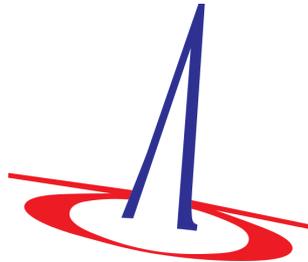
WHIZARD[1]

Wolfgang Kilian,[2] Thorsten Ohl,[3] Jürgen Reuter[4]

Version 2.8.2, Oct 24 2019
with contributions from: Fabian Bach, Tim Barklow, Vincent
Bettaque, Mikael Berggren, Hans-Werner Boschmann, Felix
Braam, Simon Brass, Bijan Chokoufé Nejad, Christian Fleper,
David Gordo Gomez, Akiya Miyamoto, Pascal Stienemeier, Moritz
Preißer, Vincent Rothe, Sebastian Schmidt, Marco Sekulla, So
Young Shim, Christian Speckner, Pascal Stienemeier, Manuel
Utsch, Christian Weiss, Daniel Wiesler, Zhijie Zhao

---


[1]The original meaning of the acronym is *W, Higgs, Z, And Respective Decays*. The current program is much more than that, however.

Abstract

WHIZARD is an application of the VAMP algorithm: Adaptive multi-channel integration and event generation. The bare VAMP library is augmented by modules for Lorentz algebra, particles, phase space, etc., such that physical processes with arbitrary complex final states [well, in principle. . .] can be integrated and *unweighted* events be generated.

```

We are strict with our names:

⟨*Standard module head*⟩≡
```
    implicit none
    private
```

This is the way to envoke the kinds module (not contained in this source)

⟨*Use kinds*⟩≡
```
    use kinds, only: default
```

⟨*Use kinds with double*⟩≡
```
    use kinds, only: default, double
```

And we make heavy use of variable-length strings

⟨*Use strings*⟩≡
```
    use iso_varying_string, string_t => varying_string
```

Access to the `debug_on` master switch

⟨*Use debug*⟩≡
```
    use debug_master, only: debug_on
```

And we need the Fortran 2008 MPI module, if compiled with `MPI`.

⟨*Use mpi f08*⟩≡

⟨*MPI: Use mpi f08*⟩≡
```
    use mpi_f08 !NODEP!
```

Chapter 3

Utilities

These modules are intended as part of WHIZARD, but in fact they are generic and could be useful for any purpose.

The modules depend only on modules from the `basics` set.

file_utils Procedures that deal with external files, if not covered by Fortran built-ins.

file_registries Manage files that are accessed by their name.

string_utils Some string-handling utilities. Includes conversion to C string.

format_utils Utilities for pretty-printing.

format_defs Predefined format strings.

numeric_utils Utilities for comparing numerical values.

3.1 File Utilities

This module provides miscellaneous tools associated with named external files. Currently only:

- Delete a named file

⟨`file_utils.f90`⟩≡
  ⟨*File header*⟩

  module file_utils

    use io_units

  ⟨*Standard module head*⟩

  ⟨*File utils: public*⟩

  contains

  ⟨*File utils: procedures*⟩

  end module file_utils

$$\boxed{\text{No internal dependencies}}$$

Figure 3.1: Module dependencies in `src/utilities`.

3.1.1 Deleting a file

Fortran does not contain a command for deleting a file. Here, we provide a subroutine that deletes a file if it exists. We do not handle the subtleties, so we assume that it is writable if it exists.

⟨*File utils: public*⟩≡
```
    public :: delete_file
```

⟨*File utils: procedures*⟩≡
```
    subroutine delete_file (name)
      character(*), intent(in) :: name
      logical :: exist
      integer :: u
      inquire (file = name, exist = exist)
      if (exist) then
         u = free_unit ()
         open (unit = u, file = name)
         close (u, status = "delete")
      end if
    end subroutine delete_file
```

3.2 File Registries

This module provides a file-registry facility. We can open and close files multiple times without inadvertedly accessing a single file by two different I/O unit numbers. Opening a file the first time enters it into the registry. Opening again just returns the associated I/O unit. The registry maintains a reference count, so closing a file does not actually complete until the last reference is released.

File access will always be sequential, however. The file can't be opened at different positions simultaneously.

⟨`file_registries.f90`⟩≡
    ⟨*File header*⟩

```
module file_registries
```

⟨*Use strings*⟩
```
  use io_units
```

⟨*Standard module head*⟩

⟨*File registries: public*⟩

⟨*File registries: types*⟩

```
contains
```

⟨*File registries: procedures*⟩

```
end module file_registries
```

3.2.1 File handle

This object holds a filename (fully qualified), the associated unit, and a reference count. The idea is that the object should be deleted when the reference count drops to zero.

⟨*File registries: types*⟩≡
```
    type :: file_handle_t
       type(string_t) :: file
       integer :: unit = 0
       integer :: refcount = 0
     contains
     ⟨File registries: file handle: TBP⟩
    end type file_handle_t
```

Debugging output:

⟨*File registries: file handle: TBP*⟩≡
```
    procedure :: write => file_handle_write
```

⟨*File registries: procedures*⟩≡
```
    subroutine file_handle_write (handle, u, show_unit)
      class(file_handle_t), intent(in) :: handle
      integer, intent(in) :: u
      logical, intent(in), optional :: show_unit
      logical :: show_u
      show_u = .false.;  if (present (show_unit))  show_u = show_unit
      if (show_u) then
         write (u, "(3x,A,1x,I0,1x,'(',I0,')')")  &
              char (handle%file), handle%unit, handle%refcount
      else
         write (u, "(3x,A,1x,'(',I0,')')")  &
              char (handle%file), handle%refcount
      end if
    end subroutine file_handle_write
```

Initialize with a file name, don't open the file yet:

⟨File registries: file handle: TBP⟩+≡
```
    procedure :: init => file_handle_init
```

⟨File registries: procedures⟩+≡
```
    subroutine file_handle_init (handle, file)
      class(file_handle_t), intent(out) :: handle
      type(string_t), intent(in) :: file
      handle%file = file
    end subroutine file_handle_init
```

We check the `refcount` before actually opening the file.

⟨File registries: file handle: TBP⟩+≡
```
    procedure :: open => file_handle_open
```

⟨File registries: procedures⟩+≡
```
    subroutine file_handle_open (handle)
      class(file_handle_t), intent(inout) :: handle
      if (handle%refcount == 0) then
         handle%unit = free_unit ()
         open (unit = handle%unit, file = char (handle%file), action = "read", &
              status = "old")
      end if
      handle%refcount = handle%refcount + 1
    end subroutine file_handle_open
```

Analogously, close if the refcount drops to zero. The caller may then delete the object.

⟨File registries: file handle: TBP⟩+≡
```
    procedure :: close => file_handle_close
```

⟨File registries: procedures⟩+≡
```
    subroutine file_handle_close (handle)
      class(file_handle_t), intent(inout) :: handle
      handle%refcount = handle%refcount - 1
      if (handle%refcount == 0) then
         close (handle%unit)
         handle%unit = 0
      end if
    end subroutine file_handle_close
```

The I/O unit will be nonzero when the file is open.

⟨File registries: file handle: TBP⟩+≡
```
    procedure :: is_open => file_handle_is_open
```

⟨File registries: procedures⟩+≡
```
    function file_handle_is_open (handle) result (flag)
      class(file_handle_t), intent(in) :: handle
      logical :: flag
      flag = handle%unit /= 0
    end function file_handle_is_open
```

Return the filename, so we can identify the entry.

⟨*File registries: file handle: TBP*⟩+≡
```
    procedure :: get_file => file_handle_get_file
```

⟨*File registries: procedures*⟩+≡
```
    function file_handle_get_file (handle) result (file)
      class(file_handle_t), intent(in) :: handle
      type(string_t) :: file
      file = handle%file
    end function file_handle_get_file
```

For debugging, return the I/O unit number.

⟨*File registries: file handle: TBP*⟩+≡
```
    procedure :: get_unit => file_handle_get_unit
```

⟨*File registries: procedures*⟩+≡
```
    function file_handle_get_unit (handle) result (unit)
      class(file_handle_t), intent(in) :: handle
      integer :: unit
      unit = handle%unit
    end function file_handle_get_unit
```

3.2.2   File handles registry

This is implemented as a doubly-linked list. The list exists only once in the program, as a private module variable.

Extend the handle type to become a list entry:

⟨*File registries: types*⟩+≡
```
    type, extends (file_handle_t) :: file_entry_t
       type(file_entry_t), pointer :: prev => null ()
       type(file_entry_t), pointer :: next => null ()
    end type file_entry_t
```

The actual registry. We need only the pointer to the first entry.

⟨*File registries: public*⟩≡
```
    public :: file_registry_t
```

⟨*File registries: types*⟩+≡
```
    type :: file_registry_t
       type(file_entry_t), pointer :: first => null ()
     contains
     ⟨File registries: file registry: TBP⟩
    end type file_registry_t
```

Debugging output.

⟨*File registries: file registry: TBP*⟩≡
```
    procedure :: write => file_registry_write
```

⟨*File registries: procedures*⟩+≡

```
    subroutine file_registry_write (registry, unit, show_unit)
      class(file_registry_t), intent(in) :: registry
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: show_unit
      type(file_entry_t), pointer :: entry
      integer :: u
      u = given_output_unit (unit)
      if (associated (registry%first)) then
         write (u, "(1x,A)")  "File registry:"
         entry => registry%first
         do while (associated (entry))
            call entry%write (u, show_unit)
            entry => entry%next
         end do
      else
         write (u, "(1x,A)")  "File registry: [empty]"
      end if
    end subroutine file_registry_write
```

Open a file: find the appropriate entry. Create a new entry and add to the list if necessary. The list is extended at the beginning. Return the I/O unit number for the records.

⟨*File registries: file registry: TBP*⟩+≡

```
    procedure :: open => file_registry_open
```

⟨*File registries: procedures*⟩+≡

```
    subroutine file_registry_open (registry, file, unit)
      class(file_registry_t), intent(inout) :: registry
      type(string_t), intent(in) :: file
      integer, intent(out), optional :: unit
      type(file_entry_t), pointer :: entry
      entry => registry%first
      FIND_ENTRY: do while (associated (entry))
         if (entry%get_file () == file)  exit FIND_ENTRY
         entry => entry%next
      end do FIND_ENTRY
      if (.not. associated (entry)) then
         allocate (entry)
         call entry%init (file)
         if (associated (registry%first)) then
            registry%first%prev => entry
            entry%next => registry%first
         end if
         registry%first => entry
      end if
      call entry%open ()
      if (present (unit))  unit = entry%get_unit ()
    end subroutine file_registry_open
```

Close a file: find the appropriate entry. Delete the entry if there is no file connected to it anymore.

⟨*File registries: file registry: TBP*⟩+≡

```
      procedure :: close => file_registry_close
```
⟨*File registries: procedures*⟩+≡
```
    subroutine file_registry_close (registry, file)
      class(file_registry_t), intent(inout) :: registry
      type(string_t), intent(in) :: file
      type(file_entry_t), pointer :: entry
      entry => registry%first
      FIND_ENTRY: do while (associated (entry))
         if (entry%get_file () == file)  exit FIND_ENTRY
         entry => entry%next
      end do FIND_ENTRY
      if (associated (entry)) then
         call entry%close ()
         if (.not. entry%is_open ()) then
            if (associated (entry%prev)) then
               entry%prev%next => entry%next
            else
               registry%first => entry%next
            end if
            if (associated (entry%next)) then
               entry%next%prev => entry%prev
            end if
            deallocate (entry)
         end if
      end if
    end subroutine file_registry_close
```

3.3   String Utilities

This module provides tools associated with strings (built-in and variable). Currently:

- Upper and lower case for strings

- Convert to null-terminated C string

⟨string_utils.f90⟩≡
  ⟨*File header*⟩

```
  module string_utils

    use, intrinsic :: iso_c_binding
```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩

  ⟨*Standard module head*⟩

  ⟨*String utils: public*⟩

  ⟨*String utils: interfaces*⟩

```
    contains
```

⟨*String utils: procedures*⟩

```
    end module string_utils
```

3.3.1 Upper and Lower Case

These are, unfortunately, not part of Fortran.

⟨*String utils: public*⟩≡
```
    public :: upper_case
    public :: lower_case
```

⟨*String utils: interfaces*⟩≡
```
    interface upper_case
       module procedure upper_case_char, upper_case_string
    end interface
    interface lower_case
       module procedure lower_case_char, lower_case_string
    end interface
```

⟨*String utils: procedures*⟩≡
```
    function upper_case_char (string) result (new_string)
      character(*), intent(in) :: string
      character(len(string)) :: new_string
      integer :: pos, code
      integer, parameter :: offset = ichar('A')-ichar('a')
      do pos = 1, len (string)
         code = ichar (string(pos:pos))
         select case (code)
         case (ichar('a'):ichar('z'))
            new_string(pos:pos) = char (code + offset)
         case default
            new_string(pos:pos) = string(pos:pos)
         end select
      end do
    end function upper_case_char

    function lower_case_char (string) result (new_string)
      character(*), intent(in) :: string
      character(len(string)) :: new_string
      integer :: pos, code
      integer, parameter :: offset = ichar('a')-ichar('A')
      do pos = 1, len (string)
         code = ichar (string(pos:pos))
         select case (code)
         case (ichar('A'):ichar('Z'))
            new_string(pos:pos) = char (code + offset)
         case default
            new_string(pos:pos) = string(pos:pos)
         end select
      end do
    end function lower_case_char
```

```
function upper_case_string (string) result (new_string)
  type(string_t), intent(in) :: string
  type(string_t) :: new_string
  new_string = upper_case_char (char (string))
end function upper_case_string

function lower_case_string (string) result (new_string)
  type(string_t), intent(in) :: string
  type(string_t) :: new_string
  new_string = lower_case_char (char (string))
end function lower_case_string
```

3.3.2   C-compatible Output

Convert a FORTRAN string into a zero terminated C string.

⟨*String utils: public*⟩+≡
```
public :: string_f2c
```

⟨*String utils: interfaces*⟩+≡
```
interface string_f2c
   module procedure string_f2c_char, string_f2c_var_str
end interface string_f2c
```

⟨*String utils: procedures*⟩+≡
```
pure function string_f2c_char (i) result (o)
  character(*), intent(in) :: i
  character(kind=c_char, len=len (i) + 1) :: o
  o = i // c_null_char
end function string_f2c_char

pure function string_f2c_var_str (i) result (o)
  type(string_t), intent(in) :: i
  character(kind=c_char, len=len (i) + 1) :: o
  o = char (i) // c_null_char
end function string_f2c_var_str
```

3.3.3   Number Conversion

Create a string from a number. We use fixed format for the reals and variable format for integers.

⟨*String utils: public*⟩+≡
```
public :: str
```

⟨*String utils: interfaces*⟩+≡
```
interface str
   module procedure str_log, str_logs, str_int, str_ints, &
        str_real, str_reals, str_complex, str_complexs
end interface
```

⟨*String utils: procedures*⟩+≡
```fortran
function str_log (l) result (s)
  logical, intent(in) :: l
  type(string_t) :: s
  if (l) then
     s = "True"
  else
     s = "False"
  end if
end function str_log

function str_logs (x) result (s)
  logical, dimension(:), intent(in) :: x
  ⟨concatenate strings⟩
end function str_logs

function str_int (i) result (s)
  integer, intent(in) :: i
  type(string_t) :: s
  character(32) :: buffer
  write (buffer, "(I0)")  i
  s = var_str (trim (adjustl (buffer)))
end function str_int

function str_ints (x) result (s)
  integer, dimension(:), intent(in) :: x
  ⟨concatenate strings⟩
end function str_ints

function str_real (x) result (s)
  real(default), intent(in) :: x
  type(string_t) :: s
  character(32) :: buffer
  write (buffer, "(ES17.10)")  x
  s = var_str (trim (adjustl (buffer)))
end function str_real

function str_reals (x) result (s)
  real(default), dimension(:), intent(in) :: x
  ⟨concatenate strings⟩
end function str_reals

function str_complex (x) result (s)
  complex(default), intent(in) :: x
  type(string_t) :: s
  s = str_real (real (x)) // " + i " // str_real (aimag (x))
end function str_complex

function str_complexs (x) result (s)
  complex(default), dimension(:), intent(in) :: x
  ⟨concatenate strings⟩
end function str_complexs
```

⟨*concatenate strings*⟩≡

```
type(string_t) :: s
integer :: i
s = '['
do i = 1, size(x) - 1
   s = s // str(x(i)) // ', '
end do
s = s // str(x(size(x))) // ']'
```

Auxiliary: Read real, integer, string value.

⟨*String utils: public*⟩+≡
```
public :: read_rval
public :: read_ival
```

⟨*String utils: procedures*⟩+≡
```
function read_rval (s) result (rval)
  real(default) :: rval
  type(string_t), intent(in) :: s
  character(80) :: buffer
  buffer = s
  read (buffer, *)  rval
end function read_rval

function read_ival (s) result (ival)
  integer :: ival
  type(string_t), intent(in) :: s
  character(80) :: buffer
  buffer = s
  read (buffer, *)  ival
end function read_ival
```

3.3.4 String splitting

⟨*String utils: public*⟩+≡
```
public :: string_contains_word
```

⟨*String utils: procedures*⟩+≡
```
pure function string_contains_word (str, word, include_identical) result (val)
  logical :: val
  type(string_t), intent(in) :: str, word
  type(string_t) :: str_tmp, str_out
  logical, intent(in), optional :: include_identical
  logical :: yorn
  str_tmp = str
  val = .false.
  yorn = .false.; if (present (include_identical))  yorn = include_identical
  if (yorn)  val = str == word
  call split (str_tmp, str_out, word)
  val = val .or. (str_out /= "")
end function string_contains_word
```

Create an array of strings using a separator.

⟨*String utils: public*⟩+≡
```
public :: split_string
```

⟨*String utils: procedures*⟩+≡

```
    pure subroutine split_string (str, separator, str_array)
      type(string_t), dimension(:), allocatable, intent(out) :: str_array
      type(string_t), intent(in) :: str, separator
      type(string_t) :: str_tmp, str_out
      integer :: n_str
      n_str = 0; str_tmp = str
      do while (string_contains_word (str_tmp, separator))
         n_str = n_str + 1
         call split (str_tmp, str_out, separator)
      end do
      allocate (str_array (n_str))
      n_str = 1; str_tmp = str
      do while (string_contains_word (str_tmp, separator))
         call split (str_tmp, str_array (n_str), separator)
         n_str = n_str + 1
      end do
    end subroutine split_string
```

3.4   Format Utilities

This module provides miscellaneous tools associated with formatting and pretty-printing.

- Horizontal separator lines in output

- Indenting an output line

- Formatting a number for TeX output.

- Formatting a number for MetaPost output.

- Alternate numeric formats.

⟨`format_utils.f90`⟩≡
  ⟨*File header*⟩

```
  module format_utils
```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
```
    use string_utils, only: lower_case

```

  ⟨*Format utils: procedures*⟩

```
  end module format_utils
```

3.4.1 Line Output

Write a separator line.

⟨Format utils: public⟩≡

```
    public :: write_separator
```

⟨Format utils: procedures⟩≡

```
    subroutine write_separator (u, mode)
      integer, intent(in) :: u
      integer, intent(in), optional :: mode
      integer :: m
      m = 1;  if (present (mode))  m = mode
      select case (m)
      case default
         write (u, "(A)")  repeat ("-", 72)
      case (1)
         write (u, "(A)")  repeat ("-", 72)
      case (2)
         write (u, "(A)")  repeat ("=", 72)
      end select
    end subroutine write_separator
```

Indent the line with given number of blanks.

⟨Format utils: public⟩+≡

```
    public :: write_indent
```

⟨Format utils: procedures⟩+≡

```
    subroutine write_indent (unit, indent)
      integer, intent(in) :: unit
      integer, intent(in), optional :: indent
      if (present (indent)) then
         write (unit, "(1x,A)", advance="no")  repeat ("  ", indent)
      end if
    end subroutine write_indent
```

3.4.2 Array Output

Write an array of integers.

⟨Format utils: public⟩+≡

```
    public :: write_integer_array
```

⟨Format utils: procedures⟩+≡

```
    subroutine write_integer_array (array, unit, n_max, no_skip)
      integer, intent(in), dimension(:) :: array
      integer, intent(in), optional :: unit
      integer, intent(in), optional :: n_max
      logical, intent(in), optional :: no_skip
      integer :: u, i, n
      logical :: yorn
      u = given_output_unit (unit)
      yorn = .false.; if (present (no_skip)) yorn = no_skip
      if (present (n_max)) then
         n = n_max
```

```
      else
         n = size (array)
      end if
      do i = 1, n
         if (i < n .or. yorn) then
            write (u, "(I0, A)", advance = "no") array(i), ", "
         else
            write (u, "(I0)") array(i)
         end if
      end do
   end subroutine write_integer_array
```

3.4.3   TeX-compatible Output

Quote underscore characters for use in TeX output.

⟨*Format utils: public*⟩+≡
```
   public :: quote_underscore
```

⟨*Format utils: procedures*⟩+≡
```
   function quote_underscore (string) result (quoted)
     type(string_t) :: quoted
     type(string_t), intent(in) :: string
     type(string_t) :: part
     type(string_t) :: buffer
     buffer = string
     quoted = ""
     do
       call split (part, buffer, "_")
       quoted = quoted // part
       if (buffer == "")  exit
       quoted = quoted // "\_"
     end do
   end function quote_underscore
```

Format a number with n significant digits for use in TeX documents.

⟨*Format utils: public*⟩+≡
```
   public :: tex_format
```

⟨*Format utils: procedures*⟩+≡
```
   function tex_format (rval, n_digits) result (string)
     type(string_t) :: string
     real(default), intent(in) :: rval
     integer, intent(in) :: n_digits
     integer :: e, n, w, d
     real(default) :: absval
     real(default) :: mantissa
     character :: sign
     character(20) :: format
     character(80) :: cstr
     n = min (abs (n_digits), 16)
     if (rval == 0) then
        string = "0"
     else
```

```
        absval = abs (rval)
        e = int (log10 (absval))
        if (rval < 0) then
            sign = "-"
        else
            sign = ""
        end if
        select case (e)
        case (:-3)
            d = max (n - 1, 0)
            w = max (d + 2, 2)
            write (format, "('(F',I0,'.',I0,',A,I0,A)')")  w, d
            mantissa = absval * 10._default ** (1 - e)
            write (cstr, fmt=format)  mantissa, "\times 10^{", e - 1, "}"
        case (-2:0)
            d = max (n - e, 1 - e)
            w = max (d + e + 2, d + 2)
            write (format, "('(F',I0,'.',I0,')')")  w, d
            write (cstr, fmt=format)  absval
        case (1:2)
            d = max (n - e - 1, -e, 0)
            w = max (d + e + 2, d + 2, e + 2)
            write (format, "('(F',I0,'.',I0,')')")  w, d
            write (cstr, fmt=format)  absval
        case default
            d = max (n - 1, 0)
            w = max (d + 2, 2)
            write (format, "('(F',I0,'.',I0,',A,I0,A)')")  w, d
            mantissa = absval * 10._default ** (- e)
            write (cstr, fmt=format)  mantissa, "\times 10^{", e, "}"
        end select
        string = sign // trim (cstr)
    end if
  end function tex_format
```

3.4.4   Metapost-compatible Output

Write a number for use in Metapost code:

⟨*Format utils: public*⟩+≡
```
    public :: mp_format
```

⟨*Format utils: procedures*⟩+≡
```
    function mp_format (rval) result (string)
      type(string_t) :: string
      real(default), intent(in) :: rval
      character(16) :: tmp
      write (tmp, "(G16.8)")  rval
      string = lower_case (trim (adjustl (trim (tmp))))
    end function mp_format
```

3.4.5 Conditional Formatting

Conditional format string, intended for switchable numeric precision.

⟨*Format utils: public*⟩+≡
```
    public :: pac_fmt
```

⟨*Format utils: procedures*⟩+≡
```
    subroutine pac_fmt (fmt, fmt_orig, fmt_pac, pacify)
      character(*), intent(in) :: fmt_orig, fmt_pac
      character(*), intent(out) :: fmt
      logical, intent(in), optional :: pacify
      logical :: pacified
      pacified = .false.
      if (present (pacify))  pacified = pacify
      if (pacified) then
         fmt = fmt_pac
      else
         fmt = fmt_orig
      end if
    end subroutine pac_fmt
```

3.4.6 Compressed output of integer arrays

⟨*Format utils: public*⟩+≡
```
    public :: write_compressed_integer_array
```

⟨*Format utils: procedures*⟩+≡
```
    subroutine write_compressed_integer_array (chars, array)
      character(len=*), intent(out) :: chars
      integer, intent(in), allocatable, dimension(:) :: array
      logical, dimension(:), allocatable :: used
      character(len=16) :: tmp
      type(string_t) :: string
      integer :: i, j, start_chain, end_chain
      chars = '[none]'
      string = ""
      if (allocated (array)) then
         if (size (array) > 0) then
            allocate (used (size (array)))
            used = .false.
            do i = 1, size (array)
               if (.not. used(i)) then
                  start_chain = array(i)
                  end_chain = array(i)
                  used(i) = .true.
                  EXTEND: do
                     do j = 1, size (array)
                        if (array(j) == end_chain + 1) then
                           end_chain = array(j)
                           used(j) = .true.
                           cycle EXTEND
                        end if
                        if (array(j) == start_chain - 1) then
                           start_chain = array(j)
```

```
                            used(j) = .true.
                            cycle EXTEND
                        end if
                    end do
                    exit
                end do EXTEND
                if (end_chain - start_chain > 0) then
                    write (tmp, "(I0,A,I0)") start_chain, "-", end_chain
                else
                    write (tmp, "(I0)") start_chain
                end if
                string = string // trim (tmp)
                if (any (.not. used)) then
                    string = string // ','
                end if
            end if
        end do
        chars = string
      end if
    end if
    chars = adjustr (chars)
  end subroutine write_compressed_integer_array
```

3.5 Format Definitions

This module provides named integer parameters that specify certain format
strings, used for numerical output.

⟨format_defs.f90⟩≡
  ⟨*File header*⟩

  `module format_defs`

  ⟨*Standard module head*⟩

  ⟨*Format defs: public parameters*⟩

  `end module format_defs`

We collect format strings for various numerical output formats here.

⟨*Format defs: public parameters*⟩≡
```
    character(*), parameter, public :: FMT_19 = "ES19.12"
    character(*), parameter, public :: FMT_18 = "ES18.11"
    character(*), parameter, public :: FMT_17 = "ES17.10"
    character(*), parameter, public :: FMT_16 = "ES16.9"
    character(*), parameter, public :: FMT_15 = "ES15.8"
    character(*), parameter, public :: FMT_14 = "ES14.7"
    character(*), parameter, public :: FMT_13 = "ES13.6"
    character(*), parameter, public :: FMT_12 = "ES12.5"
    character(*), parameter, public :: FMT_11 = "ES11.4"
    character(*), parameter, public :: FMT_10 = "ES10.3"
```

Fixed-point formats for better readability, where appropriate.

⟨*Format defs: public parameters*⟩+≡
```
    character(*), parameter, public :: FMF_12 = "F12.9"
```

3.6   Numeric Utilities

⟨`numeric_utils.f90`⟩≡
  ⟨*File header*⟩
```
  module numeric_utils
```
  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
```
    use string_utils
    use constants
    use format_defs
```
  ⟨*Standard module head*⟩

  ⟨*Numeric utils: public*⟩

  ⟨*Numeric utils: parameters*⟩

  ⟨*Numeric utils: types*⟩

  ⟨*Numeric utils: interfaces*⟩
```
  contains
```
  ⟨*Numeric utils: procedures*⟩
```
  end module numeric_utils
```

⟨*Numeric utils: public*⟩≡
```
    public :: assert
```

⟨*Numeric utils: procedures*⟩≡
```
    subroutine assert (unit, ok, description, exit_on_fail)
      integer, intent(in) :: unit
      logical, intent(in) :: ok
      character(*), intent(in), optional :: description
      logical, intent(in), optional :: exit_on_fail
      logical :: ef
      ef = .false.;  if (present (exit_on_fail)) ef = exit_on_fail
      if (.not. ok) then
         if (present(description)) then
            write (unit, "(A)") "* FAIL: " // description
         else
            write (unit, "(A)") "* FAIL: Assertion error"
         end if
         if (ef)  stop 1
      end if
    end subroutine assert
```

Compare numbers and output error message if not equal.

⟨*Numeric utils: public*⟩+≡
```
    public:: assert_equal
    interface assert_equal
       module procedure assert_equal_integer, assert_equal_integers, &
                assert_equal_real, assert_equal_reals, &
                assert_equal_complex, assert_equal_complexs
    end interface
```

⟨*Numeric utils: procedures*⟩+≡
```
    subroutine assert_equal_integer (unit, lhs, rhs, description, exit_on_fail)

      type(string_t) :: desc
      logical :: ok
      ok = all(lhs == rhs)
      desc = ''; if (present (description)) desc = var_str(description) // ": "
      call assert (unit, ok, char(desc // str (lhs) // " /= " // str (rhs)), exit_on_fail)
    end subroutine assert_equal_integers
```

⟨*Numeric utils: procedures*⟩+≡
```
    subroutine assert_equal_real (unit, lhs, rhs, description, &
                                    abs_smallness, rel_smallness, exit_on_fail)
      integer, intent(in) :: unit
      real(default), intent(in) :: lhs, rhs
      character(*), intent(in), optional :: description
      real(default), intent(in), optional :: abs_smallness, rel_smallness
      logical, intent(in), optional :: exit_on_fail
      type(string_t) :: desc
      logical :: ok
      ok = nearly_equal (lhs, rhs, abs_smallness, rel_smallness)
      desc = ''; if (present (description)) desc = var_str(description) // ": "
      call assert (unit, ok, char(desc // str (lhs) // " /= " // str (rhs)), exit_on_fail)
    end subroutine assert_equal_real
```

⟨*Numeric utils: procedures*⟩+≡
```
    subroutine assert_equal_reals (unit, lhs, rhs, description, &
```

```
                              abs_smallness, rel_smallness, exit_on_fail)
    integer, intent(in) :: unit
    real(default), dimension(:), intent(in) :: lhs, rhs
    character(*), intent(in), optional :: description
    real(default), intent(in), optional :: abs_smallness, rel_smallness
    logical, intent(in), optional :: exit_on_fail
    type(string_t) :: desc
    logical :: ok
    ok = all(nearly_equal (lhs, rhs, abs_smallness, rel_smallness))
    desc = ''; if (present (description)) desc = var_str(description) // ": "
    call assert (unit, ok, char(desc // str (lhs) // " /= " // str (rhs)), exit_on_fail)
  end subroutine assert_equal_reals
```

⟨*Numeric utils: procedures*⟩+≡
```
  subroutine assert_equal_complex (unit, lhs, rhs, description, &
                              abs_smallness, rel_smallness, exit_on_fail)
    integer, intent(in) :: unit
    complex(default), intent(in) :: lhs, rhs
    character(*), intent(in), optional :: description
    real(default), intent(in), optional :: abs_smallness, rel_smallness
    logical, intent(in), optional :: exit_on_fail
    type(string_t) :: desc
    logical :: ok
    ok = nearly_equal (real(lhs), real(rhs), abs_smallness, rel_smallness) &
         .and. nearly_equal (aimag(lhs), aimag(rhs), abs_smallness, rel_smallness)
    desc = ''; if (present (description)) desc = var_str(description) // ": "
    call assert (unit, ok, char(desc // str (lhs) // " /= " // str (rhs)), exit_on_fail)
  end subroutine assert_equal_complex
```

⟨*Numeric utils: procedures*⟩+≡
```
  subroutine assert_equal_complexs (unit, lhs, rhs, description, &
                              abs_smallness, rel_smallness, exit_on_fail)
    integer, intent(in) :: unit
    complex(default), dimension(:), intent(in) :: lhs, rhs
    character(*), intent(in), optional :: description
    real(default), intent(in), optional :: abs_smallness, rel_smallness
    logical, intent(in), optional :: exit_on_fail
    type(string_t) :: desc
    logical :: ok
    ok = all (nearly_equal (real(lhs), real(rhs), abs_smallness, rel_smallness)) &
         .and. all (nearly_equal (aimag(lhs), aimag(rhs), abs_smallness, rel_smallness))
    desc = ''; if (present (description)) desc = var_str(description) // ": "
    call assert (unit, ok, char(desc // str (lhs) // " /= " // str (rhs)), exit_on_fail)
  end subroutine assert_equal_complexs
```

Note that this poor man's check will be disabled if someone compiles with
`-ffast-math` or similar optimizations.

⟨*Numeric utils: procedures*⟩+≡
```
  elemental function ieee_is_nan (x) result (yorn)
    logical :: yorn
    real(default), intent(in) :: x
    yorn = (x /= x)
```

```
      end function ieee_is_nan
```

This is still not perfect but should work in most cases. Usually one wants to compare to a relative epsilon `rel_smallness`, except for numbers close to zero defined by `abs_smallness`. Both might need adaption to specific use cases but have reasonable defaults.

⟨*Numeric utils: public*⟩+≡
```
    public :: nearly_equal
```

⟨*Numeric utils: interfaces*⟩≡
```
    interface nearly_equal
       module procedure nearly_equal_real
       module procedure nearly_equal_complex
    end interface nearly_equal
```

⟨*Numeric utils: procedures*⟩+≡
```
    elemental function nearly_equal_real (a, b, abs_smallness, rel_smallness) result (r)
      logical :: r
      real(default), intent(in) :: a, b
      real(default), intent(in), optional :: abs_smallness, rel_smallness
      real(default) :: abs_a, abs_b, diff, abs_small, rel_small
      abs_a = abs (a)
      abs_b = abs (b)
      diff = abs (a - b)
      ! shortcut, handles infinities and nans
      if (a == b) then
         r = .true.
         return
      else if (ieee_is_nan (a) .or. ieee_is_nan (b) .or. ieee_is_nan (diff)) then
         r = .false.
         return
      end if
      abs_small = tiny_13; if (present (abs_smallness)) abs_small = abs_smallness
      rel_small = tiny_10; if (present (rel_smallness)) rel_small = rel_smallness
      if (abs_a < abs_small .and. abs_b < abs_small) then
         r = diff < abs_small
      else
         r = diff / max (abs_a, abs_b) < rel_small
      end if
    end function nearly_equal_real
```

⟨*Numeric utils: procedures*⟩+≡
```
    elemental function nearly_equal_complex (a, b, abs_smallness, rel_smallness) result (r)
      logical :: r
      complex(default), intent(in) :: a, b
      real(default), intent(in), optional :: abs_smallness, rel_smallness
      r = nearly_equal_real (real (a), real (b), abs_smallness, rel_smallness) .and. &
           nearly_equal_real (aimag (a), aimag(b), abs_smallness, rel_smallness)
    end function nearly_equal_complex
```

Often we will need to check whether floats vanish:

⟨*Numeric utils: public*⟩+≡

51

```
      public:: vanishes
      interface vanishes
         module procedure vanishes_real, vanishes_complex
      end interface
```

⟨*Numeric utils: procedures*⟩+≡
```
      elemental function vanishes_real (x, abs_smallness, rel_smallness) result (r)
        logical :: r
        real(default), intent(in) :: x
        real(default), intent(in), optional :: abs_smallness, rel_smallness
        r = nearly_equal (x, zero, abs_smallness, rel_smallness)
      end function vanishes_real

      elemental function vanishes_complex (x, abs_smallness, rel_smallness) result (r)
        logical :: r
        complex(default), intent(in) :: x
        real(default), intent(in), optional :: abs_smallness, rel_smallness
        r = vanishes_real (abs (x), abs_smallness, rel_smallness)
      end function vanishes_complex
```

        amp2 = sum (amp_tree * conjg (amp_tree) + &
                    amp_tree * conjg (amp_blob) + &
                    amp_blob * conjg (amp_tree))
      end function expanded_amp2
```

⟨*Numeric utils: public*⟩+≡
```
      public :: abs2
```

⟨*Numeric utils: procedures*⟩+≡
```
      elemental function abs2 (c) result (c2)
        real(default) :: c2
        complex(default), intent(in) :: c
        c2 = real (c * conjg(c))
      end function abs2
```

Remove all duplicates from an array of signed integers and returns an unordered
array of remaining elements. This method does not really fit into this module.
It could be part of a larger module which deals with array manipulations.

⟨*Numeric utils: public*⟩+≡
```
      public :: remove_duplicates_from_int_array
```

⟨*Numeric utils: procedures*⟩+≡
```
      function remove_duplicates_from_int_array (array) result (array_unique)
        integer, intent(in), dimension(:) :: array
        integer, dimension(:), allocatable :: array_unique
        integer :: i
        allocate (array_unique(0))
```

```
        do i = 1, size (array)
            if (any (array_unique == array(i))) cycle
            array_unique = [array_unique, [array(i)]]
        end do
    end function remove_duplicates_from_int_array
```

⟨*Numeric utils: public*⟩+≡
```
    public :: extend_integer_array
```

⟨*Numeric utils: procedures*⟩+≡
```
    subroutine extend_integer_array (list, incr, initial_value)
      integer, intent(inout), dimension(:), allocatable :: list
      integer, intent(in) :: incr
      integer, intent(in), optional :: initial_value
      integer, dimension(:), allocatable :: list_store
      integer :: n, ini
      ini = 0; if (present (initial_value)) ini = initial_value
      n = size (list)
      allocate (list_store (n))
      list_store = list
      deallocate (list)
      allocate (list (n+incr))
      list(1:n) = list_store
      list(1+n : n+incr) = ini
      deallocate (list_store)
    end subroutine extend_integer_array
```

⟨*Numeric utils: public*⟩+≡
```
    public :: crop_integer_array
```

⟨*Numeric utils: procedures*⟩+≡
```
    subroutine crop_integer_array (list, i_crop)
      integer, intent(inout), dimension(:), allocatable :: list
      integer, intent(in) :: i_crop
      integer, dimension(:), allocatable :: list_store
      allocate (list_store (i_crop))
      list_store = list(1:i_crop)
      deallocate (list)
      allocate (list (i_crop))
      list = list_store
      deallocate (list_store)
    end subroutine crop_integer_array
```

We also need an evaluation of $\log x$ which is stable near $x = 1$.

⟨*Numeric utils: public*⟩+≡
```
    public :: log_prec
```

⟨*Numeric utils: procedures*⟩+≡
```
    function log_prec (x, xb) result (lx)
      real(default), intent(in) :: x, xb
      real(default) :: a1, a2, a3, lx
      a1 = xb
      a2 = a1 * xb / two
      a3 = a2 * xb * two / three
```

```
      if (abs (a3) < epsilon (a3)) then
         lx = - a1 - a2 - a3
      else
         lx = log (x)
      end if
    end function log_prec
```

⟨*Numeric utils: public*⟩+≡
```
    public :: split_array
```

⟨*Numeric utils: interfaces*⟩+≡
```
    interface split_array
       module procedure split_integer_array
       module procedure split_real_array
    end interface
```

⟨*Numeric utils: procedures*⟩+≡
```
    subroutine split_integer_array (list1, list2)
      integer, intent(inout), dimension(:), allocatable :: list1, list2
      integer, dimension(:), allocatable :: list_store
      allocate (list_store (size (list1) - size (list2)))
      list2 = list1(:size (list2))
      list_store = list1 (size (list2) + 1:)
      deallocate (list1)
      allocate (list1 (size (list_store)))
      list1 = list_store
      deallocate (list_store)
    end subroutine split_integer_array

    subroutine split_real_array (list1, list2)
      real(default), intent(inout), dimension(:), allocatable :: list1, list2
      real(default), dimension(:), allocatable :: list_store
      allocate (list_store (size (list1) - size (list2)))
      list2 = list1(:size (list2))
      list_store = list1 (size (list2) + 1:)
      deallocate (list1)
      allocate (list1 (size (list_store)))
      list1 = list_store
      deallocate (list_store)
    end subroutine split_real_array
```

Chapter 4

Testing

This part contains tools for automatic testing.

unit_tests A handler that executes test procedures and compares and collects results.

4.1   Unit tests

We provide functionality for automated unit tests. Each test is required to produce output which is compared against a reference file. If the two are identical, we signal success. Otherwise, we signal failure and write the output to a file.

⟨unit_tests.f90⟩≡
　⟨*File header*⟩

　```
module unit_tests
```

　⟨*Use strings*⟩
　　```
use io_units
```

　⟨*Standard module head*⟩

　⟨*Tests: public*⟩

　⟨*Tests: parameters*⟩

　⟨*Tests: types*⟩

　⟨*Tests: interfaces*⟩

　```
contains
```

　⟨*Tests: procedures*⟩

　```
end module unit_tests
```

Figure 4.1: Module dependencies in `src/testing`.

4.1.1 Parameters

Building blocks of file names. The directory names and suffixes are hard-coded here, and they must reflect actual Makefile targets where applicable.

⟨*Tests: parameters*⟩≡

```
character(*), parameter :: ref_prefix = "ref-output/"
character(*), parameter :: ref = ".ref"

character(*), parameter :: err_prefix = "err-output/"
character(*), parameter :: err = ".out"
```

4.1.2 Type for storing test results

We store the results of the individual unit tests in a linked list. Here is the entry:

⟨*Tests: public*⟩≡

```
public :: test_results_t
```

⟨*Tests: types*⟩≡

```
type :: test_result_t
   logical :: success = .false.
   type(string_t) :: name
   type(string_t) :: description
   type(test_result_t), pointer :: next => null ()
end type test_result_t

type :: test_results_t
   private
   type(test_result_t), pointer :: first => null ()
   type(test_result_t), pointer :: last => null ()
   integer :: n_success = 0
   integer :: n_failure = 0
 contains
```

⟨*Tests: test results: TBP*⟩
    end type test_results_t

Add a test result.

⟨*Tests: test results: TBP*⟩≡
    procedure, private :: add => test_results_add

⟨*Tests: procedures*⟩≡
```
    subroutine test_results_add (list, name, description, success)
      class(test_results_t), intent(inout) :: list
      character(len=*), intent(in) :: name
      character(len=*), intent(in) :: description
      logical, intent(in) :: success
      type(test_result_t), pointer :: result
      allocate (result)
      result%success = success
      result%name = name
      result%description = description
      if (associated (list%first)) then
         list%last%next => result
      else
         list%first => result
      end if
      list%last => result
      if (success) then
         list%n_success = list%n_success + 1
      else
         list%n_failure = list%n_failure + 1
      end if
    end subroutine test_results_add
```

Display the current state.

⟨*Tests: test results: TBP*⟩+≡
    procedure, private :: write => test_results_write

⟨*Tests: procedures*⟩+≡
```
    subroutine test_results_write (list, u)
      class(test_results_t), intent(in) :: list
      integer, intent(in) :: u
      type(test_result_t), pointer :: result
      write (u, "(A)")  "*** Test Summary ***"
      if (list%n_success > 0) then
         write (u, "(2x,A)")  "Success:"
         result => list%first
         do while (associated (result))
            if (result%success)  write (u, "(4x,A,': ',A)")  &
                 char (result%name), char (result%description)
            result => result%next
         end do
      end if
      if (list%n_failure > 0) then
         write (u, "(2x,A)")  "Failure:"
         result => list%first
         do while (associated (result))
```

57

```
                if (.not. result%success)  write (u, "(4x,A,': ',A)")  &
                     char (result%name), char (result%description)
               result => result%next
           end do
       end if
       write (u, "(A,I0)")  "Total   = ", list%n_success + list%n_failure
       write (u, "(A,I0)")  "Success = ", list%n_success
       write (u, "(A,I0)")  "Failure = ", list%n_failure
       write (u, "(A)")  "*** End of test Summary ***"
    end subroutine test_results_write
```

Return true if all tests were successful (or no test).

