL, V_CMPLX)
        call eval_node_compile_expr  (en, pn, var_list)
     case (V_LOG)
        call eval_node_compile_lexpr (en, pn, var_list)

     end select
  else
     call eval_node_compile_expr  (en, pn, var_list)
  end if
  if (debug_active (D_MODEL_F)) then
     call eval_node_write (en)
     print *, "done genexpr"
  end if
end subroutine eval_node_compile_genexpr
```

Numeric expressions

This procedure compiles a numerical expression. This is a single term or a sum or difference of terms. We have to account for all combinations of integer and

real arguments. If both are constant, we immediately do the calculation and allocate a constant node.

⟨*Eval trees: procedures*⟩+≡

```
  recursive subroutine eval_node_compile_expr (en, pn, var_list)

Integer, real and complex values have an optional unit. The unit is extracted
and applied immediately. An integer with unit evaluates to a real constant.

Real, complex and integer values are numeric literals with an optional unit
attached. In case of an integer, the unit actually makes it a real value in
disguise. The signed version of real values is not possible in generic expressions;
it is a special case for numeric constants in model files (see below). We do not
introduce signed versions of complex values.

⟨*Eval trees: procedures*⟩+≡

  end if
end subroutine eval_node_compile_constant
```

Compile a variable, with or without a specified type. Take the list of variables,

look for the name and make a node with a pointer to the value. If no type is provided, the variable is numeric, and the stored value determines whether it is real or integer.

We explicitly demand that the variable is defined, so we do not accidentally point to variables that are declared only later in the script but have come into existence in a previous compilation pass.

Variables may actually be anonymous, these are expressions in disguise. In that case, the expression replaces the variable name in the parse tree, and we allocate an ordinary expression node in the eval tree.

Variables of type V_PDG (pdg-code array) are not treated here. They are handled by `eval_node_compile_cvariable`.

Retrieve the result of an integration. If the requested process has been integrated, the results are available as special variables. (The variables cannot be accessed in the usual way since they contain brackets in their names.)

Since this compilation step may occur before the processes have been loaded, we have to initialize the required variables before they are used.

This user observable behaves like a variable. We link the node to the generic user-observable entry in the variable list. The syntax element has an argument which provides the name of the user variable, this is stored as an eval-node alongside with the variable. When the variable value is used, the user-supplied external function is called and provides the (real) result value.

Variable definition

A block expression contains a variable definition (first argument) and an expression where the definition can be used (second argument). The `result_type` decides which type of expression is expected for the second argument. For numeric variables, if there is a mismatch between real and integer type, insert an extra node for type conversion.

⟨*Eval trees: procedures*⟩+≡
```

```

Conditionals

A conditional has the structure if lexpr then expr else expr. So we first eval-
uate the logical expression, then depending on the result the first or second
expression. Note that the second expression is mandatory.

The `result_type`, if present, defines the requested type of the `then` and
`else` clauses. Default is numeric (int/real). If there is a mismatch between real
and integer result types, insert conversion nodes.

⟨*Eval trees: procedures*⟩+≡
```
   recursive subroutine eval_node_compile_conditional &
       (en, pn, var_list, result_type)
     type(eval_node_t), pointer :: en

Comparisons

Up to the loop, this is easy. There is always at least one comparison. This is evaluated, and the result is the logical node **en**. If it is constant, we keep its second sub-node as **en2**. (Thus, at the very end **en2** has to be deleted if **en** is (still) constant.)

If there is another comparison, we first check if the first comparison was constant. In that case, there are two possibilities: (i) it was true. Then, its right-hand side is compared with the new right-hand side, and the result replaces the previous one which is deleted. (ii) it was false. In this case, the result of the whole comparison is false, and we can exit the loop without evaluating anything else.

Now assume that the first comparison results in a valid branch, its second sub-node kept as **en2**. We first need a copy of this, which becomes the new left-hand side. If **en2** is constant, we make an identical constant node **en1**. Otherwise, we make **en1** an appropriate pointer node. Next, the first branch is saved as **en0** and we evaluate the comparison between **en1** and the a right-hand side. If this turns out to be constant, there are again two possibilities: (i) true, then we revert to the previous result. (ii) false, then the wh

    end subroutine eval_node_compile_compared_expr
```

This takes two extra arguments: `en1`, the left-hand-side of the comparison, is already allocated and evaluated. `en2` (the right-hand side) and `en` (the result) are allocated by the routine. `pn` is the parse node which contains the operator and the right-hand side as subnodes.

If the result of the comparison is constant, `en1` is deleted but `en2` is kept, because it may be used in a subsequent comparison. `en` then becomes a constant.

If the result is variable, `en` becomes a branch node which refers to `en1` and `en2`.

      if (debug_active (D_MODEL_F)) then
          call eval_node_write (en)
          print *, "done pterm"
```

```
        end if
    end subroutine eval_node_compile_pterm
```

A particle-list value is a PDG-code array, a particle identifier, a variable, a (grouped) pexpr, a block pexpr, a conditional, or a particle-list function.

The `cexpr` node is responsible for transforming a constant PDG-code array into a subevent. It takes the code array as its first argument, the event subevent as its second argument, and the requested particle type (incoming/outgoing) as its zero-th argument. The result is the list of particles in the event that match the code array.

⟨*Eval trees: procedures*⟩+≡

Particle functions

This combines the treatment of 'join', 'combine', 'collect', 'cluster', 'select', and 'extract' which all have the same syntax. The one or two argument nodes are allocated. If there is a condition, the condition node is also allocated as a logical expression, for which the variable list is augmented by the appropriate (unary/binary) observables.

     call eval_node_compile_conditional (en, pn, var_list, V_PDG)
  case default
     call parse_node_mismatch &
          ("grouped_cexpr|block_cexpr|conditional_cexpr|" // &
           "pdg_code|cvariable|prt_name", pn)
  end select
  if (debug_active (D_MODEL_F)) then
     call eval_node_write (en)
     print *, "done avalue"
  end if
end subroutine eval_node_compile_avalue
```

Compile a PDG-code expression, which is the key PDG with an integer expression
as argument. The procedure is analogous to eval_node_compile_unary_function.
⟨*Eval trees: procedures*⟩+≡

```
subroutine eval_node_compile_pdg_code (en, pn, var_list)
  type(eval_node_t), pointer :: en
  type(parse_node_t), intent(in), target :: pn
  type(var_list_t), intent(in), target :: var_list
  type(parse_node_t), pointer :: pn_arg
  type(eval_node_t), pointer :: en1
  type(string_t) :: key
  type(pdg_array_t) :: aval
  integer :: t
  if (debug_active (D_MODEL_F)) then
     print *, "read PDG code";  call parse_node_write (pn)
  end if
  pn_arg => parse_node_get_sub_ptr (pn, 2)
  call eval_node_compile_expr &
       (en1, parse_node_get_sub_ptr (pn_arg, tag="expr"), var_list)
  t = en1%result_type
  allocate (en)
  key = "PDG"
  if (en1%type == EN_CONSTANT) then
     select case (t)
     case (V_INT)
```

```
      call pdg_i (aval, en1)
      call eval_node_init_pdg_array (en, aval)
   case default;  call eval_type_error (pn, char (key), t)
   end select
   call eval_node_final_rec (en1)
   deallocate (en1)
else
   select case (t)
   case (V_INT);  call eval_node_set_op1_pdg (en, pdg_i)
   case default;  call eval_type_error (pn, char (key), t)
   end select
end if
if (debug_active (D_MODEL_F)) then
   call eval_node_write (en)
   print *, "done function"
end if
end subroutine eval_node_compile_pdg_code
```

This is entirely analogous to `eval_node_compile_variable`. However, PDG-array variables occur in different contexts.

To avoid name clashes between PDG-array variables and ordinary variables, we prepend a character (*). This is not visible to the user.

⟨*Eval trees: procedures*⟩+≡

```
subroutine eval_node_compile_cvariable (en, pn, var_list)
  type(eval_node_t), pointer :: en
  type(parse_node_t), intent(in), target :: pn
  type(var_list_t), intent(in), target :: var_list
  type(parse_node_t), pointer :: pn_name
  type(string_t) :: var_name
  type(pdg_array_t), pointer :: aptr
  type(pdg_array_t), target, save :: no_aval
  logical, pointer :: known
  logical, target, save :: unknown = .false.
  if (debug_active (D_MODEL_F)) then

     call eval_node_init_pdg_array_ptr (en, var_name, no_aval, unknown)
  end if
  if (debug_active (D_MODEL_F)) then
     call eval_node_write (en)
     print *, "done cvariable"
  end if
end subroutine eval_node_compile_cvariable
```

String expressions

A string expression is either a string value or a concatenation of string values.

⟨*Eval trees: procedures*⟩+≡
```
recursive subroutine eval_node_compile_sexpr (en, pn, var_list)
  type(eval_node_t), pointer :: en
  type(parse_node_t), intent(in) :: pn
  type(var_list_t), intent(in), target :: var_list
  type(parse_node_t), pointer :: pn_svalue, pn_concatenation, pn_op, pn_arg
  type(eval_node_t), pointer :: en1, en2
  type(string_t) :: string
  if (debug_active (D_MODEL_F)) then
     print *, "read sexpr";  call parse_node_write (pn)
  end if
  pn_svalue => parse_node_get_sub_ptr (pn)
  call eval_node_compile_svalue (en, pn_svalue, var_list)
  pn_concatenation => &
       parse_node_get_next_ptr (pn_svalue, tag="str_concatenation")
  do while (associated (pn_concatenation))
     pn_op => parse_node_get_sub_ptr (pn_concatenation)
     pn_arg => parse_node_get_next_ptr (pn_op)
     en1 => en
     call eval_node_compile_svalue (en2, pn_arg, var_list)
     allocate (en)
     if (en1%type == EN_CONSTANT .and. en2%type == EN_CONSTANT) then
        call concat_ss (string, en1, en2)
        call eval_node_init_string (en, string)
        call eval_node_final_rec (en1)
        call eval_node_final_rec (en2)
        deallocate (en1, en2)
     else
        call eval_node_init_branch &
             (en, var_str ("concat"), V_STR, en1, en2)
        call eval_node_set_op2_str (en, concat_ss)
     end if
     pn_concatenation => parse_node_get_next_ptr (pn_concatenation)
  end do
  if (debug_active (D_MODEL_F)) then
     call eval_node_write (en)
     print *, "done sexpr"
  end if
end subroutine eval_node_compile_sexpr
```

A string value is a string literal, a variable, a (grouped) sexpr, a block sexpr, or a conditional.

⟨*Eval trees: procedures*⟩+≡
```
recursive subroutine eval_node_compile_svalue (en, pn, var_list)
  type(eval_node_t), pointer :: en
  type(parse_node_t), intent(in) :: pn
  type(var_list_t), intent(in), target :: var_list
  if (debug_active (D_MODEL_F)) then
     print *, "read svalue";  call parse_node_write (pn)
  end if
  select case (char (parse_node_get_rule_key (pn)))
```

3950