⟨*Tests: test results: TBP*⟩+≡
```
    procedure, private :: report => test_results_report
```

⟨*Tests: procedures*⟩+≡
```
    subroutine test_results_report (list, success)
      class(test_results_t), intent(in) :: list
      logical, intent(out) :: success
      success = list%n_failure == 0
    end subroutine test_results_report
```

Delete the list.

⟨*Tests: test results: TBP*⟩+≡
```
    procedure, private :: final => test_results_final
```

⟨*Tests: procedures*⟩+≡
```
    subroutine test_results_final (list)
      class(test_results_t), intent(inout) :: list
      type(test_result_t), pointer :: result
      do while (associated (list%first))
         result => list%first
         list%first => result%next
         deallocate (result)
      end do
      list%last => null ()
      list%n_success = 0
      list%n_failure = 0
    end subroutine test_results_final
```

4.1.3   Wrapup

This will write results, report status, and finalize. This is the only method
which we need to access from outside.

⟨*Tests: test results: TBP*⟩+≡
```
    procedure :: wrapup => test_results_wrapup
```

⟨*Tests: procedures*⟩+≡
```
    subroutine test_results_wrapup (list, u, success)
      class(test_results_t), intent(inout) :: list
      integer, intent(in) :: u
      logical, intent(out), optional :: success
```

```
      call list%write (u)
      if (present (success))  call list%report (success)
      call list%final ()
   end subroutine test_results_wrapup
```

4.1.4   Tool for Unit Tests

This procedure takes a test routine as an argument. It runs the test, output
directed to a temporary file. Then, it compares the file against a reference file.

The test routine must take the output unit as argument. We export this
abstract interface, so the test drivers can reference it for declaring the actual
test routines.

⟨*Tests: public*⟩+≡
```
      public :: unit_test
```

⟨*Tests: interfaces*⟩≡
```
      abstract interface
         subroutine unit_test (u)
           integer, intent(in) :: u
         end subroutine unit_test
      end interface
```

The test routine can print to screen and, optionally, to a logging unit.

NB: We call `fatal_force_crash` to produce a deliberate crash with back-
trace on any fatal error, if the runtime system does allow it. This is not normal
behavior, but should be useful if something goes wrong.

⟨*Tests: public*⟩+≡
```
      public :: test
```

⟨*Tests: procedures*⟩+≡
```
      subroutine test (test_proc, name, description, u_log, results)
        procedure(unit_test) :: test_proc
        character(*), intent(in) :: name
        character(*), intent(in) :: description
        integer, intent(in) :: u_log
        type(test_results_t), intent(inout) :: results
        integer :: u_test, u_ref, u_err
        logical :: exist
        character(256) :: buffer1, buffer2
        integer :: iostat1, iostat2
        logical :: success
        write (*, "(A)", advance="no")  "Running test: " // name
        write (u_log, "(A)")  "Test: " // name
        u_test = free_unit ()
        open (u_test, status="scratch", action="readwrite")
        call fatal_force_crash ()
        call test_proc (u_test)
        rewind (u_test)
        inquire (file=ref_prefix//name//ref, exist=exist)
        if (exist) then
           u_ref = free_unit ()
           open (u_ref, file=ref_prefix//name//ref, status="old", action="read")
```

```
      COMPARE_FILES: do
          read (u_test, "(A)", iostat=iostat1)  buffer1
          read (u_ref, "(A)", iostat=iostat2)  buffer2
          if (iostat1 /= iostat2) then
             success = .false.
             exit COMPARE_FILES
          else if (iostat1 < 0) then
             success = .true.
             exit COMPARE_FILES
          else if (buffer1 /= buffer2) then
             success = .false.
             exit COMPARE_FILES
          end if
      end do COMPARE_FILES
      close (u_ref)
   else
      write (*, "(A)", advance="no") " ... no reference output available"
      write (u_log, "(A)") "  No reference output available."
      success = .false.
   end if
   if (success) then
      write (*, "(A)") " ... success."
      write (u_log, "(A)")  "  Success."
   else
      write (*, "(A)") " ... failure.  See: " // err_prefix//name//err
      write (u_log, "(A)")  "  Failure."
      rewind (u_test)
      u_err = free_unit ()
      open (u_err, file=err_prefix//name//err, &
           action="write", status="replace")
      WRITE_OUTPUT: do
          read (u_test, "(A)", end=1) buffer1
          write (u_err, "(A)")  trim (buffer1)
      end do WRITE_OUTPUT
1      close (u_err)
   end if
   close (u_test)
   call results%add (name, description, success)
 end subroutine test
```

Chapter 5

System: Interfaces and Handlers

Here, we collect modules that deal with the "system": operating-system interfaces, error handlers and diagnostics.

system_defs Constants relevant for the modules in this set.

diagnostics Error and diagnostic message handling. Any messages and errors issued by WHIZARD functions are handled by the subroutines in this module, if possible.

os_interface Execute system calls, build and link external object files and libraries.

cputime Timer data type and methods, for measuring performance.

5.1 Constants

The parameters here are used in various parts of the program, starting from the modules in the current chapter. Some of them may be modified if the need arises.

⟨`system_defs.f90`⟩≡
  ⟨*File header*⟩

  ```
  module system_defs

    use, intrinsic :: iso_fortran_env, only: iostat_end, iostat_eor !NODEP!
  ```

  ⟨*Standard module head*⟩

  ⟨*System defs: public parameters*⟩

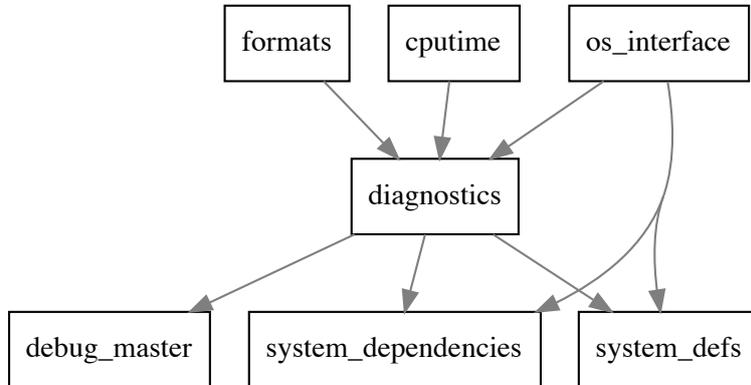
  ```
  end module system_defs
  ```


Figure 5.1: Module dependencies in `src/system`.

5.1.1 Version

The version string is used for checking files. Note that the string length MUST NOT be changed, because reading binary files relies on it.

⟨*System defs: public parameters*⟩≡
```
integer, parameter, public :: VERSION_STRLEN = 255
character(len=VERSION_STRLEN), parameter, public :: &
     & VERSION_STRING = "WHIZARD version ⟨Version⟩ (⟨Date⟩)"
```

5.1.2 Text Buffer

There is a hard limit on the line length which we should export. This buffer size is used both by the message handler, the lexer, and some further modules.

⟨*System defs: public parameters*⟩+≡
```
integer, parameter, public :: BUFFER_SIZE = 1000
```

5.1.3 IOSTAT Codes

Defined in `iso_fortran_env`, but we would like to use shorthands.

⟨*System defs: public parameters*⟩+≡
```
integer, parameter, public :: EOF = iostat_end,  EOR = iostat_eor
```

5.1.4 Character Codes

Single-character constants.

⟨*System defs: public parameters*⟩+≡

```
    character, parameter, public :: BLANK = ' '
    character, parameter, public :: TAB = achar(9)
    character, parameter, public :: CR = achar(13)
    character, parameter, public :: LF = achar(10)
    character, parameter, public :: BACKSLASH = achar(92)
```

Character strings that indicate character classes.

⟨*System defs: public parameters*⟩+≡
```
    character(*), parameter, public :: WHITESPACE_CHARS = BLANK// TAB // CR // LF
    character(*), parameter, public :: LCLETTERS = "abcdefghijklmnopqrstuvwxyz"
    character(*), parameter, public :: UCLETTERS = "ABCDEFGHIJKLMNOPQRSTUVWXYZ"
    character(*), parameter, public :: DIGITS = "0123456789"
```

5.2   C wrapper for sigaction

This implements calls to `sigaction` and the appropriate signal handlers in C.
The functionality is needed for the `diagnostics` module.

⟨`signal_interface.c`⟩≡
```c
  /*
  ⟨File header⟩
  */
  #include <signal.h>
  #include <stdlib.h>

  extern int wo_sigint;
  extern int wo_sigterm;
  extern int wo_sigxcpu;
  extern int wo_sigxfsz;

  static void wo_handler_sigint (int sig) {
    wo_sigint = sig;
  }

  static void wo_handler_sigterm (int sig) {
    wo_sigterm = sig;
  }

  static void wo_handler_sigxcpu (int sig) {
    wo_sigxcpu = sig;
  }

  static void wo_handler_sigxfsz (int sig) {
    wo_sigxfsz = sig;
  }

  int wo_mask_sigint () {
    struct sigaction sa;
    sigset_t blocks;
    sigfillset (&blocks);
    sa.sa_flags = 0;
    sa.sa_mask = blocks;
```

```c
  sa.sa_handler = wo_handler_sigint;
  return sigaction(SIGINT, &sa, NULL);
}

int wo_mask_sigterm () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = wo_handler_sigterm;
  return sigaction(SIGTERM, &sa, NULL);
}

int wo_mask_sigxcpu () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = wo_handler_sigxcpu;
  return sigaction(SIGXCPU, &sa, NULL);
}

int wo_mask_sigxfsz () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = wo_handler_sigxfsz;
  return sigaction(SIGXFSZ, &sa, NULL);
}

int wo_release_sigint () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = SIG_DFL;
  return sigaction(SIGINT, &sa, NULL);
}

int wo_release_sigterm () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = SIG_DFL;
  return sigaction(SIGTERM, &sa, NULL);
}
```

```
int wo_release_sigxcpu () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = SIG_DFL;
  return sigaction(SIGXCPU, &sa, NULL);
}

int wo_release_sigxfsz () {
  struct sigaction sa;
  sigset_t blocks;
  sigfillset (&blocks);
  sa.sa_flags = 0;
  sa.sa_mask = blocks;
  sa.sa_handler = SIG_DFL;
  return sigaction(SIGXFSZ, &sa, NULL);
}
```

5.3   C wrapper for printf

The `printf` family of functions is implemented in C with an undefined number of arguments. This is not supported by the `bind(C)` interface. We therefore write wrappers for the versions of `sprintf` that we will actually use.

This is used by the `formats` module.

⟨sprintf␣interface.c⟩≡
```
/*
⟨File header⟩
*/
#include <stdio.h>

int sprintf_none(char* str, const char* format) {
  return sprintf(str, format);
}

int sprintf_int(char* str, const char* format, int val) {
  return sprintf(str, format, val);
}

int sprintf_double(char* str, const char* format, double val) {
  return sprintf(str, format, val);
}

int sprintf_str(char* str, const char* format, const char* val) {
  return sprintf(str, format, val);
}
```

⟨sprintf interfaces⟩≡
```
    interface
      function sprintf_none (str, fmt) result (stat) bind(C)
        use iso_c_binding !NODEP!
```

```
        integer(c_int) :: stat
        character(c_char), dimension(*), intent(inout) :: str
        character(c_char), dimension(*), intent(in) :: fmt
      end function sprintf_none
    end interface

    interface
      function sprintf_int (str, fmt, val) result (stat) bind(C)
        use iso_c_binding !NODEP!
        integer(c_int) :: stat
        character(c_char), dimension(*), intent(inout) :: str
        character(c_char), dimension(*), intent(in) :: fmt
        integer(c_int), value :: val
      end function sprintf_int
    end interface

    interface
      function sprintf_double (str, fmt, val) result (stat) bind(C)
        use iso_c_binding !NODEP!
        integer(c_int) :: stat
        character(c_char), dimension(*), intent(inout) :: str
        character(c_char), dimension(*), intent(in) :: fmt
        real(c_double), value :: val
      end function sprintf_double
    end interface

    interface
      function sprintf_str(str, fmt, val) result (stat) bind(C)

5.4   Error, Message and Signal Handling

We are not so ambitious as to do proper exception handling in WHIZARD, but
at least it may be useful to have a common interface for diagnostics: Results,
messages, warnings, and such. As module variables we keep a buffer where
the current message may be written to and a level indicator which tells which
messages should be written on screen and which ones should be skipped. Alter-
natively, a string may be directly supplied to the message routine: this overrides
the buffer, avoiding the necessety of formatted I/O in trivial cases.

Mask fatal errors so that are treated as normal errors. Useful for interactive mode.

⟨*Diagnostics: public*⟩+≡
```
    public :: mask_fatal_errors
```

⟨*Diagnostics: variables*⟩+≡
```
    logical, save :: mask_fatal_errors = .false.
```

How to handle bugs and unmasked fatal errors. Either execute a normal stop statement, or call the C `exit()` function, or try to cause a program crash by dereferencing a null pointer.

These procedures are appended to the `diagnostics` source code, but not as module procedures but as external procedures. This avoids a circular module dependency across source directories.

⟨*Diagnostics: parameters*⟩+≡
```
    integer, parameter, public :: TERM_STOP = 0, TERM_EXIT = 1, TERM_CRASH = 2
```

⟨*Diagnostics: public*⟩+≡
```
    public :: handle_fatal_errors
```

⟨*Diagnostics: variables*⟩+≡
```
    integer, save :: handle_fatal_errors = TERM_EXIT
```

⟨*Diagnostics: external procedures*⟩≡
```
    subroutine fatal_force_crash ()
      use diagnostics, only: handle_fatal_errors, TERM_CRASH !NODEP!
      implicit none
      handle_fatal_errors = TERM_CRASH
    end subroutine fatal_force_crash

    subroutine fatal_force_exit ()
      use diagnostics, only: handle_fatal_errors, TERM_EXIT !NODEP!
      implicit none
      handle_fatal_errors = TERM_EXIT
    end subroutine fatal_force_exit

    subroutine fatal_force_stop ()
      use diagnostics, only: handle_fatal_errors, TERM_STOP !NODEP!
      implicit none
      handle_fatal_errors = TERM_STOP
    end subroutine fatal_force_stop
```

Keep track of errors. This might be used for exception handling, later. The counter is incremented only for screen messages, to avoid double counting.

⟨*Diagnostics: public*⟩+≡
```
    public :: msg_count
```

72

⟨*Diagnostics: variables*⟩+≡
```
    integer, dimension(TERMINATE:WARNING), save :: msg_count = 0
```

Keep a list of all errors and warnings. Since we do not know the number of entries beforehand, we use a linked list.

⟨*Diagnostics: types*⟩+≡
```
    type :: string_list
       character(len=BUFFER_SIZE) :: string
       type(string_list), pointer :: next
    end type string_list
    type :: string_list_pointer
       type(string_list), pointer :: first, last
    end type string_list_pointer
```

⟨*Diagnostics: variables*⟩+≡
```
    type(string_list_pointer), dimension(TERMINATE:WARNING), save :: &
         & msg_list = string_list_pointer (null(), null())
```

Create a format string indicating color
Add the current message buffer contents to the internal list.

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine msg_add (level)
      integer, intent(in) :: level
      type(string_list), pointer :: message
      select case (level)
      case (TERMINATE:WARNING)
         allocate (message)
         message%string = msg_buffer
         nullify (message%next)
         if (.not.associated (msg_list(level)%first)) &
              & msg_list(level)%first => message
         if (associated (msg_list(level)%last)) &
              & msg_list(level)%last%next => message
         msg_list(level)%last => message
         msg_count(level) = msg_count(level) + 1
      end select
    end subroutine msg_add
```

Initialization:

⟨*Diagnostics: public*⟩+≡
```
    public :: msg_list_clear
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine msg_list_clear
      integer :: level
      type(string_list), pointer :: message
      do level = TERMINATE, WARNING
         do while (associated (msg_list(level)%first))
            message => msg_list(level)%first
            msg_list(level)%first => message%next
            deallocate (message)
         end do
         nullify (msg_list(level)%last)
      end do
```

```
       msg_count = 0
    end subroutine msg_list_clear
```

Display the summary of errors and warnings (no need to count fatals. . .)
⟨*Diagnostics: public*⟩+≡
```
    public :: msg_summary
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine msg_summary (unit)
      integer, intent(in), optional :: unit
      call expect_summary (unit)
  1   format (A,1x,I2,1x,A,I2,1x,A)
      if (msg_count(ERROR) > 0 .and. msg_count(WARNING) > 0) then
         write (msg_buffer, 1) "There were", &
               & msg_count(ERROR), "error(s) and  ", &
               & msg_count(WARNING), "warning(s)."
         call msg_message (unit=unit)
      else if (msg_count(ERROR) > 0) then
         write (msg_buffer, 1) "There were", &
               & msg_count(ERROR), "error(s) and no warnings."
         call msg_message (unit=unit)
      else if (msg_count(WARNING) > 0) then
         write (msg_buffer, 1) "There were no errors and  ", &
               & msg_count(WARNING), "warning(s)."
         call msg_message (unit=unit)
      end if
    end subroutine msg_summary
```

Print the list of all messages of a given level.
⟨*Diagnostics: public*⟩+≡
```
    public :: msg_listing
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine msg_listing (level, unit, prefix)
      integer, intent(in) :: level
      integer, intent(in), optional :: unit
      character(len=*), intent(in), optional :: prefix
      type(string_list), pointer :: message
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      if (present (unit))  u = unit
      message => msg_list(level)%first
      do while (associated (message))
         if (present (prefix)) then
            write (u, "(A)") prefix // trim (message%string)
         else
            write (u, "(A)") trim (message%string)
         end if
         message => message%next
      end do
      flush (u)
    end subroutine msg_listing
```

The message buffer:

⟨*Diagnostics: public*⟩+≡
```
    public :: msg_buffer
```

⟨*Diagnostics: variables*⟩+≡
```
    character(len=BUFFER_SIZE), save :: msg_buffer = " "
```

After a message is issued, the buffer should be cleared:

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine buffer_clear
      msg_buffer = " "
    end subroutine buffer_clear

```

⟨*Diagnostics: public*⟩+≡
```
    public :: create_col_string
```

⟨*Diagnostics: procedures*⟩+≡
```
    function create_col_string (color) result (col_string)
       type(string_t) :: col_string
       integer, intent(in) :: color
       character(2) :: buf
       write (buf, '(I2)') color
       col_string = var_str ("[") // var_str (buf) // var_str ("m")
    end function create_col_string

```

The generic handler for messages. If the unit is omitted (or = 6), the message is
written to standard output if the precedence if sufficiently high (as determined
by the value of msg_level). If the string is omitted, the buffer is used. In
any case, the buffer is cleared after printing. In accordance with FORTRAN
custom, the first column in the output is left blank. For messages and warnings,
an additional exclamation mark and a blank is prepended. Furthermore, each
message is appended to the internal message list (without prepending anything).

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine message_print (level, string, str_arr, unit, logfile, area, color)

```

The number of non-fatal errors that we allow before stopping the program. We
might trade this later for an adjustable number.

⟨*System defs: public parameters*⟩+≡
```
    integer, parameter, public :: MAX_ERRORS = 10
```

The specific handlers. In the case of fatal errors, bugs (failed assertions) and
normal termination execution is stopped. For non-fatal errors a message is
printed to standard output if no unit is given. Only if the number of MAX_ERRORS
errors is reached, we abort the program. There are no further actions in the
other cases, but this may change.

Debugging aids. Print messages or values of various kinds. All versions ultimately call `msg_debug_none`, which in turn uses `message_print`.

Safeguard: force crash if a routine (i.e., a debugging routine below) is called while the master switch `debug_on` is unset. Such calls should always be hidden behind `if (debug_on)`, since they can significantly slow down the program.

⟨*debug guard*⟩≡
```
  if (.not. debug_on)  call msg_bug ("msg_debug called with debug_on=.false.")
```

The `debug_on` flag is provided by the `debug_master` module, and we can assume that it is a compile-time parameter.

⟨*Diagnostics: public*⟩+≡
```
    public :: msg_debug
```

⟨*Diagnostics: interfaces*⟩+≡
```
    interface msg_debug
       module procedure msg_debug_none

5.4.1 Logfile

All screen output should be duplicated in the logfile, unless requested otherwise.

⟨*Diagnostics: public*⟩+≡
```
    public :: logging
```

⟨*Diagnostics: variables*⟩+≡
```
    integer, save :: log_unit = -1
    logical, target, save :: logging = .false.
```

⟨*Diagnostics: public*⟩+≡
```
    public :: logfile_init
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine logfile_init (filename)
      type(string_t), intent(in) :: filename
      call msg_message ("Writing log to '" // char (filename) // "'")
      if (.not. logging)  call msg_message ("(Logging turned off.)")
      log_unit = free_unit ()
      open (file = char (filename), unit = log_unit, &
            action = "write", status = "replace")
    end subroutine logfile_init
```

⟨*Diagnostics: public*⟩+≡
```
    public :: logfile_final
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine logfile_final ()
      if (log_unit >= 0) then
         close (log_unit)
         log_unit = -1
      end if
    end subroutine logfile_final
```

This returns the valid logfile unit only if the default is write to screen, and if `logfile` is not set false.

⟨*Diagnostics: public*⟩+≡
```
    public :: logfile_unit
```

⟨*Diagnostics: procedures*⟩+≡
```
    function logfile_unit (unit, logfile)
      integer :: logfile_unit
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: logfile
      if (logging) then
         if (present (unit)) then
            if (unit == output_unit) then
               logfile_unit = log_unit
            else
               logfile_unit = -1
            end if
         else if (present (logfile)) then
            if (logfile) then
               logfile_unit = log_unit
            else
               logfile_unit = -1
            end if
         else
            logfile_unit = log_unit
         end if
      else
         logfile_unit = -1
      end if
    end function logfile_unit
```

5.4.2 Checking values

The `expect` function does not just check a value for correctness (actually, it checks if a logical expression is true); it records its result here. If failures are present when the program terminates, the exit code is nonzero.

⟨*Diagnostics: variables*⟩+≡
```
    integer, save :: expect_total = 0
    integer, save :: expect_failures = 0
```

⟨*Diagnostics: public*⟩+≡
```
    public :: expect_record
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine expect_record (success)
      logical, intent(in) :: success
      expect_total = expect_total + 1
      if (.not. success)  expect_failures = expect_failures + 1
    end subroutine expect_record
```

⟨*Diagnostics: public*⟩+≡
```
    public :: expect_clear
```

⟨*Diagnostics: procedures*⟩+≡
```
    subroutine expect_clear ()
      expect_total = 0
      expect_failures = 0
    end subroutine expect_clear
```

⟨*Diagnostics: public*⟩+≡
```
    public :: expect_summary
```
⟨*Diagnostics: procedures*⟩+≡
```
    subroutine expect_summary (unit, force)
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: force
      logical :: force_output
      force_output = .false.;  if (present (force))  force_output = force
      if (expect_total /= 0 .or. force_output) then
         call msg_message ("Summary of value checks:", unit)
         write (msg_buffer, "(2x,A,1x,I0,1x,A,1x,A,1x,I0)") &
               "Failures:", expect_failures, "/", "Total:", expect_total
         call msg_message (unit=unit)
      end if
    end subroutine expect_summary
```

  if (abs (real (x)) < tolerance)   &
       x = cmplx (0._default, aimag (x), kind=default)
  if (abs (aimag (x)) < tolerance)  &
       x = cmplx (real (x), 0._default, kind=default)
end subroutine pacify_complex_default
```

5.4.4   Signal handling

Killing the program by external signals may leave the files written by it in an undefined state. This can be avoided by catching signals and deferring program termination. Instead of masking only critical sections, we choose to mask signals globally (done in the main program) and terminate the program at predefined checkpoints only. Checkpoints are after each command, within the sampling function (so the program can be terminated after each event), and after each iteration in the phase-space generation algorithm.

Signal handling is done via a C interface to the `sigaction` system call. When a signal is raised that has been masked by the handler, the corresponding variable is set to the value of the signal. The variables are visible from the C signal handler.

The signal SIGINT is for keyboard interrupt (ctrl-C), SIGTERM is for system interrupt, e.g., at shutdown. The SIGXCPU and SIGXFSZ signals may be issued by batch systems.

⟨*Diagnostics: public*⟩+≡
```
public :: wo_sigint
public :: wo_sigterm
public :: wo_sigxcpu
public :: wo_sigxfsz
```

⟨*Diagnostics: variables*⟩+≡
```
integer(c_int), bind(C), volatile :: wo_sigint = 0
integer(c_int), bind(C), volatile :: wo_sigterm = 0
integer(c_int), bind(C), volatile :: wo_sigxcpu = 0
integer(c_int), bind(C), volatile :: wo_sigxfsz = 0
```

Here are the interfaces to the C functions. The routine `mask_term_signals` forces termination signals to be delayed. `release_term_signals` restores normal behavior. However, the program can be terminated anytime by calling `terminate_now_if_signal` which inspects the signals and terminates the program if requested..

⟨*Diagnostics: public*⟩+≡
```
public :: mask_term_signals
```

⟨*Diagnostics: procedures*⟩+≡
```
subroutine mask_term_signals ()
  logical :: ok
  wo_sigint = 0
  ok = wo_mask_sigint () == 0
  if (.not. ok)  call msg_error ("Masking SIGINT failed")
  wo_sigterm = 0
  ok = wo_mask_sigterm () == 0
  if (.not. ok)  call msg_error ("Masking SIGTERM failed")
  wo_sigxcpu = 0
  ok = wo_mask_sigxcpu () == 0
  if (.not. ok)  call msg_error ("Masking SIGXCPU failed")
  wo_sigxfsz = 0
  ok = wo_mask_sigxfsz () == 0
  if (.not. ok)  call msg_error ("Masking SIGXFSZ failed")
end subroutine mask_term_signals
```

⟨*Diagnostics: interfaces*⟩+≡

```

```
      end if
   end subroutine terminate_now_if_single_event
```

5.5   Operating-system interface

For specific purposes, we need direct access to the OS (system calls). This is,
of course, system dependent. The current version is valid for GNU/Linux; we
expect to use a preprocessor for this module if different OSs are to be supported.

   The current implementation lacks error handling.

⟨os_interface.f90⟩≡
  ⟨*File header*⟩

```
  module os_interface

    use, intrinsic :: iso_c_binding !NODEP!
```

  ⟨*Use strings*⟩
```
    use io_units

  ⟨*OS interface: types*⟩

  ⟨*OS interface: interfaces*⟩

```
  contains
```

  ⟨*OS interface: procedures*⟩

```
  end module os_interface
```

5.5.1   Path variables

This is a transparent container for storing user-defined path variables.

⟨*OS interface: public*⟩≡
```
    public :: paths_t
```

⟨*OS interface: types*⟩≡
```
    type :: paths_t
       type(string_t) :: prefix
       type(string_t) :: exec_prefix
       type(string_t) :: bindir
       type(string_t) :: libdir
       type(string_t) :: includedir
```

```
          type(string_t) :: datarootdir
          type(string_t) :: localprefix
          type(string_t) :: libtool
          type(string_t) :: lhapdfdir
      end type paths_t
```

⟨*OS interface: public*⟩+≡
```
    public :: paths_init
```

⟨*OS interface: procedures*⟩≡
```
    subroutine paths_init (paths)
      type(paths_t), intent(out) :: paths
      paths%prefix = ""
      paths%exec_prefix = ""
      paths%bindir = ""
      paths%libdir = ""
      paths%includedir = ""
      paths%datarootdir = ""
      paths%localprefix = ""
      paths%libtool = ""
      paths%lhapdfdir = ""
    end subroutine paths_init
```

5.5.2 System dependencies

We store all potentially system- and user/run-dependent data in a transparent
container. This includes compiler/linker names and flags, file extensions, etc.
There are actually two different possibilities for extensions of shared libraries,
depending on whether the Fortran compiler or the system linker (usually the C
compiler) has been used for linking. The default for the Fortran compiler on
most systems is `.so`.

⟨*OS interface: public*⟩+≡
```
    public :: os_data_t
```

⟨*OS interface: types*⟩+≡
```
    type :: os_data_t
       logical :: use_libtool
       logical :: use_testfiles
       type(string_t) :: fc
       type(string_t) :: fcflags
       type(string_t) :: fcflags_pic
       type(string_t) :: fc_src_ext
       type(string_t) :: cc
       type(string_t) :: cflags
       type(string_t) :: cflags_pic
       type(string_t) :: obj_ext
       type(string_t) :: ld
       type(string_t) :: ldflags

Replace occurences of GNU path variables (such as `${prefix}`) by their values.
Do this for all strings that could depend on them, and do the replacement in
reverse order, since the path variables may be defined in terms of each other.

            status = status)
       call os_system_call (os_data%ps2pdf // " " // filename // ".ps", &
            verbose = .true., status = status)
    end if
    if (present (stat_out)) stat_out = status
  end subroutine os_data_build_latex_file
```

5.5.3 Dynamic linking

We define a type that holds the filehandle for a dynamically linked library (shared object), together with functions to open and close the library, and to access functions in this library.

⟨*OS interface: public*⟩+≡
```fortran
    public :: dlaccess_t
```

⟨*OS interface: types*⟩+≡
```fortran
    type :: dlaccess_t
       private
       type(string_t) :: filename
       type(c_ptr) :: handle = c_null_ptr
       logical :: is_open = .false.
       logical :: has_error = .false.
       type(string_t) :: error
     contains
```

⟨*OS interface: dlaccess: TBP*⟩
```
    end type dlaccess_t
```

Output. This is called by the output routine for the process library.

⟨*OS interface: dlaccess: TBP*⟩≡
```
    procedure :: write => dlaccess_write
```

⟨*OS interface: procedures*⟩+≡
```
    subroutine dlaccess_write (object, unit)
      class(dlaccess_t), intent(in) :: object
      integer, intent(in) :: unit
      write (unit, "(1x,A)")  "DL access info:"
      write (unit, "(3x,A,L1)")   "is open  = ", object%is_open
      if (object%has_error) then
         write (unit, "(3x,A,A,A)")  "error    = '", char (object%error), "'"
      else
         write (unit, "(3x,A)")      "error    = [none]"
      end if
    end subroutine dlaccess_write
```

The interface to the library functions:

⟨*OS interface: interfaces*⟩≡
```
    interface
       function dlopen (filename, flag) result (handle) bind(C)
         import
         character(c_char), dimension(*) :: filename
         integer(c_int), value :: flag
         type(c_ptr) :: handle
       end function dlopen
    end interface

    interface
       function dlclose (handle) result (status) bind(C)
         import
         type(c_ptr), value :: handle
         integer(c_int) :: status
       end function dlclose
    end interface

    interface
       function dlerror () result (str) bind(C)
         import
         type(c_ptr) :: str
       end function dlerror
    end interface

    interface
       function dlsym (handle, symbol) result (fptr) bind(C)
         import
         type(c_ptr), value :: handle
         character(c_char), dimension(*) :: symbol
         type(c_funptr) :: fptr
       end function dlsym
```

```
      end interface
```

This reads an error string and transforms it into a `string_t` object, if an error has occured. If not, set the error flag to false and return an empty string.

⟨*System defs: public parameters*⟩+≡

```
    integer, parameter, public :: DLERROR_LEN = 160
```

⟨*OS interface: procedures*⟩+≡

```
    subroutine read_dlerror (has_error, error)
      logical, intent(out) :: has_error
      type(string_t), intent(out) :: error
      type(c_ptr) :: err_cptr
      character(len=DLERROR_LEN, kind=c_char), pointer :: err_fptr
      integer :: str_end
      err_cptr = dlerror ()
      if (c_associated (err_cptr)) then
         call c_f_pointer (err_cptr, err_fptr)
         has_error = .true.
         str_end = scan (err_fptr, c_null_char)
         if (str_end > 0) then
            error = err_fptr(1:str_end-1)
         else
            error = err_fptr
         end if
      else
         has_error = .false.
         error = ""
      end if
    end subroutine read_dlerror
```

This is the Fortran API. Init/final open and close the file, i.e., load and unload the library.

Note that a library can be opened more than once, and that for an ultimate close as many `dlclose` calls as `dlopen` calls are necessary. However, we assume that it is opened and closed only once.

⟨*OS interface: public*⟩+≡

```
    public :: dlaccess_init
    public :: dlaccess_final
```

⟨*OS interface: dlaccess: TBP*⟩+≡

```
    procedure :: init => dlaccess_init
    procedure :: final => dlaccess_final
```

⟨*OS interface: procedures*⟩+≡

```
    subroutine dlaccess_init (dlaccess, prefix, libname, os_data)
      class(dlaccess_t), intent(out) :: dlaccess
      type(string_t), intent(in) :: prefix, libname
      type(os_data_t), intent(in), optional :: os_data
      type(string_t) :: filename
      logical :: exist
      dlaccess%filename = libname
      filename = prefix // "/" // libname
      inquire (file=char(filename), exist=exist)
      if (.not. exist) then
```

```
        filename = prefix // "/.libs/" // libname
        inquire (file=char(filename), exist=exist)
        if (.not. exist) then
           dlaccess%has_error = .true.
           dlaccess%error = "Library '" // filename // "' not found"
           return
        end if
     end if
     dlaccess%handle = dlopen (char (filename) // c_null_char, ior ( &
        RTLD_LAZY, RTLD_LOCAL))
     dlaccess%is_open = c_associated (dlaccess%handle)
     call read_dlerror (dlaccess%has_error, dlaccess%error)
  end subroutine dlaccess_init

  subroutine dlaccess_final (dlaccess)
    class(dlaccess_t), intent(inout) :: dlaccess
    integer(c_int) :: status
    if (dlaccess%is_open) then
       status = dlclose (dlaccess%handle)
       dlaccess%is_open = .false.
       call read_dlerror (dlaccess%has_error, dlaccess%error)
    end if
  end subroutine dlaccess_final
```

Return true if an error has occured.

⟨*OS interface: public*⟩+≡
```
    public :: dlaccess_has_error
```

⟨*OS interface: procedures*⟩+≡
```
    function dlaccess_has_error (dlaccess) result (flag)
      logical :: flag
      type(dlaccess_t), intent(in) :: dlaccess
      flag = dlaccess%has_error
    end function dlaccess_has_error
```

Return the error string currently stored in the `dlaccess` object.

⟨*OS interface: public*⟩+≡
```
    public :: dlaccess_get_error
```

⟨*OS interface: procedures*⟩+≡
```
    function dlaccess_get_error (dlaccess) result (error)
      type(string_t) :: error
      type(dlaccess_t), intent(in) :: dlaccess
      error = dlaccess%error
    end function dlaccess_get_error
```

The symbol handler returns the C address of the function with the given string name. (It is a good idea to use `bind(C)` for all functions accessed by this, such that the name string is well-defined.) Call `c_f_procpointer` to cast this into a Fortran procedure pointer with an appropriate interface.

⟨*OS interface: public*⟩+≡
```
    public :: dlaccess_get_c_funptr
```

⟨OS interface: procedures⟩+≡

```
function dlaccess_get_c_funptr (dlaccess, fname) result (fptr)
  type(c_funptr) :: fptr
  type(dlaccess_t), intent(inout) :: dlaccess
  type(string_t), intent(in) :: fname
  fptr = dlsym (dlaccess%handle, char (fname) // c_null_char)
  call read_dlerror (dlaccess%has_error, dlaccess%error)
end function dlaccess_get_c_funptr
```

5.5.4 Predicates

Return true if the library is loaded. In particular, this is false if loading was unsuccessful.

⟨OS interface: public⟩+≡

```
public :: dlaccess_is_open
```

⟨OS interface: procedures⟩+≡

```
function dlaccess_is_open (dlaccess) result (flag)
  logical :: flag
  type(dlaccess_t), intent(in) :: dlaccess
  flag = dlaccess%is_open
end function dlaccess_is_open
```

5.5.5 Shell access

This is the standard system call for executing a shell command, such as invoking a compiler.

In F2008 there will be the equivalent built-in command `execute_command_line`.

⟨OS interface: public⟩+≡

```
public :: os_system_call
```

⟨OS interface: procedures⟩+≡

```
subroutine os_system_call (command_string, status, verbose)
  type(string_t), intent(in) :: command_string
  integer, intent(out), optional :: status
  logical, intent(in), optional :: verbose
  logical :: verb
  integer :: stat
  verb = .false.;  if (present (verbose))  verb = verbose
  if (verb) &
       call msg_message ("command: " // char (command_string))
  stat = system (char (command_string) // c_null_char)
  if (present (status)) then
     status = stat
  else if (stat /= 0) then
     if (.not. verb) &
          call msg_message ("command: " // char (command_string))
     write (msg_buffer, "(A,I0)")  "Return code = ", stat
     call msg_message ()
     call msg_fatal ("System command returned with nonzero status code")
  end if
```

```
        end subroutine os_system_call
```

⟨*OS interface: interfaces*⟩+≡
```
    interface
       function system (command) result (status) bind(C)
         import
         integer(c_int) :: status
         character(c_char), dimension(*) :: command
       end function system
    end interface
```

5.5.6   Querying for a directory

This queries for the existence of a directory. There is no standard way to achieve this in FORTRAN, and if we were to call into `libc`, we would need access to C macros for evaluating the result, so we resort to calling `test` as a system call.

⟨*OS interface: public*⟩+≡
```
    public :: os_dir_exist
```

⟨*OS interface: procedures*⟩+≡
```
    function os_dir_exist (name) result (res)
      type(string_t), intent(in) :: name
      logical :: res
      integer :: status
      call os_system_call ('test -d "' // name // '"', status=status)
      res = status == 0
    end function os_dir_exist
```

⟨*OS interface: public*⟩+≡
```
    public :: os_file_exist
```

⟨*OS interface: procedures*⟩+≡
```
    function os_file_exist (name) result (exist)
      type(string_t), intent(in) :: name
  !    logical, intent(in), optional :: verb
      logical :: exist
  !    integer :: status
  !    call  os_system_call ('test -f "' // name // '"', status=status, verbose=verb)
  !    res = (status == 0)
      inquire (file = char (name), exist=exist)
    end function os_file_exist
```

5.5.7   Pack/unpack

The argument to `pack` may be a file or a directory. The name of the packed file will get the `pack_ext` extension appended. The argument to `unpack` must be a file, with the extension already included in the file name.

⟨*OS interface: public*⟩+≡
```
    public :: os_pack_file
    public :: os_unpack_file
```

⟨*OS interface: procedures*⟩+≡
```
    subroutine os_pack_file (file, os_data, status)
      type(string_t), intent(in) :: file
      type(os_data_t), intent(in) :: os_data
      integer, intent(out), optional :: status
      type(string_t) :: command_string
      command_string = os_data%pack_cmd // " " &
            // file // os_data%pack_ext // " " // file
      call os_system_call (command_string, status)
    end subroutine os_pack_file

    subroutine os_unpack_file (file, os_data, status)
      type(string_t), intent(in) :: file
      type(os_data_t), intent(in) :: os_data
      integer, intent(out), optional :: status
      type(string_t) :: command_string
      command_string = os_data%unpack_cmd // " " // file
      call os_system_call (command_string, status)
    end subroutine os_unpack_file
```

5.5.8 Fortran compiler and linker

Compile a single module for use in a shared library, but without linking.

⟨*OS interface: public*⟩+≡
```
    public :: os_compile_shared
```

⟨*OS interface: procedures*⟩+≡
```
    subroutine os_compile_shared (src, os_data, status)
      type(string_t), intent(in) :: src
      type(os_data_t), intent(in) :: os_data
      integer, intent(out), optional :: status
      type(string_t) :: command_string
      if (os_data%use_libtool) then
         command_string = &
              os_data%whizard_libtool // " --mode=compile " // &
              os_data%fc // " " // &
              "-c " // &
              os_data%whizard_includes // " " // &
              os_data%fcflags // " " // &
              "'" // src // os_data%fc_src_ext // "'"
      else
         command_string = &
              os_data%fc // " " // &
              "-c  " // &
              os_data%fcflags_pic // " " // &
              os_data%whizard_includes // " " // &
              os_data%fcflags // " " // &
              "'" // src // os_data%fc_src_ext // "'"
      end if
      call os_system_call (command_string, status)
    end subroutine os_compile_shared
```

Link an array of object files to build a shared object library. In the libtool case, we have to specify a -rpath, otherwise only a static library can be built. However, since the library is never installed, this rpath is irrelevant.

⟨*OS interface: public*⟩+≡
```
    public :: os_link_shared
```

⟨*OS interface: procedures*⟩+≡
```
    subroutine os_link_shared (objlist, lib, os_data, status)
      type(string_t), intent(in) :: objlist, lib
      type(os_data_t), intent(in) :: os_data
      integer, intent(out), optional :: status
      type(string_t) :: command_string
      if (os_data%use_libtool) then
         command_string = &
              os_data%whizard_libtool // " --mode=link " // &
              os_data%fc // " " // &
              "-module " // &
              "-rpath /usr/local/lib" // " " // &
              os_data%fcflags // " " // &
              os_data%whizard_ldflags // " " // &
              os_data%ldflags // " " // &
              "-o '" // lib // ".la' " // &
              objlist
      else
         command_string = &
              os_data%ld // " " // &
              os_data%ldflags_so // " " // &
              os_data%fcflags // " " // &
              os_data%whizard_ldflags // " " // &
              os_data%ldflags // " " // &
              "-o '" // lib // "." // os_data%fc_shrlib_ext // "' " // &
              objlist
      end if
      call os_system_call (command_string, status)
    end subroutine os_link_shared
```

Link an array of object files / libraries to build a static executable.

⟨*OS interface: public*⟩+≡
```
    public :: os_link_static
```

⟨*OS interface: procedures*⟩+≡
```
    subroutine os_link_static (objlist, exec_name, os_data, status)
      type(string_t), intent(in) :: objlist, exec_name
      type(os_data_t), intent(in) :: os_data
      integer, intent(out), optional :: status
      type(string_t) :: command_string
      if (os_data%use_libtool) then
         command_string = &
              os_data%whizard_libtool // " --mode=link " // &
              os_data%fc // " " // &
              "-static " // &
              os_data%fcflags // " " // &
              os_data%whizard_ldflags // " " // &
              os_data%ldflags // " " // &
```

```
            os_data%ldflags_static // " " // &
            "-o '" // exec_name // "' " // &
            objlist // " " // &
            os_data%ldflags_hepmc // " " // &
            os_data%ldflags_lcio // " " // &
            os_data%ldflags_hoppet // " " // &
            os_data%ldflags_looptools
    else
       command_string = &
            os_data%ld // " " // &
            os_data%ldflags_so // " " // &
            os_data%fcflags // " " // &
            os_data%whizard_ldflags // " " // &
            os_data%ldflags // " " // &
            os_data%ldflags_static // " " // &
            "-o '" // exec_name // "' " // &
            objlist // " " // &
            os_data%ldflags_hepmc // " " // &
            os_data%ldflags_lcio // " " // &
            os_data%ldflags_hoppet // " " // &
            os_data%ldflags_looptools
    end if
    call os_system_call (command_string, status)
  end subroutine os_link_static
```

Determine the name of the shared library to link. If libtool is used, this is
encoded in the `.la` file which resides in place of the library itself.