```
      case ("svariable")
         call eval_node_compile_variable (en, pn, var_list, V_STR)
      case ("sexpr")
         call eval_node_compile_sexpr (en, pn, var_list)
      case ("block_sexpr")
         call eval_node_compile_block_expr (en, pn, var_list, V_STR)
      case ("conditional_sexpr")
         call eval_node_compile_conditional (en, pn, var_list, V_STR)
      case ("sprintf_fun")
         call eval_node_compile_sprintf (en, pn, var_list)
      case ("string_literal")
         allocate (en)
         call eval_node_init_string (en, parse_node_get_string (pn))
      case default
         call parse_node_mismatch &
              ("svariable|" // &
               "grouped_sexpr|block_sexpr|conditional_sexpr|" // &
               "string_function|string_literal", pn)
      end select
      if (debug_active (D_MODEL_F)) then
         call eval_node_write (en)
         print *, "done svalue"
      end if
    end subroutine eval_node_compile_svalue
```

There is currently one string function, sprintf. For sprintf, the first argument
(no brackets) is the format string, the optional arguments in brackets are the
expressions or variables to be formatted.

⟨*Eval trees: procedures*⟩+≡

```
    recursive subroutine eval_node_compile_sprintf (en, pn, var_list)
      type(eval_node_t), pointer :: en

```

3953

```
        end if
    end subroutine evaluate_sprintf
```

29.3.5 Auxiliary functions for the compiler

Issue an error that the current node could not be compiled because of type mismatch:

⟨*Eval trees: procedures*⟩+≡
```
    subroutine eval_type_error (pn, string, t)
      type(parse_node_t), intent(in) :: pn
      character(*), intent(in) :: string
      integer, intent(in) :: t
      type(string_t) :: type
      select case (t)
      case (V_NONE); type = "(none)"
      case (V_LOG);  type = "'logical'"
      case (V_INT);  type = "'integer'"
      case (V_REAL); type = "'real'"
      case (V_CMPLX); type = "'complex'"
      case default;  type = "(unknown)"
      end select
      call parse_node_write (pn)
      call msg_fatal (" The " // string // &
           " operation is not defined for the given argument type " // &
           char (type))
    end subroutine eval_type_error
```

If two numerics are combined, the result is integer if both arguments are integer, if one is integer and the other real or both are real, than its argument is real, otherwise complex.

⟨*Eval trees: procedures*⟩+≡
```
    function numeric_result_type (t1, t2) result (t)
      integer, intent(in) :: t1, t2
      integer :: t
      if (t1 == V_INT .and. t2 == V_INT) then
         t = V_INT
      else if (t1 == V_INT .and. t2 == V_REAL) then
         t = V_REAL
      else if (t1 == V_REAL .and. t2 == V_INT) then
         t = V_REAL
      else if (t1 == V_REAL .and. t2 == V_REAL) then
         t = V_REAL
      else
         t = V_CMPLX
      end if
    end function numeric_result_type
```

29.3.6 Evaluation

Evaluation is done recursively. For leaf nodes nothing is to be done.

Evaluating particle-list functions: First, we evaluate the particle lists. If
a condition is present, we assign the particle pointers of the condition node
to the allocated particle entries in the parent node, keeping in mind that the
observables in the variable stack used for the evaluation of the condition also
contain pointers to these entries. Then, the assigned procedure is evaluated,
which sets the subevent in the parent node. If required, the procedure evaluates
the condition node once for each (pair of) particles to determine the result.

⟨*Eval trees: procedures*⟩+≡

```

  end subroutine eval_node_evaluate
```

Test method

This is called from a unit test: initialize a particular observable.

⟨*Eval trees: eval node: TBP*⟩+≡
```
    procedure :: test_obs => eval_node_test_obs
```

⟨*Eval trees: procedures*⟩+≡
```
    subroutine eval_node_test_obs (node, var_list, var_name)
      class(eval_node_t), intent(inout) :: node
      type(var_list_t), intent(in) :: var_list
      type(string_t), intent(in) :: var_name
      procedure(obs_unary_int), pointer :: obs1_iptr
      type(prt_t), pointer :: p1
      call var_list%get_obs1_iptr (var_name, obs1_iptr, p1)
      call eval_node_init_obs1_int_ptr (node, var_name, obs1_iptr, p1)
    end subroutine eval_node_test_obs
```

29.3.7 Evaluation syntax

We have two different flavors of the syntax: with and without particles.

⟨*Eval trees: public*⟩+≡
```
    public :: syntax_expr
    public :: syntax_pexpr
```

⟨*Eval trees: variables*⟩≡
```
    type(syntax_t), target, save :: syntax_expr
    type(syntax_t), target, save :: syntax_pexpr
```

These are for testing only and may be removed:

⟨*Eval trees: public*⟩+≡
```
    public :: syntax_expr_init
    public :: syntax_pexpr_init
```

⟨*Eval trees: procedures*⟩+≡
```
    subroutine syntax_expr_init ()
      type(ifile_t) :: ifile
      call define_expr_syntax (ifile, particles=.false., analysis=.false.)
      call syntax_init (syntax_expr, ifile)
      call ifile_final (ifile)
    end subroutine syntax_expr_init

    subroutine syntax_pexpr_init ()
      type(ifile_t) :: ifile
      call define_expr_syntax (ifile, particles=.true., analysis=.false.)
      call syntax_init (syntax_pexpr, ifile)
      call ifile_final (ifile)
    end subroutine syntax_pexpr_init
```

⟨*Eval trees: public*⟩+≡
```
    public :: syntax_expr_final
    public :: syntax_pexpr_final
```
⟨*Eval trees: procedures*⟩+≡
```
    subroutine syntax_expr_final ()
      call syntax_final (syntax_expr)
    end subroutine syntax_expr_final

    subroutine syntax_pexpr_final ()
      call syntax_final (syntax_pexpr)
    end subroutine syntax_pexpr_final
```

⟨*Eval trees: public*⟩+≡
```
    public :: syntax_pexpr_write
```
⟨*Eval trees: procedures*⟩+≡
```
    subroutine syntax_pexpr_write (unit)
      integer, intent(in), optional :: unit
      call syntax_write (syntax_pexpr, unit)
    end subroutine syntax_pexpr_write
```

⟨*Eval trees: public*⟩+≡
```
    public :: define_expr_syntax
```
Numeric expressions.

⟨*Eval trees: procedures*⟩+≡
```
    subroutine define_expr_syntax (ifile, particles, analysis)
      type(ifile_t), intent(inout) :: ifile
      logical, intent(in) :: particles, analysis
      type(string_t) :: numeric_pexpr
      type(string_t) :: var_plist, var_alias
      if (particles) then

      call lexer_final (lexer)
   end subroutine parse_tree_init_sexpr
```

29.3.9 The evaluation tree

The evaluation tree contains the initial variable list and the root node.

⟨*Eval trees: public*⟩+≡
```
      public :: eval_tree_t
```

⟨*Eval trees: types*⟩+≡
```
      type, extends (expr_t) :: eval_tree_t
        private
        type(parse_node_t), pointer :: pn => null ()
```

```
      type(var_list_t) :: var_list
      type(eval_node_t), pointer :: root => null ()
    contains
    ⟨Eval trees: eval tree: TBP⟩
    end type eval_tree_t
```

Init from stream, using a temporary parse tree.

⟨*Eval trees: eval tree: TBP*⟩≡
```
    procedure :: init_stream => eval_tree_init_stream
```

⟨*Eval trees: procedures*⟩+≡
```
    subroutine eval_tree_init_stream &
        (eval_tree, stream, var_list, subevt, result_type)
      class(eval_tree_t), intent(out), target :: eval_tree
      type(stream_t), intent(inout), target :: stream
      type(var_list_t), intent(in), target :: var_list
      type(subevt_t), intent(in), target, optional :: subevt
      integer, intent(in), optional :: result_type
      type(parse_tree_t) :: parse_tree
      type(parse_node_t), pointer :: nd_root
      integer :: type
      type = V_REAL;  if (present (result_type))  type = result_type
      select case (type)
      case (V_INT, V_REAL, V_CMPLX)
         call parse_tree_init_expr (parse_tree, stream, present (subevt))
      case (V_LOG)
         call parse_tree_init_lexpr (parse_tree, stream, present (subevt))
      case (V_SEV)
         call parse_tree_init_pexpr (parse_tree, stream)
      case (V_PDG)
         call parse_tree_init_cexpr (parse_tree, stream)
      case (V_STR)
         call parse_tree_init_sexpr (parse_tree, stream, present (subevt))
      end select
      nd_root => parse_tree%get_root_ptr ()
      if (associated (nd_root)) then
         select case (type)
         case (V_INT, V_REAL, V_CMPLX)
            call eval_tree_init_expr (eval_tree, nd_root, var_list, subevt)
         case (V_LOG)
            call eval_tree_init_lexpr (eval_tree, nd_root, var_list, subevt)
         case (V_SEV)
            call eval_tree_init_pexpr (eval_tree, nd_root, var_list, subevt)
         case (V_PDG)
            call eval_tree_init_cexpr (eval_tree, nd_root, var_list, subevt)
         case (V_STR)
            call eval_tree_init_sexpr (eval_tree, nd_root, var_list, subevt)
         end select
      end if
      call parse_tree_final (parse_tree)
    end subroutine eval_tree_init_stream
```

API (to be superseded by the methods below): Init from a given parse-tree

node. If we evaluate an expression that contains particle-list references, the original subevent has to be supplied. The initial variable list is optional.

⟨*Eval trees: eval tree: TBP*⟩+≡

```
procedure :: init_expr  => eval_tree_init_expr
procedure :: init_lexpr => eval_tree_init_lexpr
procedure :: init_pexpr => eval_tree_init_pexpr
procedure :: init_cexpr => eval_tree_init_cexpr
procedure :: init_sexpr => eval_tree_init_sexpr
```

⟨*Eval trees: procedures*⟩+≡

```
subroutine eval_tree_init_expr &

      call eval_tree_link_var_list (expr, var_list)
      if (present (subevt))  call eval_tree_set_subevt (expr, subevt)
      call eval_node_compile_sexpr &
            (expr%root, parse_node, expr%var_list)
    end subroutine eval_tree_init_sexpr
```

Alternative: set up the expression using the parse node that has already been stored. We assume that the subevt or any other variable that may be referred to has already been added to the local variable list.

⟨*Eval trees: eval tree: TBP*⟩+≡
```
    procedure :: setup_expr  => eval_tree_setup_expr
    procedure :: setup_lexpr => eval_tree_setup_lexpr
    procedure :: setup_pexpr => eval_tree_setup_pexpr
    procedure :: setup_cexpr => eval_tree_setup_cexpr
    procedure :: setup_sexpr => eval_tree_setup_sexpr
```

⟨*Eval trees: procedures*⟩+≡
```
    subroutine eval_tree_setup_expr (expr, vars)
      class(eval_tree_t), intent(inout), target :: expr
      class(vars_t), intent(in), target :: vars
      call eval_tree_link_var_list (expr, vars)
      call eval_node_compile_expr (expr%root, expr%pn, expr%var_list)
    end subroutine eval_tree_setup_expr

    subroutine eval_tree_setup_lexpr (expr, vars)
      class(eval_tree_t), intent(inout), target :: expr
      class(vars_t), intent(in), target :: vars
      call eval_tree_link_var_list (expr, vars)
      call eval_node_compile_lexpr (expr%root, expr%pn, expr%var_list)
    end subroutine eval_tree_setup_lexpr

    subroutine eval_tree_setup_pexpr (expr, vars)
      class(eval_tree_t), intent(inout), target :: expr
      class(vars_t), intent(in), target :: vars
      call eval_tree_link_var_list (expr, vars)
      call eval_node_compile_pexpr (expr%root, expr%pn, expr%var_list)
    end subroutine eval_tree_setup_pexpr

    subroutine eval_tree_setup_cexpr (expr, vars)
      class(eval_tree_t), intent(inout), target :: expr
      class(vars_t), intent(in), target :: vars
      call eval_tree_link_var_list (expr, vars)
      call eval_node_compile_cexpr (expr%root, expr%pn, expr%var_list)
    end subroutine eval_tree_setup_cexpr
```

```
subroutine eval_tree_setup_sexpr (expr, vars)
  class(eval_tree_t), intent(inout), target :: expr
  class(vars_t), intent(in), target :: vars
  call eval_tree_link_var_list (expr, vars)
  call eval_node_compile_sexpr (expr%root, expr%pn, expr%var_list)
end subroutine eval_tree_setup_sexpr
```

This extra API function handles numerical constant expressions only. The only nontrivial part is the optional unit.

⟨*Eval trees: eval tree: TBP*⟩+≡
```
procedure :: init_numeric_value => eval_tree_init_numeric_value
```

⟨*Eval trees: procedures*⟩+≡
```
subroutine eval_tree_init_numeric_value (eval_tree, parse_node)
  class(eval_tree_t), intent(out), target :: eval_tree
  type(parse_node_t), intent(in), target :: parse_node
  call eval_node_compile_numeric_value (eval_tree%root, parse_node)
end subroutine eval_tree_init_numeric_value
```

Initialize the variable list, linking it to a context variable list.

⟨*Eval trees: procedures*⟩+≡
```
subroutine eval_tree_link_var_list (eval_tree, vars)
  type(eval_tree_t), intent(inout), target :: eval_tree
  class(vars_t), intent(in), target :: vars
  call eval_tree%var_list%link (vars)
end subroutine eval_tree_link_var_list
```

Include a subevent object in the initialization. We add a pointer to this as variable @evt in the local variable list.

⟨*Eval trees: procedures*⟩+≡
```
subroutine eval_tree_set_subevt (eval_tree, subevt)
  type(eval_tree_t), intent(inout), target :: eval_tree
  type(subevt_t), intent(in), target :: subevt
  logical, save, target :: known = .true.
  call var_list_append_subevt_ptr &
       (eval_tree%var_list, var_str ("@evt"), subevt, known, &
       intrinsic=.true.)
end subroutine eval_tree_set_subevt
```

Finalizer.

⟨*Eval trees: eval tree: TBP*⟩+≡
```
procedure :: final => eval_tree_final
```

⟨*Eval trees: procedures*⟩+≡
```
subroutine eval_tree_final (expr)
  class(eval_tree_t), intent(inout) :: expr
  call expr%var_list%final ()
  if (associated (expr%root)) then
     call eval_node_final_rec (expr%root)
     deallocate (expr%root)
  end if
```

```
      end subroutine eval_tree_final
```

⟨*Eval trees: eval tree: TBP*⟩+≡
```
    procedure :: evaluate => eval_tree_evaluate
```

⟨*Eval trees: procedures*⟩+≡
```
    subroutine eval_tree_evaluate (expr)
      class(eval_tree_t), intent(inout) :: expr
      if (associated (expr%root)) then
         call eval_node_evaluate (expr%root)
      end if
    end subroutine eval_tree_evaluate
```

Check if the eval tree is allocated.

⟨*Eval trees: procedures*⟩+≡
```
    function eval_tree_is_defined (eval_tree) result (flag)
      logical :: flag
      type(eval_tree_t), intent(in) :: eval_tree
      flag = associated (eval_tree%root)
    end function eval_tree_is_defined
```

Check if the eval tree result is constant.

⟨*Eval trees: procedures*⟩+≡
```
    function eval_tree_is_constant (eval_tree) result (flag)
      logical :: flag
      type(eval_tree_t), intent(in) :: eval_tree
      if (associated (eval_tree%root)) then
         flag = eval_tree%root%type == EN_CONSTANT
      else
         flag = .false.
      end if
    end function eval_tree_is_constant
```

Insert a conversion node at the root, if necessary (only for real/int conversion)

⟨*Eval trees: procedures*⟩+≡
```
    subroutine eval_tree_convert_result (eval_tree, result_type)
      type(eval_tree_t), intent(inout) :: eval_tree
      integer, intent(in) :: result_type
      if (associated (eval_tree%root)) then
         call insert_conversion_node (eval_tree%root, result_type)
      end if
    end subroutine eval_tree_convert_result
```

Return the value of the top node, after evaluation. If the tree is empty, return
the type of V_NONE. When extracting the value, no check for existence is done.
For numeric values, the functions are safe against real/integer mismatch.

⟨*Eval trees: eval tree: TBP*⟩+≡

       type(subevt_t), intent(in), optional, target :: subevt
       integer, intent(out), optional :: ival
       real(default), intent(out), optional :: rval
       complex(default), intent(out), optional :: cval
       logical, intent(out), optional :: is_known
       integer, intent(out), optional :: result_type
       type(eval_tree_t), target :: eval_tree
       call eval_tree_init_expr &
            (eval_tree, parse_node, var_list, subevt)
       call eval_tree_evaluate (eval_tree)
       if (eval_tree_result_is_known (eval_tree)) then
          if (present (ival))  ival = eval_tree_get_int (eval_tree)
          if (present (rval))  rval = eval_tree_get_real (eval_tree)
          if (present (cval))  cval = eval_tree_get_cmplx (eval_tree)
          if (present (is_known))  is_known = .true.
       else
          call eval_tree_unknown (eval_tree, parse_node)
          if (present (ival))  ival = 0
          if (present (rval))  rval = 0
          if (present (cval))  cval = 0
          if (present (is_known))  is_known = .false.
       end if
       if (present (result_type))  &
            result_type = eval_tree_get_result_type (eval_tree)
       call eval_tree_final (eval_tree)
     end subroutine eval_numeric
```

Error message with debugging info:

⟨*Eval trees: procedures*⟩+≡
```
subroutine eval_tree_unknown (eval_tree, parse_node)
  type(eval_tree_t), intent(in) :: eval_tree
  type(parse_node_t), intent(in) :: parse_node
  call parse_node_write_rec (parse_node)
  call eval_tree_write (eval_tree)
  call msg_error ("Evaluation yields an undefined result, inserting default")
end subroutine eval_tree_unknown
```

29.3.11 Factory Type

Since `eval_tree_t` is an implementation of `expr_t`, we also need a matching factory type and build method.

⟨*Eval trees: public*⟩+≡
```
public :: eval_tree_factory_t
```

⟨*Eval trees: types*⟩+≡
```
type, extends (expr_factory_t) :: eval_tree_factory_t
   private
   type(parse_node_t), pointer :: pn => null ()
 contains
```
⟨*Eval trees: eval tree factory: TBP*⟩
```
end type eval_tree_factory_t
```

Output: delegate to the output of the embedded parse node.

⟨*Eval trees: eval tree factory: TBP*⟩≡
```
procedure :: write => eval_tree_factory_write
```

⟨*Eval trees: procedures*⟩+≡
```
subroutine eval_tree_factory_write (expr_factory, unit)
  class(eval_tree_factory_t), intent(in) :: expr_factory
  integer, intent(in), optional :: unit
  if (associated (expr_factory%pn)) then
     call parse_node_write_rec (expr_factory%pn, unit)
  end if
end subroutine eval_tree_factory_write
```

Initializer: take a parse node and hide it thus from the environment.

⟨*Eval trees: eval tree factory: TBP*⟩+≡
```
procedure :: init => eval_tree_factory_init
```

⟨*Eval trees: procedures*⟩+≡
```
subroutine eval_tree_factory_init (expr_factory, pn)
  class(eval_tree_factory_t), intent(out) :: expr_factory
  type(parse_node_t), intent(in), pointer :: pn
  expr_factory%pn => pn
end subroutine eval_tree_factory_init
```

Factory method: allocate expression with correct eval tree type. If the stored parse node is not associate, don't allocate.

⟨*Eval trees: eval tree factory: TBP*⟩+≡
```
procedure :: build => eval_tree_factory_build
```

⟨*Eval trees: procedures*⟩+≡
```
subroutine eval_tree_factory_build (expr_factory, expr)
  class(eval_tree_factory_t), intent(in) :: expr_factory
  class(expr_t), intent(out), allocatable :: expr
  if (associated (expr_factory%pn)) then
      allocate (eval_tree_t :: expr)
      select type (expr)
      type is (eval_tree_t)
         expr%pn => expr_factory%pn
      end select
  end if
end subroutine eval_tree_factory_build
```

29.4 Physics Models

A model object represents a physics model. It contains a table of particle data, a list of parameters, and a vertex table. The list of parameters is a variable list which includes the real parameters (which are pointers to the particle data table) and PDG array variables for the particles themselves. The vertex list is used for phase-space generation, not for calculating the matrix element.

The actual numeric model data are in the base type `model_data_t`, as part of the `qft` section. We implement the `model_t` as an extension of this, for convenient direct access to the base-type methods via inheritance. (Alternatively, we could delegate these calls explicitly.) The extension contains administrative additions, such as the methods for recalculating derived data and keeping the parameter set consistent. It thus acts as a proxy of the actual model-data object towards the WHIZARD package. There are further proxy objects, such as the `parameter_t` array which provides the interface to the actual numeric parameters.

Model definitions are read from model files. Therefore, this module contains a parser for model files. The parameter definitions (derived parameters) are Sindarin expressions.

The models, as read from file, are stored in a model library which is a simple list of model definitions. For setting up a process object we should make a copy (an instance) of a model, which gets the current parameter values from the global variable list.

29.4.2 Physics Parameters

A parameter has a name, a value. Derived parameters also have a definition in terms of other parameters, which is stored as an eval_tree. External parameters are set by an external program.