⟨OS interface: public⟩+≡
```
    public :: os_get_dlname
```

⟨OS interface: procedures⟩+≡
```
    function os_get_dlname (lib, os_data, ignore, silent) result (dlname)
      type(string_t) :: dlname
      type(string_t), intent(in) :: lib
      type(os_data_t), intent(in) :: os_data
      logical, intent(in), optional :: ignore, silent
      type(string_t) :: filename
      type(string_t) :: buffer
      logical :: exist, required, quiet
      integer :: u
      u = free_unit ()
      if (present (ignore)) then
         required = .not. ignore
      else
         required = .true.
      end if
     if (present (silent)) then
         quiet = silent
      else
         quiet = .false.
      end if
      if (os_data%use_libtool) then
         filename = lib // ".la"
         inquire (file=char(filename), exist=exist)
```

```
            if (exist) then
                open (unit=u, file=char(filename), action="read", status="old")
                SCAN_LTFILE: do
                    call get (u, buffer)
                    if (extract (buffer, 1, 7) == "dlname=") then
                        dlname = extract (buffer, 9)
                        dlname = remove (dlname, len (dlname))
                        exit SCAN_LTFILE
                    end if
                end do SCAN_LTFILE
                close (u)
            else if (required) then
                if (.not. quiet) call msg_fatal (" Library '" // char (lib) &
                    // "': libtool archive not found")
                dlname = ""
            else
                if (.not. quiet) call msg_message ("[No compiled library '" &
                    // char (lib) // "']")
                dlname = ""
            end if
        else
            dlname = lib // "." // os_data%fc_shrlib_ext
            inquire (file=char(dlname), exist=exist)
            if (.not. exist) then
                if (required) then
                    if (.not. quiet) call msg_fatal (" Library '" // char (lib) &
                        // "' not found")
                else
                    if (.not. quiet) call msg_message &
                        ("[No compiled process library '" // char (lib) // "']")
                    dlname = ""
                end if
            end if
        end if
    end if
end function os_get_dlname
```

5.5.9   Controlling OpenMP

OpenMP is handled automatically by the library for the most part. Here is a convenience routine for setting the number of threads, with some diagnostics.

⟨*OS interface: public*⟩+≡
```
    public :: openmp_set_num_threads_verbose
```

⟨*OS interface: procedures*⟩+≡
```
    subroutine openmp_set_num_threads_verbose (num_threads, openmp_logging)
      integer, intent(in) :: num_threads
      integer :: n_threads
      logical, intent(in), optional :: openmp_logging
      logical :: logging
      if (present (openmp_logging)) then
          logging = openmp_logging
      else
          logging = .true.
```

```fortran
      end if
    n_threads = num_threads
    if (openmp_is_active ()) then
       if (num_threads == 1) then
          if (logging) then

       end if
    end if
  end subroutine openmp_set_num_threads_verbose
```

5.5.10 Controlling MPI

The overall MPI handling has to be defined a context specific way, but we can simplify things like logging or receiving n_size or rank.

⟨*OS interface: public*⟩+≡
```
public :: mpi_set_logging
```

⟨*OS interface: procedures*⟩+≡
```
subroutine mpi_set_logging (mpi_logging)
  logical, intent(in) :: mpi_logging
  integer :: n_size, rank
  call mpi_get_comm_id (n_size, rank)
  if (mpi_logging .and. n_size > 1) then
     write (msg_buffer, "(A,I0,A)") "MPI: Using ", n_size, " processes."
     call msg_message ()
     if (rank == 0) then
        call msg_message ("MPI: master worker")
     else
        write (msg_buffer, "(A,I0)") "MPI: slave worker #", rank
        call msg_message ()
     end if
  end if
end subroutine mpi_set_logging
```

Receive communicator size and rank inside communicator. The subroutine is a stub, if not compiled with MPI.

⟨*OS interface: public*⟩+≡
```
public :: mpi_get_comm_id
```

⟨*OS interface: procedures*⟩+≡
```
subroutine mpi_get_comm_id (n_size, rank)
  integer, intent(out) :: n_size
  integer, intent(out) :: rank
  n_size = 1
  rank = 0
```
⟨*OS interface: mpi get comm id*⟩
```
end subroutine mpi_get_comm_id
```

⟨*OS interface: mpi get comm id*⟩≡

⟨*MPI: OS interface: mpi get comm id*⟩≡
```
call MPI_Comm_size (MPI_COMM_WORLD, n_size)
call MPI_Comm_rank (MPI_COMM_WORLD, rank)
```

⟨*OS interface: public*⟩+≡
```
public :: mpi_is_comm_master
```

⟨*OS interface: procedures*⟩+≡
```
logical function mpi_is_comm_master () result (flag)
  integer :: n_size, rank
  call mpi_get_comm_id (n_size, rank)
  flag = (rank == 0)
end function mpi_is_comm_master
```

5.5.11 Unit tests

5.6   Interface for formatted I/O

For access to formatted printing (possibly input), we interface the C `printf`
family of functions. There are two important issues here:

1. `printf` takes an arbitrary number of arguments, relying on the C stack.
   This is not interoperable. We interface it with C wrappers that output a
   single integer, real or string and restrict the allowed formats accordingly.

2. Restricting format strings is essential also for preventing format string
   attacks. Allowing arbitrary format string would create a real security hole
   in a Fortran program.

3. The string returned by `sprintf` must be allocated to the right size.

5.6.1 Parsing a C format string

The C format string contains characters and format conversion specifications.
The latter are initiated by a `%` sign. If the next letter is also a `%`, a percent sign is
printed and no conversion is done. Otherwise, a conversion is done and applied
to the next argument in the argument list. First comes an optional flag (`#`, `0`, `-`,
`+`, or space), an optional field width (decimal digits starting not with zero), an
optional precision (period, then another decimal digit string), a length modifier
(irrelevant for us, therefore not supported), and a conversion specifier: `d` or `i`
for integer; `e`, `f`, `g` (also upper case) for double-precision real, `s` for a string.

We explicitly exclude all other conversion specifiers, and we check the spec-
ifiers against the actual arguments.

A type for passing arguments

This is a polymorphic type that can hold integer, real (double), and string
arguments.

⟨*Formats: parameters*⟩≡
```
    integer, parameter, public :: ARGTYPE_NONE = 0
    integer, parameter, public :: ARGTYPE_LOG = 1
    integer, parameter, public :: ARGTYPE_INT = 2
    integer, parameter, public :: ARGTYPE_REAL = 3
    integer, parameter, public :: ARGTYPE_STR = 4
```

The integer and real entries are actually scalars, but we avoid relying on the
allocatable-scalar feature and make them one-entry arrays. The character entry
is a real array which is a copy of the string.

Logical values are mapped to strings (true or false), so this type parameter value is mostly unused.

⟨*Formats: public*⟩≡
```
    public :: sprintf_arg_t
```

⟨*Formats: types*⟩≡
```
    type :: sprintf_arg_t
      private
      integer :: type = ARGTYPE_NONE
      integer(c_int), dimension(:), allocatable :: ival
      real(c_double), dimension(:), allocatable :: rval
      character(c_char), dimension(:), allocatable :: sval
    end type sprintf_arg_t
```

⟨*Formats: public*⟩+≡
```
    public :: sprintf_arg_init
```

⟨*Formats: interfaces*⟩≡
```
    interface sprintf_arg_init

              length = log10 (real (huge (arg%ival(1)))) + 2
          case (ARGTYPE_REAL)
              length = log10 (real (radix (arg%rval(1))) ** digits (arg%rval(1))) + 8
          case (ARGTYPE_STR)
              length = size (arg%sval)
          case default
              length = 0
          end select
        end function sprintf_arg_get_length
```

⟨*Formats: procedures*⟩+≡

```
subroutine sprintf_arg_apply_sprintf (arg, fmt, result, actual_length)
  type(sprintf_arg_t), intent(in) :: arg
  character(c_char), dimension(:), intent(in) :: fmt
  character(c_char), dimension(:), intent(inout) :: result
  integer, intent(out) :: actual_length
  integer(c_int) :: ival
  real(c_double) :: rval
  select case (arg%type)
  case (ARGTYPE_NONE)
    actual_length = sprintf_none (result, fmt)
  case (ARGTYPE_INT)
    ival = arg%ival(1)
    actual_length = sprintf_int (result, fmt, ival)
  case (ARGTYPE_REAL)
    rval = arg%rval(1)
    actual_length = sprintf_double (result, fmt, rval)
  case (ARGTYPE_STR)
    actual_length = sprintf_str (result, fmt, arg%sval)
  case default
    call msg_bug ("sprintf_arg_apply_sprintf called with illegal type")
  end select
  if (actual_length < 0) then
     write (msg_buffer, *) "Format: '", fmt, "'"
     call msg_message ()
     write (msg_buffer, *) "Output: '", result, "'"
     call msg_message ()
     call msg_error ("I/O error in sprintf call")
     actual_length = 0
  end if
end subroutine sprintf_arg_apply_sprintf
```

Container type for the output

There is a procedure which chops the format string into pieces that contain at
most one conversion specifier. Pairing this with a `sprintf_arg` object, we get
the actual input to the `sprintf` interface. The type below holds this input and
can allocate the output string.

⟨*Formats: types*⟩+≡

```
type :: sprintf_interface_t
  private
  character(c_char), dimension(:), allocatable :: input_fmt
  type(sprintf_arg_t) :: arg
  character(c_char), dimension(:), allocatable :: output_str
  integer :: output_str_len = 0
end type sprintf_interface_t
```

⟨*Formats: procedures*⟩+≡

```
subroutine sprintf_interface_init (intf, fmt, arg)
  type(sprintf_interface_t), intent(out) :: intf
  type(string_t), intent(in) :: fmt
  type(sprintf_arg_t), intent(in) :: arg
  integer :: fmt_len, i
```

```
      fmt_len = len (fmt)
      allocate (intf%input_fmt (fmt_len + 1))
      do i = 1, fmt_len
          intf%input_fmt(i) = extract (fmt, i, i)
      end do
      intf%input_fmt(fmt_len+1) = c_null_char
      intf%arg = arg
      allocate (intf%output_str (len (fmt) + sprintf_arg_get_length (arg) + 1))
    end subroutine sprintf_interface_init
```

⟨*Formats: procedures*⟩+≡
```
    subroutine sprintf_interface_write (intf, unit)
      type(sprintf_interface_t), intent(in) :: intf
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, *) "Format string = ", '"', intf%input_fmt, '"'
      write (u, "(1x,A,1x)", advance = "no") "Argument = "
      call sprintf_arg_write (intf%arg, unit)
      if (intf%output_str_len > 0) then
          write (u, *) "Result string = ", &
                '"', intf%output_str (1:intf%output_str_len), '"'
      end if
    end subroutine sprintf_interface_write
```

Return the output string:

⟨*Formats: procedures*⟩+≡
```
    function sprintf_interface_get_result (intf) result (string)
      type(string_t) :: string
      type(sprintf_interface_t), intent(in) :: intf
      character(kind = c_char, len = max (intf%output_str_len, 0)) :: buffer
      integer :: i
      if (intf%output_str_len > 0) then
          do i = 1, intf%output_str_len
             buffer(i:i) = intf%output_str(i)
          end do
          string = buffer(1:intf%output_str_len)
      else
          string = ""
      end if
    end function sprintf_interface_get_result
```

⟨*Formats: procedures*⟩+≡
```
    subroutine sprintf_interface_apply_sprintf (intf)
      type(sprintf_interface_t), intent(inout) :: intf
      call sprintf_arg_apply_sprintf &
            (intf%arg, intf%input_fmt, intf%output_str, intf%output_str_len)
    end subroutine sprintf_interface_apply_sprintf
```

Import the interfaces defined in the previous section:

⟨*Formats: interfaces*⟩+≡
```
    ⟨sprintf interfaces⟩
```

Scan the format string

Chop it into pieces that contain one conversion specifier each. The zero-th piece contains the part before the first specifier. Check the specifiers and allow only the subset that we support. Also check for an exact match between conversion specifiers and input arguments. The result is an allocated array of `sprintf_interface` object; each one contains a piece of the format string and the corresponding argument.

⟨*Formats: procedures*⟩+≡

```
subroutine chop_and_check_format_string (fmt, arg, intf)
  type(string_t), intent(in) :: fmt
  type(sprintf_arg_t), dimension(:), intent(in) :: arg
  type(sprintf_interface_t), dimension(:), intent(out), allocatable :: intf
  integer :: n_args, i
  type(string_t), dimension(:), allocatable :: split_fmt
  type(string_t) :: word, buffer, separator
  integer :: pos, length, l

5.7   CPU timing

The time is stored in a simple derived type which just holds a floating-point
number.

⟨cputime.f90⟩≡
  ⟨*File header*⟩

  module cputime

  ⟨*Use kinds*⟩
    use io_units
  ⟨*Use strings*⟩
    use diagnostics

  ⟨*Standard module head*⟩

  ⟨*CPU time: public*⟩

  ⟨*CPU time: types*⟩

  ⟨*CPU time: interfaces*⟩

  contains

  ⟨*CPU time: procedures*⟩

  end module cputime

The CPU time is a floating-point number with an arbitrary reference time. It is single precision (default real, not `real(default)`). It is measured in seconds.

⟨*CPU time: public*⟩≡
    public :: time_t

⟨*CPU time: types*⟩≡
    type :: time_t
       private
       logical :: known = .false.
       real :: value = 0
     contains
     ⟨*CPU time: time: TBP*⟩
    end type time_t

⟨*CPU time: time: TBP*⟩≡
    procedure :: write => time_write

⟨*CPU time: procedures*⟩≡
    subroutine time_write (object, unit)
      class(time_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A)", advance="no") "Time in seconds ="
      if (object%known) then
         write (u, "(1x,ES10.3)") object%value
      else
         write (u, "(1x,A)") "[unknown]"
      end if
    end subroutine time_write

127

Set the current time

⟨CPU time: time: TBP⟩+≡
```
    procedure :: set_current => time_set_current
```

⟨CPU time: procedures⟩+≡
```
    subroutine time_set_current (time)
      class(time_t), intent(out) :: time
      integer :: msecs
      call system_clock (msecs)
      time%value = real (msecs) / 1000.
      time%known = time%value > 0
    end subroutine time_set_current
```

Assign to a `real(default` value. If the time is undefined, return zero.

⟨CPU time: public⟩+≡
```
    public :: assignment(=)
```

⟨CPU time: interfaces⟩≡
```
    interface assignment(=)
      module procedure real_assign_time
      module procedure real_default_assign_time
    end interface
```

⟨CPU time: procedures⟩+≡
```
    pure subroutine real_assign_time (r, time)
      real, intent(out) :: r
      class(time_t), intent(in) :: time
      if (time%known) then
         r = time%value
      else
         r = 0
      end if
    end subroutine real_assign_time

    pure subroutine real_default_assign_time (r, time)
      real(default), intent(out) :: r
      class(time_t), intent(in) :: time
      if (time%known) then
         r = time%value
      else
         r = 0
      end if
    end subroutine real_default_assign_time
```

Assign an integer or (single precision) real value to the time object.

⟨CPU time: time: TBP⟩+≡
```
    generic :: assignment(=) => time_assign_from_integer, time_assign_from_real
    procedure, private :: time_assign_from_integer
    procedure, private :: time_assign_from_real
```

⟨CPU time: procedures⟩+≡
```
    subroutine time_assign_from_integer (time, ival)
      class(time_t), intent(out) :: time
      integer, intent(in) :: ival
```

```
      time%value = ival
      time%known = .true.
    end subroutine time_assign_from_integer

    subroutine time_assign_from_real (time, rval)
      class(time_t), intent(out) :: time
      real, intent(in) :: rval
      time%value = rval
      time%known = .true.
    end subroutine time_assign_from_real
```

Add times and compute time differences. If any input value is undefined, the result is undefined.

⟨*CPU time: time: TBP*⟩+≡
```
    generic :: operator(-) => subtract_times
    generic :: operator(+) => add_times
    procedure, private :: subtract_times
    procedure, private :: add_times
```

⟨*CPU time: procedures*⟩+≡
```
    pure function subtract_times (t_end, t_begin) result (time)
      type(time_t) :: time
      class(time_t), intent(in) :: t_end, t_begin
      if (t_end%known .and. t_begin%known) then
         time%known = .true.
         time%value = t_end%value - t_begin%value
      end if
    end function subtract_times

    pure function add_times (t1, t2) result (time)
      type(time_t) :: time
      class(time_t), intent(in) :: t1, t2
      if (t1%known .and. t2%known) then
         time%known = .true.
         time%value = t1%value + t2%value
      end if
    end function add_times
```

Check if a time is known, so we can use it:

⟨*CPU time: time: TBP*⟩+≡
```
    procedure :: is_known => time_is_known
```

⟨*CPU time: procedures*⟩+≡
```
    function time_is_known (time) result (flag)
      class(time_t), intent(in) :: time
      logical :: flag
      flag = time%known
    end function time_is_known
```

We define functions for converting the time into ss / mm:ss / hh:mm:ss / dd:mm:hh:ss.

⟨*CPU time: time: TBP*⟩+≡
```
    generic :: expand => time_expand_s, time_expand_ms, &
```

```
        time_expand_hms, time_expand_dhms
    procedure, private :: time_expand_s
    procedure, private :: time_expand_ms
    procedure, private :: time_expand_hms
    procedure, private :: time_expand_dhms
```

⟨*CPU time: procedures*⟩+≡
```
    subroutine time_expand_s (time, sec)
      class(time_t), intent(in) :: time
      integer, intent(out) :: sec
      if (time%known) then
         sec = time%value
      else
         call msg_bug ("Time: attempt to expand undefined value")
      end if
    end subroutine time_expand_s

    subroutine time_expand_ms (time, min, sec)
      class(time_t), intent(in) :: time
      integer, intent(out) :: min, sec
      if (time%known) then
         if (time%value >= 0) then
            sec = mod (int (time%value), 60)
         else
            sec = - mod (int (- time%value), 60)
         end if
         min = time%value / 60
      else
         call msg_bug ("Time: attempt to expand undefined value")
      end if
    end subroutine time_expand_ms

    subroutine time_expand_hms (time, hour, min, sec)
      class(time_t), intent(in) :: time
      integer, intent(out) :: hour, min, sec
      call time%expand (min, sec)
      hour = min / 60
      if (min >= 0) then
         min = mod (min, 60)
      else
         min = - mod (-min, 60)
      end if
    end subroutine time_expand_hms

    subroutine time_expand_dhms (time, day, hour, min, sec)
      class(time_t), intent(in) :: time
      integer, intent(out) :: day, hour, min, sec
      call time%expand (hour, min, sec)
      day = hour / 24
      if (hour >= 0) then
         hour = mod (hour, 24)
      else
         hour = - mod (- hour, 24)
      end if
    end subroutine time_expand_dhms
```

Use the above expansions to generate a time string.

⟨*CPU time: time: TBP*⟩+≡
```
    procedure :: to_string_s => time_to_string_s
    procedure :: to_string_ms => time_to_string_ms

      integer :: s, m, h, d
      call time%expand (d, h, m, s)
      write (buffer, "(I0,'d:',I2.2,'h:',I2.2,'m:',I2.2,'s')")  &
           d, abs (h), abs (m), abs (s)
```

```
        str = trim (buffer)
    end function time_to_string_dhms
```

5.7.1 Timer

A timer can measure real (wallclock) time differences. The base type corresponds to the result, i.e., time difference. The object contains two further times for start and stop time.

⟨*CPU time: public*⟩+≡
```
    public :: timer_t
```

⟨*CPU time: types*⟩+≡
```
    type, extends (time_t) :: timer_t
      private
      logical :: running = .false.
      type(time_t) :: t1, t2
     contains
     ⟨CPU time: timer: TBP⟩
    end type timer_t
```

Output. If the timer is running, we indicate this, otherwise write just the result.

⟨*CPU time: timer: TBP*⟩≡
```
    procedure :: write => timer_write
```

⟨*CPU time: procedures*⟩+≡
```
    subroutine timer_write (object, unit)
      class(timer_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      if (object%running) then
         write (u, "(1x,A)")  "Time in seconds = [running]"
      else
         call object%time_t%write (u)
      end if
    end subroutine timer_write
```

Start the timer: store the current time in the first entry and adapt the status. We forget any previous values.

⟨*CPU time: timer: TBP*⟩+≡
```
    procedure :: start => timer_start
```

⟨*CPU time: procedures*⟩+≡
```
    subroutine timer_start (timer)
      class(timer_t), intent(out) :: timer
      call timer%t1%set_current ()
      timer%running = .true.
    end subroutine timer_start
```

Restart the timer: simply adapt the status, keeping the start time.

⟨*CPU time: timer: TBP*⟩+≡
```
    procedure :: restart => timer_restart
```

⟨*CPU time: procedures*⟩+≡
```fortran
    subroutine timer_restart (timer)
      class(timer_t), intent(inout) :: timer
      if (timer%t1%known .and. .not. timer%running) then
         timer%running = .true.
      else
         call msg_bug ("Timer: restart attempt from wrong status")
      end if
    end subroutine timer_restart
```

Stop the timer: store the current time in the second entry, adapt the status, and compute the elapsed time.

⟨*CPU time: timer: TBP*⟩+≡
```fortran
    procedure :: stop => timer_stop
```

⟨*CPU time: procedures*⟩+≡
```fortran
    subroutine timer_stop (timer)
      class(timer_t), intent(inout) :: timer
      call timer%t2%set_current ()
      timer%running = .false.
      call timer%evaluate ()
    end subroutine timer_stop
```

Manually set the time (for unit test)

⟨*CPU time: timer: TBP*⟩+≡
```fortran
    procedure :: set_test_time1 => timer_set_test_time1
    procedure :: set_test_time2 => timer_set_test_time2
```

⟨*CPU time: procedures*⟩+≡
```fortran
    subroutine timer_set_test_time1 (timer, t)
      class(timer_t), intent(inout) :: timer
      integer, intent(in) :: t
      timer%t1 = t
    end subroutine timer_set_test_time1

    subroutine timer_set_test_time2 (timer, t)
      class(timer_t), intent(inout) :: timer
      integer, intent(in) :: t
      timer%t2 = t
    end subroutine timer_set_test_time2
```

This is separate, available for the unit test.

⟨*CPU time: timer: TBP*⟩+≡
```fortran
    procedure :: evaluate => timer_evaluate
```

⟨*CPU time: procedures*⟩+≡
```fortran
    subroutine timer_evaluate (timer)
      class(timer_t), intent(inout) :: timer
      timer%time_t = timer%t2 - timer%t1
    end subroutine timer_evaluate
```

⟨*CPU time: public test*⟩≡
```
    public :: cputime_test
```

⟨*CPU time: test driver*⟩≡
```
    subroutine cputime_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
    ⟨CPU time: execute tests⟩
    end subroutine cputime_test
```

Basic tests

Check basic functions of the time object. The part which we can't check is
getting the actual time from the system clock, since the output will not be

reproducible. However, we can check time formats and operations.

⟨CPU time: execute tests⟩≡
```
    call test (cputime_1, "cputime_1", &
        "time operations", &
        u, results)
```

⟨CPU time: test declarations⟩≡
```
    public :: cputime_1
```

⟨CPU time: tests⟩≡
```
    subroutine cputime_1 (u)
      integer, intent(in) :: u
      type(time_t) :: time, time1, time2
      real :: t
      integer :: d, h, m, s

      write (u, "(A)")  "* Test output: cputime_1"
      write (u, "(A)")  "*   Purpose: check time operations"
      write (u, "(A)")

      write (u, "(A)") "* Undefined time"
      write (u, *)

      call time%write (u)

      write (u, *)
      write (u, "(A)") "* Set time to zero"
      write (u, *)

      time = 0
      call time%write (u)

      write (u, *)
      write (u, "(A)") "* Set time to 1.234 s"
      write (u, *)

      time = 1.234
      call time%write (u)

      t = time
      write (u, "(1x,A,F6.3)")  "Time as real =", t

      write (u, *)
      write (u, "(A)") "* Compute time difference"
      write (u, *)

```

```
    call timer%evaluate ()
    call timer%write (u)

    write (u, *)
    write (u, "(A)")  "* Test output end: cputime_2"

  end subroutine cputime_2
```

Chapter 6

Combinatorics

These modules implement standard algorithms (sorting, hashing, etc.) that are not available in Fortran.

Fortran doesn't support generic programming, therefore the algorithms are implemented only for specific data types.

bytes Derived types for bytes and words.

hashes Types and tools for setting up hashtables.

md5 The MD5 algorithm for message digest.

permutations Permuting an array of integers.

sorting Sorting integer and real values.

grids d-dimensional grids can be saved to disk and used for interpolation, maximum finding, etc.

6.1   Bytes and such

In a few instances we will need the notion of a byte (8-bit) and a word (32 bit), even a 64-bit word. A block of 512 bit is also needed (for MD5).

We rely on integers up to 64 bit being supported by the processor. The main difference to standard integers is the interpretation as unsigned integers.

⟨bytes.f90⟩≡
  ⟨*File header*⟩

  module bytes

    use kinds, only: i8, i32, i64
    use io_units

  ⟨*Standard module head*⟩

  ⟨*Bytes: public*⟩

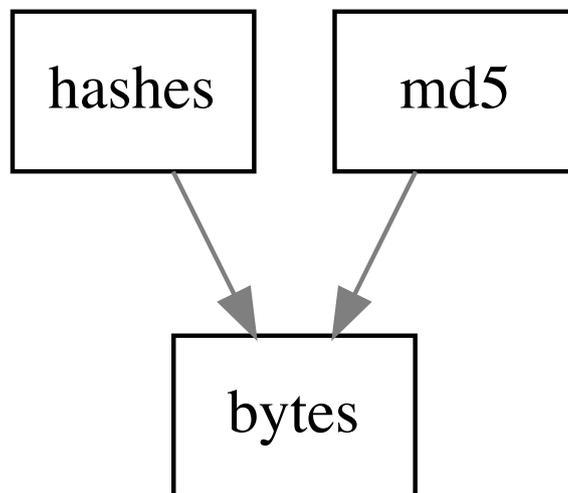
  ⟨*Bytes: types*⟩


Figure 6.1: Module dependencies in `src/combinatorics`.

⟨*Bytes: parameters*⟩

⟨*Bytes: interfaces*⟩

```
contains
```

⟨*Bytes: procedures*⟩

```
end module bytes
```

6.1.1   8-bit words: bytes

This is essentially a wrapper around 8-bit integers. The wrapper emphasises their special interpretation as a sequence of bits. However, we interpret bytes as unsigned integers.

⟨*Bytes: public*⟩≡
```
    public :: byte_t
```

⟨*Bytes: types*⟩≡
```
    type :: byte_t
       private
       integer(i8) :: i
    end type byte_t
```

⟨*Bytes: public*⟩+≡
```
    public :: byte_zero
```

⟨*Bytes: parameters*⟩≡
```
    type(byte_t), parameter :: byte_zero = byte_t (0_i8)
```

Set a byte from 8-bit integer:

⟨*Bytes: public*⟩+≡
```
    public :: assignment(=)
```

⟨*Bytes: interfaces*⟩≡
```
    interface assignment(=)
       module procedure set_byte_from_i8
    end interface
```

⟨*Bytes: procedures*⟩≡
```
    subroutine set_byte_from_i8 (b, i)
      type(byte_t), intent(out) :: b
      integer(i8), intent(in) :: i
      b%i = i
    end subroutine set_byte_from_i8
```

Write a byte in one of two formats: either as a hexadecimal number (two digits, default) or as a decimal number (one to three digits). The decimal version is nontrivial because bytes are unsigned integers. Optionally append a newline.

⟨*Bytes: public*⟩+≡
```
    public :: byte_write
```

⟨*Bytes: interfaces*⟩+≡
```
    interface byte_write
       module procedure byte_write_unit, byte_write_string
    end interface
```

⟨*Bytes: procedures*⟩+≡
```
    subroutine byte_write_unit (b, unit, decimal, newline)
      type(byte_t), intent(in), optional :: b
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: decimal, newline
      logical :: dc, nl
      type(word32_t) :: w
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      dc = .false.;  if (present (decimal))  dc = decimal
      nl = .false.;  if (present (newline))  nl = newline
      if (dc) then
         w = b
         write (u, '(I3)', advance='no')  w%i
      else
         write (u, '(z2.2)', advance='no')  b%i
      end if
      if (nl) write (u, *)
    end subroutine byte_write_unit
```

The string version is hex-only

⟨*Bytes: procedures*⟩+≡
```
    subroutine byte_write_string (b, s)
      type(byte_t), intent(in) :: b
      character(len=2), intent(inout) :: s
      write (s, '(z2.2)')  b%i
    end subroutine byte_write_string
```

6.1.2   32-bit words

This is not exactly a 32-bit integer. A word is to be filled with bytes, and it may be partially filled. The filling is done lowest-byte first, highest-byte last. We count the bits, so `fill` should be either 0, 8, 16, 24, or 32. In printing words, we correspondingly distinguish between printing zeros and printing blanks.

⟨*Bytes: public*⟩+≡
```
    public :: word32_t
```

⟨*Bytes: types*⟩+≡
```
    type :: word32_t
      private
      integer(i32) :: i
      integer :: fill = 0
    end type word32_t
```

Assignment: the word is filled by inserting a 32-bit integer

⟨*Bytes: interfaces*⟩+≡
```
    interface assignment(=)
```

143

```
      module procedure word32_set_from_i32
      module procedure word32_set_from_byte
    end interface
```

⟨*Bytes: procedures*⟩+≡
```
    subroutine word32_set_from_i32 (w, i)
      type(word32_t), intent(out) :: w
      integer(i32), intent(in) :: i
      w%i = i
      w%fill = 32
    end subroutine word32_set_from_i32
```

Reverse assignment to a 32-bit integer. We do not check the fill status.

⟨*Bytes: interfaces*⟩+≡
```
    interface assignment(=)
      module procedure i32_from_word32
    end interface
```

⟨*Bytes: procedures*⟩+≡
```
    subroutine i32_from_word32 (i, w)
      integer(i32), intent(out) :: i
      type(word32_t), intent(in) :: w
      i = w%i
    end subroutine i32_from_word32
```

Filling with a 8-bit integer is slightly tricky, because in this interpretation integers are unsigned.

⟨*Bytes: procedures*⟩+≡
```
    subroutine word32_set_from_byte (w, b)
      type(word32_t), intent(out) :: w
      type(byte_t), intent(in) :: b
      if (b%i >= 0_i8) then
         w%i = b%i
      else
         w%i = 2_i32*(huge(0_i8)+1_i32) + b%i
      end if
      w%fill = 32
    end subroutine word32_set_from_byte
```

Check the fill status

⟨*Bytes: public*⟩+≡
```
    public :: word32_empty, word32_filled, word32_fill
```

⟨*Bytes: procedures*⟩+≡
```
    function word32_empty (w)
      type(word32_t), intent(in) :: w
      logical :: word32_empty
      word32_empty = (w%fill == 0)
    end function word32_empty

    function word32_filled (w)
      type(word32_t), intent(in) :: w
      logical :: word32_filled
      word32_filled = (w%fill == 32)
```

```
      end function word32_filled

   function word32_fill (w)
     type(word32_t), intent(in) :: w
     integer :: word32_fill
     word32_fill = w%fill
   end function word32_fill
```

Partial assignment: append a byte to a partially filled word. (Note: no assignment if the word is filled, so check this before if necessary.)

⟨*Bytes: public*⟩+≡
```
   public :: word32_append_byte
```

⟨*Bytes: procedures*⟩+≡
```
   subroutine word32_append_byte (w, b)
     type(word32_t), intent(inout) :: w
     type(byte_t), intent(in) :: b
     type(word32_t) :: w1
     if (.not. word32_filled (w)) then
        w1 = b
        call mvbits (w1%i, 0, 8, w%i, w%fill)
        w%fill = w%fill + 8
     end if
   end subroutine word32_append_byte
```

Extract a byte from a word. The argument i is the position, which may be 0, 1, 2, or 3.

For the final assignment, we set the highest bit separately. Otherwise, we might trigger an overflow condition for a compiler with strict checking turned on.

⟨*Bytes: public*⟩+≡
```
   public :: byte_from_word32
```

⟨*Bytes: procedures*⟩+≡
```
   function byte_from_word32 (w, i) result (b)
     type(word32_t), intent(in) :: w
     integer, intent(in) :: i
     type(byte_t) :: b
     integer(i32) :: j
     j = 0
     if (i >= 0 .and. i*8 < w%fill) then
        call mvbits (w%i, i*8, 8, j, 0)
     end if
     b%i = int (ibclr (j, 7), kind=i8)
     if (btest (j, 7))  b%i = ibset (b%i, 7)
   end function byte_from_word32
```

Write a word to file or STDOUT. We understand words as unsigned integers, therefore we cannot use the built-in routine unchanged. However, we can make use of the existence of 64-bit integers and their output routine.

In hexadecimal format, the default version prints eight hex characters, highest-first. The bytes version prints four bytes (two-hex characters), lowest first, with

spaces in-between. The decimal bytes version is analogous. In the `bytes` version, missing bytes are printed as whitespace.

⟨*Bytes: public*⟩+≡
```
public :: word32_write
```

⟨*Bytes: interfaces*⟩+≡
```
interface word32_write
   module procedure word32_write_unit
end interface
```

⟨*Bytes: procedures*⟩+≡
```
subroutine word32_write_unit (w, unit, bytes, decimal, newline)
  type(word32_t), intent(in) :: w
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: bytes, decimal, newline
  logical :: dc, by, nl
  type(word64_t) :: ww
  integer :: i, u
  u = given_output_unit (unit);  if (u < 0)  return
  by = .false.;  if (present (bytes))  by = bytes
  dc = .false.;  if (present (decimal)) dc = decimal
  nl = .false.;  if (present (newline)) nl = newline
  if (by) then
     do i = 0, 3
        if (i>0)  write (u, '(1x)', advance='no')
        if (8*i < w%fill) then
           call byte_write (byte_from_word32 (w, i), unit, decimal=decimal)
        else if (dc) then
           write (u, '(3x)', advance='no')
        else
           write (u, '(2x)', advance='no')
        end if
     end do
  else if (dc) then
     ww = w
     write (u, '(I10)', advance='no') ww%i
  else
     select case (w%fill)
     case ( 0)
     case ( 8);  write (6, '(1x,z8.2)', advance='no') ibits (w%i, 0, 8)
     case (16);  write (6, '(1x,z8.4)', advance='no') ibits (w%i, 0,16)
     case (24);  write (6, '(1x,z8.6)', advance='no') ibits (w%i, 0,24)
     case (32);  write (6, '(1x,z8.8)', advance='no') ibits (w%i, 0,32)
     end select
  end if
  if (nl) write (u, *)
end subroutine word32_write_unit
```

6.1.3   Operations on 32-bit words

Define the usual logical operations, as well as addition (mod 2^{32}). We assume that all operands are completely filled.

⟨*Bytes: public*⟩+≡

```

        type(word32_t), intent(in) :: w1
        integer, intent(in) :: s
        type(word32_t) :: w2
        w2 = ishft (w1%i, s)
      end function word_shft

      function word_shftc (w1, s) result (w2)
```

```
      type(word32_t), intent(in) :: w1
      integer, intent(in) :: s
      type(word32_t) :: w2
      w2 = ishftc (w1%i, s, 32)
   end function word_shftc
```

Addition is defined mod 2^{32}, i.e., without overflow checking. This means that
we have to work around a possible overflow check enforced by the compiler.

```

```
        end if
    end function word_add_i32
```

6.1.4   64-bit words

These objects consist of two 32-bit words. They thus can hold integer numbers larger than 2^{32} (to be exact, 2^{31} since FORTRAN integers are signed). The order is low-word, high-word.

⟨*Bytes: public*⟩+≡
```
    public :: word64_t
```

⟨*Bytes: types*⟩+≡
```
    type :: word64_t
       private
       integer(i64) :: i
    end type word64_t
```

Set a 64 bit word:

⟨*Bytes: interfaces*⟩+≡
```
    interface assignment(=)
       module procedure word64_set_from_i64
       module procedure word64_set_from_word32
    end interface
```

⟨*Bytes: procedures*⟩+≡
```
    subroutine word64_set_from_i64 (ww, i)
      type(word64_t), intent(out) :: ww
      integer(i64), intent(in) :: i
      ww%i = i
    end subroutine word64_set_from_i64
```

Filling with a 32-bit word:

⟨*Bytes: procedures*⟩+≡
```
    subroutine word64_set_from_word32 (ww, w)
      type(word64_t), intent(out) :: ww
      type(word32_t), intent(in) :: w
      if (w%i >= 0_i32) then
         ww%i = w%i
      else
         ww%i = 2_i64*(huge(0_i32)+1_i64) + w%i
      end if
    end subroutine word64_set_from_word32
```

Extract a byte from a word. The argument `i` is the position, which may be between 0 and 7.

For the final assignment, we set the highest bit separately. Otherwise, we might trigger an overflow condition for a compiler with strict checking turned on.

⟨*Bytes: public*⟩+≡
```
    public :: byte_from_word64, word32_from_word64
```

⟨*Bytes: procedures*⟩+≡
```
    function byte_from_word64 (ww, i) result (b)
      type(word64_t), intent(in) :: ww
      integer, intent(in) :: i
      type(byte_t) :: b
      integer(i64) :: j
      j = 0
      if (i >= 0 .and. i*8 < 64) then
          call mvbits (ww%i, i*8, 8, j, 0)
      end if
      b%i = int (ibclr (j, 7), kind=i8)
      if (btest (j, 7))  b%i = ibset (b%i, 7)
    end function byte_from_word64
```

Extract a 32-bit word from a 64-bit word. The position is either 0 or 1.

⟨*Bytes: procedures*⟩+≡
```
    function word32_from_word64 (ww, i) result (w)
      type(word64_t), intent(in) :: ww
      integer, intent(in) :: i
      type(word32_t) :: w
      integer(i64) :: j
      j = 0
      select case (i)
      case (0);  call mvbits (ww%i,  0, 32, j, 0)
      case (1);  call mvbits (ww%i, 32, 32, j, 0)
      end select
      w = int (ibclr (j, 31), kind=i32)
      if (btest (j, 31))  w = ibset (w%i, 31)
    end function word32_from_word64
```

Print a 64-bit word. Decimal version works up to 2^{63}. The `words` version uses the 'word32' printout, separated by two spaces. The low-word is printed first. The `bytes` version also uses the 'word32' printout. This implies that the lowest byte is first. The default version prints a hexadecimal number without spaces, highest byte first.

⟨*Bytes: public*⟩+≡
```
    public :: word64_write
```

⟨*Bytes: interfaces*⟩+≡
```
    interface word64_write
       module procedure word64_write_unit
    end interface
```

⟨*Bytes: procedures*⟩+≡
```
    subroutine word64_write_unit (ww, unit, words, bytes, decimal, newline)
      type(word64_t), intent(in) :: ww
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: words, bytes, decimal, newline
      logical :: wo, by, dc, nl
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      wo = .false.;  if (present (words))    wo = words
      by = .false.;  if (present (bytes))    by = bytes
      dc = .false.;  if (present (decimal))  dc = decimal
```

```
      nl = .false.;  if (present (newline))  nl = newline
      if (wo .or. by) then
         call word32_write_unit (word32_from_word64 (ww, 0), unit, by, dc)
         write (u, '(2x)', advance='no')
         call word32_write_unit (word32_from_word64 (ww, 1), unit, by, dc)
      else if (dc) then
         write (u, '(I19)', advance='no') ww%i
      else
         write (u, '(Z16)', advance='no') ww%i
      end if
      if (nl) write (u, *)
   end subroutine word64_write_unit
```

6.2   Hashtables

Hash tables, like lists, are not part of Fortran and must be defined on a per-case basis. In this section we define a module that contains a hash function.

Furthermore, for reference there is a complete framework of hashtable type definitions and access functions. This code is to be replicated where hash tables are used, mutatis mutandis.

⟨hashes.f90⟩≡
  ⟨*File header*⟩

```
  module hashes

    use kinds, only: i8, i32
    use bytes
```

  ⟨*Standard module head*⟩

  ⟨*Hashes: public*⟩

```
  contains
```

  ⟨*Hashes: procedures*⟩

```
  end module hashes
```

6.2.1   The hash function

This is the one-at-a-time hash function by Bob Jenkins (from Wikipedia), re-implemented in Fortran. The function works on an array of bytes (8-bit integers), as could be produced by, e.g., the `transfer` function, and returns a single 32-bit integer. For determining the position in a hashtable, one can pick the lower bits of the result as appropriate to the hashtable size (which should be a power of 2). Note that we are working on signed integers, so the interpretation of values differs from the C version. This should not matter in practice, however.

⟨*Hashes: public*⟩≡
```
    public :: hash
```

⟨Hashes: procedures⟩≡

```fortran
function hash (key) result (hashval)
  integer(i32) :: hashval
  integer(i8), dimension(:), intent(in) :: key
  type(word32_t) :: w
  integer :: i
  w = 0_i32
  do i = 1, size (key)
     w = w + key(i)
     w = w + ishft (w, 10)
     w = ieor (w, ishft (w, -6))
  end do
  w = w + ishft (w, 3)
  w = ieor (w, ishft (w, -11))
  w = w + ishft (w, 15)
  hashval = w
end function hash
```

6.2.2   The hash table

We define a generic hashtable type (that depends on the `hash_data_t` type) together with associated methods.

This is a template:

⟨Hashtables: types⟩≡

```fortran
type :: hash_data_t
   integer :: i
end type hash_data_t
```

Associated methods:

⟨Hashtables: procedures⟩≡

```fortran
subroutine hash_data_final (data)
  type(hash_data_t), intent(inout) :: data
end subroutine hash_data_final

subroutine hash_data_write (data, unit)
  type(hash_data_t), intent(in) :: data
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit);  if (u < 0)  return
  write (u, *) data%i
end subroutine hash_data_write
```

Each hash entry stores the unmasked hash value, the key, and points to actual data if present. Note that this could be an allocatable scalar in principle, but making it a pointer avoids deep copy when expanding the hashtable.

⟨Hashtables: types⟩+≡

```fortran
type :: hash_entry_t
   integer(i32) :: hashval = 0
   integer(i8), dimension(:), allocatable :: key
   type(hash_data_t), pointer :: data => null ()
end type hash_entry_t
```

The hashtable object holds the actual table, the number of filled entries and the number of entries after which the size should be doubled. The mask is equal to the table size minus one and thus coincides with the upper bound of the table index, which starts at zero.

⟨*Hashtables: types*⟩+≡
```
type :: hashtable_t
   integer :: n_entries = 0
   real :: fill_ratio = 0
   integer :: n_entries_max = 0
   integer(i32) :: mask = 0
   type(hash_entry_t), dimension(:), allocatable :: entry
end type hashtable_t
```

Initializer: The size has to be a power of two, the fill ratio is a real (machine-default!) number between 0 and 1.

⟨*Hashtables: procedures*⟩+≡
```
subroutine hashtable_init (hashtable, size, fill_ratio)
  type(hashtable_t), intent(out) :: hashtable
  integer, intent(in) :: size
  real, intent(in) :: fill_ratio
  hashtable%fill_ratio = fill_ratio
  hashtable%n_entries_max = size * fill_ratio
  hashtable%mask = size - 1
  allocate (hashtable%entry (0:hashtable%mask))
end subroutine hashtable_init
```

Finalizer: This calls a `hash_data_final` subroutine which must exist.

⟨*Hashtables: procedures*⟩+≡
```
subroutine hashtable_final (hashtable)
  type(hashtable_t), intent(inout) :: hashtable
  integer :: i
  do i = 0, hashtable%mask
     if (associated (hashtable%entry(i)%data)) then
        call hash_data_final (hashtable%entry(i)%data)
        deallocate (hashtable%entry(i)%data)
     end if
  end do
  deallocate (hashtable%entry)
end subroutine hashtable_final
```

Output. Here, we refer to a `hash_data_write` subroutine.

⟨*Hashtables: procedures*⟩+≡
```
subroutine hashtable_write (hashtable, unit)
  type(hashtable_t), intent(in) :: hashtable
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit);  if (u < 0)  return
  do i = 0, hashtable%mask
     if (associated (hashtable%entry(i)%data)) then
        write (u, *) i, "(hash =", hashtable%entry(i)%hashval, ")", &
```

```
              hashtable%entry(i)%key
          call hash_data_write (hashtable%entry(i)%data, unit)
        end if
    end do
  end subroutine hashtable_write
```

6.2.3 Hashtable insertion

Insert a single entry with the hash value as trial place. If the table is filled, first
expand it.