This parameter object should be considered as a proxy object. The parameter name and value are stored in a corresponding modelpar_data_t object which is located in a model_data_t object. The latter is a component of the model_t handler. Methods of parameter_t can be delegated to the par_data_t component.

The pn component is a pointer to the parameter definition inside the model parse tree. It allows us to recreate the eval_tree when making copies (instances) of the parameter object.

⟨*Models: parameters*⟩≡
```
    integer, parameter :: PAR_NONE = 0, PAR_UNUSED = -1
    integer, parameter :: PAR_INDEPENDENT = 1, PAR_DERIVED = 2
    integer, parameter :: PAR_EXTERNAL = 3
```

⟨*Models: types*⟩≡
```
    type :: parameter_t
      private
      integer :: type  = PAR_NONE
      class(modelpar_data_t), pointer :: data => null ()
      type(parse_node_t), pointer :: pn => null ()
      class(expr_t), allocatable :: expr
    contains
    ⟨Models: parameter: TBP⟩
    end type parameter_t
```

Initialization depends on parameter type. Independent parameters are initialized by a constant value or a constant numerical expression (which may contain

a unit). Derived parameters are initialized by an arbitrary numerical expression, which makes use of the current variable list. The expression is evaluated by the function `parameter_reset`.

This implementation supports only real parameters and real values.

⟨*Models: parameter: TBP*⟩≡
```

      end if
    end subroutine parameter_show
```

29.4.3 Model Object

A model object holds all information about parameters, particles, and vertices. For models that require an external program for parameter calculation, there is

the pointer to a function that does this calculation, given the set of independent and derived parameters.

As explained above, the type inherits from `model_data_t`, which is the actual storage for the model data.

When reading a model, we create a parse tree. Parameter definitions are available via parse nodes. Since we may need those later when making model instances, we keep the whole parse tree in the model definition (but not in the instances).

⟨*Models: public*⟩≡
```
    public :: model_t
```

⟨*Models: types*⟩+≡
```
    type, extends (model_data_t) :: model_t
      private
      character(32) :: md5sum = ""
      logical :: ufo_model = .false.
      type(string_t) :: ufo_path
      type(string_t), dimension(:), allocatable :: schemes
      type(string_t), allocatable :: selected_scheme
      type(parameter_t), dimension(:), allocatable :: par
      integer :: max_par_name_length = 0
      integer :: max_field_name_length = 0
      type(var_list_t) :: var_list
      type(string_t) :: dlname
      procedure(model_init_external_parameters), nopass, pointer :: &
           init_external_parameters => null ()
      type(dlaccess_t) :: dlaccess
      type(parse_tree_t) :: parse_tree
    contains
    ⟨Models: model: TBP⟩
    end type model_t
```

This is the interface for a procedure that initializes the calculation of external parameters, given the array of all parameters.

⟨*Models: interfaces*⟩≡
```
    abstract interface
      subroutine model_init_external_parameters (par) bind (C)
        import
        real(c_default_float), dimension(*), intent(inout) :: par
      end subroutine model_init_external_parameters
    end interface
```

Initialization: Specify the number of parameters, particles, vertices and allocate memory. If an associated DL library is specified, load this library.

The model may already carry scheme information, so we have to save and restore the scheme number when actually initializing the `model_data_t` base.

⟨*Models: model: TBP*⟩≡

```

For a model instance, we do not attempt to load a DL library. This is the core
of the full initializer above.

4001

⟨*Models: model: TBP*⟩+≡
```
    procedure, private :: basic_init => model_basic_init
```

⟨*Models: procedures*⟩+≡
```
    subroutine model_basic_init (model, name, n_par, n_prt, n_vtx)
      class(model_t), intent(inout) :: model
      type(string_t), intent(in) :: name
      integer, intent(in) :: n_par, n_prt, n_vtx
      allocate (model%par (n_par))
      call model%model_data_t%init (name, n_par, 0, n_prt, n_vtx)
    end subroutine model_basic_init
```

Finalization: The variable list contains allocated pointers, also the parse tree. We also close the DL access object, if any, that enables external parameter calculation.

⟨*Models: model: TBP*⟩+≡
```
    procedure :: final => model_final
```

⟨*Models: procedures*⟩+≡
```
    subroutine model_final (model)
      class(model_t), intent(inout) :: model
      integer :: i
      if (allocated (model%par)) then
         do i = 1, size (model%par)
            call model%par(i)%final ()
         end do
      end if

Make a copy of a parameter. We assume that the model_data_t parameter
arrays have already been copied, so names and values are available in the current
model, and can be used as targets. The eval tree should not be copied, since
it should refer to the new variable list. The safe solution is to make use of the
above initializers, which also take care of the building a new variable list.

      integer, intent(in) :: i
      type(string_t), intent(in) :: name_src
      type(field_data_t), pointer :: field_src, field
      field_src => model%get_field_ptr (name_src)
      field => model%get_field_ptr_by_index (i)
      call field%copy_from (field_src)
    end subroutine model_copy_field
```

29.4.4   Model Access via Variables

Write the model variable list.

⟨*Models: model: TBP*⟩+≡
```
    procedure :: write_var_list => model_write_var_list
```

⟨*Models: procedures*⟩+≡
```
    subroutine model_write_var_list (model, unit, follow_link)
      class(model_t), intent(in) :: model
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: follow_link
      call var_list_write (model%var_list, unit, follow_link)
    end subroutine model_write_var_list
```

Link a variable list to the model variables.

⟨*Models: model: TBP*⟩+≡
```
    procedure :: link_var_list => model_link_var_list
```

⟨*Models: procedures*⟩+≡
```
    subroutine model_link_var_list (model, var_list)
      class(model_t), intent(inout) :: model
      type(var_list_t), intent(in), target :: var_list
      call model%var_list%link (var_list)
    end subroutine model_link_var_list
```

Check if the model contains a named variable.

⟨*Models: model: TBP*⟩+≡
```
    procedure :: var_exists => model_var_exists
```

⟨*Models: procedures*⟩+≡
```
    function model_var_exists (model, name) result (flag)
      class(model_t), intent(in) :: model
      type(string_t), intent(in) :: name
      logical :: flag
```

```
      flag = model%var_list%contains (name, follow_link=.false.)
    end function model_var_exists
```

Check if the model variable is a derived parameter, i.e., locked.
⟨*Models: model: TBP*⟩+≡
```
    procedure :: var_is_locked => model_var_is_locked
```

⟨*Models: procedures*⟩+≡
```
    function model_var_is_locked (model, name) result (flag)
      class(model_t), intent(in) :: model
      type(string_t), intent(in) :: name
      logical :: flag
      flag = model%var_list%is_locked (name, follow_link=.false.)
    end function model_var_is_locked
```

Set a model parameter via the named variable. We assume that the variable
exists and is writable, i.e., non-locked. We update the model and variable list,
so independent and derived parameters are always synchronized.
⟨*Models: model: TBP*⟩+≡
```
    procedure :: set_real => model_var_set_real
```

⟨*Models: procedures*⟩+≡
```
    subroutine model_var_set_real (model, name, rval, verbose, pacified)
      class(model_t), intent(inout) :: model
      type(string_t), intent(in) :: name
      real(default), intent(in) :: rval
      logical, intent(in), optional :: verbose, pacified
      call model%var_list%set_real (name, rval, &
           is_known=.true., ignore=.false., &
           verbose=verbose, model_name=model%get_name (), pacified=pacified)
      call model%update_parameters ()
    end subroutine model_var_set_real
```

Retrieve a model parameter value.
⟨*Models: model: TBP*⟩+≡
```
    procedure :: get_rval => model_var_get_rval
```

⟨*Models: procedures*⟩+≡
```
    function model_var_get_rval (model, name) result (rval)
      class(model_t), intent(in) :: model
      type(string_t), intent(in) :: name
      real(default) :: rval
      rval = model%var_list%get_rval (name, follow_link=.false.)
    end function model_var_get_rval
```

[To be deleted] Return a pointer to the variable list.
⟨*Models: model: TBP*⟩+≡
```
    procedure :: get_var_list_ptr => model_get_var_list_ptr
```

⟨*Models: procedures*⟩+≡
```
    function model_get_var_list_ptr (model) result (var_list)
      type(var_list_t), pointer :: var_list
      class(model_t), intent(in), target :: model
```

```
    var_list => model%var_list
  end function model_get_var_list_ptr
```

29.4.5   UFO models

A single flag identifies a model as a UFO model. There is no other distinction,
but the flag allows us to handle built-in and UFO models with the same name
in parallel.

⟨*Models: model: TBP*⟩+≡
```
    procedure :: is_ufo_model => model_is_ufo_model
```

⟨*Models: procedures*⟩+≡
```
    function model_is_ufo_model (model) result (flag)
      class(model_t), intent(in) :: model
      logical :: flag
      flag = model%ufo_model
    end function model_is_ufo_model
```

Return the UFO path used for fetching the UFO source.

⟨*Models: model: TBP*⟩+≡
```
    procedure :: get_ufo_path => model_get_ufo_path
```

⟨*Models: procedures*⟩+≡
```
    function model_get_ufo_path (model) result (path)
      class(model_t), intent(in) :: model
      type(string_t) :: path
      if (model%ufo_model) then
         path = model%ufo_path
      else
         path = ""
      end if
    end function model_get_ufo_path
```

Call OMega and generate a model file from an UFO source file. We start with a
file name; the model name is expected to be the base name, stripping extensions.

   The path search either takes ufo_path_requested, or searches first in the
working directory, then in a hard-coded UFO model directory.

⟨*Models: procedures*⟩+≡
```
    subroutine model_generate_ufo (filename, os_data, ufo_path, &
         ufo_path_requested)
      type(string_t), intent(in) :: filename
      type(os_data_t), intent(in) :: os_data
      type(string_t), intent(out) :: ufo_path
      type(string_t), intent(in), optional :: ufo_path_requested
      type(string_t) :: model_name, omega_path, ufo_dir, ufo_init
      logical :: exist
      call get_model_name (filename, model_name)
      call msg_message ("Model: Generating model '" // char (model_name) &
           // "' from UFO sources")
      if (present (ufo_path_requested)) then
         call msg_message ("Model: Searching for UFO sources in '" &
```

```
            // char (ufo_path_requested) // "'")
      ufo_path = ufo_path_requested
      ufo_dir = ufo_path_requested // "/" // model_name
      ufo_init = ufo_dir // "/" // "__init__.py"
      inquire (file = char (ufo_init), exist = exist)
   else
      call msg_message ("Model: Searching for UFO sources in &
           &working directory")
      ufo_path = "."
      ufo_dir = ufo_path // "/" // model_name
      ufo_init = ufo_dir // "/" // "__init__.py"
      inquire (file = char (ufo_init), exist = exist)
      if (.not. exist) then
         ufo_path = char (os_data%whizard_modelpath_ufo)
         ufo_dir = ufo_path // "/" // model_name
         ufo_init = ufo_dir // "/" // "__init__.py"
         call msg_message ("Model: Searching for UFO sources in '" &
              // char (os_data%whizard_modelpath_ufo) // "'")
         inquire (file = char (ufo_init), exist = exist)
      end if
   end if
   if (exist) then
      call msg_message ("Model: Found UFO sources for model '" &
           // char (model_name) // "'")
   else
      call msg_fatal ("Model: UFO sources for model '" &
           // char (model_name) // "' not found")
   end if
   omega_path = os_data%whizard_omega_binpath // "/omega_UFO.opt"
   call os_system_call (omega_path &
        // " -model:UFO_dir " // ufo_dir &
        // " -model:exec" &
        // " -model:write_WHIZARD" &
        // " > " // filename)
   inquire (file = char (filename), exist = exist)
   if (exist) then
       call msg_message ("Model: Model file '" // char (filename) //&
            "' generated")
   else
       call msg_fatal ("Model: Model file '" // char (filename) &
            // "' could not be generated")
   end if
contains
  subroutine get_model_name (filename, model_name)
     type(string_t), intent(in) :: filename
     type(string_t), intent(out) :: model_name
     type(string_t) :: string
     string = filename
     call split (string, model_name, ".")
  end subroutine get_model_name
end subroutine model_generate_ufo
```

29.4.6   Scheme handling

A model can specify a set of allowed schemes that steer the setup of model variables. The model file can contain scheme-specific declarations that are selected by a `select scheme` clause. Scheme support is optional.

If enabled, the model object contains a list of allowed schemes, and the model reader takes the active scheme as an argument. After the model has been read, the scheme is fixed and can no longer be modified.

The model supports schemes if the scheme array is allocated.

⟨*Models: model: TBP*⟩+≡
```
procedure :: has_schemes => model_has_schemes
```

⟨*Models: procedures*⟩+≡
```
function model_has_schemes (model) result (flag)
  logical :: flag
  class(model_t), intent(in) :: model
  flag = allocated (model%schemes)
end function model_has_schemes
```

Enable schemes: fix the list of allowed schemes.

⟨*Models: model: TBP*⟩+≡
```
procedure :: enable_schemes => model_enable_schemes
```

⟨*Models: procedures*⟩+≡
```
subroutine model_enable_schemes (model, scheme)
  class(model_t), intent(inout) :: model
  type(string_t), dimension(:), intent(in) :: scheme
  allocate (model%schemes (size (scheme)), source = scheme)
end subroutine model_enable_schemes
```

Find the scheme. Check if the scheme is allowed. The numeric index of the selected scheme is stored in the `model_data_t` base object.

If no argument is given, select the first scheme. The numeric scheme ID will then be 1, while a model without schemes retains 0.

⟨*Models: model: TBP*⟩+≡
```
procedure :: set_scheme => model_set_scheme
```

⟨*Models: procedures*⟩+≡
```
subroutine model_set_scheme (model, scheme)
  class(model_t), intent(inout) :: model
  type(string_t), intent(in), optional :: scheme
  logical :: ok
  integer :: i
  if (model%has_schemes ()) then
    if (present (scheme)) then
      ok = .false.
      CHECK_SCHEME: do i = 1, size (model%schemes)
        if (scheme == model%schemes(i)) then
          allocate (model%selected_scheme, source = scheme)
          call model%set_scheme_num (i)
          ok = .true.
          exit CHECK_SCHEME
        end if
      end do CHECK_SCHEME
```

```
          if (.not. ok) then
             call msg_fatal &
                  ("Model '" // char (model%get_name ()) &
                  // "': scheme '" // char (scheme) // "' not supported")
          end if
      else
          allocate (model%selected_scheme, source = model%schemes(1))
          call model%set_scheme_num (1)
      end if
   else
      if (present (scheme)) then
          call msg_error &
                  ("Model '" // char (model%get_name ()) &
                  // "' does not support schemes")
      end if
   end if
end subroutine model_set_scheme
```

Get the scheme. Note that the base `model_data_t` provides a `get_scheme_num` getter function.

⟨*Models: model: TBP*⟩+≡
```
    procedure :: get_scheme => model_get_scheme
```

⟨*Models: procedures*⟩+≡
```
function model_get_scheme (model) result (scheme)
  class(model_t), intent(in) :: model
  type(string_t) :: scheme
  if (allocated (model%selected_scheme)) then
     scheme = model%selected_scheme
  else
     scheme = ""
  end if
end function model_get_scheme
```

Check if a model has been set up with a specific name and (if applicable) scheme.
This helps in determining whether we need a new model object.

A UFO model is considered to be distinct from a non-UFO model. We
assume that if `ufo` is asked for, there is no scheme argument. Furthermore,
if there is an `ufo_path` requested, it must coincide with the `ufo_path` of the
model. If not, the model `ufo_path` is not checked.

⟨*Models: model: TBP*⟩+≡
```
    procedure :: matches => model_matches
```

⟨*Models: procedures*⟩+≡
```
function model_matches (model, name, scheme, ufo, ufo_path) result (flag)
  logical :: flag
  class(model_t), intent(in) :: model
  type(string_t), intent(in) :: name
  type(string_t), intent(in), optional :: scheme
  logical, intent(in), optional :: ufo
  type(string_t), intent(in), optional :: ufo_path
  logical :: ufo_model
  ufo_model = .false.;  if (present (ufo))  ufo_model = ufo
```

```
         if (name /= model%get_name ()) then
            flag = .false.
         else if (ufo_model .neqv. model%is_ufo_model ()) then
            flag = .false.
         else if (ufo_model) then
            if (present (ufo_path)) then
               flag = model%get_ufo_path () == ufo_path
            else
               flag = .true.
            end if
         else if (model%has_schemes ()) then
            if (present (scheme)) then
               flag = model%get_scheme () == scheme
            else
               flag = model%get_scheme_num () == 1
            end if
         else if (present (scheme)) then
            flag = .false.
         else
            flag = .true.
         end if
      end function model_matches
```

29.4.7   Reading models from file

This procedure defines the model-file syntax for the parser, returning an internal
file (ifile).

Note that arithmetic operators are defined as keywords in the expression
syntax, so we exclude them here.

⟨*Models: procedures*⟩+≡

```
   subroutine define_model_file_syntax (ifile)
     type(ifile_t), intent(inout) :: ifile
     call ifile_append (ifile, "SEQ model_def = model_name_def " // &
           "scheme_header parameters external_pars particles vertices")
     call ifile_append (ifile, "SEQ model_name_def = model model_name")
     call ifile_append (ifile, "KEY model")
     call ifile_append (ifile, "QUO model_name = '""'...'""'")
     call ifile_append (ifile, "SEQ scheme_header = scheme_decl?")
     call ifile_append (ifile, "SEQ scheme_decl = schemes '=' scheme_list")
     call ifile_append (ifile, "KEY schemes")
     call ifile_append (ifile, "LIS scheme_list = scheme_name+")
     call ifile_append (ifile, "QUO scheme_name = '""'...'""'")
     call ifile_append (ifile, "SEQ parameters = generic_par_def*")
     call ifile_append (ifile, "ALT generic_par_def = &
          &parameter_def | derived_def | unused_def | scheme_block")

call ifile_append (ifile, "KEY anti")
call ifile_append (ifile, "KEY tex_name")
call ifile_append (ifile, "KEY tex_anti")
call ifile_append (ifile, "ALT name_def = name_string | name_id")
call ifile_append (ifile, "QUO name_string = '""'...'""'")
call ifile_append (ifile, "IDE name_id")
call ifile_append (ifile, "SEQ prt_spin = spin frac")
call ifile_append (ifile, "KEY spin")
```

```
      call ifile_append (ifile, "SEQ prt_isospin = isospin frac")
      call ifile_append (ifile, "KEY isospin")
      call ifile_append (ifile, "SEQ prt_charge = charge frac")
      call ifile_append (ifile, "KEY charge")
      call ifile_append (ifile, "SEQ prt_color = color integer_literal")
      call ifile_append (ifile, "KEY color")
      call ifile_append (ifile, "SEQ prt_mass = mass par_name")
      call ifile_append (ifile, "KEY mass")
      call ifile_append (ifile, "SEQ prt_width = width par_name")
      call ifile_append (ifile, "KEY width")
      call ifile_append (ifile, "SEQ vertices = vertex_def*")
      call ifile_append (ifile, "SEQ vertex_def = vertex name_def+")
      call ifile_append (ifile, "KEY vertex")
      call define_expr_syntax (ifile, particles=.false., analysis=.false.)
    end subroutine define_model_file_syntax
```

The model-file syntax and lexer are fixed, therefore stored as module variables:

⟨*Models: variables*⟩≡
```
    type(syntax_t), target, save :: syntax_model_file
```

⟨*Models: public*⟩+≡
```
    public :: syntax_model_file_init
```

⟨*Models: procedures*⟩+≡
```
    subroutine syntax_model_file_init ()
      type(ifile_t) :: ifile
      call define_model_file_syntax (ifile)
      call syntax_init (syntax_model_file, ifile)
      call ifile_final (ifile)
    end subroutine syntax_model_file_init
```

⟨*Models: procedures*⟩+≡
```
    subroutine lexer_init_model_file (lexer)
      type(lexer_t), intent(out) :: lexer
      call lexer_init (lexer, &
           comment_chars = "#!", &
           quote_chars = '"{', &
           quote_match = '"}', &
           single_chars = ":(),", &
           special_class = [ "+-*/^", "<>=  " ] , &
           keyword_list = syntax_get_keyword_list_ptr (syntax_model_file))
    end subroutine lexer_init_model_file
```

⟨*Models: public*⟩+≡
```
    public :: syntax_model_file_final
```

⟨*Models: procedures*⟩+≡
```
    subroutine syntax_model_file_final ()

    end subroutine syntax_model_file_final
```

⟨*Models: public*⟩+≡
```
    public :: syntax_model_file_write
```

⟨*Models: procedures*⟩+≡
```
    subroutine syntax_model_file_write (unit)
      integer, intent(in), optional :: unit
      call syntax_write (syntax_model_file, unit)
    end subroutine syntax_model_file_write
```

Read a model from file. Handle all syntax and respect the provided scheme.

The `ufo` flag just says that the model object should be tagged as being derived from an UFO model. The UFO model path may be requested by the caller. If not, we use a standard path search for UFO models. There is no difference in the contents of the file or the generated model object.

⟨*Models: model: TBP*⟩+≡
```
    procedure :: read => model_read
```

⟨*Models: procedures*⟩+≡
```
    subroutine model_read (model, filename, os_data, exist, &
        scheme, ufo, ufo_path_requested, rebuild_mdl)
      class(model_t), intent(out), target :: model
      type(string_t), intent(in) :: filename
      type(os_data_t), intent(in) :: os_data
      logical, intent(out), optional :: exist
      type(string_t), intent(in), optional :: scheme
      logical, intent(in), optional :: ufo
      type(string_t), intent(in), optional :: ufo_path_requested

procedure :: link => model_list_link
```

⟨*Models: procedures*⟩+≡
```
    subroutine model_list_link (model_list, context)
      class(model_list_t), intent(inout) :: model_list
      type(model_list_t), intent(in), target :: context
      model_list%context => context
    end subroutine model_list_link
```

(Private, used below:) Append an existing model, for which we have allocated a pointer entry, to the model list. The original pointer becomes disassociated, and the model should now be considered as part of the list. We assume that this model is not yet part of the list.

If we provide a `model` argument, this returns a pointer to the new entry.

⟨*Models: model list: TBP*⟩+≡
```
    procedure, private :: import => model_list_import
```

⟨*Models: procedures*⟩+≡
```
    subroutine model_list_import (model_list, current, model)

      type(model_entry_t), pointer :: current
      if (model_list%model_exists (name, follow_link=.false.)) then
         model => null ()
      else
         allocate (current)
         call current%init (name, var_str (""), os_data, &
              n_par, n_prt, n_vtx)
```

4032