⟨*Hashtables: procedures*⟩+≡

```
  subroutine hashtable_insert (hashtable, key, data)
    type(hashtable_t), intent(inout) :: hashtable
    integer(i8), dimension(:), intent(in) :: key
    type(hash_data_t), intent(in), target :: data
    integer(i32) :: h
    if (hashtable%n_entries >= hashtable%n_entries_max) &
        call hashtable_expand (hashtable)
    h = hash (key)
    call hashtable_insert_rec (hashtable, h, h, key, data)
  end subroutine hashtable_insert
```

We need this auxiliary routine for doubling the size of the hashtable. We rely on
the fact that default assignment copies the data pointer, not the data themselves.
The temporary array must not be finalized; it is deallocated automatically to-
gether with its allocatable components.

⟨*Hashtables: procedures*⟩+≡

```
  subroutine hashtable_expand (hashtable)
    type(hashtable_t), intent(inout) :: hashtable
    type(hash_entry_t), dimension(:), allocatable :: table_tmp
    integer :: i, s
    allocate (table_tmp (0:hashtable%mask))
    table_tmp = hashtable%entry
    deallocate (hashtable%entry)
    s = 2 * size (table_tmp)
    hashtable%n_entries = 0
    hashtable%n_entries_max = s * hashtable%fill_ratio
    hashtable%mask = s - 1
    allocate (hashtable%entry (0:hashtable%mask))
    do i = 0, ubound (table_tmp, 1)
       if (associated (table_tmp(i)%data)) then
          call hashtable_insert_rec (hashtable, table_tmp(i)%hashval, &
               table_tmp(i)%hashval, table_tmp(i)%key, table_tmp(i)%data)
       end if
    end do
  end subroutine hashtable_expand
```

Insert a single entry at a trial place `h`, reduced to the table size. Collision
resolution is done simply by choosing the next element, recursively until the
place is empty. For bookkeeping, we preserve the original hash value. For a
good hash function, there should be no clustering.

Note that if the new key exactly matches an existing key, nothing is done.

⟨*Hashtables: procedures*⟩+≡
```
recursive subroutine hashtable_insert_rec (hashtable, h, hashval, key, data)
  type(hashtable_t), intent(inout) :: hashtable
  integer(i32), intent(in) :: h, hashval
  integer(i8), dimension(:), intent(in) :: key
  type(hash_data_t), intent(in), target :: data
  integer(i32) :: i
  i = iand (h, hashtable%mask)
  if (associated (hashtable%entry(i)%data)) then
     if (size (hashtable%entry(i)%key) /= size (key)) then
        call hashtable_insert_rec (hashtable, h + 1, hashval, key, data)
     else if (any (hashtable%entry(i)%key /= key)) then
        call hashtable_insert_rec (hashtable, h + 1, hashval, key, data)
     end if
  else
     hashtable%entry(i)%hashval = hashval
     allocate (hashtable%entry(i)%key (size (key)))
     hashtable%entry(i)%key = key
     hashtable%entry(i)%data => data
     hashtable%n_entries = hashtable%n_entries + 1
  end if
end subroutine hashtable_insert_rec
```

6.2.4   Hashtable lookup

The lookup function has to parallel the insert function. If the place is filled, check if the key matches. Yes: return the pointer; no: increment the hash value and check again.

⟨*Hashtables: procedures*⟩+≡
```
function hashtable_lookup (hashtable, key) result (ptr)
  type(hash_data_t), pointer :: ptr
  type(hashtable_t), intent(in) :: hashtable
  integer(i8), dimension(:), intent(in) :: key
  ptr => hashtable_lookup_rec (hashtable, hash (key), key)
end function hashtable_lookup
```

⟨*Hashtables: procedures*⟩+≡
```
recursive function hashtable_lookup_rec (hashtable, h, key) result (ptr)
  type(hash_data_t), pointer :: ptr
  type(hashtable_t), intent(in) :: hashtable
  integer(i32), intent(in) :: h
  integer(i8), dimension(:), intent(in) :: key
  integer(i32) :: i
  i = iand (h, hashtable%mask)
  if (associated (hashtable%entry(i)%data)) then
     if (size (hashtable%entry(i)%key) == size (key)) then
        if (all (hashtable%entry(i)%key == key)) then
           ptr => hashtable%entry(i)%data
        else
           ptr => hashtable_lookup_rec (hashtable, h + 1, key)
        end if
```

```
         else
            ptr => hashtable_lookup_rec (hashtable, h + 1, key)
         end if
      else
         ptr => null ()
      end if
   end function hashtable_lookup_rec
```

⟨*Hashtables: public*⟩≡
```
    public :: hashtable_test
```

⟨*Hashtables: procedures*⟩+≡
```
    subroutine hashtable_test ()
      type(hash_data_t), pointer :: data
      type(hashtable_t) :: hashtable
      integer(i8) :: i
      call hashtable_init (hashtable, 16, 0.25)
      do i = 1, 10
         allocate (data)
         data%i = i*i
         call hashtable_insert (hashtable, [i, i+i], data)
      end do
      call hashtable_insert (hashtable, [2_i8, 4_i8], data)
      call hashtable_write (hashtable)
      data => hashtable_lookup (hashtable, [5_i8, 10_i8])
      if (associated (data)) then
         print *, "lookup:", data%i
      else
         print *, "lookup: --"
      end if
      data => hashtable_lookup (hashtable, [6_i8, 12_i8])
      if (associated (data)) then
         print *, "lookup:", data%i
      else
         print *, "lookup: --"
      end if
      data => hashtable_lookup (hashtable, [4_i8, 9_i8])
      if (associated (data)) then
         print *, "lookup:", data%i
      else
         print *, "lookup: --"
      end if
      call hashtable_final (hashtable)
    end subroutine hashtable_test
```

6.3   MD5 Checksums

Implementing MD5 checksums allows us to check input/file integrity on the
basis of a well-known standard. The building blocks have been introduced in
the `bytes` module.

⟨md5.f90⟩≡

⟨*File header*⟩

```
module md5

  use kinds, only: i8, i32, i64
  use io_units
  use system_defs, only: BUFFER_SIZE
  use system_defs, only: LF, EOR, EOF
  use diagnostics
  use bytes
```

⟨*Standard module head*⟩

⟨*MD5: public*⟩

⟨*MD5: types*⟩

⟨*MD5: variables*⟩

⟨*MD5: interfaces*⟩

```
contains
```

⟨*MD5: procedures*⟩

```
end module md5
```

6.3.1 Blocks

A block is a sequence of 16 words (64 bytes or 512 bits). We anticipate that blocks will be linked, so include a pointer to the next block. There is a fill status (word counter), as there is one for each word. The fill status is equal to the number of bytes that are in, so it may be between 0 and 64.

⟨*MD5: types*⟩≡

```
    type :: block_t
       private
       type(word32_t), dimension(0:15) :: w
       type(block_t), pointer :: next => null ()
       integer :: fill = 0
    end type block_t
```

Check if a block is completely filled or empty:

⟨*MD5: procedures*⟩≡

```
    function block_is_empty (b)
      type(block_t), intent(in) :: b
      logical :: block_is_empty
      block_is_empty = (b%fill == 0 .and. word32_empty (b%w(0)))
    end function block_is_empty

    function block_is_filled (b)
      type(block_t), intent(in) :: b
      logical :: block_is_filled
      block_is_filled = (b%fill == 64)
```

157

```
      end function block_is_filled
```

Append a single byte to a block. Works only if the block is not yet filled.

⟨MD5: procedures⟩+≡
```
    subroutine block_append_byte (bl, by)
      type(block_t), intent(inout) :: bl
      type(byte_t), intent(in) :: by
      if (.not. block_is_filled (bl)) then
         call word32_append_byte (bl%w(bl%fill/4), by)
         bl%fill = bl%fill + 1
      end if
    end subroutine block_append_byte
```

The printing routine allows for printing as sequences of words or bytes, decimal or hex.

⟨MD5: interfaces⟩≡
```
    interface block_write
       module procedure block_write_unit
    end interface
```
⟨MD5: procedures⟩+≡
```
    subroutine block_write_unit (b, unit, bytes, decimal)
      type(block_t), intent(in) :: b
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: bytes, decimal
      logical :: by, dc
      integer :: i, u
      u = given_output_unit (unit);  if (u < 0)  return
      by = .false.;  if (present (bytes))    by = bytes
      dc = .false.;  if (present (decimal))  dc = decimal
      do i = 0, b%fill/4 - 1
         call newline_or_blank (u, i, by, dc)
         call word32_write (b%w(i), unit, bytes, decimal)
      end do
      if (.not. block_is_filled (b)) then
         i = b%fill/4
         if (.not. word32_empty (b%w(i))) then
            call newline_or_blank (u, i, by, dc)
            call word32_write (b%w(i), unit, bytes, decimal)
         end if
      end if
      write (u, *)
    contains
      subroutine newline_or_blank (u, i, bytes, decimal)
        integer, intent(in) :: u, i
        logical, intent(in) :: bytes, decimal
        if (decimal) then
           select case (i)
           case (0)
           case (2,4,6,8,10,12,14);  write (u, *)
           case default
              write (u, '(2x)', advance='no')
           end select
```

```
         else if (bytes) then
            select case (i)
            case (0)
            case (4,8,12);  write (u, *)
            case default
               write (u, '(2x)', advance='no')
            end select
         else
            if (i == 8)  write (u, *)
         end if
      end subroutine newline_or_blank
   end subroutine block_write_unit
```

6.3.2   Messages

A message (within this module) is a linked list of blocks.

⟨*MD5: types*⟩+≡
```
   type :: message_t
     private
     type(block_t), pointer :: first => null ()
     type(block_t), pointer :: last => null ()
     integer :: n_blocks = 0
   end type message_t
```

Clear the message list

⟨*MD5: procedures*⟩+≡
```
   subroutine message_clear (m)
     type(message_t), intent(inout) :: m
     type(block_t), pointer :: b
     nullify (m%last)
     do
        b => m%first
        if (.not.(associated (b))) exit
        m%first => b%next
        deallocate (b)
     end do
     m%n_blocks = 0
   end subroutine message_clear
```

Append an empty block to the message list

⟨*MD5: procedures*⟩+≡
```
   subroutine message_append_new_block (m)
     type(message_t), intent(inout) :: m
     if (associated (m%last)) then
        allocate (m%last%next)
        m%last => m%last%next
        m%n_blocks = m%n_blocks + 1
     else
        allocate (m%first)
        m%last => m%first
        m%n_blocks = 1
```

```
      end if
   end subroutine message_append_new_block
```

Initialize: clear and allocate the first (empty) block.

⟨*MD5: procedures*⟩+≡
```
   subroutine message_init (m)
     type(message_t), intent(inout) :: m
     call message_clear (m)
     call message_append_new_block (m)
   end subroutine message_init
```

Append a single byte to a message. If necessary, allocate a new block. If the message is empty, initialize it.

⟨*MD5: procedures*⟩+≡
```
   subroutine message_append_byte (m, b)
     type(message_t), intent(inout) :: m
     type(byte_t), intent(in) :: b
     if (.not. associated (m%last)) then
        call message_init (m)
     else if (block_is_filled (m%last)) then
        call message_append_new_block (m)
     end if
     call block_append_byte (m%last, b)
   end subroutine message_append_byte
```

Append zero bytes until the current block is filled up to the required position. If we are already beyond that, append a new block and fill that one.

⟨*MD5: procedures*⟩+≡
```
   subroutine message_pad_zero (m, i)
     type(message_t), intent(inout) :: m
     integer, intent(in) :: i
     type(block_t), pointer :: b
     integer :: j
     if (associated (m%last)) then
        b => m%last
        if (b%fill > i) then
           do j = b%fill + 1, 64 + i
              call message_append_byte (m, byte_zero)
           end do
        else
           do j = b%fill + 1, i
              call message_append_byte (m, byte_zero)
           end do
        end if
     end if
   end subroutine message_pad_zero
```

This returns the number of bits within a message. We need a 64-bit word for the result since it may be more than 2^{31}. This is also required by the MD5 standard.

⟨*MD5: procedures*⟩+≡

```
function message_bits (m) result (length)
  type(message_t), intent(in) :: m
  type(word64_t) :: length
  type(block_t), pointer :: b
  integer(i64) :: n_blocks_filled, n_bytes_extra
  if (m%n_blocks > 0) then
     b => m%last
     if (block_is_filled (b)) then
        n_blocks_filled = m%n_blocks
        n_bytes_extra = 0
     else
        n_blocks_filled = m%n_blocks - 1
        n_bytes_extra = b%fill
     end if
     length = n_blocks_filled * 512 + n_bytes_extra * 8
  else
     length = 0_i64
  end if
end function message_bits
```

6.3.3 Message I/O

Append the contents of a string to a message. We first cast the character string into a 8-bit integer array and the append this byte by byte.

⟨*MD5: procedures*⟩+≡
```
subroutine message_append_string (m, s)
  type(message_t), intent(inout) :: m
  character(len=*), intent(in) :: s
  integer(i64) :: i, n_bytes
  integer(i8), dimension(:), allocatable :: buffer
  integer(i8), dimension(1) :: mold
  type(byte_t) :: b
  n_bytes = size (transfer (s, mold))
  allocate (buffer (n_bytes))
  buffer = transfer (s, mold)
  do i = 1, size (buffer)
     b = buffer(i)
     call message_append_byte (m, b)
  end do
  deallocate (buffer)
end subroutine message_append_string
```

Append the contents of a 32-bit integer to a message. We first cast the 32-bit integer into a 8-bit integer array and the append this byte by byte.

⟨*MD5: procedures*⟩+≡
```
subroutine message_append_i32 (m, x)
  type(message_t), intent(inout) :: m
  integer(i32), intent(in) :: x
  integer(i8), dimension(4) :: buffer
  type(byte_t) :: b
  integer :: i
  buffer = transfer (x, buffer, size(buffer))
```

```
      do i = 1, size (buffer)
         b = buffer(i)
         call message_append_byte (m, b)
      end do
   end subroutine message_append_i32
```

Append one line from file to a message. Include the newline character.

⟨*MD5: procedures*⟩+≡
```
   subroutine message_append_from_unit (m, u, iostat)
     type(message_t), intent(inout) :: m
     integer, intent(in) :: u
     integer, intent(out) :: iostat
     character(len=BUFFER_SIZE) :: buffer
     read (u, *, iostat=iostat) buffer
     call message_append_string (m, trim (buffer))
     call message_append_string (m, LF)
   end subroutine message_append_from_unit
```

Fill a message from file. (Each line counts as a string.)

⟨*MD5: procedures*⟩+≡
```
   subroutine message_read_from_file (m, f)
     type(message_t), intent(inout) :: m
     character(len=*), intent(in) :: f
     integer :: u, iostat
     u = free_unit ()
     open (file=f, unit=u, action='read')
     do
        call message_append_from_unit (m, u, iostat=iostat)
        if (iostat < 0) exit
     end do
     close (u)
   end subroutine message_read_from_file
```

Write a message. After each block, insert an empty line.

⟨*MD5: interfaces*⟩+≡
```
   interface message_write
       module procedure message_write_unit
   end interface
```

⟨*MD5: procedures*⟩+≡
```
   subroutine message_write_unit (m, unit, bytes, decimal)
     type(message_t), intent(in) :: m
     integer, intent(in), optional :: unit
     logical, intent(in), optional :: bytes, decimal
     type(block_t), pointer :: b
     integer :: u
     u = given_output_unit (unit);  if (u < 0)  return
     b => m%first
     if (associated (b)) then
        do
           call block_write_unit (b, unit, bytes, decimal)
           b => b%next
           if (.not. associated (b))  exit
```

```
            write (u, *)
          end do
      end if
  end subroutine message_write_unit
```

6.3.4   Auxiliary functions

These four functions on three words are defined in the MD5 standard:

⟨*MD5: procedures*⟩+≡
```
  function ff (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: ff
    ff = ior (iand (x, y), iand (not (x), z))
  end function ff

  function fg (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: fg
    fg = ior (iand (x, z), iand (y, not (z)))
  end function fg

  function fh (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: fh
    fh = ieor (ieor (x, y), z)
  end function fh

  function fi (x, y, z)
    type(word32_t), intent(in) :: x, y, z
    type(word32_t) :: fi
    fi = ieor (y, ior (x, not (z)))
  end function fi
```

6.3.5   Auxiliary stuff

This defines and initializes the table of transformation constants:

⟨*MD5: variables*⟩≡
```
  type(word32_t), dimension(64), save :: t
  logical, save :: table_initialized = .false.
```

⟨*MD5: procedures*⟩+≡
```
  subroutine table_init
    type(word64_t) :: ww
    integer :: i
    if (.not.table_initialized) then
      do i = 1, 64
        ww = int (4294967296d0 * abs (sin (i * 1d0)), kind=i64)
        t(i) = word32_from_word64 (ww, 0)
      end do
      table_initialized = .true.
    end if
```

```
        end subroutine table_init
```

This encodes the message digest (4 words) into a 32-character string.

⟨*MD5: procedures*⟩+≡
```
    function digest_string (aa) result (s)
      type(word32_t), dimension (0:3), intent(in) :: aa
      character(len=32) :: s
      integer :: i, j
      do i = 0, 3
         do j = 0, 3
            call byte_write (byte_from_word32 (aa(i), j), s(i*8+j*2+1:i*8+j*2+2))
         end do
      end do
    end function digest_string
```

6.3.6   MD5 algorithm

Pad the message with a byte `x80` and then pad zeros up to a full block minus two words; in these words, insert the message length (before padding) as a 64-bit word, low-word first.

⟨*MD5: procedures*⟩+≡
```
    subroutine message_pad (m)
      type(message_t), intent(inout) :: m
      type(word64_t) :: length
      integer(i8), parameter :: ipad = -128  ! z'80'
      type(byte_t) :: b
      integer :: i
      length = message_bits (m)
      b = ipad
      call message_append_byte (m, b)
      call message_pad_zero (m, 56)
      do i = 0, 7
         call message_append_byte (m, byte_from_word64 (length, i))
      end do
    end subroutine message_pad
```

Apply a series of transformations onto a state `a,b,c,d`, where the transform function uses each word of the message together with the predefined words. Finally, encode the state as a 32-character string.

⟨*MD5: procedures*⟩+≡
```
    subroutine message_digest (m, s)
      type(message_t), intent(in) :: m
      character(len=32), intent(out) :: s
      integer(i32), parameter :: ia =  1732584193  ! z'67452301'
      integer(i32), parameter :: ib =  -271733879  ! z'efcdab89'
      integer(i32), parameter :: ic = -1732584194  ! z'98badcfe'
      integer(i32), parameter :: id =   271733878  ! z'10325476'
      type(word32_t) :: a, b, c, d
      type(word32_t) :: aa, bb, cc, dd
      type(word32_t), dimension(0:15) :: x
      type(block_t), pointer :: bl
```

```
call table_init
a = ia;  b = ib;  c = ic;  d = id
bl => m%first
do
   if (.not.associated (bl)) exit
   x = bl%w
   aa = a;  bb = b;  cc = c;  dd = d
   call transform (ff, a, b, c, d,  0,  7,  1)
   call transform (ff, d, a, b, c,  1, 12,  2)
   call transform (ff, c, d, a, b,  2, 17,  3)
   call transform (ff, b, c, d, a,  3, 22,  4)
   call transform (ff, a, b, c, d,  4,  7,  5)
   call transform (ff, d, a, b, c,  5, 12,  6)
   call transform (ff, c, d, a, b,  6, 17,  7)
   call transform (ff, b, c, d, a,  7, 22,  8)
   call transform (ff, a, b, c, d,  8,  7,  9)
   call transform (ff, d, a, b, c,  9, 12, 10)
   call transform (ff, c, d, a, b, 10, 17, 11)
   call transform (ff, b, c, d, a, 11, 22, 12)
   call transform (ff, a, b, c, d, 12,  7, 13)
   call transform (ff, d, a, b, c, 13, 12, 14)
   call transform (ff, c, d, a, b, 14, 17, 15)
   call transform (ff, b, c, d, a, 15, 22, 16)
   call transform (fg, a, b, c, d,  1,  5, 17)
   call transform (fg, d, a, b, c,  6,  9, 18)
   call transform (fg, c, d, a, b, 11, 14, 19)
   call transform (fg, b, c, d, a,  0, 20, 20)
   call transform (fg, a, b, c, d,  5,  5, 21)

   call transform (fh, c, d, a, b, 11, 16, 35)
   call transform (fh, b, c, d, a, 14, 23, 36)
   call transform (fh, a, b, c, d,  1,  4, 37)
   call transform (fh, d, a, b, c,  4, 11, 38)
   call transform (fh, c, d, a, b,  7, 16, 39)
   call transform (fh, b, c, d, a, 10, 23, 40)
   call transform (fh, a, b, c, d, 13,  4, 41)
   call transform (fh, d, a, b, c,  0, 11, 42)
   call transform (fh, c, d, a, b,  3, 16, 43)
   call transform (fh, b, c, d, a,  6, 23, 44)
   call transform (fh, a, b, c, d,  9,  4, 45)
   call transform (fh, d, a, b, c, 12, 11, 46)
   call transform (fh, c, d, a, b, 15, 16, 47)
```

```
                call transform (fh, b, c, d, a,  2, 23, 48)
                call transform (fi, a, b, c, d,  0,  6, 49)
                call transform (fi, d, a, b, c,  7, 10, 50)
                call transform (fi, c, d, a, b, 14, 15, 51)
                call transform (fi, b, c, d, a,  5, 21, 52)
                call transform (fi, a, b, c, d, 12,  6, 53)
                call transform (fi, d, a, b, c,  3, 10, 54)
                call transform (fi, c, d, a, b, 10, 15, 55)
                call transform (fi, b, c, d, a,  1, 21, 56)
                call transform (fi, a, b, c, d,  8,  6, 57)
                call transform (fi, d, a, b, c, 15, 10, 58)
                call transform (fi, c, d, a, b,  6, 15, 59)
                call transform (fi, b, c, d, a, 13, 21, 60)
                call transform (fi, a, b, c, d,  4,  6, 61)
                call transform (fi, d, a, b, c, 11, 10, 62)
                call transform (fi, c, d, a, b,  2, 15, 63)
                call transform (fi, b, c, d, a,  9, 21, 64)
                a = a + aa
                b = b + bb
                c = c + cc
                d = d + dd
                bl => bl%next
            end do
            s = digest_string ([a, b, c, d])
        contains
        ⟨MD5: Internal subroutine transform⟩
        end subroutine message_digest
```

And this is the actual transformation that depends on one of the previous functions, four words, and three integers. The implicit arguments are x, the word from the message to digest, and t, the entry in the predefined table.

⟨*MD5: Internal subroutine transform*⟩≡

```
        subroutine transform (f, a, b, c, d, k, s, i)
            interface
                function f (x, y, z)
                    import word32_t
                    type(word32_t), intent(in) :: x, y, z
                    type(word32_t) :: f
                end function f
            end interface
            type(word32_t), intent(inout) :: a
            type(word32_t), intent(in) :: b, c, d
            integer, intent(in) :: k, s, i
            a = b + ishftc (a + f(b, c, d) + x(k) + t(i), s)
        end subroutine transform
```

6.3.7   User interface

⟨*MD5: public*⟩≡

```
        public :: md5sum
```

⟨*MD5: interfaces*⟩+≡

```
        interface md5sum
```

```
      module procedure md5sum_from_string
      module procedure md5sum_from_unit
   end interface
```

This function computes the MD5 sum of the input string and returns it as a 32-character string

⟨*MD5: procedures*⟩+≡
```
   function md5sum_from_string (s) result (digest)
     character(len=*), intent(in) :: s
     character(len=32) :: digest
     type(message_t) :: m
     call message_append_string (m, s)
     call message_pad (m)
     call message_digest (m, digest)
     call message_clear (m)
   end function md5sum_from_string
```

This funct. reads from unit u (an unformmated sequence of integers) and computes the MD5 sum.

⟨*MD5: procedures*⟩+≡
```
   function md5sum_from_unit (u) result (digest)
     integer, intent(in) :: u
     character(len=32) :: digest
     type(message_t) :: m
     character :: char
     integer :: iostat
     READ_CHARS: do
        read (u, "(A)", advance="no", iostat=iostat)  char
        select case (iostat)
        case (0)
           call message_append_string (m, char)
        case (EOR)
           call message_append_string (m, LF)
        case (EOF)
           exit READ_CHARS
        case default
           call msg_fatal &
                ("Computing MD5 sum: I/O error while reading from scratch file")
        end select
     end do READ_CHARS
     call message_pad (m)
     call message_digest (m, digest)
     call message_clear (m)
   end function md5sum_from_unit
```

⟨*Permutations: interfaces*⟩

```
contains
```

⟨*Permutations: procedures*⟩

```
end module permutations
```

6.4.1 Permutations

A permutation is an array of integers. Each integer between one and `size` should occur exactly once.

⟨*Permutations: public*⟩≡
```
    public :: permutation_t
```

⟨*Permutations: types*⟩≡
```
    type :: permutation_t
       private
       integer, dimension(:), allocatable :: p
    end type permutation_t
```

Initialize with the identity permutation.

⟨*Permutations: public*⟩+≡
```
    public :: permutation_init
    public :: permutation_final
```

⟨*Permutations: procedures*⟩≡
```
    elemental subroutine permutation_init (p, size)
      type(permutation_t), intent(inout) :: p
      integer, intent(in) :: size
      integer :: i
      allocate (p%p (size))
      forall (i = 1:size)
         p%p(i) = i
      end forall
    end subroutine permutation_init

    elemental subroutine permutation_final (p)
      type(permutation_t), intent(inout) :: p
      deallocate (p%p)
    end subroutine permutation_final
```

I/O:

⟨*Permutations: public*⟩+≡
```
    public :: permutation_write
```

⟨*Permutations: procedures*⟩+≡
```
    subroutine permutation_write (p, u)
      type(permutation_t), intent (in) :: p
```

```
      integer, intent(in) :: u
      integer :: i
      do i = 1, size (p%p)
         if (size (p%p) < 10) then
            write (u,"(1x,I1)", advance="no") p%p(i)
         else
            write (u,"(1x,I3)", advance="no") p%p(i)
         end if
      end do
      write (u, *)
   end subroutine permutation_write
```

Administration:

⟨*Permutations: public*⟩+≡
```
   public :: permutation_size
```

⟨*Permutations: procedures*⟩+≡
```
   elemental function permutation_size (perm) result (s)
     type(permutation_t), intent(in) :: perm
     integer :: s
     s = size (perm%p)
   end function permutation_size
```

Extract an entry in a permutation.

⟨*Permutations: public*⟩+≡
```
   public :: permute
```

⟨*Permutations: procedures*⟩+≡
```
   elemental function permute (i, p) result (j)
     integer, intent(in) :: i
     type(permutation_t), intent(in) :: p
     integer :: j
     if (i > 0 .and. i <= size (p%p)) then
        j = p%p(i)
     else
        j = 0
     end if
   end function permute
```

Check whether a permutation is valid: Each integer in the range occurs exactly once.

⟨*Permutations: public*⟩+≡
```
   public :: permutation_ok
```

⟨*Permutations: procedures*⟩+≡
```
   elemental function permutation_ok (perm) result (ok)
     type(permutation_t), intent(in) :: perm
     logical :: ok
     integer :: i
     logical, dimension(:), allocatable :: set
     ok = .true.
     allocate (set (size (perm%p)))
     set = .false.
```

```
      do i = 1, size (perm%p)
         ok = (perm%p(i) > 0 .and. perm%p(i) <= size (perm%p))
         if (.not.ok) return
         set(perm%p(i)) = .true.
      end do
      ok = all (set)
   end function permutation_ok
```

Find the permutation that transforms the second array into the first one. We assume that this is possible and unique and all bounds are set correctly.

This cannot be elemental.

⟨*Permutations: public*⟩+≡
```
    public :: permutation_find
```

⟨*Permutations: procedures*⟩+≡
```
    subroutine permutation_find (perm, a1, a2)
      type(permutation_t), intent(inout) :: perm
      integer, dimension(:), intent(in) :: a1, a2
      integer :: i, j
      if (allocated (perm%p))  deallocate (perm%p)
      allocate (perm%p (size (a1)))
      do i = 1, size (a1)
         do j = 1, size (a2)
            if (a1(i) == a2(j)) then
               perm%p(i) = j
               exit
            end if
            perm%p(i) = 0
         end do
      end do
    end subroutine permutation_find
```

Find all permutations that transform an array of integers into itself. The resulting permutation list is allocated with the correct length and filled.

The first step is to count the number of different entries in `code`. Next, we scan `code` again and assign a mask to each different entry, true for all identical entries. Finally, we recursively permute the identity for each possible mask.

The permutation is done as follows: A list of all permutations of the initial one with respect to the current mask is generated, then the permutations are generated in turn for each permutation in this list with the next mask. The result is always stored back into the main list, starting from the end of the current list.

⟨*Permutations: public*⟩+≡
```
    public :: permutation_array_make
```

⟨*Permutations: procedures*⟩+≡
```
    subroutine permutation_array_make (pa, code)
      type(permutation_t), dimension(:), allocatable, intent(out) :: pa
      integer, dimension(:), intent(in) :: code
      logical, dimension(size(code)) :: mask
      logical, dimension(:,:), allocatable :: imask
      integer, dimension(:), allocatable :: n_i
      type(permutation_t) :: p_init
```

```
          type(permutation_t), dimension(:), allocatable :: p_tmp
          integer :: psize, i, j, k, n_different, n, nn_k
          psize = size (code)
          mask = .true.
          n_different = 0
          do i=1, psize
             if (mask(i)) then
                n_different = n_different + 1
                mask = mask .and. (code /= code(i))
             end if
          end do
          allocate (imask(psize, n_different), n_i(n_different))
          mask = .true.
          k = 0
          do i=1, psize
             if (mask(i)) then
                k = k + 1
                imask(:,k) = (code == code(i))
                n_i(k) = factorial (count(imask(:,k)))
                mask = mask .and. (code /= code(i))
             end if
          end do
          n = product (n_i)
          allocate (pa (n))
          call permutation_init (p_init, psize)
          pa(1) = p_init
          nn_k = 1
          do k = 1, n_different
             allocate (p_tmp (n_i(k)))
             do i = nn_k, 1, -1
                call permutation_array_with_mask (p_tmp, imask(:,k), pa(i))
                do j = n_i(k), 1, -1
                   pa((i-1)*n_i(k) + j) = p_tmp(j)
                end do
             end do
             deallocate (p_tmp)
             nn_k = nn_k * n_i(k)
          end do
          call permutation_final (p_init)
          deallocate (imask, n_i)
       end subroutine permutation_array_make
```

Make a list of permutations of the elements marked true in the `mask` array. The
final permutation list must be allocated with the correct length ($n!$). The third
argument is the initial permutation to start with, which must have the same
length as the `mask` array (this is not checked).

⟨*Permutations: procedures*⟩+≡

```
    subroutine permutation_array_with_mask (pa, mask, p_init)
      type(permutation_t), dimension(:), intent(inout) :: pa
      logical, dimension(:), intent(in) :: mask
      type(permutation_t), intent(in) :: p_init
      integer :: plen
      integer :: i, ii, j, fac_i, k, x
```

```
      integer, dimension(:), allocatable :: index
      plen = size (pa)
      allocate (index(count(mask)))
      ii = 0
      do i = 1, size (mask)
         if (mask(i)) then
            ii = ii + 1
            index(ii) = i
         end if
      end do
      pa = p_init
      ii = 0
      fac_i = 1
      do i = 1, size (mask)
         if (mask(i)) then
            ii = ii + 1
            fac_i = fac_i * ii
            x = permute (i, p_init)
            do j = 1, plen
               k = ii - mod (((j-1)*fac_i)/plen, ii)
               call insert (pa(j), x, k, ii, index)
            end do
         end if
      end do
      deallocate (index)
    contains
      subroutine insert (p, x, k, n, index)
        type(permutation_t), intent(inout) :: p
        integer, intent(in) :: x, k, n
        integer, dimension(:), intent(in) :: index
        integer :: i
        do i = n, k+1, -1
           p%p(index(i)) = p%p(index(i-1))
        end do
        p%p(index(k)) = x
      end subroutine insert
    end subroutine permutation_array_with_mask
```

The factorial function is needed for pre-determining the number of permutations
that will be generated:

⟨*Permutations: public*⟩+≡
```
    public :: factorial
```

⟨*Permutations: procedures*⟩+≡
```
    function factorial (n) result (f)
      integer, intent(in) :: n
      integer :: f
      integer :: i
      f = 1
      do i=2, abs(n)
         f = f*i
      end do
    end function factorial
```

6.4.2 Operations on binary codes

Binary codes are needed for phase-space trees. Since the permutation function uses permutations, and no other special type is involved, we put the functions here.

This is needed for phase space trees: permute bits in a tree binary code. If no permutation is given, leave as is. (We may want to access the permutation directly here if this is efficiency-critical.)

⟨*Permutations: public*⟩+≡

```
    public :: tc_permute
```

⟨*Permutations: procedures*⟩+≡

```
    function tc_permute (k, perm, mask_in) result (pk)
      integer(TC), intent(in) :: k, mask_in
      type(permutation_t), intent(in) :: perm
      integer(TC) :: pk
      integer :: i
      pk = iand (k, mask_in)
      do i = 1, size (perm%p)
         if (btest(k,i-1))  pk = ibset (pk, perm%p(i)-1)
      end do
    end function tc_permute
```

This routine returns the number of set bits in the tree code value `k`. Hence, it is the number of externals connected to the current line. If `mask` is present, the complement of the tree code is also considered, and the smaller number is returned. This gives the true distance from the external states, taking into account the initial particles. The complement number is increased by one, since for a scattering diagram the vertex with the sum of all final-state codes is still one point apart from the initial particles.

⟨*Permutations: public*⟩+≡

```
    public :: tc_decay_level
```

⟨*Permutations: interfaces*⟩≡

```
    interface tc_decay_level
       module procedure decay_level_simple
       module procedure decay_level_complement
    end interface
```

⟨*Permutations: procedures*⟩+≡

```
    function decay_level_complement (k, mask) result (l)
      integer(TC), intent(in) :: k, mask
      integer :: l
      l = min (decay_level_simple (k), &
           &   decay_level_simple (ieor (k, mask)) + 1)
    end function decay_level_complement

    function decay_level_simple (k) result(l)
      integer(TC), intent(in) :: k
      integer :: l
      integer :: i
      l = 0
      do i=0, bit_size(k)-1
         if (btest(k,i)) l = l+1
```

```
        end do
    end function decay_level_simple
```

6.5 Sorting

This small module provides functions for sorting integer or real arrays.

⟨sorting.f90⟩≡

  ⟨*File header*⟩

```
module sorting
```

  ⟨*Use kinds*⟩
```
    use diagnostics
```

  ⟨*Standard module head*⟩

  ⟨*Sorting: public*⟩

  ⟨*Sorting: interfaces*⟩

```
contains
```

  ⟨*Sorting: procedures*⟩

```
end module sorting
```

6.5.1 Implementation

The sort function returns, for a given integer or real array, the array sorted by increasing value. The current implementation is *mergesort*, which has $O(n \ln n)$ behavior in all cases, and is stable for elements of equal value.

The sort_abs variant sorts by increasing absolute value, where for identical absolute value, the positive number comes first.

⟨*Sorting: public*⟩≡
```
    public :: sort
    public :: sort_abs
```

⟨*Sorting: interfaces*⟩≡
```
    interface sort
       module procedure sort_int
       module procedure sort_real
    end interface

    interface sort_abs
       module procedure sort_int_abs
    end interface
```

This variant of integer sort returns The body is identical, just the interface differs.

⟨*Sorting: procedures*⟩≡

```
      function sort_int (val_in) result (val)
        integer, dimension(:), intent(in) :: val_in
        integer, dimension(size(val_in)) :: val
```
⟨*Sorting: sort*⟩
```
      end function sort_int

      function sort_real (val_in) result (val)
        real(default), dimension(:), intent(in) :: val_in
        real(default), dimension(size(val_in)) :: val
```
⟨*Sorting: sort*⟩
```
      end function sort_real

      function sort_int_abs (val_in) result (val)
        integer, dimension(:), intent(in) :: val_in
        integer, dimension(size(val_in)) :: val
```
⟨*Sorting: sort abs*⟩
```
      end function sort_int_abs
```

⟨*Sorting: sort*⟩≡
```
      val = val_in( order (val_in) )
```
⟨*Sorting: sort abs*⟩≡
```
      val = val_in( order_abs (val_in) )
```

The `order` function returns, for a given integer or real array, the array of indices of the elements sorted by increasing value.

⟨*Sorting: public*⟩+≡
```
      public :: order
      public :: order_abs
```
⟨*Sorting: interfaces*⟩+≡
```
      interface order
         module procedure order_int
         module procedure order_real
      end interface

      interface order_abs
         module procedure order_int_abs
      end interface
```

⟨*Sorting: procedures*⟩+≡
```
      function order_int (val) result (idx)
        integer, dimension(:), intent(in) :: val
        integer, dimension(size(val)) :: idx
```
⟨*Sorting: order*⟩
```
      end function order_int

      function order_real (val) result (idx)
        real(default), dimension(:), intent(in) :: val
        integer, dimension(size(val)) :: idx
```
⟨*Sorting: order*⟩
```
      end function order_real

      function order_int_abs (val) result (idx)
        integer, dimension(:), intent(in) :: val
```

177

```
      integer, dimension(size(val)) :: idx
```
⟨*Sorting: order abs*⟩
```
   end function order_int_abs
```

We start by individual elements, merge them to pairs, merge those to four-element subarrays, and so on. The last subarray can extend only up to the original array bound, of course, and the second of the subarrays to merge should contain at least one element.

⟨*Sorting: order*⟩≡
  ⟨*Sorting: order1*⟩
```
         call merge (idx(b1:e2), idx(b1:e1), idx(b2:e2), val)
```
  ⟨*Sorting: order2*⟩

⟨*Sorting: order abs*⟩≡
  ⟨*Sorting: order1*⟩
```
         call merge_abs (idx(b1:e2), idx(b1:e1), idx(b2:e2), val)
```
  ⟨*Sorting: order2*⟩

⟨*Sorting: order1*⟩≡
```
   integer :: n, i, s, b1, b2, e1, e2
   n = size (idx)
   do i = 1, n
      idx(i) = i
   end do
   s = 1
   do while (s < n)
      do b1 = 1, n-s, 2*s
         b2 = b1 + s
         e1 = b2 - 1
         e2 = min (e1 + s, n)
```

⟨*Sorting: order2*⟩≡
```
      end do
      s = 2 * s
   end do
```

The merging step does the actual sorting. We take two sorted array sections and merge them to a sorted result array. We are working on the indices, and comparing is done by taking the associated `val` which is real or integer.

⟨*Sorting: interfaces*⟩+≡
```
   interface merge
      module procedure merge_int
      module procedure merge_real
   end interface

   interface merge_abs
      module procedure merge_int_abs
   end interface
```

⟨*Sorting: procedures*⟩+≡
```
   subroutine merge_int (res, src1, src2, val)
     integer, dimension(:), intent(out) :: res
     integer, dimension(:), intent(in) :: src1, src2
     integer, dimension(:), intent(in) :: val
```

```
      integer, dimension(size(res)) :: tmp
    ⟨Sorting: merge⟩
    end subroutine merge_int

    subroutine merge_real (res, src1, src2, val)
      integer, dimension(:), intent(out) :: res
      integer, dimension(:), intent(in) :: src1, src2
      real(default), dimension(:), intent(in) :: val
      integer, dimension(size(res)) :: tmp
    ⟨Sorting: merge⟩
    end subroutine merge_real

    subroutine merge_int_abs (res, src1, src2, val)
      integer, dimension(:), intent(out) :: res
      integer, dimension(:), intent(in) :: src1, src2
      integer, dimension(:), intent(in) :: val
      integer, dimension(size(res)) :: tmp
    ⟨Sorting: merge abs⟩
    end subroutine merge_int_abs
```

⟨*Sorting: merge*⟩≡
```
  ⟨Sorting: merge1⟩
      if (val(src1(i1)) <= val(src2(i2))) then
  ⟨Sorting: merge2⟩
```

We keep the elements if the absolute values are strictly ordered. If they are equal in magnitude, we keep them if the larger value comes first, or if they are equal.

⟨*Sorting: merge abs*⟩≡
```
  ⟨Sorting: merge1⟩
      if (abs (val(src1(i1))) < abs (val(src2(i2))) .or. &
          (abs (val(src1(i1))) == abs (val(src2(i2))) .and. &
          val(src1(i1)) >= val(src2(i2)))) then
  ⟨Sorting: merge2⟩
```

⟨*Sorting: merge1*⟩≡
```
    integer :: i1, i2, i
    i1 = 1
    i2 = 1
    do i = 1, size (tmp)
```

⟨*Sorting: merge2*⟩≡
```
        tmp(i) = src1(i1);  i1 = i1 + 1
        if (i1 > size (src1)) then
           tmp(i+1:) = src2(i2:)
           exit
        end if
     else
        tmp(i) = src2(i2);  i2 = i2 + 1
        if (i2 > size (src2)) then
           tmp(i+1:) = src1(i1:)
           exit
        end if
     end if
   end do
```

179

```
        res = tmp
```

6.5.2   Unit tests

Test module, followed by the corresponding implementation module.

6.6 Grids

*This is not really a combinatorics module but this directory is the closest I could
find. Maybe this will be moved to a seperate directory or combined with related
stuff.*

⟨`grids.f90`⟩≡
  ⟨*File header*⟩

  ```
  module grids
  ```

  ⟨*Use kinds*⟩
  ```
    use constants, only: zero, one, tiny_07
    use io_units
    use format_defs, only: FMT_16
    use diagnostics
  ```
  ⟨*Use mpi f08*⟩

  ⟨*Standard module head*⟩

  ⟨*Grids: public*⟩

  ⟨*Grids: parameters*⟩

  ⟨*Grids: types*⟩

  ```
  contains
  ```

  ⟨*Grids: procedures*⟩

  ```
  end module grids
  ```

Grids are used in many applications and a general implementation seems useful.
The relevant properties implemented so far are

- Segments of the hypercube are represented by an integer array with size
  d corresponding to the dimension.

- There is a mapping from the indices to the location in the continuous
  memory block of values.

- Given a point in the hypercube, find the corresponding segment and the
  value of the grid therein.

- Update the grid sequentially to represent the maximum of a function over
  the unit hypercube.

- The grid can be saved to and recovered from disk.

The following might be implemented in the future

- Generate a random point in the hypercube by interpreting the grid as probability distribution.

  This would most likely be solved by using projections and the `selector_t`*, which would make a move of this module higher up in the dependency tree necessary.*

- Update the grid sequentially to represent the *minimum* of a function over the unit hypercube.

⟨*Grids: public*⟩≡
```
public :: grid_t
```

⟨*Grids: types*⟩≡
```
type :: grid_t
   private
   real(default), dimension(:), allocatable :: values
   integer, dimension(:), allocatable :: points
contains
 ⟨Grids: grid: TBP⟩
end type grid_t
```

6.6.1 Initializer and finalizer

For initialization, we expect the number of points for each dimension as an array or the the number of dimensions as a scalar whereby the default number of points is used then for each dimension.