```
      call model_list%import (current, model)
   end if
end subroutine model_list_add
```

Read a new model from file and add to the list, if it does not yet exist. Finalize the model by allocating the vertex table. Return a pointer to the new model. If unsuccessful, return the original pointer.

The model is always inserted in the last link of a chain of model lists. This way, we avoid loading models twice from different contexts. When a model is modified, we should first allocate a local copy.

⟨*Models: model list: TBP*⟩+≡

         deallocate (current)
      end do
    end subroutine model_list_final
```

29.4.10   Model instances

A model instance is a copy of a model object. The parameters are true copies.
The particle data and the variable list pointers should point to the copy, so
modifying the parameters has only a local effect. Hence, we build them up

explicitly. The vertex array is also rebuilt, it contains particle pointers. Finally, the vertex hash table can be copied directly since it contains no pointers.

The `multiplicity` entry depends on the association of the `mass_data` entry and therefore has to be set at the end.

The instance must carry the `target` attribute.

Parameters: the `copy_parameter` method essentially copies the parameter decorations (parse node, expression etc.). The current parameter values are part of the `model_data_t` base type and are copied afterwards via its `copy_from` method.

Note: the parameter set is initialized for real parameters only.

⟨*Models: model: TBP*⟩+≡
```
   procedure :: init_instance => model_copy
```

⟨*Models: procedures*⟩+≡
```
  subroutine model_copy (model, orig)
    class(model_t), intent(out), target :: model
    type(model_t), intent(in) :: orig
    integer :: n_par, n_prt, n_vtx
    integer :: i
    n_par = orig%get_n_real ()
    n_prt = orig%get_n_field ()
    n_vtx = orig%get_n_vtx ()
    call model%basic_init (orig%get_name (), n_par, n_prt, n_vtx)
    if (allocated (orig%schemes)) then
       model%schemes = orig%schemes
       if (allocated (orig%selected_scheme)) then
          model%selected_scheme = orig%selected_scheme
          call model%set_scheme_num (orig%get_scheme_num ())
       end if
    end if

```

Construct a Model

Here, we construct a toy model explicitly without referring to a file.

⟨*Models: execute tests*⟩≡
```
    call test (models_1, "models_1", &
        "construct model", &
        u, results)
```

⟨*Models: test declarations*⟩≡
```
    public :: models_1
```

⟨*Models: tests*⟩≡
```
    subroutine models_1 (u)
      integer, intent(in) :: u
      type(os_data_t) :: os_data
      type(model_list_t) :: model_list
      type(model_t), pointer :: model
      type(string_t) :: model_name
      type(string_t) :: x_longname
      type(string_t), dimension(2) :: parname
      type(string_t), dimension(2) :: x_name
      type(string_t), dimension(1) :: x_anti
      type(string_t) :: x_tex_name, x_tex_anti
      type(string_t) :: y_longname
      type(string_t), dimension(2) :: y_name
      type(string_t) :: y_tex_name
      type(field_data_t), pointer :: field

      write (u, "(A)")  "* Test output: models_1"
      write (u, "(A)")  "*   Purpose: create a model"
      write (u, *)

29.5.1 Preprocessor

SLHA is a mixed-format standard. It should be read in assuming free format (but line-oriented), but it has some fixed-format elements.

To overcome this difficulty, we implement a preprocessing step which transforms the SLHA into a format that can be swallowed by our generic free-format lexer and parser. Each line with a blank first character is assumed to be a data line. We prepend a 'DATA' keyword to these lines. Furthermore, to enforce line-orientation, each line is appended a '$' key which is recognized by the

parser. To do this properly, we first remove trailing comments, and skip lines consisting only of comments.

The preprocessor reads from a stream and puts out an `ifile`. Blocks that are not recognized are skipped. For some blocks, data items are quoted, so they can be read as strings if necessary.

⟨*SLHA: parameters*⟩≡

```
    integer, parameter :: MODE_SKIP = 0, MODE_DATA = 1, MODE_INFO = 2
```

⟨*SLHA: procedures*⟩≡

```
    subroutine slha_preprocess (stream, ifile)

      call ifile_append (ifile, "SEQ decay_line = data_item integer pdg_code+")
    end subroutine define_slha_syntax
```

The SLHA specification allows for string data items in certain places. Currently, we do not interpret them, but the strings, which are not quoted, must be parsed somehow. The hack for this problem is to allow essentially all characters as special characters, so the string can be read before it is discarded.

⟨*SLHA: public*⟩+≡

```
      public :: lexer_init_slha
```
⟨*SLHA: procedures*⟩+≡
```
    subroutine lexer_init_slha (lexer)
      type(lexer_t), intent(out) :: lexer
      call lexer_init (lexer, &
           comment_chars = "#", &
           quote_chars = '"', &
           quote_match = '"', &
           single_chars = "+-=$", &
           special_class = [ "" ], &
           keyword_list = syntax_get_keyword_list_ptr (syntax_slha), &
           upper_case_keywords = .true.)  ! $
    end subroutine lexer_init_slha
```

29.5.3   Interpreter

Find blocks

From the parse tree, find the node that represents a particular block. If `required`
is true, issue an error if not found. Since `block_name` is always invoked with
capital letters, we have to capitalize pn_block_name.

⟨*SLHA: procedures*⟩+≡
```
    function slha_get_block_ptr &
         (parse_tree, block_name, required) result (pn_block)
      type(parse_node_t), pointer :: pn_block
      type(parse_tree_t), intent(in) :: parse_tree
      type(string_t), intent(in) :: block_name
      logical, intent(in) :: required
      type(parse_node_t), pointer :: pn_root, pn_block_spec, pn_block_name
      pn_root => parse_tree%get_root_ptr ()
      pn_block => parse_node_get_sub_ptr (pn_root)
      do while (associated (pn_block))
         select case (char (parse_node_get_rule_key (pn_block)))
         case ("block_def")
            pn_block_spec => parse_node_get_sub_ptr (pn_block, 2)
            pn_block_name => parse_node_get_sub_ptr (pn_block_spec)
            if (trim (adjustl (upper_case (parse_node_get_string &
                 (pn_block_name)))) == block_name) then
               return
            end if
         end select
         pn_block => parse_node_get_next_ptr (pn_block)
      end do

Transfer data from SLHA to variables

Extract real parameter with index `i`. If it does not exist, retrieve it from the variable list, using the given name.

⟨*SLHA: procedures*⟩+≡

```
function get_parameter_in_block (pn_block, code, name, var_list) result (var)
  real(default) :: var
  type(parse_node_t), intent(in), target :: pn_block
  integer, intent(in) :: code
  type(string_t), intent(in) :: name
  type(var_list_t), intent(in), target :: var_list
  type(parse_node_t), pointer :: pn_data, pn_item
  call slha_find_index_ptr (pn_block, pn_data, pn_item, code)
  if (associated (pn_item)) then
     var = get_real_parameter (pn_item)
  else
     var = var_list%get_rval (name)
  end if
end function get_parameter_in_block
```

Extract a real data item with index `i`. If it does exist, set it in the variable list, using the given name. If the variable is not present in the variable list, ignore it.

⟨*SLHA: procedures*⟩+≡

```
subroutine set_data_item (pn_block, code, name, var_list)
  type(parse_node_t), intent(in), target :: pn_block
  integer, intent(in) :: code
  type(string_t), intent(in) :: name
  type(var_list_t), intent(inout), target :: var_list

  end if
end subroutine set_matrix_element
```

Transfer data from variables to SLHA

Get a real/integer parameter with index `i` from the variable list and write it to the current output file. In the integer case, we account for the fact that the variable is type real. If it does not exist, do nothing.

⟨*SLHA: procedures*⟩+≡

```
subroutine write_integer_data_item (u, code, name, var_list, comment)
  integer, intent(in) :: u
  integer, intent(in) :: code
  type(string_t), intent(in) :: name
  type(var_list_t), intent(in) :: var_list
  character(*), intent(in) :: comment
  integer :: item
  if (var_list%contains (name)) then
     item = nint (var_list%get_rval (name))
     call write_integer_parameter (u, code, item, comment)
  end if
end subroutine write_integer_data_item

subroutine write_real_data_item (u, code, name, var_list, comment)
  integer, intent(in) :: u
  integer, intent(in) :: code
  type(string_t), intent(in) :: name
  type(var_list_t), intent(in) :: var_list
  character(*), intent(in) :: comment
  real(default) :: item
  if (var_list%contains (name)) then
     item = var_list%get_rval (name)
     call write_real_parameter (u, code, item, comment)
  end if
end subroutine write_real_data_item
```

Get a real data item with two integer indices from the variable list and write it to the current output file. If it does not exist, do nothing.

⟨*SLHA: procedures*⟩+≡

```
subroutine write_matrix_element (u, code1, code2, name, var_list, comment)
  integer, intent(in) :: u
  integer, intent(in) :: code1, code2
  type(string_t), intent(in) :: name
  type(var_list_t), intent(in) :: var_list
  character(*), intent(in) :: comment
  real(default) :: item
  if (var_list%contains (name)) then
     item = var_list%get_rval (name)
     call write_real_matrix_element (u, code1, code2, item, comment)
  end if
end subroutine write_matrix_element
```

29.5.4 Auxiliary function

Write a block header.

⟨*SLHA: procedures*⟩+≡

```
subroutine write_block_header (u, name, comment)
  integer, intent(in) :: u
  character(*), intent(in) :: name, comment
  write (u, "(A,1x,A,3x,'#',1x,A)")  "BLOCK", name, comment
end subroutine write_block_header
```

Extract a real parameter that may be defined real or integer, signed or unsigned.

⟨*SLHA: procedures*⟩+≡

```
function get_real_parameter (pn_item) result (var)
  real(default) :: var
  type(parse_node_t), intent(in), target :: pn_item
  type(parse_node_t), pointer :: pn_sign, pn_var
  integer :: sign
  select case (char (parse_node_get_rule_key (pn_item)))
  case ("signed_number")
     pn_sign => parse_node_get_sub_ptr (pn_item)
     pn_var  => parse_node_get_next_ptr (pn_sign)
     select case (char (parse_node_get_key (pn_sign)))
     case ("+");  sign = +1
     case ("-");  sign = -1
     end select
  case default
     sign = +1
     pn_var => pn_item
  end select
  select case (char (parse_node_get_rule_key (pn_var)))
  case ("integer");  var = sign * parse_node_get_integer (pn_var)
  case ("real");     var = sign * parse_node_get_real (pn_var)
  end select
end function get_real_parameter
```

Auxiliary: Extract an integer parameter that may be defined signed or unsigned.
A real value is an error.

⟨*SLHA: procedures*⟩+≡

```
function get_integer_parameter (pn_item) result (var)
  integer :: var
  type(parse_node_t), intent(in), target :: pn_item
  type(parse_node_t), pointer :: pn_sign, pn_var
  integer :: sign
  select case (char (parse_node_get_rule_key (pn_item)))
  case ("signed_integer")
     pn_sign => parse_node_get_sub_ptr (pn_item)
     pn_var  => parse_node_get_next_ptr (pn_sign)
     select case (char (parse_node_get_key (pn_sign)))
     case ("+");  sign = +1
     case ("-");  sign = -1
     end select
  case ("integer")
     sign = +1
```

```
         pn_var => pn_item
      case default
         call parse_node_write (pn_var)
         call msg_error ("SLHA: Integer parameter expected")
         var = 0
         return
      end select
      var = sign * parse_node_get_integer (pn_var)
   end function get_integer_parameter
```

Write an integer parameter with a single index directly to file, using the required output format.

⟨*SLHA: procedures*⟩+≡

```
   subroutine write_integer_parameter (u, code, item, comment)
     integer, intent(in) :: u
     integer, intent(in) :: code
     integer, intent(in) :: item
     character(*), intent(in) :: comment
1    format (1x, I9, 3x, 3x, I9, 4x, 3x, '#', 1x, A)
     write (u, 1)  code, item, comment
   end subroutine write_integer_parameter
```

Write a real parameter with two indices directly to file, using the required output format.

⟨*SLHA: procedures*⟩+≡

```
   subroutine write_real_parameter (u, code, item, comment)
     integer, intent(in) :: u
     integer, intent(in) :: code
     real(default), intent(in) :: item
     character(*), intent(in) :: comment
1    format (1x, I9, 3x, 1P, E16.8, 0P, 3x, '#', 1x, A)
     write (u, 1)  code, item, comment
   end subroutine write_real_parameter
```

Write a real parameter with a single index directly to file, using the required output format.

⟨*SLHA: procedures*⟩+≡

```
   subroutine write_real_matrix_element (u, code1, code2, item, comment)
     integer, intent(in) :: u
     integer, intent(in) :: code1, code2
     real(default), intent(in) :: item
     character(*), intent(in) :: comment
1    format (1x, I2, 1x, I2, 3x, 1P, E16.8, 0P, 3x, '#', 1x, A)
     write (u, 1)  code1, code2, item, comment
   end subroutine write_real_matrix_element
```

The concrete SLHA interpreter

SLHA codes for particular physics models

⟨*SLHA: parameters*⟩+≡
```

```
      integer, parameter :: MDL_MSSM = 0
      integer, parameter :: MDL_NMSSM = 1
```

Take the parse tree and extract relevant data. Select the correct model and
store all data that is present in the appropriate variable list. Finally, update
the variable record.

Public for use in unit test.

   end subroutine slha_write_MODSEL
```

SMINPUTS

Read SM parameters and update the variable list accordingly. If a parameter is not defined in the block, we use the previous value from the model variable list. For the basic parameters we have to do a small recalculation, since SLHA uses the G_F-α-m_Z scheme, while WHIZARD derives them from G_F, m_W, and m_Z.

⟨*SLHA: procedures*⟩+≡

```

             "tau mass")
    end subroutine slha_write_SMINPUTS
```

MINPAR

The block of SUSY input parameters. They are accessible to WHIZARD, but
they only get used when an external spectrum generator is invoked. The precise
set of parameters depends on the type of SUSY breaking, which by itself is one
of the parameters.

⟨*SLHA: procedures*⟩+≡
```
    subroutine slha_handle_MINPAR (parse_tree, model, mssm_type)
      type(parse_tree_t), intent(in) :: parse_tree
      type(model_t), intent(inout), target :: model
      integer, intent(in) :: mssm_type
      type(var_list_t), pointer :: var_list
      type(parse_node_t), pointer :: pn_block
      var_list => model%get_var_list_ptr ()
      call var_list%set_real &
           (var_str ("mtype"),  real(mssm_type, default), is_known=.true.)

         end select
      end subroutine slha_write_MINPAR
```

Mass spectrum

Set masses. Since the particles are identified by PDG code, read the line and try
to set the appropriate particle mass in the current model. At the end, update
parameters, just in case the W or Z mass was included.

⟨*SLHA: procedures*⟩+≡

```
      subroutine slha_handle_MASS (parse_tree, model)
        type(parse_tree_t), intent(in) :: parse_tree
        type(model_t), intent(inout), target :: model
        type(parse_node_t), pointer :: pn_block, pn_data, pn_line, pn_code
        type(parse_node_t), pointer :: pn_mass
        integer :: pdg
        real(default) :: mass
        pn_block => slha_get_block_ptr &
             (parse_tree, var_str ("MASS"), required=.true.)
        if (.not. (associated (pn_block)))  return
        pn_data => parse_node_get_sub_ptr (pn_block, 4)
        do while (associated (pn_data))
           pn_line => parse_node_get_sub_ptr (pn_data, 2)
           pn_code => parse_node_get_sub_ptr (pn_line)
           if (associated (pn_code)) then
              pdg = get_integer_parameter (pn_code)
              pn_mass => parse_node_get_next_ptr (pn_code)
              if (associated (pn_mass)) then
                 mass = get_real_parameter (pn_mass)
                 call model%set_field_mass (pdg, mass)
              else
                 call msg_error ("SLHA: Block MASS: Missing mass value")
              end if
           else
              call msg_error ("SLHA: Block MASS: Missing PDG code")
           end if
           pn_data => parse_node_get_next_ptr (pn_data)
        end do
      end subroutine slha_handle_MASS
```

Widths

Set widths. For each DECAY block, extract the header, read the PDG code
and width, and try to set the appropriate particle width in the current model.

⟨*SLHA: procedures*⟩+≡

```
      subroutine slha_handle_decays (parse_tree, model)
        type(parse_tree_t), intent(in) :: parse_tree
        type(model_t), intent(inout), target :: model
        type(parse_node_t), pointer :: pn_decay, pn_decay_spec, pn_code, pn_width
```

```
      integer :: pdg
      real(default) :: width
      pn_decay => slha_get_first_decay_ptr (parse_tree)
      do while (associated (pn_decay))
         pn_decay_spec => parse_node_get_sub_ptr (pn_decay, 2)
         pn_code => parse_node_get_sub_ptr (pn_decay_spec)
         pdg = get_integer_parameter (pn_code)
         pn_width => parse_node_get_next_ptr (pn_code)
         width = get_real_parameter (pn_width)
         call model%set_field_width (pdg, width)
         pn_decay => slha_get_next_decay_ptr (pn_decay)
      end do
    end subroutine slha_handle_decays
```

Mixing matrices

Read mixing matrices. We can treat all matrices by a single procedure if we just know the block name, variable prefix, and matrix dimension. The matrix dimension must be less than 10. For the pseudoscalar Higgses in NMSSM-type models we need off-diagonal matrices, so we generalize the definition.

⟨*SLHA: procedures*⟩+≡
```
    subroutine slha_handle_matrix_block &
        (parse_tree, block_name, var_prefix, dim1, dim2, model)
      type(parse_tree_t), intent(in) :: parse_tree
      character(*), intent(in) :: block_name, var_prefix
      integer, intent(in) :: dim1, dim2
      type(model_t), intent(inout), target :: model
      type(parse_node_t), pointer :: pn_block
      type(var_list_t), pointer :: var_list
      integer :: i, j
      character(len=len(var_prefix)+2) :: var_name
      var_list => model%get_var_list_ptr ()
      pn_block => slha_get_block_ptr &
          (parse_tree, var_str (block_name), required=.false.)
      if (.not. (associated (pn_block)))  return
      do i = 1, dim1
         do j = 1, dim2
            write (var_name, "(A,I1,I1)")  var_prefix, i, j
            call set_matrix_element (pn_block, i, j, var_str (var_name), var_list)
         end do
      end do
    end subroutine slha_handle_matrix_block
```

Higgs data

Read the block ALPHA which holds just the Higgs mixing angle.

⟨*SLHA: procedures*⟩+≡
```
    subroutine slha_handle_ALPHA (parse_tree, model)
      type(parse_tree_t), intent(in) :: parse_tree
      type(model_t), intent(inout), target :: model
      type(parse_node_t), pointer :: pn_block, pn_line, pn_data, pn_item
```

```
      type(var_list_t), pointer :: var_list
      real(default) :: al_h
      var_list => model%get_var_list_ptr ()
      pn_block => slha_get_block_ptr &
           (parse_tree, var_str ("ALPHA"), required=.false.)
      if (.not. (associated (pn_block)))  return
      pn_data => parse_node_get_sub_ptr (pn_block, 4)
      pn_line => parse_node_get_sub_ptr (pn_data, 2)
      pn_item => parse_node_get_sub_ptr (pn_line)
      if (associated (pn_item)) then
         al_h = get_real_parameter (pn_item)
         call var_list%set_real (var_str ("al_h"), al_h, &
              is_known=.true., ignore=.true.)
      end if
   end subroutine slha_handle_ALPHA
```

Read the block HMIX for the Higgs mixing parameters

⟨*SLHA: procedures*⟩+≡

```
   subroutine slha_handle_HMIX (parse_tree, model)
     type(parse_tree_t), intent(in) :: parse_tree
     type(model_t), intent(inout), target :: model
     type(parse_node_t), pointer :: pn_block
     type(var_list_t), pointer :: var_list
     var_list => model%get_var_list_ptr ()
     pn_block => slha_get_block_ptr &
          (parse_tree, var_str ("HMIX"), required=.false.)
     if (.not. (associated (pn_block)))  return
     call set_data_item (pn_block, 1, var_str ("mu_h"), var_list)
     call set_data_item (pn_block, 2, var_str ("tanb_h"), var_list)
   end subroutine slha_handle_HMIX
```

Read the block NMSSMRUN for the specific NMSSM parameters

⟨*SLHA: procedures*⟩+≡

```
   subroutine slha_handle_NMSSMRUN (parse_tree, model)
     type(parse_tree_t), intent(in) :: parse_tree
     type(model_t), intent(inout), target :: model
     type(parse_node_t), pointer :: pn_block
     type(var_list_t), pointer :: var_list
     var_list => model%get_var_list_ptr ()
     pn_block => slha_get_block_ptr &
          (parse_tree, var_str ("NMSSMRUN"), required=.false.)
     if (.not. (associated (pn_block)))  return
     call set_data_item (pn_block, 1, var_str ("ls"), var_list)
     call set_data_item (pn_block, 2, var_str ("ks"), var_list)
     call set_data_item (pn_block, 3, var_str ("a_ls"), var_list)
     call set_data_item (pn_block, 4, var_str ("a_ks"), var_list)
     call set_data_item (pn_block, 5, var_str ("nmu"), var_list)
   end subroutine slha_handle_NMSSMRUN
```

29.5.5 Parser

Read a SLHA file from stream, including preprocessing, and make up a parse
tree.