⟨*Grids: grid: TBP*⟩≡
```
generic :: init => init_base, init_simple
procedure :: init_base => grid_init_base
procedure :: init_simple => grid_init_simple
```

⟨*Grids: procedures*⟩≡
```
pure subroutine grid_init_base (grid, points)
  class(grid_t), intent(inout) :: grid
  integer, dimension(:), intent(in) :: points
  allocate (grid%points (size (points)))
  allocate (grid%values (product (points)))
  grid%points = points
  grid%values = zero
end subroutine grid_init_base
```

⟨*Grids: procedures*⟩+≡
```
pure subroutine grid_init_simple (grid, dimensions)
  class(grid_t), intent(inout) :: grid
  integer, intent(in) :: dimensions
  allocate (grid%points (dimensions))
  allocate (grid%values (DEFAULT_POINTS_PER_DIMENSION ** dimensions))
  grid%points = DEFAULT_POINTS_PER_DIMENSION
  grid%values = zero
end subroutine grid_init_simple
```

Manual assignment (tests)

⟨*Grids: grid: TBP*⟩+≡
```
    procedure :: set_values => grid_set_values
```

⟨*Grids: procedures*⟩+≡
```
    subroutine grid_set_values (grid, values)
      class(grid_t), intent(inout) :: grid
      real(default), dimension(:), intent(in) :: values
      grid%values = values
    end subroutine grid_set_values
```

A reasonable default

⟨*Grids: parameters*⟩≡
```
    integer, parameter :: DEFAULT_POINTS_PER_DIMENSION = 100
```

Calling this is not mandatory, when an instance of **grid_t** goes out of scope as it will be done by Fortran automatically.

⟨*Grids: grid: TBP*⟩+≡
```
    procedure :: final => grid_final
```

⟨*Grids: procedures*⟩+≡
```
    pure subroutine grid_final (grid)
      class(grid_t), intent(inout) :: grid
      if (allocated (grid%values)) then
         deallocate (grid%values)
      end if
      if (allocated (grid%points)) then
         deallocate (grid%points)
      end if
    end subroutine grid_final
```

6.6.2 Segment finding and memory mapping

The `indices` array is expected to go from 1 to d whereby the entries for the different dims are from 1 to $n_{\text{points}}(\text{dim})$.
We get the value of the grid either from given `indices` or from a point `x` in the hypercube. In the latter case, we have to find the segment first.

⟨*Grids: grid: TBP*⟩+≡
```
    generic :: get_value => get_value_from_x, get_value_from_indices
    procedure :: get_value_from_x => grid_get_value_from_x
    procedure :: get_value_from_indices => grid_get_value_from_indices
```

⟨*Grids: procedures*⟩+≡
```
    function grid_get_value_from_indices (grid, indices)
      real(default) :: grid_get_value_from_indices
      class(grid_t), intent(in) :: grid
      integer, dimension(:), intent(in) :: indices
      grid_get_value_from_indices = grid%values(grid%get_index(indices))
    end function grid_get_value_from_indices
```

⟨*Grids: procedures*⟩+≡
```
function grid_get_value_from_x (grid, x)
  real(default) :: grid_get_value_from_x
  class(grid_t), intent(in) :: grid
  real(default), dimension(:), intent(in) :: x
  grid_get_value_from_x = grid_get_value_from_indices &
        (grid, grid_get_segment (grid, x))
end function grid_get_value_from_x
```

The segment is the part of the grid that contains the point x and is identified by a tupel of indices. This is just a brute force search, for fine grids one could also implement a binary search for $\mathcal{O}(\log N)$ behavior instead of $\mathcal{O}(N)$.

⟨*Grids: grid: TBP*⟩+≡
```
procedure :: get_segment => grid_get_segment
```

⟨*Grids: procedures*⟩+≡
```
function grid_get_segment (grid, x, unit)
  class(grid_t), intent(in) :: grid
  real(default), dimension(:), intent(in) :: x
  integer, intent(in), optional :: unit
  integer, dimension(1:size (x)) :: grid_get_segment
  integer :: dim, i
  real(default) :: segment_width
  grid_get_segment = 0
  do dim = 1, size (grid%points)
     segment_width = one / grid%points (dim)
     SEARCH: do i = 1, grid%points (dim)
        if (x (dim) <= i * segment_width + tiny_07) then
           grid_get_segment (dim) = i
           exit SEARCH
        end if
     end do SEARCH
     if (grid_get_segment (dim) == 0) then
        do i = 1, size(x)
           write (msg_buffer, "(A," // DEFAULT_OUTPUT_PRECISION // ")") &
                 "x[i] = ", x(i)
           call msg_message ()
        end do
        call msg_error ("grid_get_segment: Did not find x in [0,1]^d", &
              unit=unit)
     end if
  end do
end function grid_get_segment
```

This is a simple storage mapping function but more sophisticated ideas like hashing could be implemented.

$$
\begin{aligned}
\text{index} = \text{indices}(1) + \\
\text{indices}(2) * \text{size}(1) + \\
\text{indices}(3) * \text{size}(1) * \text{size}(2) + \dots
\end{aligned}
\tag{6.1}
$$

⟨*Grids: grid: TBP*⟩+≡
```
procedure :: get_index => grid_get_index
```

⟨*Grids: procedures*⟩+≡
```
pure function grid_get_index (grid, indices) result (grid_index)
  integer :: grid_index
  class(grid_t), intent(in) :: grid
  integer, dimension(:), intent(in) :: indices
  integer :: dim_innerloop, dim_outerloop, multiplier
  grid_index = 1
  do dim_outerloop = 1, size(indices)
    multiplier = 1
    do dim_innerloop = 1, dim_outerloop - 1
      multiplier = multiplier * grid%points (dim_innerloop)
    end do
    grid_index = grid_index + (indices(dim_outerloop) - 1) * multiplier
  end do
end function grid_get_index
```

6.6.3 Grid manipulations

Given a point in the hypercube x and its value y, we update the grids, such that the stepwise function f defined by the grid is $f(x_i) \geq y_i \ \forall \{x_i, y_i\}$.

⟨*Grids: grid: TBP*⟩+≡
```
procedure :: update_maxima => grid_update_maxima
```

⟨*Grids: procedures*⟩+≡
```
subroutine grid_update_maxima (grid, x, y)
  class(grid_t), intent(inout) :: grid
  real(default), dimension(:), intent(in) :: x
  real(default), intent(in) :: y
  integer, dimension(1:size(x)) :: indices
  indices = grid%get_segment (x)
  if (grid%get_value (indices) < y) then

⟨*solver: tests*⟩≡

Chapter 7

Text handling

`WHIZARD` has to handle complex structures in input (and output) data. Doing this in a generic and transparent way requires a generic lexer and parser. The necessary modules are implemented here:

ifiles Implementation of line-oriented internal files in a more flexible way (linked lists of variable-length strings) than the Fortran builtin features.

lexers Read text and transform it into a token stream.

syntax_rules Define the rules for interpreting tokens, to be used by the WHIZARD parser.

parser Categorize tokens (keyword, string, number etc.) and use a set of syntax rules to transform the input into a parse tree.

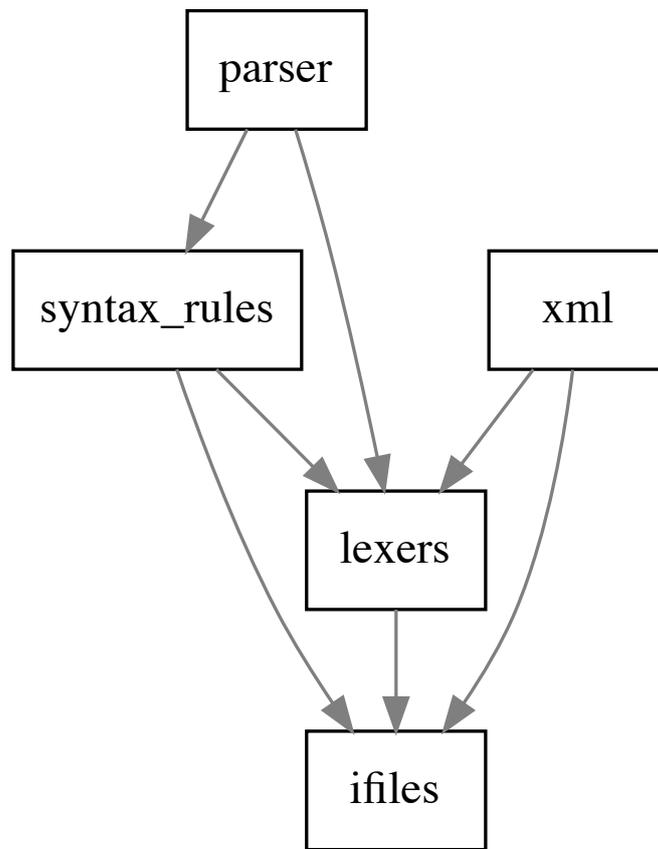
xml Read and parse XML text, separate from the WHIZARD parser.


Figure 7.1: Module dependencies in `src/parsing`.

7.1 Internal files

The internal files introduced here (`ifile`) are a replacement for the built-in internal files, which are fixed-size arrays of fixed-length character strings. The `ifile` type is a doubly-linked list of variable-length character strings with line numbers.

⟨`ifiles.f90`⟩≡
  ⟨*File header*⟩

  ```
module ifiles
```

  ⟨*Use strings*⟩
    ```
use io_units
use system_defs, only: EOF
```

  ⟨*Standard module head*⟩

  ⟨*Ifiles: public*⟩

  ⟨*Ifiles: types*⟩

  ⟨*Ifiles: interfaces*⟩

  ```
contains
```

  ⟨*Ifiles: subroutines*⟩

  ```
end module ifiles
```

7.1.1 The line type

The line entry type is for internal use, it is the list entry to be collected in an `ifile` object.

⟨*Ifiles: types*⟩≡
```
type :: line_entry_t
  private
  type(line_entry_t), pointer :: previous => null ()
  type(line_entry_t), pointer :: next => null ()
  type(string_t) :: string
  integer :: index
end type line_entry_t
```

Create a new list entry, given a varying string as input. The line number and pointers are not set, these make sense only within an `ifile`.

⟨*Ifiles: subroutines*⟩≡
```
subroutine line_entry_create (line, string)
  type(line_entry_t), pointer :: line
  type(string_t), intent(in) :: string
  allocate (line)
  line%string = string
end subroutine line_entry_create
```

Destroy a single list entry: Since the pointer components should not be deallocated explicitly, just deallocate the object itself.

⟨*Ifiles: subroutines*⟩+≡
```
subroutine line_entry_destroy (line)
  type(line_entry_t), pointer :: line
  deallocate (line)
end subroutine line_entry_destroy
```

7.1.2   The ifile type

The internal file is a linked list of line entries.

⟨*Ifiles: public*⟩≡
```
public :: ifile_t
```

⟨*Ifiles: types*⟩+≡
```
type :: ifile_t
  private
  type(line_entry_t), pointer :: first => null ()
  type(line_entry_t), pointer :: last => null ()
  integer :: n_lines = 0
 contains
 ⟨Ifiles: ifile: TBP⟩
end type ifile_t
```

We need no explicit initializer, but a routine which recursively deallocates the contents may be appropriate. After this, existing line pointers may become undefined, so they should be nullified before the file is destroyed.

⟨*Ifiles: public*⟩+≡
```
public :: ifile_clear
```

⟨*Ifiles: subroutines*⟩+≡
```
subroutine ifile_clear (ifile)
  class(ifile_t), intent(inout) :: ifile
  type(line_entry_t), pointer :: current
  do while (associated (ifile%first))
     current => ifile%first
     ifile%first => current%next
     call line_entry_destroy (current)
  end do
  nullify (ifile%last)
  ifile%n_lines = 0
end subroutine ifile_clear
```

The finalizer is just an alias for the above.

⟨*Ifiles: public*⟩+≡
```
public :: ifile_final
```

⟨*Ifiles: ifile: TBP*⟩≡
```
procedure :: final => ifile_clear
```

⟨*Ifiles: interfaces*⟩≡
```
interface ifile_final
   module procedure ifile_clear
end interface
```

7.1.3 I/O on ifiles

Fill an ifile from an ordinary external file, i.e., I/O unit. If the ifile is not empty, the old contents will be destroyed. We can read a fixed-length character string, an ISO varying string, an ordinary internal file (character-string array), or from an external unit. In the latter case, lines are appended until EOF is reached. Finally, there is a variant which reads from another ifile, effectively copying it.

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_read
```

⟨*Ifiles: interfaces*⟩+≡
```
    interface ifile_read
       module procedure ifile_read_from_string
       module procedure ifile_read_from_char
       module procedure ifile_read_from_unit
       module procedure ifile_read_from_char_array
       module procedure ifile_read_from_ifile
    end interface
```

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine ifile_read_from_string (ifile, string)
      type(ifile_t), intent(inout) :: ifile
      type(string_t), intent(in) :: string
      call ifile_clear (ifile)
      call ifile_append (ifile, string)
    end subroutine ifile_read_from_string

    subroutine ifile_read_from_char (ifile, char)
      type(ifile_t), intent(inout) :: ifile
      character(*), intent(in) :: char
      call ifile_clear (ifile)
      call ifile_append (ifile, char)
    end subroutine ifile_read_from_char

    subroutine ifile_read_from_char_array (ifile, char)
      type(ifile_t), intent(inout) :: ifile
      character(*), dimension(:), intent(in) :: char
      call ifile_clear (ifile)
      call ifile_append (ifile, char)
    end subroutine ifile_read_from_char_array

    subroutine ifile_read_from_unit (ifile, unit, iostat)
      type(ifile_t), intent(inout) :: ifile
      integer, intent(in) :: unit
      integer, intent(out), optional :: iostat
      call ifile_clear (ifile)
      call ifile_append (ifile, unit, iostat)
    end subroutine ifile_read_from_unit

    subroutine ifile_read_from_ifile (ifile, ifile_in)
      type(ifile_t), intent(inout) :: ifile
      type(ifile_t), intent(in) :: ifile_in
      call ifile_clear (ifile)
      call ifile_append (ifile, ifile_in)
    end subroutine ifile_read_from_ifile
```

Append to an ifile. The same as reading, but without resetting the ifile. In
addition, there is a routine for appending a whole ifile.

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_append
```

⟨*Ifiles: ifile: TBP*⟩+≡
```
    generic :: append => &
        ifile_append_from_char
    procedure, private :: ifile_append_from_char
```

⟨*Ifiles: interfaces*⟩+≡
```
    interface ifile_append
       module procedure ifile_append_from_string
       module procedure ifile_append_from_char
       module procedure ifile_append_from_unit
       module procedure ifile_append_from_char_array
       module procedure ifile_append_from_ifile
    end interface
```

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine ifile_append_from_string (ifile, string)
      class(ifile_t), intent(inout) :: ifile
      type(string_t), intent(in) :: string
      type(line_entry_t), pointer :: current
      call line_entry_create (current, string)
      current%index = ifile%n_lines + 1
      if (associated (ifile%last)) then
         current%previous => ifile%last
         ifile%last%next => current
      else
         ifile%first => current
      end if
      ifile%last => current
      ifile%n_lines = current%index
    end subroutine ifile_append_from_string

    subroutine ifile_append_from_char (ifile, char)
      class(ifile_t), intent(inout) :: ifile
      character(*), intent(in) :: char
      call ifile_append_from_string (ifile, var_str (trim (char)))
    end subroutine ifile_append_from_char

    subroutine ifile_append_from_char_array (ifile, char)
      class(ifile_t), intent(inout) :: ifile
      character(*), dimension(:), intent(in) :: char
      integer :: i
      do i = 1, size (char)
         call ifile_append_from_string (ifile, var_str (trim (char(i))))
      end do
    end subroutine ifile_append_from_char_array

    subroutine ifile_append_from_unit (ifile, unit, iostat)
      class(ifile_t), intent(inout) :: ifile
      integer, intent(in) :: unit
```

```
      integer, intent(out), optional :: iostat
      type(string_t) :: buffer
      integer :: ios
      ios = 0
      READ_LOOP: do
         call get (unit, buffer, iostat = ios)
         if (ios == EOF .or. ios > 0)  exit READ_LOOP
         call ifile_append_from_string (ifile, buffer)
      end do READ_LOOP
      if (present (iostat)) then
         iostat = ios
      else if (ios > 0) then
         call get (unit, buffer)  ! trigger error again
      end if
    end subroutine ifile_append_from_unit

    subroutine ifile_append_from_ifile (ifile, ifile_in)
      class(ifile_t), intent(inout) :: ifile
      type(ifile_t), intent(in) :: ifile_in
      type(line_entry_t), pointer :: current
      current => ifile_in%first
      do while (associated (current))
         call ifile_append_from_string (ifile, current%string)
         current => current%next
      end do
    end subroutine ifile_append_from_ifile
```

Write the ifile contents to an external unit

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_write
```

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine ifile_write (ifile, unit, iostat)
      type(ifile_t), intent(in) :: ifile
      integer, intent(in), optional :: unit
      integer, intent(out), optional :: iostat
      integer :: u
      type(line_entry_t), pointer :: current
      u = given_output_unit (unit);  if (u < 0)  return
      current => ifile%first
      do while (associated (current))
         call put_line (u, current%string, iostat)
         current => current%next
      end do
    end subroutine ifile_write
```

Convert the ifile to an array of strings, which is allocated by this function:

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_to_string_array
```

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine ifile_to_string_array (ifile, string)
      type(ifile_t), intent(in) :: ifile
      type(string_t), dimension(:), intent(inout), allocatable :: string
```

```
        type(line_entry_t), pointer :: current
        integer :: i
        allocate (string (ifile_get_length (ifile)))
        current => ifile%first
        do i = 1, ifile_get_length (ifile)
            string(i) = current%string
            current => current%next
        end do
    end subroutine ifile_to_string_array
```

7.1.4   Ifile tools

⟨*Ifiles: public*⟩+≡
```
    public :: ifile_get_length
```

⟨*Ifiles: subroutines*⟩+≡
```
    function ifile_get_length (ifile) result (length)
      integer :: length
      type(ifile_t), intent(in) :: ifile
      length = ifile%n_lines
    end function ifile_get_length
```

7.1.5   Line pointers

Instead of the implicit pointer used in ordinary file access, we define explicit
pointers, so there can be more than one at a time.

⟨*Ifiles: public*⟩+≡
```
    public :: line_p
```

⟨*Ifiles: types*⟩+≡
```
    type :: line_p
       private
       type(line_entry_t), pointer :: p => null ()
    end type line_p
```

Assign a file pointer to the first or last line in an ifile:

⟨*Ifiles: public*⟩+≡
```
    public :: line_init
```

⟨*Ifiles: subroutines*⟩+≡
```
    subroutine line_init (line, ifile, back)
      type(line_p), intent(inout) :: line
      type(ifile_t), intent(in) :: ifile
      logical, intent(in), optional :: back
      if (present (back)) then
         if (back) then
            line%p => ifile%last
         else
            line%p => ifile%first
         end if
      else
         line%p => ifile%first
```

```
        end if
     end subroutine line_init
```

Remove the pointer association:

⟨Ifiles: public⟩+≡
```
     public :: line_final
```

⟨Ifiles: subroutines⟩+≡
```
     subroutine line_final (line)
       type(line_p), intent(inout) :: line
       nullify (line%p)
     end subroutine line_final
```

Go one step forward

⟨Ifiles: public⟩+≡
```
     public :: line_advance
```

⟨Ifiles: subroutines⟩+≡
```
     subroutine line_advance (line)
       type(line_p), intent(inout) :: line
       if (associated (line%p))  line%p => line%p%next
     end subroutine line_advance
```

Go one step backward

⟨Ifiles: public⟩+≡
```
     public :: line_backspace
```

⟨Ifiles: subroutines⟩+≡
```
     subroutine line_backspace (line)
       type(line_p), intent(inout) :: line
       if (associated (line%p))  line%p => line%p%previous
     end subroutine line_backspace
```

Check whether we are accessing a valid line

⟨Ifiles: public⟩+≡
```
     public :: line_is_associated
```

⟨Ifiles: subroutines⟩+≡
```
     function line_is_associated (line) result (ok)
       logical :: ok
       type(line_p), intent(in) :: line
       ok = associated (line%p)
     end function line_is_associated
```

7.1.6   Access lines via pointers

We do not need the ifile as an argument to these functions, because the `line`
type will point to an existing ifile.

⟨Ifiles: public⟩+≡
```
     public :: line_get_string
```

⟨*Ifiles: subroutines*⟩+≡
```
    function line_get_string (line) result (string)
      type(string_t) :: string
      type(line_p), intent(in) :: line
      if (associated (line%p)) then
         string = line%p%string
      else
         string = ""
      end if
    end function line_get_string
```

Variant where the line pointer is advanced after reading.
⟨*Ifiles: public*⟩+≡
```
    public :: line_get_string_advance
```
⟨*Ifiles: subroutines*⟩+≡
```
    function line_get_string_advance (line) result (string)
      type(string_t) :: string
      type(line_p), intent(inout) :: line
      if (associated (line%p)) then
         string = line%p%string
         call line_advance (line)
      else
         string = ""
      end if
    end function line_get_string_advance
```

⟨*Ifiles: public*⟩+≡
```
    public :: line_get_index
```
⟨*Ifiles: subroutines*⟩+≡
```
    function line_get_index (line) result (index)
      integer :: index
      type(line_p), intent(in) :: line
      if (associated (line%p)) then
         index = line%p%index
      else
         index = 0
      end if
    end function line_get_index
```

⟨*Ifiles: public*⟩+≡
```
    public :: line_get_length
```
⟨*Ifiles: subroutines*⟩+≡
```
    function line_get_length (line) result (length)
      integer :: length
      type(line_p), intent(in) :: line
      if (associated (line%p)) then
         length = len (line%p%string)
      else
         length = 0
      end if
    end function line_get_length
```

7.2 Lexer

The lexer purpose is to read from a line-separated character input stream (usually a file) and properly chop the stream into lexemes (tokens). [The parser will transform lexemes into meaningful tokens, to be stored in a parse tree, therefore we do not use the term 'token' here.] The input is read line-by-line, but interpreted free-form, except for quotes and the comment syntax. (Fortran 2003 would allow us to use a stream type for reading.)

In an object-oriented approach, we can dynamically create and destroy lexers, including the lexer setup.

The main lexer function is to return a lexeme according to the basic lexer rules (quotes, comments, whitespace, special classes). There is also a routine to write back a lexeme to the input stream (but only once).

For the rules, we separate the possible characters into classes. Whitespace usually consists of blank, tab, and line-feed, where any number of consecutive whitespace is equivalent to one. Quoted strings are enclosed by a pair of quote characters, possibly multiline. Comments are similar to quotes, but interpreted as whitespace. Numbers are identified (not distinguishing real and integer) but not interpreted. Other character classes make up identifiers.

⟨`lexers.f90`⟩≡
  ⟨*File header*⟩

```
  module lexers
```

  ⟨*Use strings*⟩
```
    use io_units
    use string_utils
    use system_defs, only: EOF, EOR
    use system_defs, only: LF
    use system_defs, only: WHITESPACE_CHARS, LCLETTERS, UCLETTERS, DIGITS
    use diagnostics
    use ifiles, only: ifile_t
    use ifiles, only: line_p, line_is_associated, line_init, line_final
    use ifiles, only: line_get_string_advance
```

  ⟨*Lexer: interfaces*⟩

```
  contains
```

  ⟨*Lexer: procedures*⟩

```
  end module lexers
```

7.2.1 Input streams

For flexible input, we define a generic stream type that refers to either an external file, an external unit which is already open, a string, an `ifile` object (internal file, i.e., string list), or a line pointer to an `ifile` object. The stream type actually follows the idea of a formatted external file, which is line-oriented. Thus, the stream reader always returns a whole record (input line).

Note that only in the string version, the stream contents are stored inside the stream object. In the `ifile` version, the stream contains only the line pointer, while in the external-file case, the line pointer is implicitly created by the runtime library.

⟨*Lexer: public*⟩≡
```
public :: stream_t
```

⟨*Lexer: types*⟩≡
```
type :: stream_t
   type(string_t), pointer :: filename => null ()
   integer, pointer :: unit => null ()
   type(string_t), pointer :: string => null ()
   type(ifile_t), pointer :: ifile => null ()
   type(line_p), pointer :: line => null ()
   integer :: record = 0
   logical :: eof = .false.
 contains
 ⟨Lexer: stream: TBP⟩
 end type stream_t
```

The initializers refer to the specific version. The stream should be undefined before calling this.

⟨*Lexer: public*⟩+≡
```
public :: stream_init
```

⟨*Lexer: stream: TBP*⟩≡
```
generic :: init => &
     stream_init_filename, &
     stream_init_unit, &
     stream_init_string, &
     stream_init_ifile, &
     stream_init_line
procedure, private :: stream_init_filename
procedure, private :: stream_init_unit
procedure, private :: stream_init_string
procedure, private :: stream_init_ifile
procedure, private :: stream_init_line
```

⟨*Lexer: interfaces*⟩≡
```
interface stream_init
   module procedure stream_init_filename
   module procedure stream_init_unit
   module procedure stream_init_string
   module procedure stream_init_ifile
   module procedure stream_init_line
end interface
```

⟨*Lexer: procedures*⟩≡
```fortran
    subroutine stream_init_filename (stream, filename)
      class(stream_t), intent(out) :: stream
      character(*), intent(in) :: filename
      integer :: unit
      unit = free_unit ()
      open (unit=unit, file=filename, status="old", action="read")
      call stream_init_unit (stream, unit)
      allocate (stream%filename)
      stream%filename = filename
    end subroutine stream_init_filename

    subroutine stream_init_unit (stream, unit)
      class(stream_t), intent(out) :: stream
      integer, intent(in) :: unit
      allocate (stream%unit)
      stream%unit = unit
      stream%eof = .false.
    end subroutine stream_init_unit

    subroutine stream_init_string (stream, string)
      class(stream_t), intent(out) :: stream
      type(string_t), intent(in) :: string
      allocate (stream%string)
      stream%string = string
    end subroutine stream_init_string

    subroutine stream_init_ifile (stream, ifile)
      class(stream_t), intent(out) :: stream
      type(ifile_t), intent(in) :: ifile
      type(line_p) :: line
      call line_init (line, ifile)
      call stream_init_line (stream, line)
      allocate (stream%ifile)
      stream%ifile = ifile
    end subroutine stream_init_ifile

    subroutine stream_init_line (stream, line)
      class(stream_t), intent(out) :: stream
      type(line_p), intent(in) :: line
      allocate (stream%line)
      stream%line = line
    end subroutine stream_init_line
```

The finalizer restores the initial state. If an external file was opened, it is closed.

⟨*Lexer: public*⟩+≡
```fortran
    public :: stream_final
```

⟨*Lexer: stream: TBP*⟩+≡
```fortran
    procedure :: final => stream_final
```

⟨*Lexer: procedures*⟩+≡
```fortran
    subroutine stream_final (stream)
      class(stream_t), intent(inout) :: stream
      if (associated (stream%filename)) then
```

```
      close (stream%unit)
      deallocate (stream%unit)
      deallocate (stream%filename)
   else if (associated (stream%unit)) then
      deallocate (stream%unit)
   else if (associated (stream%string)) then
      deallocate (stream%string)
   else if (associated (stream%ifile)) then
      call line_final (stream%line)
      deallocate (stream%line)
      deallocate (stream%ifile)
   else if (associated (stream%line)) then
      call line_final (stream%line)
      deallocate (stream%line)
   end if
end subroutine stream_final
```

This returns the next record from the input stream. Depending on the stream type, the stream pointers are modified: Reading from external unit, the external file is advanced (implicitly). Reading from string, the string is replaced by an empty string. Reading from `ifile`, the line pointer is advanced. Note that the `iostat` argument is mandatory.

⟨*Lexer: public*⟩+≡
```
   public :: stream_get_record
```

⟨*Lexer: procedures*⟩+≡
```
   subroutine stream_get_record (stream, string, iostat)
     type(stream_t), intent(inout) :: stream
     type(string_t), intent(out) :: string
     integer, intent(out) :: iostat
     if (associated (stream%unit)) then
        if (stream%eof) then
           iostat = EOF
        else
           call get (stream%unit, string, iostat=iostat)
           if (iostat == EOR) then
              iostat = 0
              stream%record = stream%record + 1
           end if
           if (iostat == EOF) then
              iostat = 0
              stream%eof = .true.
              if (len (string) /= 0) stream%record = stream%record + 1
           end if
        end if
     else if (associated (stream%string)) then
        if (len (stream%string) /= 0) then
           string = stream%string
           stream%string = ""
           iostat = 0
           stream%record = stream%record + 1
        else
           string = ""
           iostat = EOF
```

217

```
            end if
        else if (associated (stream%line)) then
            if (line_is_associated (stream%line)) then
                string = line_get_string_advance (stream%line)
                iostat = 0
                stream%record = stream%record + 1
            else
                string = ""
                iostat = EOF
            end if
        else
            call msg_bug (" Attempt to read from uninitialized input stream")
        end if
    end subroutine stream_get_record
```

Return the current stream source as a message string.

⟨*Lexer: public*⟩+≡
```
    public :: stream_get_source_info_string
```

⟨*Lexer: procedures*⟩+≡
```
    function stream_get_source_info_string (stream) result (string)
      type(string_t) :: string
      type(stream_t), intent(in) :: stream
      character(20) :: buffer
      if (associated (stream%filename)) then
          string = "File '" // stream%filename // "' (unit = "
          write (buffer, "(I0)")  stream%unit
          string = string // trim (buffer) // ")"
      else if (associated (stream%unit)) then
          write (buffer, "(I0)")  stream%unit
          string = "Unit " // trim (buffer)
      else if (associated (stream%string)) then
          string = "Input string"
      else if (associated (stream%ifile) .or. associated (stream%line)) then
          string = "Internal file"
      else
          string = ""
      end if
    end function stream_get_source_info_string
```

Return the index of the record just read as a message string.

⟨*Lexer: public*⟩+≡
```
    public :: stream_get_record_info_string
```

⟨*Lexer: procedures*⟩+≡
```
    function stream_get_record_info_string (stream) result (string)
      type(string_t) :: string
      type(stream_t), intent(in) :: stream
      character(20) :: buffer
      string = stream_get_source_info_string (stream)
      if (string /= "")  string = string // ", "
      write (buffer, "(I0)")  stream%record
      string = string // "line " // trim (buffer)
    end function stream_get_record_info_string
```

7.2.2 Keyword list

The lexer should be capable of identifying a token as a known keyword. To this end, we store a list of keywords:

⟨*Lexer: public*⟩+≡
```
    public :: keyword_list_t
```

⟨*Lexer: types*⟩+≡
```
    type :: keyword_entry_t
      private
      type(string_t) :: string
      type(keyword_entry_t), pointer :: next => null ()
    end type keyword_entry_t

    type :: keyword_list_t
      private
      type(keyword_entry_t), pointer :: first => null ()
      type(keyword_entry_t), pointer :: last => null ()
    end type keyword_list_t
```

Add a new string to the keyword list, unless it is already there:

⟨*Lexer: public*⟩+≡
```
    public :: keyword_list_add
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine keyword_list_add (keylist, string)
      type(keyword_list_t), intent(inout) :: keylist
      type(string_t), intent(in) :: string
      type(keyword_entry_t), pointer :: k_entry_new
      if (.not. keyword_list_contains (keylist, string)) then
         allocate (k_entry_new)
         k_entry_new%string = string
         if (associated (keylist%first)) then
            keylist%last%next => k_entry_new
         else
            keylist%first => k_entry_new
         end if
         keylist%last => k_entry_new
      end if
    end subroutine keyword_list_add
```

Return true if a string is a keyword.

⟨*Lexer: public*⟩+≡
```
    public :: keyword_list_contains
```

⟨*Lexer: procedures*⟩+≡
```
    function keyword_list_contains (keylist, string) result (found)
      type(keyword_list_t), intent(in) :: keylist
      type(string_t), intent(in) :: string
      logical :: found
      found = .false.
```

```
      call check_rec (keylist%first)
    contains
      recursive subroutine check_rec (k_entry)
        type(keyword_entry_t), pointer :: k_entry
        if (associated (k_entry)) then
           if (k_entry%string /= string) then
              call check_rec (k_entry%next)
           else
              found = .true.
           end if
        end if
      end subroutine check_rec
    end function keyword_list_contains
```

Write the keyword list

⟨*Lexer: public*⟩+≡
```
    public :: keyword_list_write
```

⟨*Lexer: interfaces*⟩+≡
```
    interface keyword_list_write
       module procedure keyword_list_write_unit
    end interface
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine keyword_list_write_unit (keylist, unit)
      type(keyword_list_t), intent(in) :: keylist
      integer, intent(in) :: unit
      write (unit, "(A)") "Keyword list:"
      if (associated (keylist%first)) then
         call keyword_write_rec (keylist%first)
         write (unit, *)
      else
         write (unit, "(1x,A)") "[empty]"
      end if
    contains
      recursive subroutine keyword_write_rec (k_entry)
        type(keyword_entry_t), intent(in), pointer :: k_entry
        if (associated (k_entry)) then
           write (unit, "(1x,A)", advance="no")  char (k_entry%string)
           call keyword_write_rec (k_entry%next)
        end if
      end subroutine keyword_write_rec
    end subroutine keyword_list_write_unit
```

Clear the keyword list

⟨*Lexer: public*⟩+≡
```
    public :: keyword_list_final
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine keyword_list_final (keylist)
      type(keyword_list_t), intent(inout) :: keylist
      call keyword_destroy_rec (keylist%first)
      nullify (keylist%last)
    contains
```

```
      recursive subroutine keyword_destroy_rec (k_entry)
        type(keyword_entry_t), pointer :: k_entry
        if (associated (k_entry)) then
           call keyword_destroy_rec (k_entry%next)
           deallocate (k_entry)
        end if
      end subroutine keyword_destroy_rec
   end subroutine keyword_list_final
```

7.2.3   Lexeme templates

This type is handled like a rudimentary regular expression. It determines the
lexer behavior when matching a string. The actual objects made from this type
and the corresponding matching routines are listed below.

⟨*Lexer: types*⟩+≡
```
   type :: template_t
      private
      integer :: type
      character(256) :: charset1, charset2
      integer :: len1, len2
   end type template_t
```

These are the types that valid lexemes can have:

⟨*Lexer: public*⟩+≡
```
   public :: T_KEYWORD, T_IDENTIFIER, T_QUOTED, T_NUMERIC
```

⟨*Lexer: parameters*⟩≡
```
   integer, parameter :: T_KEYWORD = 1
   integer, parameter :: T_IDENTIFIER = 2, T_QUOTED = 3, T_NUMERIC = 4
```

These are special types:

⟨*Lexer: parameters*⟩+≡
```
   integer, parameter :: EMPTY = 0, WHITESPACE = 10
   integer, parameter :: NO_MATCH = 11, IO_ERROR = 12, OVERFLOW = 13
   integer, parameter :: UNMATCHED_QUOTE = 14
```

In addition, we have `EOF` which is a negative integer, normally -1. Printout for
debugging:

⟨*Lexer: procedures*⟩+≡
```
   subroutine lexeme_type_write (type, unit)
     integer, intent(in) :: type
     integer, intent(in) :: unit
     select case (type)
     case (EMPTY);        write(unit,"(A)",advance="no") " EMPTY      "
     case (WHITESPACE);   write(unit,"(A)",advance="no") " WHITESPACE "
     case (T_IDENTIFIER); write(unit,"(A)",advance="no") " IDENTIFIER "
     case (T_QUOTED);     write(unit,"(A)",advance="no") " QUOTED     "
     case (T_NUMERIC);    write(unit,"(A)",advance="no") " NUMERIC    "
     case (IO_ERROR);     write(unit,"(A)",advance="no") " IO_ERROR   "
     case (OVERFLOW);     write(unit,"(A)",advance="no") " OVERFLOW   "
     case (UNMATCHED_QUOTE);   write(unit,"(A)",advance="no") " UNMATCHEDQ "
     case (NO_MATCH);     write(unit,"(A)",advance="no") " NO_MATCH   "
     case (EOF);          write(unit,"(A)",advance="no") " EOF        "
```

```
      case default;        write(unit,"(A)",advance="no") " [illegal]  "
      end select
    end subroutine lexeme_type_write

    subroutine template_write (tt, unit)
      type(template_t), intent(in) :: tt
      integer, intent(in) :: unit
      call lexeme_type_write (tt%type, unit)
      write (unit, "(A)", advance="no") "'" // tt%charset1(1:tt%len1) // "'"
      write (unit, "(A)", advance="no") " '" // tt%charset2(1:tt%len2) // "'"
    end subroutine template_write
```

The matching functions all return the number of matched characters in the
provided string. If this number is zero, the match has failed.

The `template` functions are declared `pure` because they appear in `forall`
loops below.

A template for whitespace:

⟨*Lexer: procedures*⟩+≡
```
    pure function template_whitespace (chars) result (tt)
      character(*), intent(in) :: chars
      type(template_t) :: tt
      tt = template_t (WHITESPACE, chars, "", len (chars), 0)
    end function template_whitespace
```

Just match the string against the character set.

⟨*Lexer: procedures*⟩+≡
```
    subroutine match_whitespace (tt, s, n)
      type(template_t), intent(in) :: tt
      character(*), intent(in) :: s
      integer, intent(out) :: n
      n = verify (s, tt%charset1(1:tt%len1)) - 1
      if (n < 0)  n = len (s)
    end subroutine match_whitespace
```

A template for normal identifiers. To match, a lexeme should have a first char-
acter in class `chars1` and an arbitrary number of further characters in class
`chars2`. If the latter is empty, we are looking for a single-character lexeme.

⟨*Lexer: procedures*⟩+≡
```
    pure function template_identifier (chars1, chars2) result (tt)
      character(*), intent(in) :: chars1, chars2
      type(template_t) :: tt
      tt = template_t (T_IDENTIFIER, chars1, chars2, len(chars1), len(chars2))
    end function template_identifier
```

Here, the first letter must match, the others may or may not.

⟨*Lexer: procedures*⟩+≡
```
    subroutine match_identifier (tt, s, n)
      type(template_t), intent(in) :: tt
      character(*), intent(in) :: s
      integer, intent(out) :: n
      if (verify (s(1:1), tt%charset1(1:tt%len1)) == 0) then
```

```
        n = verify (s(2:), tt%charset2(1:tt%len2))
        if (n == 0)  n = len (s)
   else
        n = 0
   end if
end subroutine match_identifier
```

A template for quoted strings. The same template applies for comments. The
first character set indicates the left quote (could be a sequence of several char-
acters), the second one the matching right quote.

⟨*Lexer: procedures*⟩+≡
```
pure function template_quoted (chars1, chars2) result (tt)
   character(*), intent(in) :: chars1, chars2
   type(template_t) :: tt
   tt = template_t (T_QUOTED, chars1, chars2, len (chars1), len (chars2))
end function template_quoted
```

Here, the beginning of the string must exactly match the first character set,
then we look for the second one. If found, return. If there is a first quote but
no second one, return a negative number, indicating this error condition.

⟨*Lexer: procedures*⟩+≡
```
subroutine match_quoted (tt, s, n, range)
   type(template_t), intent(in) :: tt
   character(*), intent(in) :: s
   integer, intent(out) :: n
   integer, dimension(2), intent(out) :: range
   character(tt%len1) :: ch1
   character(tt%len2) :: ch2
   integer :: i
   ch1 = tt%charset1
   if (s(1:tt%len1) == ch1) then
      ch2 = tt%charset2
      do i = tt%len1 + 1, len (s) - tt%len2 + 1
         if (s(i:i+tt%len2-1) == ch2) then
            n = i + tt%len2 - 1
            range(1) = tt%len1 + 1
            range(2) = i - 1
            return
         end if
      end do
      n = -1
      range = 0
   else
      n = 0
      range = 0
   end if
end subroutine match_quoted
```

A template for real numbers. The first character set is the set of allowed expo-
nent letters. In accordance with the other functions we return the lexeme as a
string but do not read it.

⟨*Lexer: procedures*⟩+≡

```
     pure function template_numeric (chars) result (tt)
       character(*), intent(in) :: chars
       type(template_t) :: tt
       tt = template_t (T_NUMERIC, chars, "", len (chars), 0)
     end function template_numeric
```

A numeric lexeme may be real or integer. We purposely do not allow for a preceding sign. If the number is followed by an exponent, this is included, otherwise the rest is ignored.

There is a possible pitfall with this behavior: while the string `1e3` will be interpreted as a single number, the analogous string `1a3` will be split into the number 1 and an identifier `a3`. There is no easy way around such an ambiguity. We should make sure that the syntax does not contain identifiers like `a3` or `e3`.

⟨*Lexer: procedures*⟩+≡

```
   subroutine match_numeric (tt, s, n)
     type(template_t), intent(in) :: tt
     character(*), intent(in) :: s
     integer, intent(out) :: n
     integer :: i, n0
     character(10), parameter :: digits = "0123456789"
     character(2), parameter :: signs = "-+"
     n = verify (s, digits) - 1
     if (n < 0) then
        n = 0
        return
     else if (s(n+1:n+1) == ".") then
        i = verify (s(n+2:), digits) - 1
        if (i < 0) then
           n = len (s)
           return
        else if (i > 0 .or. n > 0) then
           n = n + 1 + i
        end if
     end if
     n0 = n
     if (n > 0) then
        if (verify (s(n+1:n+1), tt%charset1(1:tt%len1)) == 0) then
           n = n + 1
           if (verify (s(n+1:n+1), signs) == 0)  n = n + 1
           i = verify (s(n+1:), digits) - 1
           if (i < 0) then
              n = len (s)
           else if (i == 0) then
              n = n0
           else
              n = n + i
           end if
        end if
     end if
   end subroutine match_numeric
```

The generic matching routine. With Fortran 2003 we would define separate types and use a SELECT TYPE instead.

⟨Lexer: procedures⟩+≡

```
subroutine match_template (tt, s, n, range)
  type(template_t), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  integer, dimension(2), intent(out) :: range
  select case (tt%type)
  case (WHITESPACE)
     call match_whitespace (tt, s, n)
     range = 0
  case (T_IDENTIFIER)
     call match_identifier (tt, s, n)
     range(1) = 1
     range(2) = len_trim (s)
  case (T_QUOTED)
     call match_quoted (tt, s, n, range)
  case (T_NUMERIC)
     call match_numeric (tt, s, n)
     range(1) = 1
     range(2) = len_trim (s)
  case default
     call msg_bug ("Invalid lexeme template encountered")
  end select
end subroutine match_template
```

Match against an array of templates. Return the index of the first template that matches together with the number of characters matched and the range of the relevant substring. If all fails, these numbers are zero.

⟨Lexer: procedures⟩+≡

```
subroutine match (tt, s, n, range, ii)
  type(template_t), dimension(:), intent(in) :: tt
  character(*), intent(in) :: s
  integer, intent(out) :: n
  integer, dimension(2), intent(out) :: range
  integer, intent(out) :: ii
  integer :: i
  do i = 1, size (tt)
     call match_template (tt(i), s, n, range)
     if (n /= 0) then
        ii = i
        return
     end if
  end do
  n = 0
  ii = 0
end subroutine match
```

7.2.4 The lexer setup

This object contains information about character classes. As said above, one class consists of quoting chars (matching left and right), another one of comment chars (similar), a class of whitespace, and several classes of characters

that make up identifiers. When creating the lexer setup, the character classes are transformed into lexeme templates which are to be matched in a certain predefined order against the input stream.

BLANK should always be taken as whitespace, some things may depend on this. TAB is also fixed by convention, but may in principle be modified. Newline (DOS!) and linefeed are also defined as whitespace. The lexer setup, containing the list of lexeme templates. No defaults yet. The type with index zero will be assigned to the NO␣MATCH lexeme.