⟨*SLHA: procedures*⟩+≡
```
subroutine slha_parse_stream (stream, parse_tree)
  type(stream_t), intent(inout), target :: stream
  type(parse_tree_t), intent(out) :: parse_tree
  type(ifile_t) :: ifile
  type(lexer_t) :: lexer
  type(stream_t), target :: stream_tmp
  call slha_preprocess (stream, ifile)
  call stream_init (stream_tmp, ifile)
  call lexer_init_slha (lexer)
  call lexer_assign_stream (lexer, stream_tmp)
  call parse_tree_init (parse_tree, syntax_slha, lexer)
  call lexer_final (lexer)
  call stream_final (stream_tmp)
  call ifile_final (ifile)
end subroutine slha_parse_stream
```

Read a SLHA file chosen by name. Check first the current directory, then the
directory where SUSY input files should be located.

Required for test:

⟨*SLHA: public*⟩+≡
```
public :: slha_parse_file
```

⟨*SLHA: procedures*⟩+≡
```
subroutine slha_parse_file (file, os_data, parse_tree)
  type(string_t), intent(in) :: file
  type(os_data_t), intent(in) :: os_data
  type(parse_tree_t), intent(out) :: parse_tree
  logical :: exist
  type(string_t) :: filename
  type(stream_t), target :: stream
  call msg_message ("Reading SLHA input file '" // char (file) // "'")
  filename = file
  inquire (file=char(filename), exist=exist)
  if (.not. exist) then
     filename = os_data%whizard_susypath // "/" // file
     inquire (file=char(filename), exist=exist)
     if (.not. exist) then
        call msg_fatal ("SLHA input file '" // char (file) // "' not found")
        return
     end if
  end if
  call stream_init (stream, char (filename))
  call slha_parse_stream (stream, parse_tree)
  call stream_final (stream)
end subroutine slha_parse_file
```

29.5.6   API

Read the SLHA file, parse it, and interpret the parse tree. The model parameters retrieved from the file will be inserted into the appropriate model, which is loaded and modified in the background. The pointer to this model is returned as the last argument.

⟨*SLHA: public*⟩+≡
```
    public :: slha_read_file
```

⟨*SLHA: procedures*⟩+≡
```
    subroutine slha_read_file &
        (file, os_data, model, input, spectrum, decays)
      type(string_t), intent(in) :: file
      type(os_data_t), intent(in) :: os_data
      type(model_t), intent(inout), target :: model
      logical, intent(in) :: input, spectrum, decays
      type(parse_tree_t) :: parse_tree
      call slha_parse_file (file, os_data, parse_tree)
      if (associated (parse_tree%get_root_ptr ())) then
         call slha_interpret_parse_tree &
              (parse_tree, model, input, spectrum, decays)
         call parse_tree_final (parse_tree)
         call model%update_parameters ()
      end if
    end subroutine slha_read_file
```

Write the SLHA contents, as far as possible, to external file.

⟨*SLHA: public*⟩+≡
```
    public :: slha_write_file
```

⟨*SLHA: procedures*⟩+≡
```
    subroutine slha_write_file (file, model, input, spectrum, decays)
      type(string_t), intent(in) :: file
      type(model_t), target, intent(in) :: model
      logical, intent(in) :: input, spectrum, decays
      integer :: mssm_type
      integer :: u
      u = free_unit ()
      call msg_message ("Writing SLHA output file '" // char (file) // "'")
      open (unit=u, file=char(file), action="write", status="replace")
      write (u, "(A)")  "# SUSY Les Houches Accord"
      write (u, "(A)")  "# Output generated by " // trim (VERSION_STRING)
      call slha_write_MODSEL (u, model, mssm_type)
      if (input) then
         call slha_write_SMINPUTS (u, model)
         call slha_write_MINPAR (u, model, mssm_type)
      end if
      if (spectrum) then
         call msg_bug ("SLHA: spectrum output not supported yet")
      end if
      if (decays) then
         call msg_bug ("SLHA: decays output not supported yet")
      end if
      close (u)
```

```
        end subroutine slha_write_file
```

29.5.7 Dispatch

⟨*SLHA: public*⟩+≡
```
    public :: dispatch_slha
```

⟨*SLHA: procedures*⟩+≡
```
    subroutine dispatch_slha (var_list, input, spectrum, decays)
      type(var_list_t), intent(inout), target :: var_list
      logical, intent(out) :: input, spectrum, decays
      input = var_list%get_lval (var_str ("?slha_read_input"))
      spectrum = var_list%get_lval (var_str ("?slha_read_spectrum"))
      decays = var_list%get_lval (var_str ("?slha_read_decays"))
    end subroutine dispatch_slha
```

           endif
c
c Not needed for the fixed order potentials:
           alamb5=0.2d0
c
c     WRITE(*,*) 'INPUT TGAMMA=',TGAMMA
c Needed in subroutine GAMMAT:
           GFERMI=1.16637d-5
c          CALL GAMMAT
c          WRITE(*,*) 'CALCULATED TGAMMA=',TGAMMA
c
           etot=2.d0*tmass+energy
c
```

```fortran
            if ((npot.eq.1).or.(npot.eq.3).or.(npot.eq.4).or.
     u            (npot.eq.5)) then
c For pure coulomb and fixed order potentials there is no delta-part:
              consde = 0.d0
            else if (npot.eq.2) then
c Initialize QCD-potential common-blocks and calculate constant multiplying
c  the delta-part of the 'qcutted' potential in momentum-space:
              call iniphc(1)
              call vqdelt(consde)
            else
              write (*,*) ' Potential not implemented! Stop.'
              stop
            endif
c Delta-part of potential is absorbed by subtracting vzero from the
c  original energy (shift from the potential to the free Hamiltonian):
            vzero = consde / (2.d0*pi)**3
c           write (*,*) 'vzero=', vzero
c
c Find x-values pp(i) and weigths w1(i) for the gaussian quadrature;
c  care about large number of points in the important intervals:
c       if (energy-vzero.le.0.d0) then
cc        call gauleg(0.d0, 1.d0, pp, w1, n/3)
cc        call gauleg(1.d0, 5.d0, pp(n/3+1), w1(n/3+1), n/3)
cc        call gauleg(0.d0, 0.2d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c         call gauleg(0.d0, 5.d0, pp, w1, n/3)
c         call gauleg(5.d0, 20.d0, pp(n/3+1), w1(n/3+1), n/3)
c         call gauleg(0.d0, 0.05d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c       else
cc Avoid numerical singular points in the inner of the intervals:
c         critp = dsqrt((energy-vzero)*tmass)
c         if (critp.le.1.d0) then
cc Gauss-Legendre is symmetric => automatically principal-value prescription:
c           call gauleg(0.d0, 2.d0*critp, pp, w1, n/3)
c           call gauleg(2.d0*critp, 20.d0, pp(n/3+1),
c     u                   w1(n/3+1), n/3)
c           call gauleg(0.d0, 0.05d0, pp(2*n/3+1), w1(2*n/3+1), n/3)
c         else
cc Better behaviour at the border of the intervals:
c           call gauleg(0.d0, critp, pp, w1, n/3)
c           call gauleg(critp, 2.d0*critp, pp(n/3+1),
c     u                   w1(n/3+1), n/3)
c           call gauleg(0.d0, 1.d0/(2.d0*critp), pp(2*n/3+1),
c     u                   w1(2*n/3+1), n/3)
c         endif
c       endif
c
c Or different (simpler) method, good for V_JKT:
            if (energy.le.0.d0) then
              critp=tmass/3.d0
            else
              critp=max(tmass/3.d0,2.d0*dsqrt(energy*tmass))
            endif
            call gauleg(0.d0, critp, pp, w1, 2*n/3)
            call gauleg(1.d0/xpmax, 1.d0/critp, pp(2*n/3+1),
```

```
      u                           w1(2*n/3+1), n/3)
c
c Do substitution p => 1/p for the last interval explicitly:
          do 10 i=2*n/3+1,n
             pp(i) = 1.d0/pp(i)
10        continue
c
c Reorder the arrays for the third interval:
          do 20 i=1,n/3
             xx(i) = pp(2*n/3+i)
             w2(i) = w1(2*n/3+i)
20        continue
          do 30 i=1,n/3
             pp(n-i+1) = xx(i)
             w1(n-i+1) = w2(i)
30        continue
c
c Calculate the integrals a(p) for the given momenta pp(i)
c  and store weights and momenta for the output arrays:
          do 40 i=1,n
             a1(i) = a(pp(i)) !!! FB: can get stuck in original Toppik!
             !!! FB: abuse 'np' as a flag to communicate unstable runs
             if ( abs(a1(i)) .gt. 1d10 ) then
               np = -1
               return
             endif
             xpp(i)=pp(i)
             xww(i)=w1(i)
40        continue
          do 41 i=n+1,nmax
             xpp(i)=0.d0
             xww(i)=0.d0
41        continue
c
c Solve the integral-equation by solving a system of algebraic equations:
          call sae(pp, w1, bb, a1, n)
c
c (The substitution for the integration to infinity  pp => 1/pp
c  is done already.)
          do 50 i=1,n
             zvfct(i)=bb(i)
             gg(i) = bb(i)*g0c(pp(i))
cc           gg(i) = (1.d0 + bb(i))*g0c(pp(i))
cc Urspruenglich anderes (Minus) VZ hier, dafuer kein Minus mehr bei der
cc  Definition des WQs ueber Im G, 2.6.1998, tt.
cc           gg(i) = - (1.d0 + bb(i))*g0c(pp(i))
50        continue
c