The keyword list is not stored, just a pointer to it. We anticipate that the keyword list is part of the syntax table, and the lexer needs not alter it. Furthermore, the lexer is typically finished before the syntax table is.

⟨*Lexer: parameters*⟩+≡

```
    integer, parameter :: CASE_KEEP = 0, CASE_UP = 1, CASE_DOWN = 2
```

⟨*Lexer: types*⟩+≡

```
    type :: lexer_setup_t
       private
       type(template_t), dimension(:), allocatable :: tt
       integer, dimension(:), allocatable :: type
       integer :: keyword_case = CASE_KEEP
       type(keyword_list_t), pointer :: keyword_list => null ()
    end type lexer_setup_t
```

Fill the lexer setup object. Some things are hardcoded here (whitespace, alphanumeric identifiers), some are free: comment chars (but these must be single, and comments must be terminated by line-feed), quote chars and matches (must be single), characters to be read as one-character lexeme, special classes (characters of one class that should be glued together as identifiers).

⟨*Lexer: procedures*⟩+≡

```
    subroutine lexer_setup_init (setup, &
         comment_chars, quote_chars, quote_match, &
         single_chars, special_class, &
         keyword_list, upper_case_keywords)
      type(lexer_setup_t), intent(inout) :: setup
      character(*), intent(in) :: comment_chars
      character(*), intent(in) :: quote_chars, quote_match
      character(*), intent(in) :: single_chars
      character(*), dimension(:), intent(in) :: special_class
      type(keyword_list_t), pointer :: keyword_list
      logical, intent(in), optional :: upper_case_keywords
      integer :: n, i
      if (present (upper_case_keywords)) then
         if (upper_case_keywords) then
            setup%keyword_case = CASE_UP
         else
            setup%keyword_case = CASE_DOWN
         end if
      else
         setup%keyword_case = CASE_KEEP
      end if
      n = 1 + len (comment_chars) + len (quote_chars) + 1 &
```

```
            + len (single_chars) + size (special_class) + 1
    allocate (setup%tt(n))
    allocate (setup%type(0:n))
    n = 0
    setup%type(n) = NO_MATCH
    n = n + 1
    setup%tt(n) = template_whitespace (WHITESPACE_CHARS)
    setup%type(n) = EMPTY
    forall (i = 1:len(comment_chars))
       setup%tt(n+i) = template_quoted (comment_chars(i:i), LF)
       setup%type(n+i) = EMPTY
    end forall
    n = n + len (comment_chars)
    forall (i = 1:len(quote_chars))
       setup%tt(n+i) = template_quoted (quote_chars(i:i), quote_match(i:i))
       setup%type(n+i) = T_QUOTED
    end forall
    n = n + len (quote_chars)
    setup%tt(n+1) = template_numeric ("EeDd")
    setup%type(n+1) = T_NUMERIC
    n = n + 1
    forall (i = 1:len (single_chars))
       setup%tt(n+i) = template_identifier (single_chars(i:i), "")
       setup%type(n+i) = T_IDENTIFIER
    end forall
    n = n + len (single_chars)
    forall (i = 1:size (special_class))
       setup%tt(n+i) = template_identifier &
            (trim (special_class(i)), trim (special_class(i)))
       setup%type(n+i) = T_IDENTIFIER
    end forall
    n = n + size (special_class)
    setup%tt(n+1) = template_identifier &
         (LCLETTERS//UCLETTERS, LCLETTERS//DIGITS//"_"//UCLETTERS)
    setup%type(n+1) = T_IDENTIFIER
    n = n + 1
    if (n /= size (setup%tt)) &
         call msg_bug ("Size mismatch in lexer setup")
    setup%keyword_list => keyword_list
  end subroutine lexer_setup_init
```

The destructor is needed only if the object is not itself part of an allocatable array

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_setup_final (setup)
      type(lexer_setup_t), intent(inout) :: setup
      deallocate (setup%tt, setup%type)
      setup%keyword_list => null ()
    end subroutine lexer_setup_final
```

For debugging: Write the lexer setup

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_setup_write (setup, unit)
```

```
    type(lexer_setup_t), intent(in) :: setup
    integer, intent(in) :: unit
    integer :: i
    write (unit, "(A)") "Lexer setup:"
    if (allocated (setup%tt)) then
       do i = 1, size (setup%tt)
          call template_write (setup%tt(i), unit)
          write (unit, '(A)', advance = "no")  " -> "
          call lexeme_type_write (setup%type(i), unit)
          write (unit, *)
       end do
    else
       write (unit, *) "[empty]"
    end if
    if (associated (setup%keyword_list)) then
       call keyword_list_write (setup%keyword_list, unit)
    end if
  end subroutine lexer_setup_write
```

7.2.5 The lexeme type

An object of this type is returned by the lexer. Apart from the lexeme string,
it gives information about the relevant substring (first and last character index)
and the lexeme type. Interpreting the string is up to the parser.

⟨*Lexer: public*⟩+≡
```
    public :: lexeme_t
```

⟨*Lexer: types*⟩+≡
```
    type :: lexeme_t
       private
       integer :: type = EMPTY
       type(string_t) :: s
       integer :: b = 0, e = 0
    end type lexeme_t
```

Debugging aid:

⟨*Lexer: public*⟩+≡
```
    public :: lexeme_write
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexeme_write (t, unit)
      type(lexeme_t), intent(in) :: t
      integer, intent(in) :: unit
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      select case (t%type)
      case (T_KEYWORD)
         write (u, *) "KEYWORD:    '" // char (t%s) // "'"
      case (T_IDENTIFIER)
         write (u, *) "IDENTIFIER: '" // char (t%s) // "'"
      case (T_QUOTED)
         write (u, *) "QUOTED:     '" // char (t%s) // "'"
      case (T_NUMERIC)
```

228

```
         write (u, *) "NUMERIC:     '" // char (t%s) // "'"
      case (UNMATCHED_QUOTE)
         write (u, *) "Unmatched quote: "// char (t%s)
      case (OVERFLOW); write (u, *) "Overflow: "// char (t%s)
      case (EMPTY);    write (u, *) "Empty lexeme"
      case (NO_MATCH); write (u, *) "No match"
      case (IO_ERROR); write (u, *) "IO error"
      case (EOF);      write (u, *) "EOF"
      case default
         write (u, *) "Error"
      end select
   end subroutine lexeme_write
```

Store string and type in a lexeme. The range determines the beginning and end
of the relevant part of the string. Check for a keyword.

⟨*Lexer: procedures*⟩+≡

```
   subroutine lexeme_set (t, keyword_list, s, range, type, keyword_case)
      type(lexeme_t), intent(out) :: t
      type(keyword_list_t), pointer :: keyword_list
      type(string_t), intent(in) :: s
      type(string_t) :: keyword
      integer, dimension(2), intent(in) :: range
      integer, intent(in) :: type
      integer, intent(in), optional :: keyword_case
      t%type = type
      if (present (keyword_case)) then
         select case (keyword_case)
         case (CASE_KEEP);   keyword = s
         case (CASE_UP);     keyword = upper_case (s)
         case (CASE_DOWN);   keyword = lower_case (s)
         end select
      else
         keyword = s
      end if
      if (type == T_IDENTIFIER) then
         if (associated (keyword_list)) then
            if (keyword_list_contains (keyword_list, keyword)) &
                t%type = T_KEYWORD
         end if
      end if
      select case (t%type)
      case (T_KEYWORD); t%s = keyword
      case default;     t%s = s
      end select
      t%b = range(1)
      t%e = range(2)
   end subroutine lexeme_set

   subroutine lexeme_clear (t)
     type(lexeme_t), intent(out) :: t
     t%type = EMPTY
     t%s = ""
   end subroutine lexeme_clear
```

Retrieve the lexeme string, the relevant part of it, and the type. The last function returns true if there is a break condition reached (error or EOF).

⟨*Lexer: public*⟩+≡

```
public :: lexeme_get_string
public :: lexeme_get_contents
public :: lexeme_get_delimiters
public :: lexeme_get_type
```

⟨*Lexer: procedures*⟩+≡

```
function lexeme_get_string (t) result (s)
  type(string_t) :: s
  type(lexeme_t), intent(in) :: t
  s = t%s
end function lexeme_get_string

function lexeme_get_contents (t) result (s)
  type(string_t) :: s
  type(lexeme_t), intent(in) :: t
  s = extract (t%s, t%b, t%e)
end function lexeme_get_contents

function lexeme_get_delimiters (t) result (del)
  type(string_t), dimension(2) :: del
  type(lexeme_t), intent(in) :: t
  del(1) = extract (t%s, finish = t%b-1)
  del(2) = extract (t%s, start = t%e+1)
end function lexeme_get_delimiters

function lexeme_get_type (t) result (type)
  integer :: type
  type(lexeme_t), intent(in) :: t
  type = t%type
end function lexeme_get_type
```

Check for a generic break condition (error/eof) and for eof in particular.

⟨*Lexer: public*⟩+≡

```
public :: lexeme_is_break
public :: lexeme_is_eof
```

⟨*Lexer: procedures*⟩+≡

```
function lexeme_is_break (t) result (break)
  logical :: break
  type(lexeme_t), intent(in) :: t
  select case (t%type)
  case (EOF, IO_ERROR, OVERFLOW, NO_MATCH)
     break = .true.
  case default
     break = .false.
  end select
end function lexeme_is_break

function lexeme_is_eof (t) result (ok)
  logical :: ok
```

230

```
      type(lexeme_t), intent(in) :: t
      ok = t%type == EOF
    end function lexeme_is_eof
```

7.2.6 The lexer object

We store the current lexeme and the current line. The line buffer is set each time a new line is read from file. The working buffer has one character more, to hold any trailing blank. Pointers to line and column are for debugging, they will be used to make up readable error messages for the parser.

⟨*Lexer: public*⟩+≡
```
    public :: lexer_t
```

⟨*Lexer: types*⟩+≡
```
    type :: lexer_t
       private
       type(lexer_setup_t) :: setup
       type(stream_t), pointer :: stream => null ()
       type(lexeme_t) :: lexeme
       type(string_t) :: previous_line2
       type(string_t) :: previous_line1
       type(string_t) :: current_line
       integer :: lines_read = 0
       integer :: current_column = 0
       integer :: previous_column = 0
       type(string_t) :: buffer
       type(lexer_t), pointer :: parent => null ()
     contains
     ⟨Lexer: lexer: TBP⟩
    end type lexer_t
```

Create-setup wrapper

⟨*Lexer: public*⟩+≡
```
    public :: lexer_init
```

⟨*Lexer: lexer: TBP*⟩≡
```
    procedure :: init => lexer_init
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_init (lexer, &
         comment_chars, quote_chars, quote_match, &
         single_chars, special_class, &
         keyword_list, upper_case_keywords, &
         parent)
      class(lexer_t), intent(inout) :: lexer
      character(*), intent(in) :: comment_chars
      character(*), intent(in) :: quote_chars, quote_match
      character(*), intent(in) :: single_chars
      character(*), dimension(:), intent(in) :: special_class
      type(keyword_list_t), pointer :: keyword_list
      logical, intent(in), optional :: upper_case_keywords
      type(lexer_t), target, intent(in), optional :: parent
      call lexer_setup_init (lexer%setup, &
           comment_chars = comment_chars, &
```

```
               quote_chars = quote_chars, &
               quote_match = quote_match, &
               single_chars = single_chars, &
               special_class = special_class, &
               keyword_list = keyword_list, &
               upper_case_keywords = upper_case_keywords)
         if (present (parent))  lexer%parent => parent
         call lexer_clear (lexer)
      end subroutine lexer_init
```

Clear the lexer state, but not the setup. This should be done when the lexing
starts, but it is not known whether the lexer was used before.

⟨*Lexer: public*⟩+≡
```
      public :: lexer_clear
```

⟨*Lexer: lexer: TBP*⟩+≡
```
      procedure :: clear => lexer_clear
```

⟨*Lexer: procedures*⟩+≡
```
      subroutine lexer_clear (lexer)
        class(lexer_t), intent(inout) :: lexer
        call lexeme_clear (lexer%lexeme)
        lexer%previous_line2 = ""
        lexer%previous_line1 = ""
        lexer%current_line = ""
        lexer%lines_read = 0
        lexer%current_column = 0
        lexer%previous_column = 0
        lexer%buffer = ""
      end subroutine lexer_clear
```

Reset lexer state and delete setup

⟨*Lexer: public*⟩+≡
```
      public :: lexer_final
```

⟨*Lexer: lexer: TBP*⟩+≡
```
      procedure :: final => lexer_final
```

⟨*Lexer: procedures*⟩+≡
```
      subroutine lexer_final (lexer)
        class(lexer_t), intent(inout) :: lexer
        call lexer%clear ()
        call lexer_setup_final (lexer%setup)
      end subroutine lexer_final
```

7.2.7   The lexer routine

For lexing we need to associate an input stream to the lexer.

⟨*Lexer: public*⟩+≡
```
      public :: lexer_assign_stream
```

⟨*Lexer: lexer: TBP*⟩+≡
```
      procedure :: assign_stream => lexer_assign_stream
```

⟨*Lexer: procedures*⟩+≡

```
    subroutine lexer_assign_stream (lexer, stream)
      class(lexer_t), intent(inout) :: lexer
      type(stream_t), intent(in), target :: stream
      lexer%stream => stream
    end subroutine lexer_assign_stream
```

The lexer. The lexer function takes the lexer and returns the currently stored lexeme. If there is none, it is read from buffer, matching against the lexeme templates in the lexer setup. Empty lexemes, i.e., comments and whitespace, are discarded and the buffer is read again until we have found a nonempty lexeme (which may also be EOF or an error condition).

The initial state of the lexer contains an empty lexeme, so reading from buffer is forced. The empty state is restored after returning the lexeme. A nonempty lexeme is present in the lexer only if `lex_back` has been executed before.

The workspace is the `lexer%buffer`, treated as a sort of input stream. We chop off lexemes from the beginning, adjusting the buffer to the left. Whenever the buffer is empty, or we are matching against an open quote which has not terminated, we read a new line and append it to the right. This may result in special conditions, which for simplicity are also returned as lexemes: I/O error, buffer overflow, end of file. If the latter happens during reading a quoted string, we return an unmatched-quote lexeme. Obviously, the special-condition lexemes have to be caught by the parser.

Note that reading further lines is only necessary when reading a quoted string. Otherwise, the line-feed that ends each line is interpreted as whitespace which terminates a preceding lexeme, so there are no other valid multiline lexemes.

To enable meaningful error messages, we also keep track of the line number of the last line read, and the beginning and the end of the current lexeme with respect to this line.

The lexer is implemented as a function that returns the next lexeme (i.e., token). It uses the `lexer` setup and modifies the buffers and pointers stored within the lexer, a side effect. The lexer reads from an input stream object, which also is modified by this reading, e.g., a line pointer is advanced.

⟨*Lexer: public*⟩+≡

```
    public :: lex
```

⟨*Lexer: procedures*⟩+≡

```
    subroutine lex (lexeme, lexer)
      type(lexeme_t), intent(out) :: lexeme
      type(lexer_t), intent(inout) :: lexer
      integer :: iostat1, iostat2
      integer :: pos
      integer, dimension(2) :: range
      integer :: template_index, type
      if (.not. associated (lexer%stream)) &
          call msg_bug ("Lexer called without assigned stream")
      GET_LEXEME: do while (lexeme_get_type (lexer%lexeme) == EMPTY)
        if (len (lexer%buffer) /= 0) then
            iostat1 = 0
```

```
         else
            call lexer_read_line (lexer, iostat1)
         end if
         select case (iostat1)
         case (0)
            MATCH_BUFFER: do
               call match (lexer%setup%tt, char (lexer%buffer), &
                           pos, range, template_index)
               if (pos >= 0) then
                  type = lexer%setup%type(template_index)
                  exit MATCH_BUFFER
               else
                  pos = 0
                  call lexer_read_line (lexer, iostat2)
                  select case (iostat2)
                  case (EOF); type = UNMATCHED_QUOTE; exit MATCH_BUFFER
                  case (1);   type = IO_ERROR;         exit MATCH_BUFFER
                  case (2);   type = OVERFLOW;         exit MATCH_BUFFER
                  end select
               end if
            end do MATCH_BUFFER
         case (EOF); type = EOF
         case (1);   type = IO_ERROR
         case (2);   type = OVERFLOW
         end select
         call lexeme_set (lexer%lexeme, lexer%setup%keyword_list, &
               extract (lexer%buffer, finish=pos), range, type, &
               lexer%setup%keyword_case)
         lexer%buffer = remove (lexer%buffer, finish=pos)
         lexer%previous_column = lexer%current_column
         lexer%current_column = lexer%current_column + pos
      end do GET_LEXEME
      lexeme = lexer%lexeme
      call lexeme_clear (lexer%lexeme)
   end subroutine lex
```

Read a line and append it to the input buffer. If the input buffer overflows, return `iostat=2`. Otherwise, `iostat=1` indicates an I/O error, and `iostat=-1` the EOF.

The input stream may either be an external unit or a `ifile` object. In the latter case, a line is read and the line pointer is advanced.

Note that inserting `LF` between input lines is the Unix convention. Since we are doing this explicitly when gluing lines together, we can pattern-match against `LF` without having to worry about the system.

⟨*Lexer: procedures*⟩+≡
```
   subroutine lexer_read_line (lexer, iostat)
     type(lexer_t), intent(inout) :: lexer
     integer, intent(out) :: iostat
     type(string_t) :: current_line
     current_line = lexer%current_line
     call stream_get_record (lexer%stream, lexer%current_line, iostat)
     if (iostat == 0) then
        lexer%lines_read = lexer%lines_read + 1
```

```
        lexer%previous_line2 = lexer%previous_line1
        lexer%previous_line1 = current_line
        lexer%buffer = lexer%buffer // lexer%current_line // LF
        lexer%previous_column = 0
        lexer%current_column = 0
      end if
    end subroutine lexer_read_line
```

Once in a while we have read one lexeme to many, which can be pushed back into the input stream. Do not do this more than once.

⟨*Lexer: public*⟩+≡
```
    public :: lexer_put_back
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_put_back (lexer, lexeme)
      type(lexer_t), intent(inout) :: lexer
      type(lexeme_t), intent(in) :: lexeme
      if (lexeme_get_type (lexer%lexeme) == EMPTY) then
         lexer%lexeme = lexeme
      else
         call msg_bug (" Lexer: lex_back fails; probably called twice")
      end if
    end subroutine lexer_put_back
```

7.2.8   Diagnostics

For debugging: print just the setup

⟨*Lexer: public*⟩+≡
```
    public :: lexer_write_setup
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_write_setup (lexer, unit)
      type(lexer_t), intent(in) :: lexer
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      call lexer_setup_write (lexer%setup, u)
    end subroutine lexer_write_setup
```

This is useful for error printing: show the current line with index and a pointer to the current column within the line.

⟨*Lexer: public*⟩+≡
```
    public :: lexer_show_location
```

⟨*Lexer: procedures*⟩+≡
```
    subroutine lexer_show_location (lexer)
      type(lexer_t), intent(in) :: lexer
      type(string_t) :: loc_str
      if (associated (lexer%parent)) then
         call lexer_show_source (lexer%parent)
         call msg_message ("[includes]")
      else
```

```
              call msg_message ()
           end if
           if (associated (lexer%stream)) then
              call msg_message &
                   (char (stream_get_record_info_string (lexer%stream)) // ":")
           end if
           if (lexer%lines_read >= 4)  call msg_result ("[...]")
           if (lexer%lines_read >= 3)  call msg_result (char (lexer%previous_line2))
           if (lexer%lines_read >= 2)  call msg_result (char (lexer%previous_line1))
           if (lexer%lines_read >= 1) then
              call msg_result (char (lexer%current_line))
              loc_str = repeat (" ", lexer%previous_column)
              loc_str = loc_str // "^"
              if (lexer%current_column > lexer%previous_column) then
                 loc_str = loc_str &
                       // repeat ("-", max (lexer%current_column &
                                              - lexer%previous_column - 1, 0)) &
                       // "^"
              end if
              call msg_result (char (loc_str))
           end if
         end subroutine lexer_show_location
```

This just prints the current stream source.

⟨*Lexer: procedures*⟩+≡
```
         recursive subroutine lexer_show_source (lexer)
           type(lexer_t), intent(in) :: lexer
           if (associated (lexer%parent)) then
              call lexer_show_source (lexer%parent)
              call msg_message ("[includes]")
           else
              call msg_message ()
           end if
           if (associated (lexer%stream)) then
              call msg_message &
                   (char (stream_get_source_info_string (lexer%stream)) // ":")
           end if
         end subroutine lexer_show_source
```

7.2.9   Unit tests

Test module, followed by the corresponding implementation module.

  ⟨*Syntax: types*⟩

  ⟨*Syntax: interfaces*⟩

```
contains
```

  ⟨*Syntax: subroutines*⟩

```
end module syntax_rules
```

7.3.1   Syntax rules

Syntax rules are used by the parser. They determine how to translate the stream of lexemes as returned by the lexer into the parse tree node. A rule may be terminal, i.e., replace a matching lexeme into a terminal node. The node will contain the lexeme interpreted as a recognized token:

- a keyword: unquoted fixed character string;

- a real number, to be determined at runtime;

- an integer, to be determined at runtime;

- a boolean value, to be determined at runtime;

- a quoted token (e.g., string), to be determined at runtime;

- an identifier (unquoted string that is not a recognized keyword), to be determined at runtime.

It may be nonterminal, i.e., contain a sequence of child rules. These are matched consecutively (and recursively) against the input stream; the resulting node will be a branch node.

- the file, i.e., the input stream as a whole;

- a sequence of syntax elements, where the last syntax element may be optional, or optional repetitive;

Sequences carry a flag that tells whether the last child is optional or may be repeated an arbitrary number of times, correponding to the regexp modifiers `?`, `*`, and `+`.

We also need an alternative rule; this will be replaced by the node generated by one of its children that matches; thus, it does not create a node of its own.

- an alternative of syntax elements.

We also define special types of sequences as convenience macros:

- a list: a sequence where the elements are separated by a separator keyword (e.g., commas), the separators are thrown away when parsing the list;

- a group: a sequence of three tokens, where the first and third ones are left and right delimiters, the delimiters are thrown away;

- an argument list: a delimited list, containing both delimiters and separators.

It would be great to have a polymorphic type for this purpose, but until Fortran 2003 is out we have to emulate this.

Here are the syntax element codes:

⟨*Syntax: public*⟩≡

```
public :: S_UNKNOWN
public :: S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, S_QUOTED
public :: S_IDENTIFIER, S_KEYWORD
public :: S_SEQUENCE, S_LIST, S_GROUP, S_ARGS
public :: S_ALTERNATIVE
public :: S_IGNORE
```

⟨*Syntax: parameters*⟩≡

```
integer, parameter :: &
     S_UNKNOWN = 0, &
     S_LOGICAL = 1, S_INTEGER = 2, S_REAL = 3, S_COMPLEX = 4, &
     S_QUOTED = 5, S_IDENTIFIER = 6, S_KEYWORD = 7, &
     S_SEQUENCE = 8, S_LIST = 9, S_GROUP = 10, S_ARGS = 11, &
     S_ALTERNATIVE = 12, &
     S_IGNORE = 99
```

We need arrays of rule pointers, therefore this construct.

⟨*Syntax: types*⟩≡

```
type :: rule_p
   private
   type(syntax_rule_t), pointer :: p => null ()
end type rule_p
```

Return the association status of the rule pointer:

⟨Syntax: subroutines⟩≡
```
    elemental function rule_is_associated (rp) result (ok)
      logical :: ok
      type (rule_p), intent(in) :: rp
      ok = associated (rp%p)
    end function rule_is_associated
```

The rule type is one of the types listed above, represented by an integer code. The keyword, for a non-keyword rule, is an identifier used for the printed syntax table. The array of children is needed for nonterminal rules. In that case, there is a modifier for the last element (blank, "?", "*", or "+"), mirrored in the flags `opt` and `rep`. Then, we have the character constants used as separators and delimiters for this rule. Finally, the `used` flag can be set to indicate that this rule is the child of another rule.

Note: we separate `delimiter_left` and `delimiter_right` because the previous fixed dimension(2) array triggered an ICE in gfortran-4.9.2.

⟨Syntax: types⟩+≡
```
    public :: syntax_rule_t
```

⟨Syntax: types⟩+≡
```
    type :: syntax_rule_t
      private
      integer :: type = S_UNKNOWN
      logical :: used = .false.
      type(string_t) :: keyword
      type(string_t) :: separator
      type(string_t) :: delimiter_left, delimiter_right
      type(rule_p), dimension(:), allocatable :: child
      character(1) :: modifier = ""
      logical :: opt = .false., rep = .false.
     contains
     ⟨Syntax: syntax rule: TBP⟩
    end type syntax_rule_t
```

Initializer: Set type and key for a rule, but do not (yet) allocate anything. Finalizer: not needed (no pointer components).

⟨Syntax: subroutines⟩+≡
```
    subroutine syntax_rule_init (rule, key, type)
      type(syntax_rule_t), intent(inout) :: rule
      type(string_t), intent(in) :: key
      integer, intent(in) :: type
      rule%keyword = key
      rule%type = type
      select case (rule%type)
      case (S_GROUP)
         call syntax_rule_set_delimiter (rule)
      case (S_LIST)
         call syntax_rule_set_separator (rule)
      case (S_ARGS)
         call syntax_rule_set_delimiter (rule)
         call syntax_rule_set_separator (rule)
```

```
        end select
    end subroutine syntax_rule_init
```

These characters will not be enclosed in quotes when writing syntax rules:

⟨*Syntax: parameters*⟩+≡
```
    character(*), parameter :: &
            UNQUOTED = "(),|_"//LCLETTERS//UCLETTERS//DIGITS
```

7.3.2 I/O

Write an account of the rule. Setting `short` true will suppress the node type.
Setting `key_only` true will suppress the definition. Setting `advance` false will
suppress the trailing newline.

⟨*Syntax: public*⟩+≡
```
    public :: syntax_rule_write
```

⟨*Syntax: syntax rule: TBP*⟩≡
```
    procedure :: write => syntax_rule_write
```

⟨*Syntax: subroutines*⟩+≡
```
    subroutine syntax_rule_write (rule, unit, short, key_only, advance)
      class(syntax_rule_t), intent(in) :: rule
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: short, key_only, advance
      logical :: typ, def, adv
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      typ = .true.;  if (present (short))    typ = .not. short

        if (typ)  call write_type (type)
        call write_key
```

243

```
    if (def) then
       write (u, "(1x,'=')", advance="no")
       if (present (del))  call write_maybe_quoted (char (del(1)))
       do i = 1, n
          if (i > 1 .and. present (sep)) &
                call write_maybe_quoted (char (sep))
          write (u, "(1x,A)", advance="no")  &
                char (wkey (syntax_rule_get_sub_ptr(rule, i)))
          if (i == n)  write (u, "(A)", advance="no")  trim (rule%modifier)
       end do
       if (present (del))  call write_maybe_quoted (char (del(2)))
    end if
  end subroutine write_sequence
end subroutine syntax_rule_write
```

In the printed representation, the keyword strings are enclosed as `<...>`, unless
they are bare keywords. Bare keywords are enclosed as `'..'` if they contain a
character which is not a letter, digit, or underscore. If they contain a single-
quote character, they are enclosed as `".."`. (A keyword must not contain both
single- and double-quotes.)

⟨*Syntax: subroutines*⟩+≡
```
function wkey (rule) result (string)
  type(string_t) :: string
  type(syntax_rule_t), intent(in) :: rule
  select case (rule%type)
  case (S_KEYWORD)
     if (verify (rule%keyword, UNQUOTED) == 0) then
        string = rule%keyword
     else if (scan (rule%keyword, "'") == 0) then
        string = "'" // rule%keyword // "'"
     else
        string = '"' // rule%keyword // '"'
     end if
  case default
     string = "<" // rule%keyword // ">"
  end select
end function wkey
```

7.3.3 Completing syntax rules

Set the separator and delimiter entries, using defaults:

⟨*Syntax: subroutines*⟩+≡
```
subroutine syntax_rule_set_separator (rule, separator)
  type(syntax_rule_t), intent(inout) :: rule
  type(string_t), intent(in), optional :: separator
  if (present (separator)) then
     rule%separator = separator
  else
     rule%separator = ","
  end if
end subroutine syntax_rule_set_separator
```

```
subroutine syntax_rule_set_delimiter (rule, delimiter)
  type(syntax_rule_t), intent(inout) :: rule
  type(string_t), dimension(2), intent(in), optional :: delimiter
  if (present (delimiter)) then
     rule%delimiter_left = delimiter(1)
     rule%delimiter_right = delimiter(2)
  else
     rule%delimiter_left = "("
     rule%delimiter_right = ")"
  end if
end subroutine syntax_rule_set_delimiter
```

Set the modifier entry and corresponding flags:

⟨*Syntax: subroutines*⟩+≡

```
function is_modifier (string) result (ok)
  logical :: ok
  type(string_t), intent(in) :: string
  select case (char (string))
  case (" ", "?", "*", "+");  ok = .true.
  case default;               ok = .false.
  end select
end function is_modifier

subroutine syntax_rule_set_modifier (rule, modifier)
  type(syntax_rule_t), intent(inout) :: rule
  type(string_t), intent(in) :: modifier
  rule%modifier = char (modifier)
  select case (rule%modifier)
  case (" ")
  case ("?");  rule%opt = .true.
  case ("*");  rule%opt = .true.;  rule%rep = .true.
  case ("+");  rule%rep = .true.
  case default
     call msg_bug (" Syntax: sequence modifier '" // rule%modifier &
           // "' is not one of '+' '*' '?'")
  end select
end subroutine syntax_rule_set_modifier
```

Check a finalized rule for completeness

⟨*Syntax: subroutines*⟩+≡

```
subroutine syntax_rule_check (rule)
  type(syntax_rule_t), intent(in) :: rule
  if (rule%keyword == "")  call msg_bug ("Rule key not set")
  select case (rule%type)
  case (S_UNKNOWN);  call bug (" Undefined rule")
  case (S_IGNORE, S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, &
           S_IDENTIFIER, S_KEYWORD)
  case (S_QUOTED)
     if (rule%delimiter_left == "" .or. rule%delimiter_right == "") &
           call bug (" Missing quote character(s)")
  case (S_SEQUENCE)
  case (S_GROUP)
```

```
          if (rule%delimiter_left == "" .or. rule%delimiter_right == "") &
               call bug (" Missing delimiter(s)")
     case (S_LIST)
          if (rule%separator == "") call bug (" Missing separator")
     case (S_ARGS)
          if (rule%delimiter_left == "" .or. rule%delimiter_right == "") &
               call bug (" Missing delimiter(s)")
          if (rule%separator == "") call bug (" Missing separator")
     case (S_ALTERNATIVE)
     case default
          call bug (" Undefined syntax code")
     end select
     select case (rule%type)
     case (S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
          if (allocated (rule%child)) then
               if (.not.all (rule_is_associated (rule%child))) &
                    call bug (" Child rules not all associated")
          else
               call bug (" Parent rule without children")
          end if
     case default
          if (allocated (rule%child))  call bug (" Non-parent rule with children")
     end select
   contains
     subroutine bug (string)
       character(*), intent(in) :: string
       call msg_bug (" Syntax table: Rule " // char (rule%keyword) // ": " &
            // string)
     end subroutine bug
   end subroutine syntax_rule_check
```

7.3.4   Accessing rules

This is the API for syntax rules:

⟨*Syntax: public*⟩+≡
```
    public :: syntax_rule_get_type
```

⟨*Syntax: subroutines*⟩+≡
```
    function syntax_rule_get_type (rule) result (type)
      integer :: type
      type(syntax_rule_t), intent(in) :: rule
      type = rule%type
    end function syntax_rule_get_type
```

⟨*Syntax: public*⟩+≡
```
    public :: syntax_rule_get_key
```

⟨*Syntax: syntax rule: TBP*⟩+≡
```
    procedure :: get_key => syntax_rule_get_key
```

⟨*Syntax: subroutines*⟩+≡
```
    function syntax_rule_get_key (rule) result (key)
      class(syntax_rule_t), intent(in) :: rule
      type(string_t) :: key
```

```
      key = rule%keyword
    end function syntax_rule_get_key
```

⟨*Syntax: public*⟩+≡
```
    public :: syntax_rule_get_separator
    public :: syntax_rule_get_delimiter
```

⟨*Syntax: subroutines*⟩+≡
```
    function syntax_rule_get_separator (rule) result (separator)
      type(string_t) :: separator
      type(syntax_rule_t), intent(in) :: rule
      separator = rule%separator
    end function syntax_rule_get_separator

    function syntax_rule_get_delimiter (rule) result (delimiter)
      type(string_t), dimension(2) :: delimiter
      type(syntax_rule_t), intent(in) :: rule
      delimiter = [rule%delimiter_left, rule%delimiter_right]
    end function syntax_rule_get_delimiter
```

Accessing child rules. If we use **syntax_rule_get_n_sub** for determining loop bounds, we do not need a check in the second routine.

⟨*Syntax: public*⟩+≡
```
    public :: syntax_rule_get_n_sub
    public :: syntax_rule_get_sub_ptr
```

⟨*Syntax: subroutines*⟩+≡
```
    function syntax_rule_get_n_sub (rule) result (n)
      integer :: n
      type(syntax_rule_t), intent(in) :: rule
      if (allocated (rule%child)) then
         n = size (rule%child)
      else
         n = 0
      end if
    end function syntax_rule_get_n_sub

    function syntax_rule_get_sub_ptr (rule, i) result (sub)
      type(syntax_rule_t), pointer :: sub
      type(syntax_rule_t), intent(in), target :: rule
      integer, intent(in) :: i
      sub => rule%child(i)%p
    end function syntax_rule_get_sub_ptr

    subroutine syntax_rule_set_sub (rule, i, sub)
      type(syntax_rule_t), intent(inout) :: rule
      integer, intent(in) :: i
      type(syntax_rule_t), intent(in), target :: sub
      rule%child(i)%p => sub
    end subroutine syntax_rule_set_sub
```

Return the modifier flags:

⟨*Syntax: public*⟩+≡

```
    public :: syntax_rule_last_optional
    public :: syntax_rule_last_repetitive
```

⟨*Syntax: subroutines*⟩+≡

```
    function syntax_rule_last_optional (rule) result (opt)
      logical :: opt
      type(syntax_rule_t), intent(in) :: rule
      opt = rule%opt
    end function syntax_rule_last_optional
    function syntax_rule_last_repetitive (rule) result (rep)
      logical :: rep
      type(syntax_rule_t), intent(in) :: rule
      rep = rule%rep
    end function syntax_rule_last_repetitive
```

Return true if the rule is atomic, i.e., logical, real, keyword etc.

⟨*Syntax: public*⟩+≡

```
    public :: syntax_rule_is_atomic
```

⟨*Syntax: subroutines*⟩+≡

```
    function syntax_rule_is_atomic (rule) result (atomic)
      logical :: atomic
      type(syntax_rule_t), intent(in) :: rule
      select case (rule%type)
      case (S_LOGICAL, S_INTEGER, S_REAL, S_COMPLEX, S_IDENTIFIER, &
              S_KEYWORD, S_QUOTED)
        atomic = .true.
      case default
        atomic = .false.
      end select
    end function syntax_rule_is_atomic
```

7.3.5   Syntax tables

A syntax table contains the tree of syntax rules and, for direct parser access,
the list of valid keywords.

Types

The syntax contains an array of rules and a list of keywords. The array is
actually used as a tree, where the top rule is the first array element, and the
other rules are recursively pointed to by this first rule. (No rule should be used
twice or be unused.) The keyword list is derived from the rule tree.

Objects of this type need the target attribute if they are associated with a
lexer. The keyword list will be pointed to by this lexer.

⟨*Syntax: public*⟩+≡

```
    public :: syntax_t
```

⟨*Syntax: types*⟩+≡

```
    type :: syntax_t
      private
      type(syntax_rule_t), dimension(:), allocatable :: rule
      type(keyword_list_t) :: keyword_list
```

```
      end type syntax_t
```

Constructor/destructor

Initialize and finalize syntax tables

⟨*Syntax: public*⟩+≡
```
    public :: syntax_init
    public :: syntax_final
```

There are two ways to create a syntax: hard-coded from rules or dynamically from file.

⟨*Syntax: interfaces*⟩≡
```
    interface syntax_init
       module procedure syntax_init_from_ifile
    end interface
```

The syntax definition is read from an `ifile` object which contains the syntax definitions in textual form, one rule per line. This interface allows for determining the number of rules beforehand.

To parse the rule definitions, we make up a temporary lexer. Obviously, we cannot use a generic parser yet, so we have to hardcode the parsing process.

⟨*Syntax: subroutines*⟩+≡
```
    subroutine syntax_init_from_ifile (syntax, ifile)
      type(syntax_t), intent(out), target :: syntax
      type(ifile_t), intent(in) :: ifile
      type(lexer_t) :: lexer
      type(line_p) :: line
      type(string_t) :: string
      integer :: n_token
      integer :: i
      call lexer_init (lexer, &
         comment_chars = "", &
         quote_chars = "<'"""", &
         quote_match = ">'"""", &
         single_chars = "?*+|=,()", &
         special_class = ["."], &
         keyword_list = null ())
      allocate (syntax%rule (ifile_get_length (ifile)))
      call line_init (line, ifile)
      do i = 1, size (syntax%rule)
         string = line_get_string_advance (line)
         call set_rule_type_and_key (syntax%rule(i), string, lexer)
      end do
      call line_init (line, ifile)
      do i = 1, size (syntax%rule)
         string = line_get_string_advance (line)
         select case (syntax%rule(i)%type)
         case (S_QUOTED, S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
            n_token = get_n_token (string, lexer)
            call set_rule_contents &
                 (syntax%rule(i), syntax, n_token, string, lexer)
         end select
```

```
        end do
        call line_final (line)
        call lexer_final (lexer)
        call syntax_make_keyword_list (syntax)
        if (.not. all (syntax%rule%used)) then
           do i = 1, size (syntax%rule)
              if (.not. syntax%rule(i)%used) then
                 call syntax_rule_write (syntax%rule(i), 6)
              end if
           end do
           call msg_bug (" Syntax table: unused rules")
        end if
     end subroutine syntax_init_from_ifile
```

For a given rule defined in the input, the first task is to determine its type
and key. With these, we can initialize the rule in the table, postponing the
association of children.

⟨*Syntax: subroutines*⟩+≡

```
    subroutine set_rule_type_and_key (rule, string, lexer)
      type(syntax_rule_t), intent(inout) :: rule
      type(string_t), intent(in) :: string
      type(lexer_t), intent(inout) :: lexer
      type(stream_t), target :: stream
      type(lexeme_t) :: lexeme
      type(string_t) :: key
      character(2) :: type
      call lexer_clear (lexer)
      call stream_init (stream, string)
      call lexer_assign_stream (lexer, stream)
      call lex (lexeme, lexer)
      type = lexeme_get_string (lexeme)
      call lex (lexeme, lexer)
      key = lexeme_get_contents (lexeme)
      call stream_final (stream)
      if (trim (key) /= "") then
         select case (type)
         case ("IG");  call syntax_rule_init (rule, key, S_IGNORE)
         case ("LO");  call syntax_rule_init (rule, key, S_LOGICAL)
         case ("IN");  call syntax_rule_init (rule, key, S_INTEGER)
         case ("RE");  call syntax_rule_init (rule, key, S_REAL)
         case ("CO");  call syntax_rule_init (rule, key, S_COMPLEX)
         case ("ID");  call syntax_rule_init (rule, key, S_IDENTIFIER)
         case ("KE");  call syntax_rule_init (rule, key, S_KEYWORD)
         case ("QU");  call syntax_rule_init (rule, key, S_QUOTED)
         case ("SE");  call syntax_rule_init (rule, key, S_SEQUENCE)
         case ("GR");  call syntax_rule_init (rule, key, S_GROUP)
         case ("LI");  call syntax_rule_init (rule, key, S_LIST)
         case ("AR");  call syntax_rule_init (rule, key, S_ARGS)
         case ("AL");  call syntax_rule_init (rule, key, S_ALTERNATIVE)
         case default
            call lexer_show_location (lexer)
            call msg_bug (" Syntax definition: unknown type '" // type // "'")
         end select
```

```
        else
            print *, char (string)
            call msg_bug (" Syntax definition: empty rule key")
        end if
    end subroutine set_rule_type_and_key
```

This function returns the number of tokens in an input line.

⟨*Syntax: subroutines*⟩+≡
```
    function get_n_token (string, lexer) result (n)
      integer :: n
      type(string_t), intent(in) :: string
      type(lexer_t), intent(inout) :: lexer
      type(stream_t), target :: stream
      type(lexeme_t) :: lexeme
      integer :: i
      call lexer_clear (lexer)
      call stream_init (stream, string)
      call lexer_assign_stream (lexer, stream)
      i = 0
      do
         call lex (lexeme, lexer)
         if (lexeme_is_break (lexeme))  exit
         i = i + 1
      end do
      n = i
      call stream_final (stream)
  end function get_n_token
```

This subroutine extracts the rule contents for an input line. There are three tasks: (1) determine the number of children, depending on the rule type; (2) find and set the separator and delimiter strings, if required; (3) scan the child rules, find them in the syntax table and associate the parent rule with them.

⟨*Syntax: subroutines*⟩+≡
```
    subroutine set_rule_contents (rule, syntax, n_token, string, lexer)
      type(syntax_rule_t), intent(inout) :: rule

    end subroutine set_rule_contents
```

This routine completes the syntax table object. We assume that the rule array
is set up. We associate the top rule with the first entry in the rule array and
build up the keyword list.

The keyword list includes delimiters and separators. Filling it can only be
done after all rules are set. We scan the rule tree. For each keyword that
we find, we try to add it to the keyword list; the pointer to the last element
is carried along with the recursive scanning. Before appending a keyword, we
check whether it is already in the list.

⟨*Syntax: subroutines*⟩+≡
```
    subroutine syntax_make_keyword_list (syntax)
      type(syntax_t), intent(inout), target :: syntax
```

```fortran
    type(syntax_rule_t), pointer :: rule
    rule => syntax%rule(1)
    call rule_scan_rec (rule, syntax%keyword_list)
  contains
    recursive subroutine rule_scan_rec (rule, keyword_list)
      type(syntax_rule_t), pointer :: rule
      type(keyword_list_t), intent(inout) :: keyword_list
      integer :: i
      if (rule%used)  return
      rule%used = .true.
      select case (rule%type)
      case (S_UNKNOWN)
         call msg_bug (" Syntax: rule tree contains undefined rule")
      case (S_KEYWORD)
         call keyword_list_add (keyword_list, rule%keyword)
      end select
      select case (rule%type)
      case (S_LIST, S_ARGS)
         call keyword_list_add (keyword_list, rule%separator)
      end select
      select case (rule%type)
      case (S_GROUP, S_ARGS)
         call keyword_list_add (keyword_list, rule%delimiter_left)
         call keyword_list_add (keyword_list, rule%delimiter_right)
      end select
      select case (rule%type)
      case (S_SEQUENCE, S_GROUP, S_LIST, S_ARGS, S_ALTERNATIVE)
         if (.not. allocated (rule%child)) &
              call msg_bug (" Syntax: Non-terminal rule without children")
      case default
         if (allocated (rule%child)) &
              call msg_bug (" Syntax: Terminal rule with children")
      end select
      if (allocated (rule%child)) then
         do i = 1, size (rule%child)
            call rule_scan_rec (rule%child(i)%p, keyword_list)
         end do
      end if
    end subroutine rule_scan_rec
  end subroutine syntax_make_keyword_list
```

The finalizer deallocates the rule pointer array and deletes the keyword list.

⟨*Syntax: subroutines*⟩+≡
```fortran
    subroutine syntax_final (syntax)
      type(syntax_t), intent(inout) :: syntax
      if (allocated (syntax%rule))  deallocate (syntax%rule)
      call keyword_list_final (syntax%keyword_list)
    end subroutine syntax_final
```

7.3.6   Accessing the syntax table

Return a pointer to the top rule

⟨*Syntax: public*⟩+≡
```
public :: syntax_get_top_rule_ptr
```

⟨*Syntax: subroutines*⟩+≡
```
function syntax_get_top_rule_ptr (syntax) result (rule)
  type(syntax_rule_t), pointer :: rule
  type(syntax_t), intent(in), target :: syntax
  if (allocated (syntax%rule)) then
     rule => syntax%rule(1)
  else
     rule => null ()
  end if
end function syntax_get_top_rule_ptr
```

Assign the pointer to the rule associated with a given key (assumes that the rule array is allocated)

⟨*Syntax: public*⟩+≡
```
public :: syntax_get_rule_ptr
```

⟨*Syntax: subroutines*⟩+≡
```
function syntax_get_rule_ptr (syntax, key) result (rule)
  type(syntax_rule_t), pointer :: rule
  type(syntax_t), intent(in), target :: syntax
  type(string_t), intent(in) :: key
  integer :: i
  do i = 1, size (syntax%rule)
     if (syntax%rule(i)%keyword == key) then
        rule => syntax%rule(i)
        return
     end if
  end do
  call msg_bug (" Syntax table: Rule " // char (key) // " not found")
end function syntax_get_rule_ptr
```

Return a pointer to the keyword list

⟨*Syntax: public*⟩+≡
```
public :: syntax_get_keyword_list_ptr
```

⟨*Syntax: subroutines*⟩+≡
```
function syntax_get_keyword_list_ptr (syntax) result (keyword_list)
  type(keyword_list_t), pointer :: keyword_list
  type(syntax_t), intent(in), target :: syntax
  keyword_list => syntax%keyword_list
end function syntax_get_keyword_list_ptr
```

7.3.7 I/O

Write a readable representation of the syntax table

⟨*Syntax: public*⟩+≡
```
public :: syntax_write
```

⟨Syntax: subroutines⟩+≡

```
    subroutine syntax_write (syntax, unit)
      type(syntax_t), intent(in) :: syntax
      integer, intent(in), optional :: unit
      integer :: u
      integer :: i
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "(A)") "Syntax table:"
      if (allocated (syntax%rule)) then
         do i = 1, size (syntax%rule)
            call syntax_rule_write (syntax%rule(i), u)
         end do
      else
         write (u, "(1x,A)") "[not allocated]"
      end if
      call keyword_list_write (syntax%keyword_list, u)
    end subroutine syntax_write
```

7.4 The parser

On a small scale, the parser interprets the string tokens returned by the lexer; they are interpreted as numbers, keywords and such and stored as a typed object. On a large scale, a text is read, parsed, and a syntax rule set is applied such that the tokens are stored as a parse tree. Syntax errors are spotted in this process, so the resulting parse tree is syntactically correct by definition.

⟨parser.f90⟩≡

7.4.1 The token type

Tokens are elements of the parsed input that carry a value: logical, integer, real, quoted string, (unquoted) identifier, or known keyword. Note that non-keyword tokens also have an abstract key attached to them.

This is an obvious candidate for polymorphism.

⟨*Parser: types*⟩≡
    type :: token_t
      private
      integer :: type = S_UNKNOWN
      logical, pointer :: lval => null ()
      integer, pointer :: ival => null ()
      real(default), pointer :: rval => null ()
      complex(default), pointer :: cval => null ()
      type(string_t), pointer :: sval => null ()
      type(string_t), pointer :: kval => null ()

257

```
      type(string_t), dimension(:), pointer :: quote => null ()
    end type token_t
```

Create a token from the lexeme returned by the lexer: Allocate storage and try to interpret the lexeme according to the type that is requested by the parser. For a keyword token, match the lexeme against the requested key. If successful, set the token type, value, and key. Otherwise, set the type to S_UNKNOWN.

⟨*Parser: procedures*⟩≡

```
    subroutine token_init (token, lexeme, requested_type, key)
      type(token_t), intent(out) :: token
      type(lexeme_t), intent(in) :: lexeme
      integer, intent(in) :: requested_type
      type(string_t), intent(in) :: key
      integer :: type

      token%quote(2) = del(2)
      token%type = S_QUOTED
    end subroutine read_quoted
  end subroutine token_init
```

Manually set a token to a keyword.

⟨*Parser: procedures*⟩+≡
```
  subroutine token_init_key (token, key)
    type(token_t), intent(out) :: token
    type(string_t), intent(in) :: key
    token%type = S_KEYWORD
    allocate (token%kval)
    token%kval = key
  end subroutine token_init_key
```

Reset a token to an empty state, freeing allocated memory, and deallocate the token itself.

⟨*Parser: procedures*⟩+≡
```
  subroutine token_final (token)
    type(token_t), intent(inout) :: token
    token%type = S_UNKNOWN
    if (associated (token%lval))  deallocate (token%lval)
    if (associated (token%ival))  deallocate (token%ival)
    if (associated (token%rval))  deallocate (token%rval)
    if (associated (token%sval))  deallocate (token%sval)
    if (associated (token%kval))  deallocate (token%kval)
    if (associated (token%quote))  deallocate (token%quote)
  end subroutine token_final
```

Check for empty=valid token:

⟨*Parser: procedures*⟩+≡
```
  function token_is_valid (token) result (valid)
    logical :: valid
    type(token_t), intent(in) :: token
    valid = token%type /= S_UNKNOWN
  end function token_is_valid
```

Write the contents of a token.

⟨*Parser: procedures*⟩+≡
```
  subroutine token_write (token, unit)
    type(token_t), intent(in) :: token
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    select case (token%type)
    case (S_LOGICAL)
       write (u, "(L1)") token%lval
    case (S_INTEGER)
```

```
          write (u, "(I0)") token%ival
       case (S_REAL)
          write (u, "(" // FMT_19 // ")") token%rval
       case (S_COMPLEX)
          write (u, "('(',"" // FMT_19 // "',',"" // FMT_19 // "',')')") token%cval
       case (S_IDENTIFIER)
          write (u, "(A)") char (token%sval)
       case (S_KEYWORD)
          write (u, "(A,A)") '[keyword] ' // char (token%kval)
       case (S_QUOTED)
          write (u, "(A)") &
               char (token%quote(1)) // char (token%sval) // char (token%quote(2))
       case default
          write (u, "(A)") '[empty]'
       end select
    end subroutine token_write
```

Token assignment via deep copy. This is useful to avoid confusion when the token is transferred to some parse-tree node.

⟨*Parser: interfaces*⟩≡
```
    interface assignment(=)
       module procedure token_assign
       module procedure token_assign_integer
       module procedure token_assign_real
       module procedure token_assign_complex
       module procedure token_assign_logical
       module procedure token_assign_string
    end interface
```

We need to copy only the contents that are actually assigned, the other pointers remain disassociated.

⟨*Parser: procedures*⟩+≡
```
    subroutine token_assign (token, token_in)
      type(token_t), intent(out) :: token
      type(token_t), intent(in) :: token_in
      token%type = token_in%type
      select case (token%type)
      case (S_LOGICAL);    allocate (token%lval);  token%lval = token_in%lval
      case (S_INTEGER);    allocate (token%ival);  token%ival = token_in%ival
      case (S_REAL);       allocate (token%rval);  token%rval = token_in%rval
      case (S_COMPLEX); allocate (token%cval);  token%cval = token_in%cval
      case (S_IDENTIFIER); allocate (token%sval);  token%sval = token_in%sval
      case (S_QUOTED);     allocate (token%sval);  token%sval = token_in%sval
         allocate (token%quote(2));  token%quote = token_in%quote
      end select
      if (token%type /= S_UNKNOWN) then
         allocate (token%kval);  token%kval = token_in%kval
      end if
    end subroutine token_assign
```

We need to copy only the contents that are actually assigned, the other pointers remain disassociated.

⟨*Parser: procedures*⟩+≡

```
    subroutine token_assign_integer (token, ival)
      type(token_t), intent(out) :: token
      integer, intent(in) :: ival
      token%type = S_INTEGER

      type(token_t), intent(out) :: token
      real(default), intent(in) :: rval
      token%type = S_REAL
      allocate (token%rval)
      token%rval = rval
    end subroutine token_assign_real

    subroutine token_assign_complex (token, cval)
      type(token_t), intent(out) :: token
      complex(default), intent(in) :: cval
      token%type = S_COMPLEX
      allocate (token%cval)
      token%cval = cval
    end subroutine token_assign_complex

    subroutine token_assign_logical (token, lval)
      type(token_t), intent(out) :: token
      logical, intent(in) :: lval
      token%type = S_LOGICAL
      allocate (token%lval)
      token%lval = lval
    end subroutine token_assign_logical

    subroutine token_assign_string (token, sval)
      type(token_t), intent(out) :: token
      type(string_t), intent(in) :: sval
      token%type = S_QUOTED
      allocate (token%sval)
      token%sval = sval
      allocate (token%quote(2));  token%quote = '"'
    end subroutine token_assign_string
```

7.4.2 Retrieve token contents

These functions all do a trivial sanity check that should avoid crashes.

⟨*Parser: procedures*⟩+≡

```
    function token_get_logical (token) result (lval)
      logical :: lval
      type(token_t), intent(in) :: token
      if (associated (token%lval)) then
         lval = token%lval
      else
```

```
      call token_mismatch (token, "logical")
   end if
end function token_get_logical

function token_get_integer (token) result (ival)
  integer :: ival
  type(token_t), intent(in) :: token
  if (associated (token%ival)) then
     ival = token%ival
  else
     call token_mismatch (token, "integer")
  end if
end function token_get_integer

function token_get_real (token) result (rval)
  real(default) :: rval
  type(token_t), intent(in) :: token
  if (associated (token%rval)) then
     rval = token%rval
  else
     call token_mismatch (token, "real")
  end if
end function token_get_real

function token_get_cmplx (token) result (cval)
  complex(default) :: cval
  type(token_t), intent(in) :: token
  if (associated (token%cval)) then
     cval = token%cval
  else
     call token_mismatch (token, "complex")
  end if
end function token_get_cmplx

function token_get_string (token) result (sval)
  type(string_t) :: sval
  type(token_t), intent(in) :: token
  if (associated (token%sval)) then
     sval = token%sval
  else
     call token_mismatch (token, "string")
  end if
end function token_get_string

function token_get_key (token) result (kval)
  type(string_t) :: kval
  type(token_t), intent(in) :: token
  if (associated (token%kval)) then
     kval = token%kval
  else
     call token_mismatch (token, "keyword")
  end if
end function token_get_key
```

```
    function token_get_quote (token) result (quote)
      type(string_t), dimension(2) :: quote
      type(token_t), intent(in) :: token
      if (associated (token%quote)) then
          quote = token%quote
      else
          call token_mismatch (token, "quote")
      end if
    end function token_get_quote
```

⟨*Parser: procedures*⟩+≡
```
    subroutine token_mismatch (token, type)
      type(token_t), intent(in) :: token
      character(*), intent(in) :: type
      write (6, "(A)", advance="no")  "Token: "
      call token_write (token)
      call msg_bug (" Token type mismatch; value required as " // type)
    end subroutine token_mismatch
```

7.4.3 The parse tree: nodes

The parser will generate a parse tree from the input stream. Each node in this
parse tree points to the syntax rule that was applied. (Since syntax rules are
stored in a pointer-type array within the syntax table, they qualify as targets.)
A leaf node contains a token. A branch node has subnodes. The subnodes are
stored as a list, so each node also has a `next` pointer.

⟨*Parser: public*⟩≡
```
    public :: parse_node_t
```

⟨*Parser: types*⟩+≡
```
    type :: parse_node_t
      private
      type(syntax_rule_t), pointer :: rule => null ()
      type(token_t) :: token
      integer :: n_sub = 0
      type(parse_node_t), pointer :: sub_first => null ()
      type(parse_node_t), pointer :: sub_last => null ()
      type(parse_node_t), pointer :: next => null ()
     contains
     ⟨Parser: parse node: TBP⟩
    end type parse_node_t
```

Container for parse node pointers, useful for creating pointer arrays:

⟨*Parser: public*⟩+≡
```
    public :: parse_node_p
```

⟨*Parser: types*⟩+≡
```
    type :: parse_node_p
      type(parse_node_t), pointer :: ptr => null ()
    end type parse_node_p
```

Output. The first version writes a node together with its sub-node tree, organized by indentation.

⟨*Parser: parse node: TBP*⟩≡
```
    procedure :: write => parse_node_write_rec
```

⟨*Parser: public*⟩+≡
```
    public :: parse_node_write_rec
```

⟨*Parser: procedures*⟩+≡
```
    recursive subroutine parse_node_write_rec (node, unit, short, depth)
      class(parse_node_t), intent(in), target :: node
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: short
      integer, intent(in), optional :: depth
      integer :: u, d
      type(parse_node_t), pointer :: current
      u = given_output_unit (unit);  if (u < 0)  return
      d = 0;  if (present (depth))  d = depth
      call parse_node_write (node, u, short=short)
      current => node%sub_first
      do while (associated (current))
         write (u, "(A)", advance = "no")  repeat ("|  ", d)
         call parse_node_write_rec (current, unit, short, d+1)
         current => current%next
      end do
    end subroutine parse_node_write_rec
```

This does the actual output for a single node, without recursion.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_write
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_write (node, unit, short)
      class(parse_node_t), intent(in) :: node
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: short
      integer :: u
      type(parse_node_t), pointer :: current
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "('+ ')", advance = "no")
      if (associated (node%rule)) then
         call syntax_rule_write (node%rule, u, &
              short=short, key_only=.true., advance=.false.)
         if (token_is_valid (node%token)) then
            write (u, "(' = ')", advance="no")
            call token_write (node%token, u)
         else if (associated (node%sub_first)) then
            write (u, "(' = ')", advance="no")
            current => node%sub_first
            do while (associated (current))
               call syntax_rule_write (current%rule, u, &
                    short=.true., key_only=.true., advance=.false.)
               current => current%next
            end do
            write (u, *)
```

```
          else
             write (u, *)
          end if
       else
          write (u, *) "[empty]"
       end if
    end subroutine parse_node_write
```

Finalize the token and recursively finalize and deallocate all sub-nodes.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_final
```

⟨*Parser: procedures*⟩+≡
```
    recursive subroutine parse_node_final (node, recursive)
      type(parse_node_t), intent(inout) :: node
      type(parse_node_t), pointer :: current
      logical, intent(in), optional :: recursive
      logical :: rec
      rec = .true.;  if (present (recursive))  rec = recursive
      call token_final (node%token)
      if (rec) then
         do while (associated (node%sub_first))
            current => node%sub_first
            node%sub_first => node%sub_first%next
            call parse_node_final (current)
            deallocate (current)
         end do
      end if
    end subroutine parse_node_final
```

7.4.4   Filling nodes

The constructors allocate and initialize the node. There are two possible initializers (in a later version, should correspond to different type extensions).

First, leaf (terminal) nodes. The token constructor does the actual work, looking at the requested type and key for the given rule and matching against the lexeme contents. If it fails, the token will keep the type S_UNKNOWN and remain empty. Otherwise, we have a valid node which contains the new token.

If the lexeme argument is absent, the token is left empty.

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_create_leaf (node, rule, lexeme)
      type(parse_node_t), pointer :: node
      type(syntax_rule_t), intent(in), target :: rule
      type(lexeme_t), intent(in) :: lexeme
      allocate (node)
      node%rule => rule
      call token_init (node%token, lexeme, &
           syntax_rule_get_type (rule), syntax_rule_get_key (rule))
      if (.not. token_is_valid (node%token))  deallocate (node)
    end subroutine parse_node_create_leaf
```

266

This version allows us to manually create a leaf node that holds a keyword.

⟨Parser: public⟩+≡
```
    public :: parse_node_create_key
```

⟨Parser: procedures⟩+≡
```
    subroutine parse_node_create_key (node, rule)
      type(parse_node_t), intent(out) :: node
      type(syntax_rule_t), intent(in), target :: rule
      node%rule => rule
      call token_init_key (node%token, syntax_rule_get_key (rule))
    end subroutine parse_node_create_key
```

This version allows us to manually create a leaf node that holds a fixed value.
Only one of the optional values should be provided.

⟨Parser: public⟩+≡
```
    public :: parse_node_create_value
```

⟨Parser: procedures⟩+≡
```
    subroutine parse_node_create_value (node, rule, ival, rval, cval, sval, lval)
      type(parse_node_t), intent(out) :: node
      type(syntax_rule_t), intent(in), target :: rule
      integer, intent(in), optional :: ival
      real(default), intent(in), optional :: rval
      complex(default), intent(in), optional :: cval
      type(string_t), intent(in), optional :: sval
      logical, intent(in), optional :: lval
      node%rule => rule
      call parse_node_set_value (node, ival, rval, cval, sval, lval)
    end subroutine parse_node_create_value
```

Directly set the value without changing anything else.

⟨Parser: public⟩+≡
```
    public :: parse_node_set_value
```

⟨Parser: procedures⟩+≡
```
    subroutine parse_node_set_value (node, ival, rval, cval, sval, lval)
      type(parse_node_t), intent(inout) :: node
      integer, intent(in), optional :: ival
      real(default), intent(in), optional :: rval
      complex(default), intent(in), optional :: cval
      type(string_t), intent(in), optional :: sval
      logical, intent(in), optional :: lval
      if (present (ival)) then
         node%token = ival
      else if (present (rval)) then
         node%token = rval
      else if (present (cval)) then
         node%token = cval
      else if (present (lval)) then
         node%token = lval
      else if (present (sval)) then
         node%token = sval
      end if
    end subroutine parse_node_set_value
```

267

Second, branch nodes. We first assign the rule:

⟨*Parser: public*⟩+≡
```
    public :: parse_node_create_branch
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_create_branch (node, rule)
      type(parse_node_t), pointer :: node
      type(syntax_rule_t), intent(in), target :: rule
      allocate (node)
      node%rule => rule
    end subroutine parse_node_create_branch
```

Copy a node. This is a shallow copy. Note that we have to nullify the `next` pointer if we don't want to inherit the context of the original node.

⟨*Parser: parse node: TBP*⟩+≡
```
    procedure :: copy => parse_node_copy
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_copy (node, copy)
      class(parse_node_t), intent(in) :: node
      type(parse_node_t), pointer, intent(out) :: copy
      allocate (copy)
      select type (node)
      type is (parse_node_t)
         copy = node
      end select
      copy%next => null ()
    end subroutine parse_node_copy
```

Append a sub-node. The sub-node must exist and be a valid target, otherwise nothing is done.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_append_sub
```

⟨*Parser: parse node: TBP*⟩+≡
```
    procedure :: append_sub => parse_node_append_sub
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_append_sub (node, sub)
      class(parse_node_t), intent(inout) :: node
      type(parse_node_t), pointer :: sub
      if (associated (sub)) then
         if (associated (node%sub_last)) then
            node%sub_last%next => sub
         else
            node%sub_first => sub
         end if
         node%sub_last => sub
      end if
    end subroutine parse_node_append_sub
```

For easy access, once the list is complete we count the number of sub-nodes. If there are no subnodes, the whole node is deleted.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_freeze_branch
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_freeze_branch (node)
      type(parse_node_t), pointer :: node
      type(parse_node_t), pointer :: current
      node%n_sub = 0
      current => node%sub_first
      do while (associated (current))
         node%n_sub = node%n_sub + 1
         current => current%next
      end do
      if (node%n_sub == 0)  deallocate (node)
    end subroutine parse_node_freeze_branch
```

Replace the syntax rule. This makes sense only if the parse node adheres to the syntax of the new rule.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_replace_rule
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_replace_rule (node, rule)
      type(parse_node_t), pointer :: node
      type(syntax_rule_t), intent(in), target :: rule
      node%rule => rule
    end subroutine parse_node_replace_rule
```

Replace the last subnode by the target node. Since the subnodes are stored as a linked list, we can do this only if we copy the subnodes. Furthermore, the target node must also be copied, and the **next** pointer of the copy is nullified. This ensures that we cannot modify the originals at the subnode level.

All copies are shallow copies. This implies that further modifications at the sub-subnode level will affect the original nodes and must therefore be forbidden.

Use with care, this invites to memory mismanagement. The copy nodes can be deallocated, but not finalized, since its subnodes are the same objects as the subnodes of the target node.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_replace_last_sub
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_replace_last_sub (node, pn_target)
      type(parse_node_t), intent(inout), target :: node
      type(parse_node_t), intent(in), target :: pn_target
      type(parse_node_t), pointer :: current, current_copy, previous
      integer :: i
      select case (node%n_sub)
      case (1)
         allocate (current_copy)
         current_copy = pn_target
         node%sub_first => current_copy
      case (2:)
         current => node%sub_first
         allocate (current_copy)
         current_copy = current
         node%sub_first => current_copy
```

```
          previous => current_copy
          do i = 1, node%n_sub - 2
             current => current%next
             allocate (current_copy)
             current_copy = current
             previous%next => current_copy
             previous => current_copy
          end do
          allocate (current_copy)
          current_copy = pn_target
          previous%next => current_copy
       case default
          call parse_node_write (node)
          call msg_bug ("'replace_last_sub' called for non-branch parse node")
       end select
       current_copy%next => null ()
       node%sub_last => current_copy
    end subroutine parse_node_replace_last_sub
```

7.4.5 Accessing nodes

Return the node contents. Check if pointers are associated. No check when accessing a sub-node; assume that **parse_node_n_sub** is always used for the upper bound.

The token extractor returns a pointer.

⟨*Parser: public*⟩+≡
```
    public :: parse_node_get_rule_ptr
    public :: parse_node_get_n_sub
    public :: parse_node_get_sub_ptr
    public :: parse_node_get_next_ptr
    public :: parse_node_get_last_sub_ptr
```

⟨*Parser: parse node: TBP*⟩+≡
```
    procedure :: get_rule_ptr => parse_node_get_rule_ptr
    procedure :: get_n_sub => parse_node_get_n_sub
    procedure :: get_sub_ptr => parse_node_get_sub_ptr
    procedure :: get_next_ptr => parse_node_get_next_ptr
```

⟨*Parser: procedures*⟩+≡
```
    function parse_node_get_rule_ptr (node) result (rule)
      class(parse_node_t), intent(in) :: node
      type(syntax_rule_t), pointer :: rule
      if (associated (node%rule)) then
         rule => node%rule
      else
         rule => null ()
         call parse_node_undefined (node, "rule")
      end if
    end function parse_node_get_rule_ptr

    function parse_node_get_n_sub (node) result (n)
      class(parse_node_t), intent(in) :: node
      integer :: n
```

270

```
      n = node%n_sub
    end function parse_node_get_n_sub

    function parse_node_get_sub_ptr (node, n, tag, required) result (sub)
      class(parse_node_t), intent(in), target :: node
      type(parse_node_t), pointer :: sub
      integer, intent(in), optional :: n
      character(*), intent(in), optional :: tag
      logical, intent(in), optional :: required
      integer :: i
      sub => node%sub_first
      if (present (n)) then
         do i = 2, n
            if (associated (sub)) then
               sub => sub%next
            else
               return
            end if
         end do
      end if
      call parse_node_check (sub, tag, required)
    end function parse_node_get_sub_ptr

    function parse_node_get_next_ptr (sub, n, tag, required) result (next)
      class(parse_node_t), intent(in), target :: sub
      type(parse_node_t), pointer :: next
      integer, intent(in), optional :: n
      character(*), intent(in), optional :: tag
      logical, intent(in), optional :: required
      integer :: i
      next => sub%next
      if (present (n)) then
         do i = 2, n
            if (associated (next)) then
               next => next%next
            else
               exit
            end if
         end do
      end if
      call parse_node_check (next, tag, required)
    end function parse_node_get_next_ptr

    function parse_node_get_last_sub_ptr (node, tag, required) result (sub)
      type(parse_node_t), pointer :: sub
      type(parse_node_t), intent(in), target :: node
      character(*), intent(in), optional :: tag
      logical, intent(in), optional :: required
      sub => node%sub_last
      call parse_node_check (sub, tag, required)
    end function parse_node_get_last_sub_ptr
```

⟨*Parser: procedures*⟩+≡

```
    subroutine parse_node_undefined (node, obj)
```

```
      type(parse_node_t), intent(in) :: node
      character(*), intent(in) :: obj
      call parse_node_write (node, 6)
      call msg_bug (" Parse-tree node: " // obj // " requested, but undefined")
    end subroutine parse_node_undefined
```

Check if a parse node has a particular tag, and if it is associated:

⟨*Parser: public*⟩+≡
```
    public :: parse_node_check
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_node_check (node, tag, required)
      type(parse_node_t), pointer :: node
      character(*), intent(in), optional :: tag
      logical, intent(in), optional :: required
      if (associated (node)) then
         if (present (tag)) then
            if (parse_node_get_rule_key (node) /= tag) &
                 call parse_node_mismatch (tag, node)
         end if
      else
         if (present (required)) then
            if (required) &
                 call msg_bug (" Missing node, expected <" // tag // ">")
         end if
      end if
    end subroutine parse_node_check
```

This is called by a parse-tree scanner if the expected and the actual nodes do not match

⟨*Parser: public*⟩+≡
```

     rewind (u)
     md5sum_pn = md5sum (u)
     close (u)
   end function parse_node_get_md5sum
```

7.4.6   The parse tree

The parse tree is a tree of nodes, where leaf nodes hold a valid token, while branch nodes point to a list of sub-nodes.

⟨*Parser: public*⟩+≡
```
   public :: parse_tree_t
```

⟨*Parser: types*⟩+≡
```
   type :: parse_tree_t
     private
     type(parse_node_t), pointer :: root_node => null ()
    contains
    ⟨Parser: parse tree: TBP⟩
   end type parse_tree_t
```

The parser. Its arguments are the parse tree (which should be empty initially), the lexer (which should be already set up), the syntax table (which should be valid), and the input stream. The input stream is completely parsed, using the lexer setup and the syntax rules as given, and the parse tree is built accordingly.

If check_eof is absent or true, the parser will complain about trailing garbage. Otherwise, it will ignore it.

By default, the input stream is matched against the top rule in the specified syntax. If key is given, it is matched against the rule with the specified key instead.

Failure at the top level means that no rule could match at all; in this case the error message will show the top rule.

⟨*Parser: public*⟩+≡
```
   public :: parse_tree_init
```

⟨*Parser: parse tree: TBP*⟩≡
```
procedure :: parse => parse_tree_init
```

⟨*Parser: procedures*⟩+≡
```
subroutine parse_tree_init &
     (parse_tree, syntax, lexer, key, check_eof)
  class(parse_tree_t), intent(inout) :: parse_tree
  type(lexer_t), intent(inout) :: lexer
  type(syntax_t), intent(in), target :: syntax
  type(string_t), intent(in), optional :: key
  logical, intent(in), optional :: check_eof
  type(syntax_rule_t), pointer :: rule
  type(lexeme_t) :: lexeme

           case (S_IGNORE);       call parse_ignore (node, ok)
           end select
        end if
        if (debug) then
           if (ok) then
              write (6, "(A)", advance="no") "Matched rule: "
           else
              write (6, "(A)", advance="no") "Failed rule: "
           end if
           call syntax_rule_write (rule)
           if (associated (node)) call parse_node_write (node)
        end if
     end subroutine parse_node_match_rule
```

Parse an alternative: try each case. If the match succeeds, the node has been filled, so return. If nothing works, return failure.

⟨*Parser: internal subroutines of* **parse_tree_init**⟩+≡

```
     recursive subroutine parse_alternative (node, rule, ok)
       type(parse_node_t), pointer :: node
       type(syntax_rule_t), intent(in), target :: rule
       logical, intent(out) :: ok
       integer :: i
       do i = 1, syntax_rule_get_n_sub (rule)
          call parse_node_match_rule (node, syntax_rule_get_sub_ptr (rule, i), ok)
          if (ok)  return
       end do
       ok = .false.
     end subroutine parse_alternative
```

Parse a group: the first and third lexemes have to be the delimiters, the second one is parsed as the actual node, using now the child rule. If the first match fails, return with failure. If the other matches fail, issue an error, since we cannot lex back more than one item.

⟨*Parser: internal subroutines of* **parse_tree_init**⟩+≡

```
     recursive subroutine parse_group (node, rule, ok)
       type(parse_node_t), pointer :: node
       type(syntax_rule_t), intent(in), target :: rule
```

```
      logical, intent(out) :: ok
      type(string_t), dimension(2) :: delimiter
      delimiter = syntax_rule_get_delimiter (rule)
      call lex (lexeme, lexer)
      if (lexeme_get_string (lexeme) == delimiter(1)) then
          call parse_node_match_rule (node, syntax_rule_get_sub_ptr (rule, 1), ok)
          if (ok) then
              call lex (lexeme, lexer)
              if (lexeme_get_string (lexeme) == delimiter(2)) then
                 ok = .true.
              else
                 call parse_error (rule, lexeme)
              end if
          else
              call parse_error (rule, lexeme)
          end if
      else
          call lexer_put_back (lexer, lexeme)
          ok = .false.
      end if
   end subroutine parse_group
```

Parsing a sequence. The last rule element may be special: optional and/or repetitive. Each sub-node that matches is appended to the sub-node list of the parent node.

If sep is true, we look for a separator after each element.

⟨*Parser: internal subroutines of* parse_tree_init⟩+≡

```
   recursive subroutine parse_sequence (node, rule, sep, ok)
     type(parse_node_t), pointer :: node
     type(syntax_rule_t), intent(in), target :: rule
     logical, intent(in) :: sep
     logical, intent(out) :: ok
     type(parse_node_t), pointer :: current
     integer :: i, n
     logical :: opt, rep, cont
     type(string_t) :: separator
     call parse_node_create_branch (node, rule)
     if (sep)  separator = syntax_rule_get_separator (rule)
     n = syntax_rule_get_n_sub (rule)
     opt = syntax_rule_last_optional (rule)
     rep = syntax_rule_last_repetitive (rule)
     ok = .true.
     cont = .true.
     SCAN_RULE: do i = 1, n
         call parse_node_match_rule &
             (current, syntax_rule_get_sub_ptr (rule, i), cont)
         if (cont) then
            call parse_node_append_sub (node, current)
            if (sep .and. (i<n .or. rep)) then
               call lex (lexeme, lexer)
               if (lexeme_get_string (lexeme) /= separator) then
                  call lexer_put_back (lexer, lexeme)
                  cont = .false.
                  exit SCAN_RULE
```

```
            end if
         end if
      else
         if (i == n .and. opt) then
            exit SCAN_RULE
         else if (i == 1) then
            ok = .false.
            exit SCAN_RULE
         else
            call parse_error (rule, lexeme)
         end if
      end if
   end do SCAN_RULE
   if (rep) then
      do while (cont)
         call parse_node_match_rule &
              (current, syntax_rule_get_sub_ptr (rule, n), cont)
         if (cont) then
            call parse_node_append_sub (node, current)
            if (sep) then
               call lex (lexeme, lexer)
               if (lexeme_get_string (lexeme) /= separator) then
                  call lexer_put_back (lexer, lexeme)
                  cont = .false.
               end if
            end if
         else
            if (sep)  call parse_error (rule, lexeme)
         end if
      end do
   end if
   call parse_node_freeze_branch (node)
end subroutine parse_sequence
```

Argument list: We use the **parse_group** code, but call **parse_sequence** inside.

⟨*Parser: internal subroutines of* **parse_tree_init**⟩+≡

```
recursive subroutine parse_args (node, rule, ok)
  type(parse_node_t), pointer :: node
  type(syntax_rule_t), intent(in), target :: rule
  logical, intent(out) :: ok
  type(string_t), dimension(2) :: delimiter
  delimiter = syntax_rule_get_delimiter (rule)
  call lex (lexeme, lexer)
  if (lexeme_get_string (lexeme) == delimiter(1)) then
     call parse_sequence (node, rule, .true., ok)
     if (ok) then
        call lex (lexeme, lexer)
        if (lexeme_get_string (lexeme) == delimiter(2)) then
           ok = .true.
        else
           call parse_error (rule, lexeme)
        end if
     else
        call parse_error (rule, lexeme)
     end if
```

```
        else
            call lexer_put_back (lexer, lexeme)
            ok = .false.
        end if
    end subroutine parse_args
```

The IGNORE syntax reads one lexeme and discards it if it is numeric, logical or string/identifier (but not a keyword). This is a successful match. Otherwise, the match fails. The node pointer is returned disassociated in any case.

⟨*Parser: internal subroutines of* **parse_tree_init**⟩+≡
```
    subroutine parse_ignore (node, ok)
      type(parse_node_t), pointer :: node
      logical, intent(out) :: ok
      call lex (lexeme, lexer)
      select case (lexeme_get_type (lexeme))
      case (T_NUMERIC, T_IDENTIFIER, T_QUOTED)
         ok = .true.
      case default
         ok = .false.
      end select
      node => null ()
    end subroutine parse_ignore
```

If the match fails and we cannot step back:

⟨*Parser: internal subroutines of* **parse_tree_init**⟩+≡
```
    subroutine parse_error (rule, lexeme)
      type(syntax_rule_t), intent(in) :: rule
      type(lexeme_t), intent(in) :: lexeme
      character(80) :: buffer
      integer :: u, iostat
      call lexer_show_location (lexer)
      u = free_unit ()
      open (u, status = "scratch")
      write (u, "(A)", advance="no")  "Expected syntax:"
      call syntax_rule_write (rule, u)
      write (u, "(A)", advance="no")  "Found token:"
      call lexeme_write (lexeme, u)
      rewind (u)
      do
         read (u, "(A)", iostat=iostat)  buffer
         if (iostat /= 0)  exit
         call msg_message (trim (buffer))
      end do
      call msg_fatal (" Syntax error " &
           // "(at or before the location indicated above)")
    end subroutine parse_error
```

The finalizer recursively deallocates all nodes and their contents. For each node, **parse_node_final** is called on the sub-nodes, which in turn deallocates the token or sub-node array contained within each of them. At the end, only the top node remains to be deallocated.

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_final
```

⟨*Parser: parse tree: TBP*⟩+≡
```
    procedure :: final => parse_tree_final
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_tree_final (parse_tree)
      class(parse_tree_t), intent(inout) :: parse_tree
      if (associated (parse_tree%root_node)) then
         call parse_node_final (parse_tree%root_node)
         deallocate (parse_tree%root_node)
      end if
    end subroutine parse_tree_final
```

Print the parse tree. Print one token per line, indented according to the depth of the node.

The `verbose` version includes type identifiers for the nodes.

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_write
```

⟨*Parser: parse tree: TBP*⟩+≡
```
    procedure :: write => parse_tree_write
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_tree_write (parse_tree, unit, verbose)
      class(parse_tree_t), intent(in) :: parse_tree
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: verbose
      integer :: u
      logical :: short
      u = given_output_unit (unit);  if (u < 0)  return
      short = .true.;  if (present (verbose))  short = .not. verbose
      write (u, "(A)") "Parse tree:"
      if (associated (parse_tree%root_node)) then
         call parse_node_write_rec (parse_tree%root_node, unit, short, 1)
      else
         write (u, *) "[empty]"
      end if
    end subroutine parse_tree_write
```

This is a generic error that can be issued if the parse tree does not meet the expectaions of the parser. This most certainly indicates a bug.

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_bug
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_tree_bug (node, keys)
      type(parse_node_t), intent(in) :: node
      character(*), intent(in) :: keys
      call parse_node_write (node)
      call msg_bug (" Inconsistency in parse tree: expected " // keys)
    end subroutine parse_tree_bug
```

7.4.7 Access the parser

For scanning the parse tree we give access to the top node, as a node pointer. Of course, there should be no write access.

⟨*Parser: parse tree: TBP*⟩+≡

```
        procedure :: get_root_ptr => parse_tree_get_root_ptr
```

⟨*Parser: procedures*⟩+≡
```
    function parse_tree_get_root_ptr (parse_tree) result (node)
      class(parse_tree_t), intent(in) :: parse_tree
      type(parse_node_t), pointer :: node
      node => parse_tree%root_node
    end function parse_tree_get_root_ptr
```

7.4.8   Tools

This operation traverses the parse tree and simplifies any occurences of a set of
syntax rules. If such a parse node has only one sub-node, it is replaced by that
subnode. (This makes sense only of the rules to eliminate have no meaningful
token.)

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_reduce
```

⟨*Parser: procedures*⟩+≡
```
    subroutine parse_tree_reduce (parse_tree, rule_key)

```

7.4.9 Applications

For a file of the form

```
process foo, bar
  <something>
process xyz
  <something>
```

get the `<something>` entry node for the first matching process tag. If no matching entry is found, the node pointer remains unassociated.

⟨*Parser: public*⟩+≡
```
    public :: parse_tree_get_process_ptr
```

⟨*Parser: procedures*⟩+≡
```
    function parse_tree_get_process_ptr (parse_tree, process) result (node)
      type(parse_node_t), pointer :: node
      type(parse_tree_t), intent(in), target :: parse_tree
      type(string_t), intent(in) :: process
      type(parse_node_t), pointer :: node_root, node_process_def
      type(parse_node_t), pointer :: node_process_phs, node_process_list
      integer :: j

7.5 XML Parser

The XML parser is actually independent from the previous modules of lexer and parser. However, for a generic I/O interface we make use of the `stream_t` facility.

We need the XML parser for reading and writing LHEF data files. Only a subset of XML is actually relevant. The parser is of the "pull" type, i.e., the program steers the reading of XML data in a context-sensitive manner.

⟨xml.f90⟩≡
  ⟨*File header*⟩

  ```
  module xml
  ```

  ⟨*Use strings*⟩
  ```
    use io_units
    use system_defs, only: BLANK, TAB
    use diagnostics
    use ifiles
    use lexers
  ```

  ⟨*Standard module head*⟩

  ⟨*XML: public*⟩

  ⟨*XML: types*⟩

  ```
  contains
  ```

  ⟨*XML: procedures*⟩

  ```
  end module xml
  ```

7.5.1 Cached Stream

The stream type as defined in the `lexer` module is versatile regarding the choice of input channel, but it does not allow reading a section more than once. Here, we define an extension where we can return a string to the stream, which is stored in a cache variable, and presented to the caller for the next read.

⟨*XML: public*⟩≡
```
    public :: cstream_t
```
⟨*XML: types*⟩≡
```
    type, extends (stream_t) :: cstream_t
      logical :: cache_is_empty = .true.
      type(string_t) :: cache
    contains
    ⟨XML: cstream: TBP⟩
    end type cstream_t
```

The initializers are simply inherited.

Finalizer: also inherited, in essence:

⟨*XML: cstream: TBP*⟩≡
```
    procedure :: final => cstream_final
```

⟨*XML: procedures*⟩≡
```
subroutine cstream_final (stream)
  class(cstream_t), intent(inout) :: stream
  stream%cache_is_empty = .true.
  call stream%stream_t%final ()
end subroutine cstream_final
```

Get record: now, if there is a cache string, return this instead of the record from the stream.

⟨*XML: cstream: TBP*⟩+≡
```
procedure :: get_record => cstream_get_record
```

⟨*XML: procedures*⟩+≡
```
subroutine cstream_get_record (cstream, string, iostat)
  class(cstream_t), intent(inout) :: cstream
  type(string_t), intent(out) :: string
  integer, intent(out) :: iostat
  if (cstream%cache_is_empty) then
     call stream_get_record (cstream%stream_t, string, iostat)
  else
     string = cstream%cache
     cstream%cache_is_empty = .true.
     iostat = 0
  end if
end subroutine cstream_get_record
```

Revert: return the (partially read) record to the stream, putting it in the cache.

⟨*XML: cstream: TBP*⟩+≡
```
procedure :: revert_record => cstream_revert_record
```

⟨*XML: procedures*⟩+≡
```
subroutine cstream_revert_record (cstream, string)
  class(cstream_t), intent(inout) :: cstream
  type(string_t), intent(in) :: string
  if (cstream%cache_is_empty) then
     cstream%cache = string
     cstream%cache_is_empty = .false.
  else
     call msg_bug ("CStream: attempt to revert twice")
  end if
end subroutine cstream_revert_record
```

7.5.2 Attributes

A tag attribute has a name and a value; both are strings. When the attribute is defined, the known flag indicates this.

⟨*XML: types*⟩+≡
```
type :: attribute_t
  type(string_t) :: name
  type(string_t) :: value
  logical :: known = .false.
 contains
```

⟨*XML: attribute: TBP*⟩
```
   end type attribute_t
```

Output in standard format, non-advancing. (If the value is unknown, we indicate this by a question mark, which is non-standard.)

⟨*XML: attribute: TBP*⟩≡
```
   procedure :: write => attribute_write
```

⟨*XML: procedures*⟩+≡
```
   subroutine attribute_write (object, unit)
     class(attribute_t), intent(in) :: object
     integer, intent(in), optional :: unit
     integer :: u
     u = given_output_unit (unit)
     write (u, "(A,'=')", advance = "no")  char (object%name)
     if (object%known) then
        write (u, "(A,A,A)", advance = "no")  '"', char (object%value), '"'
     else
        write (u, "('?')", advance = "no")
     end if
   end subroutine attribute_write
```

This is a genuine constructor. The value is optional.

⟨*XML: public*⟩+≡
```
   public :: xml_attribute
```

⟨*XML: procedures*⟩+≡
```
   function xml_attribute (name, value) result (attribute)
     type(string_t), intent(in) :: name
     type(string_t), intent(in), optional :: value
     type(attribute_t) :: attribute
     attribute%name = name
     if (present (value)) then
        attribute%value = value
        attribute%known = .true.
     else
        attribute%known = .false.
     end if
   end function xml_attribute
```

Set a value explicitly.

⟨*XML: attribute: TBP*⟩+≡
```
   procedure :: set_value => attribute_set_value
```

⟨*XML: procedures*⟩+≡
```
   subroutine attribute_set_value (attribute, value)
     class(attribute_t), intent(inout) :: attribute
     type(string_t), intent(in) :: value
     attribute%value = value
     attribute%known = .true.
   end subroutine attribute_set_value
```

Extract a value. If unset, return `"?"`

⟨*XML: attribute: TBP*⟩+≡
```
procedure :: get_value => attribute_get_value
```

⟨*XML: procedures*⟩+≡
```
function attribute_get_value (attribute) result (value)
  class(attribute_t), intent(in) :: attribute
  type(string_t) :: value
  if (attribute%known) then
     value = attribute%value
  else
     value = "?"
  end if
end function attribute_get_value
```

7.5.3 The Tag Type

The basic entity is the internal representation of an XML tag. The tag has a name, a well-defined set of attributes which may be mandatory or optional, and a flag that determines whether there is content or not. The content itself is not stored in the data structure.

⟨*XML: public*⟩+≡
```
public :: xml_tag_t
```

⟨*XML: types*⟩+≡
```
type :: xml_tag_t
  type(string_t) :: name
  type(attribute_t), dimension(:), allocatable :: attribute
  logical :: has_content = .false.
 contains
 ⟨XML: tag: TBP⟩
end type xml_tag_t
```

Initialization. There are different versions, depending on content.

⟨*XML: tag: TBP*⟩≡
```
generic :: init => init_no_attributes
procedure :: init_no_attributes => xml_tag_init_no_attributes
```

⟨*XML: procedures*⟩+≡
```
subroutine xml_tag_init_no_attributes (tag, name, has_content)
  class(xml_tag_t), intent(out) :: tag
  type(string_t), intent(in) :: name
  logical, intent(in), optional :: has_content
  tag%name = name
  allocate (tag%attribute (0))
  if (present (has_content))  tag%has_content = has_content
end subroutine xml_tag_init_no_attributes
```

This version sets attributes.

⟨*XML: tag: TBP*⟩+≡
```
generic :: init => init_with_attributes
procedure :: init_with_attributes => xml_tag_init_with_attributes
```

⟨XML: procedures⟩+≡
```
    subroutine xml_tag_init_with_attributes (tag, name, attribute, has_content)
      class(xml_tag_t), intent(out) :: tag
      type(string_t), intent(in) :: name
      type(attribute_t), dimension(:), intent(in) :: attribute
      logical, intent(in), optional :: has_content
      tag%name = name
      allocate (tag%attribute (size (attribute)))
      tag%attribute = attribute
      if (present (has_content))  tag%has_content = has_content
    end subroutine xml_tag_init_with_attributes
```

Set an attribute value explicitly.

⟨XML: tag: TBP⟩+≡
```
    procedure :: set_attribute => xml_tag_set_attribute
```

⟨XML: procedures⟩+≡
```
    subroutine xml_tag_set_attribute (tag, i, value)
      class(xml_tag_t), intent(inout) :: tag
      integer, intent(in) :: i
      type(string_t), intent(in) :: value
      call tag%attribute(i)%set_value (value)
    end subroutine xml_tag_set_attribute
```

Get an attribute value.

⟨XML: tag: TBP⟩+≡
```
    procedure :: get_attribute => xml_tag_get_attribute
```

⟨XML: procedures⟩+≡
```
    function xml_tag_get_attribute (tag, i) result (value)
      class(xml_tag_t), intent(in) :: tag
      integer, intent(in) :: i
      type(string_t) :: value
      value = tag%attribute(i)%get_value ()
    end function xml_tag_get_attribute
```

Output to an I/O unit, default STDOUT. We use non-advancing output.

⟨XML: tag: TBP⟩+≡
```
    generic :: write => write_without_content
    procedure :: write_without_content => xml_tag_write
```

⟨XML: procedures⟩+≡
```
    subroutine xml_tag_write (tag, unit)
      class(xml_tag_t), intent(in) :: tag
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit)
      write (u, "('<',A)", advance = "no")  char (tag%name)
      do i = 1, size (tag%attribute)
         write (u, "(1x)", advance = "no")
         call tag%attribute(i)%write (u)
      end do
      if (tag%has_content) then
         write (u, "('>')", advance = "no")
```

```
              else
                  write (u, "(' />')", advance = "no")
              end if
          end subroutine xml_tag_write
```

If there is content, we should write the context next (arbitrary format), the
write the corresponding closing tag. Again, non-advancing.
⟨*XML: tag: TBP*⟩+≡
```
    procedure :: close => xml_tag_close
```

⟨*XML: procedures*⟩+≡
```
    subroutine xml_tag_close (tag, unit)
      class(xml_tag_t), intent(in) :: tag
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "('</',A,'>')", advance = "no")  char (tag%name)
    end subroutine xml_tag_close
```

Given content as a single string, we can write tag, content, and closing at once
⟨*XML: tag: TBP*⟩+≡
```
    generic :: write => write_with_content
    procedure :: write_with_content => xml_tag_write_with_content
```

⟨*XML: procedures*⟩+≡
```
    subroutine xml_tag_write_with_content (tag, content, unit)
      class(xml_tag_t), intent(in) :: tag
      type(string_t), intent(in) :: content
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      call tag%write (u)
      write (u, "(A)", advance = "no")  char (content)
      call tag%close (u)
    end subroutine xml_tag_write_with_content
```

Input from stream. We know what we are looking for, so we check if the name
matches, then fill attributes. We report an error if (a) an I/O error occurs, (b)
we reach EOF before encountering the tag, (c) if the tag is incomplete.

Trailing text after reading a tag is put back to the input stream.

We assume that the tag is not broken across records, and that there is only
one tag within the record. This is more restricted than standard XML.
⟨*XML: tag: TBP*⟩+≡
```
    procedure :: read => xml_tag_read
```

⟨*XML: procedures*⟩+≡
```
    subroutine xml_tag_read (tag, cstream, success)
      class(xml_tag_t), intent(inout) :: tag
      type(cstream_t), intent(inout) :: cstream
      logical, intent(out) :: success
      type(string_t) :: string
      integer :: iostat, p1, p2
      character(2), parameter :: WS = BLANK // TAB
```

```
logical :: done

Read the content string of a tag. We check for the appropriate closing tag and
report it. If a closing tag does not match in name, ignore it.

Note: this assumes that no tag with the same name is embedded in the
current content. Also, we do not check for XML validity inside the content.

      write (u, *)
      deallocate (tag)
      close (u_tmp)
      call cstream%final ()

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: xml_4"

    end subroutine xml_4
```

Chapter 8

Random-Number Generator

These modules implement abstract types and tools for random-number generation.

rng_base Abstract random-number generator and factory

selectors Selection depending on weights and random numbers

Implementation of the RNG abstract types:

Module rng_tao: Interface to the TAO random number generator which the VAMP package provides. Note that VAMP explicitly requests this generator.

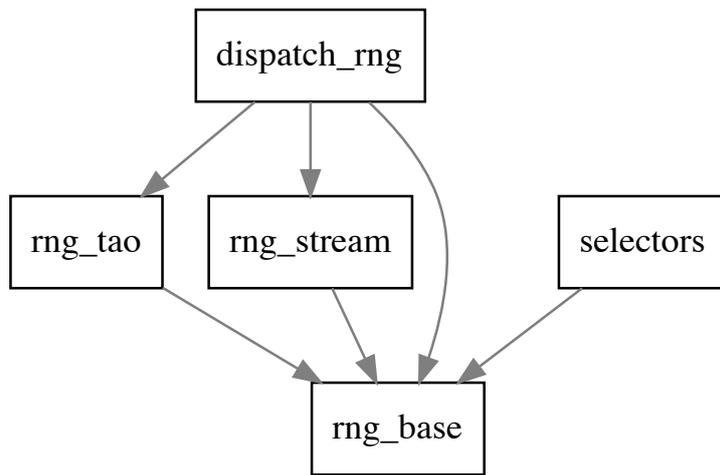
Module rng{stream: Implementation of RNGstream proposed by L'Ecuyer. The RNGStream provides access to different streams and/or substream of random numbers.


Figure 8.1: Module dependencies in `src/rng`.

8.1 Generic Random-Number Generator

For all generator implementations, we define a `rng` type which represents the state of a random-number generator with the associated methods that produce a random number. Furthermore, we define a `rng_factory` type. An object of this type is capable of allocating a sequence of `rng` objects. These generator states should be, if possible, statistically independent, so they can be used in parallel in different places of the event-generation chain.

⟨`rng_base.f90`⟩≡
  ⟨*File header*⟩

  `module rng_base`

  ⟨*Use kinds*⟩
    `use kinds, only: i16`
    `use constants, only: TWOPI`

  ⟨*Standard module head*⟩

  ⟨*RNG base: public*⟩

  ⟨*RNG base: types*⟩

  ⟨*RNG base: interfaces*⟩

  `contains`

  ⟨*RNG base: procedures*⟩

  `end module rng_base`

8.1.1 Generator type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

⟨*RNG base: public*⟩≡
    `public :: rng_t`

⟨*RNG base: types*⟩≡
    `type, abstract :: rng_t`
     `contains`
     ⟨*RNG base: rng: TBP*⟩
    `end type rng_t`

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

    The seed may be omitted. The behavior without seed is not defined, however.

⟨*RNG base: rng: TBP*⟩≡
    `procedure (rng_init), deferred :: init`

⟨*RNG base: interfaces*⟩≡
    `abstract interface`
       `subroutine rng_init (rng, seed)`

```
      import
      class(rng_t), intent(out) :: rng
      integer, intent(in), optional :: seed
    end subroutine rng_init
  end interface
```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

⟨*RNG base: rng: TBP*⟩+≡
```
    procedure (rng_final), deferred :: final
```

⟨*RNG base: interfaces*⟩+≡
```
    abstract interface
      subroutine rng_final (rng)
        import
        class(rng_t), intent(inout) :: rng
      end subroutine rng_final
    end interface
```

Output. We should, at least, identify the generator.

⟨*RNG base: rng: TBP*⟩+≡
```
    procedure (rng_write), deferred :: write
```

⟨*RNG base: interfaces*⟩+≡
```
    abstract interface
      subroutine rng_write (rng, unit, indent)
        import
        class(rng_t), intent(in) :: rng
        integer, intent(in), optional :: unit, indent
      end subroutine rng_write
    end interface
```

These routines generate a single and an array of uniformly distributed default-precision random numbers, respectively.

⟨*RNG base: rng: TBP*⟩+≡
```
    generic :: generate => generate_single, generate_array
    procedure (rng_generate_single), deferred :: generate_single
    procedure (rng_generate_array), deferred :: generate_array
```

⟨*RNG base: interfaces*⟩+≡
```
    abstract interface
      subroutine rng_generate_single (rng, x)
        import
        class(rng_t), intent(inout) :: rng
        real(default), intent(out) :: x
      end subroutine rng_generate_single
    end interface

    abstract interface
      subroutine rng_generate_array (rng, x)
        import
        class(rng_t), intent(inout) :: rng
        real(default), dimension(:), intent(out) :: x
```

```
      end subroutine rng_generate_array
    end interface
```

These routines generate a single and an array of Gaussian (normal) distributed default-precision random numbers, respectively. Mean is 0 and $\sigma = 1$. Note that $z = \mu + \sigma x$ then distributes with mean μ and variance σ^2.

The algorithm uses twice as much uniformly distributed random numbers, taken from the PDG review.

⟨*RNG base: rng: TBP*⟩+≡
```
    generic :: generate_gaussian => &
        rng_generate_gaussian_single, rng_generate_gaussian_array
    procedure, private :: rng_generate_gaussian_single
    procedure, private :: rng_generate_gaussian_array
```

⟨*RNG base: procedures*⟩≡
```
    subroutine rng_generate_gaussian_single (rng, x)
      class(rng_t), intent(inout) :: rng
      real(default), intent(out) :: x
      real(default), dimension(2) :: u
      call rng%generate (u)
      x = sin (twopi * u(1)) * sqrt (- 2 * log (u(2)))
    end subroutine rng_generate_gaussian_single

    subroutine rng_generate_gaussian_array (rng, x)
      class(rng_t), intent(inout) :: rng
      real(default), dimension(:), intent(out) :: x
      integer :: i
      do i = 1, size (x)
          call rng%generate_gaussian (x(i))
      end do
    end subroutine rng_generate_gaussian_array
```

8.1.2 RNG Factory

A factory object has a `make` method that allocates and initializes a new generator of appropriate type. It uses a 16-bit integer for initialization. For a real-life implementation, the factory should return a sequence of statistically independent generators, and for different seeds, the sequences should also be independent.

⟨*RNG base: public*⟩+≡
```
    public :: rng_factory_t
```

⟨*RNG base: types*⟩+≡
```
    type, abstract :: rng_factory_t
     contains
     ⟨RNG base: rng factory: TBP⟩
    end type rng_factory_t
```

Output. Should be short, just report the seed and current state of the factory.

⟨*RNG base: rng factory: TBP*⟩≡
```
    procedure (rng_factory_write), deferred :: write
```

⟨*RNG base: interfaces*⟩+≡
```
    abstract interface
       subroutine rng_factory_write (object, unit)
         import
         class(rng_factory_t), intent(in) :: object
         integer, intent(in), optional :: unit
       end subroutine rng_factory_write
    end interface
```

Initialize. It should be possible to do this repeatedly, resetting the state. The default seed should be 0.

⟨*RNG base: rng factory: TBP*⟩+≡
```
    procedure (rng_factory_init), deferred :: init
```

⟨*RNG base: interfaces*⟩+≡
```
    abstract interface
       subroutine rng_factory_init (factory, seed)
         import
         class(rng_factory_t), intent(out) :: factory
         integer(i16), intent(in), optional :: seed
       end subroutine rng_factory_init
    end interface
```

Spawn a new generator.

⟨*RNG base: rng factory: TBP*⟩+≡
```
    procedure (rng_factory_make), deferred :: make
```

⟨*RNG base: interfaces*⟩+≡
```
    abstract interface
       subroutine rng_factory_make (factory, rng)
         import
         class(rng_factory_t), intent(inout) :: factory
         class(rng_t), intent(out), allocatable :: rng
       end subroutine rng_factory_make
    end interface
```

8.1.3 Unit tests

Test module, followed by the corresponding implementation module.

⟨**rng_base_ut.f90**⟩≡
```
  ⟨File header⟩

  module rng_base_ut
    use unit_tests
    use rng_base_uti

  ⟨Standard module head⟩

  ⟨RNG base: public test⟩

  ⟨RNG base: public test auxiliary⟩
```

```
  contains

  ⟨RNG base: test driver⟩

  end module rng_base_ut
```

⟨rng_base_uti.f90⟩≡
  ⟨File header⟩

```
  module rng_base_uti
```

  ⟨Use kinds⟩
```
    use kinds, only: i16
    use format_utils, only: write_indent
    use io_units

    use rng_base
```

  ⟨Standard module head⟩

  ⟨RNG base: public test auxiliary⟩

  ⟨RNG base: test declarations⟩

  ⟨RNG base: test types⟩

```
  contains
```

  ⟨RNG base: tests⟩

  ⟨RNG base: test auxiliary⟩

```
  end module rng_base_uti
```
API: driver for the unit tests below.

⟨RNG base: public test⟩≡
```
    public :: rng_base_test
```

⟨RNG base: test driver⟩≡
```
    subroutine rng_base_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
```
    ⟨RNG base: execute tests⟩
```
    end subroutine rng_base_test
```

Test generator

The test 'mock' random generator generates a repeating series with the numbers $0.1, 0.3, 0.5, 0.7, 0.9$. It has an integer stored as state. The integer must be one of $1, 3, 5, 7, 9$.

⟨RNG base: public test auxiliary⟩≡
```
    public :: rng_test_t
```

⟨*RNG base: test types*⟩≡
```
type, extends (rng_t) :: rng_test_t
   integer :: state = 1
 contains
   procedure :: write => rng_test_write
   procedure :: init => rng_test_init
   procedure :: final => rng_test_final
   procedure :: generate_single => rng_test_generate_single
   procedure :: generate_array => rng_test_generate_array
end type rng_test_t
```

Output. The state is a single number, so print it.

⟨*RNG base: test auxiliary*⟩≡
```
subroutine rng_test_write (rng, unit, indent)
  class(rng_test_t), intent(in) :: rng
  integer, intent(in), optional :: unit, indent
  integer :: u, ind
  u = given_output_unit (unit)
  ind = 0;  if (present (indent))  ind = indent
  call write_indent (u, ind)
  write (u, "(A,I0,A)")  "Random-number generator: &
       &test (state = ", rng%state, ")"
end subroutine rng_test_write
```

The default seed is 1.

⟨*RNG base: test auxiliary*⟩+≡
```
subroutine rng_test_init (rng, seed)
  class(rng_test_t), intent(out) :: rng
  integer, intent(in), optional :: seed
  if (present (seed))  rng%state = seed
end subroutine rng_test_init
```

Nothing to finalize:

⟨*RNG base: test auxiliary*⟩+≡
```
subroutine rng_test_final (rng)
  class(rng_test_t), intent(inout) :: rng
end subroutine rng_test_final
```

Generate a single number and advance the state.

⟨*RNG base: test auxiliary*⟩+≡
```
subroutine rng_test_generate_single (rng, x)
  class(rng_test_t), intent(inout) :: rng
  real(default), intent(out) :: x
  x = rng%state / 10._default
  rng%state = mod (rng%state + 2, 10)
end subroutine rng_test_generate_single
```

The array generator calls the single-item generator multiple times.

⟨*RNG base: test auxiliary*⟩+≡
```
subroutine rng_test_generate_array (rng, x)
  class(rng_test_t), intent(inout) :: rng
```

```
    real(default), dimension(:), intent(out) :: x
    integer :: i
    do i = 1, size (x)
        call rng%generate (x(i))
    end do
end subroutine rng_test_generate_array
```

Test Factory

This factory makes **rng_test_t** generators, initialized with integers 1, 3, 5, 7, 9 if given the input 0, 1, 2, 3, 4. The generators within one sequence are all identical, however.

⟨*RNG base: public test auxiliary*⟩+≡
```
    public :: rng_test_factory_t
```

⟨*RNG base: test types*⟩+≡
```
    type, extends (rng_factory_t) :: rng_test_factory_t
       integer :: seed = 1
     contains
     ⟨RNG base: rng test factory: TBP⟩
    end type rng_test_factory_t
```

Output.
⟨*RNG base: rng test factory: TBP*⟩≡
```
    procedure :: write => rng_test_factory_write
```

⟨*RNG base: test auxiliary*⟩+≡
```
    subroutine rng_test_factory_write (object, unit)
      class(rng_test_factory_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A,I0,A)")  "RNG factory: test (", object%seed, ")"
    end subroutine rng_test_factory_write
```

Initialize, translating the given seed.
⟨*RNG base: rng test factory: TBP*⟩+≡
```
    procedure :: init => rng_test_factory_init
```

⟨*RNG base: test auxiliary*⟩+≡
```
    subroutine rng_test_factory_init (factory, seed)
      class(rng_test_factory_t), intent(out) :: factory
      integer(i16), intent(in), optional :: seed
      if (present (seed))  factory%seed = mod (seed * 2 + 1, 10)
    end subroutine rng_test_factory_init
```

⟨*RNG base: rng test factory: TBP*⟩+≡
```
    procedure :: make => rng_test_factory_make
```

⟨*RNG base: test auxiliary*⟩+≡
```
    subroutine rng_test_factory_make (factory, rng)
      class(rng_test_factory_t), intent(inout) :: factory
      class(rng_t), intent(out), allocatable :: rng
      allocate (rng_test_t :: rng)
      select type (rng)
      type is (rng_test_t)
         call rng%init (int (factory%seed))
      end select
    end subroutine rng_test_factory_make
```

Generator check

Initialize the generator and draw random numbers.

⟨*RNG base: execute tests*⟩≡
```
    call test (rng_base_1, "rng_base_1", &
         "rng initialization and call", &
         u, results)
```

⟨*RNG base: test declarations*⟩≡
```
    public :: rng_base_1
```

⟨*RNG base: tests*⟩≡
```
    subroutine rng_base_1 (u)
      integer, intent(in) :: u
      class(rng_t), allocatable :: rng

      real(default) :: x
      real(default), dimension(2) :: x2

      write (u, "(A)")  "* Test output: rng_base_1"
      write (u, "(A)")  "*   Purpose: initialize and call a test random-number &
           &generator"
      write (u, "(A)")

      write (u, "(A)")  "* Initialize generator"
      write (u, "(A)")

      allocate (rng_test_t :: rng)
      call rng%init (3)

      call rng%write (u)

      write (u, "(A)")
      write (u, "(A)")  "* Get random number"

      call rng%generate (x)
      write (u, "(A,2(1x,F9.7))")  "x =", x

      write (u, "(A)")
      write (u, "(A)")  "* Get random number pair"
      write (u, "(A)")
```

```
            call rng%generate (x2)
            write (u, "(A,2(1x,F9.7))")  "x =", x2

            write (u, "(A)")
            write (u, "(A)")  "* Cleanup"

            call rng%final ()

            write (u, "(A)")
            write (u, "(A)")  "* Test output end: rng_base_1"

        end subroutine rng_base_1
```

Factory check

Set up a factory and spawn generators.

⟨*RNG base: execute tests*⟩+≡
```
        call test (rng_base_2, "rng_base_2", &
            "rng factory", &
            u, results)
```

⟨*RNG base: test declarations*⟩+≡
```
        public :: rng_base_2
```

⟨*RNG base: tests*⟩+≡
```
        subroutine rng_base_2 (u)
          integer, intent(in) :: u
          type(rng_test_factory_t) :: rng_factory
          class(rng_t), allocatable :: rng

            write (u, "(A)")  "* Test output: rng_base_2"
            write (u, "(A)")  "*   Purpose: initialize and use a rng factory"
            write (u, "(A)")

            write (u, "(A)")  "* Initialize factory"
            write (u, "(A)")

            call rng_factory%init ()
            call rng_factory%write (u)

            write (u, "(A)")
            write (u, "(A)")  "* Make a generator"
            write (u, "(A)")

            call rng_factory%make (rng)
            call rng%write (u)

            write (u, "(A)")
            write (u, "(A)")  "* Cleanup"

            call rng%final ()

            write (u, "(A)")
            write (u, "(A)")  "* Test output end: rng_base_2"
```

```
end subroutine rng_base_2
```

8.2   Select from a weighted sample

⟨selectors.f90⟩≡
  ⟨*File header*⟩

```

  ⟨*Selectors: procedures*⟩

  ```
  end module selectors
```

8.2.1   Selector type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

⟨*Selectors: public*⟩≡
```
    public :: selector_t
```

⟨*Selectors: types*⟩≡
```
    type :: selector_t
       integer :: offset = 0
       integer, dimension(:), allocatable :: map
       real(default), dimension(:), allocatable :: weight
       real(default), dimension(:), allocatable :: acc
     contains
```
     ⟨*Selectors: selector: TBP*⟩
```
  end type selector_t
```

Display contents.

⟨*Selectors: selector: TBP*⟩≡
```
    procedure :: write => selector_write
```

⟨*Selectors: procedures*⟩≡
```
    subroutine selector_write (object, unit, testflag)
      class(selector_t), intent(in) :: object
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag
      integer :: u, i
      logical :: truncate
      u = given_output_unit (unit)
```

```
      truncate = .false.;  if (present (testflag))  truncate = testflag
      write (u, "(1x,A)")  "Selector: i, weight, acc. weight"
      if (allocated (object%weight)) then
         do i = 1, size (object%weight)
            if (truncate) then
               write (u, "(3x,I0,2(1x," // FMT_14 // "))") &
                     object%map(i), object%weight(i), object%acc(i)
            else
               write (u, "(3x,I0,2(1x," // FMT_19 // "))") &
                     object%map(i), object%weight(i), object%acc(i)
            end if
         end do
      else
         write (u, "(3x,A)")  "[undefined]"
      end if
   end subroutine selector_write
```

We pack the input weight array such that zero-weight entries are removed. We
also normalize it. This makes a `map` array for mapping the selected weight to
the actual entry necessary.

  We may encounter a case where all weights are zero. We do not reject this,
but set up the selector so that it always returns the first entry.

⟨*Selectors: selector: TBP*⟩+≡
```
      procedure :: init => selector_init
```

⟨*Selectors: procedures*⟩+≡
```
      subroutine selector_init (selector, weight, negative_weights, offset)
        class(selector_t), intent(out) :: selector
        real(default), dimension(:), intent(in) :: weight
        logical, intent(in), optional :: negative_weights
        integer, intent(in), optional :: offset
        real(default) :: s
        integer :: n, i
        logical :: neg_wgt
        logical, dimension(:), allocatable :: mask
        if (present (offset))  selector%offset = offset
        if (size (weight) == 0) &
             call msg_bug ("Selector init: zero-size weight array")
        neg_wgt = .false.
        if (present (negative_weights))  neg_wgt = negative_weights
        if (.not. neg_wgt .and. any (weight < 0)) &
             call msg_fatal ("Selector init: negative weight encountered")
        s = sum (weight)
        allocate (mask (size (weight)), &
             source = weight /= 0)
        n = count (mask)
        if (n > 0) then
           allocate (selector%map (n), &
                source = pack ([(i + selector%offset, i = 1, size (weight))], mask))
           allocate (selector%weight (n), &
                source = pack (abs (weight) / s, mask))
           allocate (selector%acc (n))
           selector%acc(1) = selector%weight(1)
           do i = 2, n - 1
```

```
          selector%acc(i) = selector%acc(i-1) + selector%weight(i)
        end do
        selector%acc(n) = 1
      else
        allocate (selector%map (1), source = 1)
        allocate (selector%weight (1), source = 0._default)
        allocate (selector%acc (1), source = 1._default)
      end if
    end subroutine selector_init
```

Select an entry based upon the number x, which should be a uniformly distributed random number between 0 and 1.

⟨*Selectors: selector: TBP*⟩+≡

```
    procedure :: select => selector_select
```

⟨*Selectors: procedures*⟩+≡

```
    function selector_select (selector, x) result (n)
      class(selector_t), intent(in) :: selector
      real(default), intent(in) :: x
      integer :: n
      integer :: i
      if (x < 0 .or. x > 1) &
          call msg_bug ("Selector: random number out of range")
      do i = 1, size (selector%acc)
        if (x <= selector%acc(i))  exit
      end do
      n = selector%map(i)
    end function selector_select
```

Use the provided random-number generator to select an entry. (Unless there is only one entry.)

⟨*Selectors: selector: TBP*⟩+≡

```
    procedure :: generate => selector_generate
```

⟨*Selectors: procedures*⟩+≡

```
    subroutine selector_generate (selector, rng, n)
      class(selector_t), intent(in) :: selector
      class(rng_t), intent(inout) :: rng
      integer, intent(out) :: n
      real(default) :: x
      select case (size (selector%acc))
      case (1)
        n = selector%map(1)
      case default
        call rng%generate (x)
        n = selector%select (x)
      end select
    end subroutine selector_generate
```

Determine the normalized weight for a selected entry. We use a linear search for the inverse lookup, assuming that efficiency is not an issue for this function.

⟨*Selectors: selector: TBP*⟩+≡

```
    procedure :: get_weight => selector_get_weight
```

⟨*Selectors: procedures*⟩+≡

```
    function selector_get_weight (selector, n) result (weight)
      class(selector_t), intent(in) :: selector
      integer, intent(in) :: n
      real(default) :: weight
      integer :: i
      do i = 1, size (selector%weight)
         if (selector%map(i) == n) then
            weight = selector%weight(i)
            return
         end if
      end do
      weight = 0
    end function selector_get_weight
```

8.2.2   Unit tests

Test module, followed by the corresponding implementation module.

    write (u, "(A)")  "* Cleanup"

    call rng%final ()

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: selectors_2"

  end subroutine selectors_2
```

8.3 TAO Random-Number Generator

This module provides an implementation for the generic random-number generator. Actually, we interface the TAO random-number generator which is available via the VAMP package.

⟨rng_tao.f90⟩≡
  ⟨*File header*⟩

```
  module rng_tao
```

```
⟨Use kinds⟩
  use io_units
  use format_utils, only: write_indent
  use tao_random_numbers !NODEP!

  use rng_base

⟨Standard module head⟩

⟨RNG tao: public⟩

⟨RNG tao: types⟩

contains

⟨RNG tao: procedures⟩

end module rng_tao
```

8.3.1 Generator type

The rng object is actually the state of the random-number generator. The methods initialize/reset and call the generator for this state.

We keep the seed, in case we want to recover it later, and count the number of calls since seeding.

⟨*RNG tao: public*⟩≡
```
    public :: rng_tao_t
```

⟨*RNG tao: types*⟩≡
```
    type, extends (rng_t) :: rng_tao_t
       integer :: seed = 0
       integer :: n_calls = 0
       type(tao_random_state) :: state
     contains
     ⟨RNG tao: rng tao: TBP⟩
    end type rng_tao_t
```

Output: Display seed and number of calls.

⟨*RNG tao: rng tao: TBP*⟩≡
```
    procedure :: write => rng_tao_write
```

⟨*RNG tao: procedures*⟩≡
```
    subroutine rng_tao_write (rng, unit, indent)
      class(rng_tao_t), intent(in) :: rng
      integer, intent(in), optional :: unit, indent
      integer :: u, ind
      u = given_output_unit (unit)
      ind = 0;  if (present (indent))  ind = indent
      call write_indent (u, ind)
      write (u, "(A)")  "TAO random-number generator:"
      call write_indent (u, ind)
      write (u, "(2x,A,I0)")  "seed  = ", rng%seed
```

```
      call write_indent (u, ind)
      write (u, "(2x,A,I0)")  "calls = ", rng%n_calls
    end subroutine rng_tao_write
```

The `init` method initializes the generator and sets a seed. We should implement the interface such that a single integer is sufficient for a seed.

The seed may be omitted. The default seed is 0.

⟨*RNG tao: rng tao: TBP*⟩+≡
```
    procedure :: init => rng_tao_init
```

⟨*RNG tao: procedures*⟩+≡
```
    subroutine rng_tao_init (rng, seed)
      class(rng_tao_t), intent(out) :: rng
      integer, intent(in), optional :: seed
      if (present (seed))  rng%seed = seed
      call tao_random_create (rng%state, rng%seed)
    end subroutine rng_tao_init
```

The `final` method deallocates memory where necessary and allows for another call of `init` to reset the generator.

⟨*RNG tao: rng tao: TBP*⟩+≡
```
    procedure :: final => rng_tao_final
```

⟨*RNG tao: procedures*⟩+≡
```
    subroutine rng_tao_final (rng)
      class(rng_tao_t), intent(inout) :: rng
      call tao_random_destroy (rng%state)
    end subroutine rng_tao_final
```

These routines generate a single and an array of default-precision random numbers, respectively.

We have to convert from explicit double to abstract default precision. Under normal conditions, both are equivalent, however. Unless, someone decides to do single precision, there is always an interface for `tao_random_numbers`.

⟨*RNG tao: rng tao: TBP*⟩+≡
```
    procedure :: generate_single => rng_tao_generate_single
    procedure :: generate_array => rng_tao_generate_array
```

⟨*RNG tao: procedures*⟩+≡
```
    subroutine rng_tao_generate_single (rng, x)
      class(rng_tao_t), intent(inout) :: rng
      real(default), intent(out) :: x
      real(default) :: r
      call tao_random_number (rng%state, r)
      x = r
      rng%n_calls = rng%n_calls + 1
    end subroutine rng_tao_generate_single

    subroutine rng_tao_generate_array (rng, x)
      class(rng_tao_t), intent(inout) :: rng
      real(default), dimension(:), intent(out) :: x
      real(default) :: r
      integer :: i
```

```
        do i = 1, size (x)
            call tao_random_number (rng%state, r)
            x(i) = r
        end do
        rng%n_calls = rng%n_calls + size (x)
    end subroutine rng_tao_generate_array
```

Factory

This factory makes `rng_tao_t` generators, initialized with the seeds

$$s_i = s_0 * 2^{16} + i \tag{8.1}$$

where s_0 is the seed (a 16-bit integer) given to the factory object, and i is the index in the generated sequence of generators, starting with zero.

⟨*RNG tao: public*⟩+≡
```
    public :: rng_tao_factory_t
```

⟨*RNG tao: types*⟩+≡
```
    type, extends (rng_factory_t) :: rng_tao_factory_t
       integer(i16) :: s = 0
       integer(i16) :: i = 0
     contains
     ⟨RNG tao: rng tao factory: TBP⟩
    end type rng_tao_factory_t
```

Output.
⟨*RNG tao: rng tao factory: TBP*⟩≡
```
    procedure :: write => rng_tao_factory_write
```

⟨*RNG tao: procedures*⟩+≡
```
    subroutine rng_tao_factory_write (object, unit)
      class(rng_tao_factory_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A,2(I0,A))") &
           "RNG factory: tao (", object%s, ",", object%i, ")"
    end subroutine rng_tao_factory_write
```

Initialize, translating the given seed.
⟨*RNG tao: rng tao factory: TBP*⟩+≡
```
    procedure :: init => rng_tao_factory_init
```

⟨*RNG tao: procedures*⟩+≡
```
    subroutine rng_tao_factory_init (factory, seed)
      class(rng_tao_factory_t), intent(out) :: factory
      integer(i16), intent(in), optional :: seed
      if (present (seed))  factory%s = seed
    end subroutine rng_tao_factory_init
```

⟨*RNG tao: rng tao factory: TBP*⟩+≡
```
    procedure :: make => rng_tao_factory_make
```

⟨*RNG tao: procedures*⟩+≡
```
    subroutine rng_tao_factory_make (factory, rng)
      class(rng_tao_factory_t), intent(inout) :: factory
      class(rng_t), intent(out), allocatable :: rng
      allocate (rng_tao_t :: rng)
      select type (rng)
      type is (rng_tao_t)
         call rng%init (factory%s * 65536 + factory%i)
         factory%i = int (factory%i + 1, kind = i16)
      end select
    end subroutine rng_tao_factory_make
```

8.3.2 Unit tests

Test module, followed by the corresponding implementation module.

⟨`rng_tao_ut.f90`⟩≡
  ⟨*File header*⟩

    write (u, "(A)")  "* Test output end: rng_tao_2"

  end subroutine rng_tao_2
```

8.4   RNG Stream

We implement the RNGstream proposed and implemented in C++, C and Java
by L'Ecuyer et al. (LEcuyer, Pierre, Richard Simard, E. Jack Chen, and W.
David Kelton. An Object-Oriented Random-Number Package with Many Long
Streams and Substreams. Operations Research 50, no. 6 (December 2002):
10731075. doi:10.1287/opre.50.6.1073.358.). RNGstream allows us to access

331

multiple independent streams of random numbers.

⟨rng_stream.f90⟩≡
  ⟨*File header*⟩

  ```
  module rng_stream
  ```

  ⟨*Use kinds*⟩
  ```
    use kinds, only: i16
    use io_units
    use format_utils, only: write_indent
    use diagnostics

    use rng_base
  ```

  ⟨*Standard module head*⟩

  ⟨*RNG stream: parameters*⟩

  ⟨*RNG stream: public*⟩

  ⟨*RNG stream: types*⟩

  ```
  contains
  ```

  ⟨*RNG stream: procedures*⟩

  ```
  end module rng_stream
  ```

We store the current position in the stream of random numbers. Furthermore, we store the beginning of the (latest) substream and the initial starting point of the stream, which corresponds to the "seed". The default seed is 1234.

⟨*RNG stream: public*⟩≡
```
    public :: rng_stream_t
```

⟨*RNG stream: types*⟩≡
```
    type, extends(rng_t) :: rng_stream_t
      private
      logical :: antithetic = .false.
      logical :: increased_precision = .false.
      real(default), dimension(3, 2) :: current_position = 1234._default
      real(default), dimension(3, 2) :: beginning_substream = 1234._default
      real(default), dimension(3, 2) :: initial_stream = 1234._default
    contains
    ⟨RNG stream: rng stream: TBP⟩
    end type rng_stream_t
```

Output. Display current position and the (sub-)stream positions.

⟨*RNG stream: rng stream: TBP*⟩≡
```
    procedure, public :: write => rng_stream_write
```

⟨*RNG stream: procedures*⟩≡
```
    subroutine rng_stream_write (rng, unit, indent)
      class(rng_stream_t), intent(in) :: rng
      integer, intent(in), optional :: unit
```

```
      integer, intent(in), optional :: indent
      integer :: j, u, ind
      u = given_output_unit (unit)
      ind = 0; if (present (indent)) ind = indent
      call write_indent (u, ind)
      write (u, "(A)") "RNG Stream generator"
      call write_indent (u, ind)
      write (u, "(A)") "Current position = [ "
      call write_indent (u, ind)
      write (u, "(3(F20.1,',',1X))") rng%current_position(:, 1)

Generate a single real random number from the current state of (sub-)stream.

The machine representation of the result can lead to negative numbers. We add m_1 or m_2 to the respective number to ensure they are all positive and are still congruent to $\mod m_1$ or $\mod m_2$.

The final formula $x = y(3,1) - y(3,2) \pmod{m_1}$ can lead to negative random numbers. Instead of directly calculating the modulo, we check whether $y(3,1)$ is larger than $y(3,2)$, or not. If $x(3,1) > y(3,2)$, then $y(3,1) - y(3,2)$ is congruent to $y(3,1) - y(3,2) \mod m_1$. If $y(3,1) < y(3,2)$, then $y(3,1) - y(3,2) + m_1$ is congruent to $y(3,1) - y(3,2) \mod m_1$.

```

Advance state of the current stream by n steps. We do not touch the beginning of the substream nor the initial stream. The purpose of the procedure is to reproduce the same random number (streams) among multiple workers without additional communication cost. E.g. worker 1 needs the first 5000 random numbers and the second one needs the next 5000 random numbers. In such a way we can exactly reproduce results (upon numerical noise) in single or parallel runs with the RngStream. The procedure must only be used with care! Misuse can lead to wrong results!

⟨*RNG stream: parameter*⟩≡
```
    real(default), dimension(3, 3), parameter :: A1p0 = reshape (&
        [0.0_default, 1.0_default, 0.0_default, &

  real(default), dimension(3, 3) :: c
  real(default), dimension(3, 3) :: w
  integer :: i
  w = a
  c = 0.; forall (i = 1:3) c(i, i) = 1.
  i = n
  do while (i > 0)
     if (mod(i, 2) /= 0) c = matmat_mod (w, c, m)
     w = matmat_mod (w, w, m)
     i = i / 2
  end do
end function matpow_mod

function matmat_mod (a, b, m) result (c)
  real(default), dimension(3, 3), intent(in) :: a
  real(default), dimension(3, 3), intent(in) :: b
  real(default), dimension(3, 3) :: c
  real(default), intent(in) :: m
  integer :: i
  do i = 1, 3
     c(:, i) = matmul_mod (a, b(:, i), m)
  end do
end function matmat_mod
```

8.4.1 Factory

We utilize the streams proposed by L'Ecuyer where we use precalculated transition matrices to jump between different (sub-)streams.

The random generator has the period ρ and the transition function $T :$ $s_n \to s_{n+1}$ whereas s_n is the generator's state after n steps. Furthermore, it is $T^\rho(s) = s$. The stream of random number then is disjoint into streams and

substreams. The length of the streams, which divide the overall stream, should be $Z = 2^z$ and partition those streams again in $V = 2^v$ substreams of length $W = 2^w$.

We store the seed and the initial stream, also, the beginning of the substream.

⟨*RNG stream: public*⟩+≡
```
public :: rng_stream_factory_t
```

⟨*RNG stream: types*⟩+≡
```
type, extends(rng_factory_t) :: rng_stream_factory_t
  real(default), dimension(3, 2) :: seed = 1234._default
 contains
 ⟨RNG stream: rng stream factory: TBP⟩
 end type rng_stream_factory_t
```

Output.

⟨*RNG stream: rng stream factory: TBP*⟩≡
```
procedure, public :: write => rng_stream_factory_write
```

⟨*RNG stream: procedures*⟩+≡
```
subroutine rng_stream_factory_write (object, unit)
  class(rng_stream_factory_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit)
  write (u, "(1x,A)") "RNG Stream factory"
  write (u, "(1x,A,6(F20.1,',',1X),A)") "Next seed = [ "
  write (u, "(1x,3(F20.1,',',1X))") object%seed(:, 1)
  write (u, "(1x,3(F20.1,',',1X))") object%seed(:, 2)
  write (u, "(1x,A)") "]"
end subroutine rng_stream_factory_write
```

Initialize. Default seed is 1234. We do not check whether the seed is valid, this is later done in rng_stream_init.

Additionally, we have to explicitly convert from integer to real because we are using floating-point arithmetic and not integer arithmetic due to a larger set of number in the representation of real numbers.

⟨*RNG stream: rng stream factory: TBP*⟩+≡
```
procedure, public :: init => rng_stream_factory_init
```

⟨*RNG stream: procedures*⟩+≡
```
subroutine rng_stream_factory_init (factory, seed)
  class(rng_stream_factory_t), intent(out) :: factory
  integer(i16), intent(in), optional :: seed
  real(default), dimension(3, 2) :: real_seed
  if (present (seed)) then
     factory%seed = real(seed, default)
  end if
end subroutine rng_stream_factory_init
```

Allocate a new RNG and different stream states, accordingly.

⟨*RNG stream: rng stream factory: TBP*⟩+≡
```
procedure, public :: make => rng_stream_factory_make
```

⟨*RNG stream: procedures*⟩+≡
```
    subroutine rng_stream_factory_make (factory, rng)
      class(rng_stream_factory_t), intent(inout) :: factory
      class(rng_t), intent(out), allocatable :: rng
      allocate (rng_stream_t :: rng)
      select type (rng)
      type is (rng_stream_t)
         call rng%init ()
         call rng%set_initial_stream (factory%seed)
      end select
      call factory%advance_seed ()
    end subroutine rng_stream_factory_make
```

Advance seed. Use the precalculated transistion matrices for the streams.

⟨*RNG stream: parameters*⟩+≡
```
  real(default), dimension(3,3), parameter :: A1p127 = reshape (&
       [2427906178.0_default, 3580155704.0_default, 949770784.0_default, &

8.5   Dispatch

⟨dispatch_rng.f90⟩≡
  ⟨*File header*⟩

```
  module dispatch_rng

    use kinds, only: i16
```
⟨*Use strings*⟩
```
    use diagnostics
    use variables

    use rng_base
    use rng_tao
    use rng_stream
```

⟨*Standard module head*⟩

⟨*Dispatch rng: public*⟩

⟨*Dispatch rng: variables*⟩

```
  contains
```

⟨Dispatch rng: procedures⟩

```
end module dispatch_rng
```

Allocate a random-number generator factory according to the variable $rng_method, using the current seed in the global record. (If the variable does not exist, the lookup will return the value 0.) We take only the lower 15 bits of the seed, so the actual value fits into a positive 16-bit signed integer.

   Since we want to guarantee that all random-number generators in a run are independent, we increment the global seed by one after creating the rng factory and return it to the caller. If the user wants to have identical sequences, he can always set the seed manually, before it is used.

⟨Dispatch rng: public⟩≡
```
    public :: dispatch_rng_factory
```

⟨Dispatch rng: procedures⟩≡
```
    subroutine dispatch_rng_factory (rng_factory, var_list, next_rng_seed)
      class(rng_factory_t), allocatable, intent(inout) :: rng_factory
      type(var_list_t), intent(in) :: var_list
      integer, intent(out) :: next_rng_seed
      type(var_list_t) :: local
      type(string_t) :: rng_method
      integer :: seed
      character(30) :: buffer
      integer(i16) :: s
      rng_method = var_list%get_sval (var_str ("$rng_method"))
      seed = var_list%get_ival (var_str ("seed"))
      s = int (mod (seed, 32768), i16)
      select case (char (rng_method))
      case ("tao")
         allocate (rng_tao_factory_t :: rng_factory)
         call msg_message ("RNG: Initializing TAO random-number generator")
         next_rng_seed = seed + 1
      case ("rng_stream")
         allocate (rng_stream_factory_t :: rng_factory)
         call msg_message ("RNG: Initializing RNG Stream random-number generator")
         next_rng_seed = seed + 1
      case default
         if (associated (dispatch_rng_factory_fallback)) then
            call dispatch_rng_factory_fallback &
                 (rng_factory, var_list, next_rng_seed)
         end if
         if (.not. allocated (rng_factory)) then
            call msg_fatal ("Random-number generator '" &
                 // char (rng_method) // "' not implemented")
         end if
      end select
      write (buffer, "(I0)")  s
      call msg_message ("RNG: Setting seed for random-number generator to " &
              // trim (buffer))
      call rng_factory%init (s)
    end subroutine dispatch_rng_factory
```

This is a hook that allows us to inject further handlers for RNG factory objects,

in particular a test RNG.

⟨*Dispatch rng: public*⟩+≡
```
    public :: dispatch_rng_factory_fallback
```

⟨*Dispatch rng: variables*⟩≡
```
    procedure (dispatch_rng_factory), pointer :: &
        dispatch_rng_factory_fallback => null ()
```

If the RNG factory dispatcher has used up a seed, we should reset it in the
variable list. Separate subroutine with optional argument for more flexibility.

⟨*Dispatch rng: public*⟩+≡
```
    public :: update_rng_seed_in_var_list
```

⟨*Dispatch rng: procedures*⟩+≡
```
    subroutine update_rng_seed_in_var_list (var_list, next_rng_seed)
      type(var_list_t), intent(inout), optional :: var_list
      integer, intent(in) :: next_rng_seed
      if (present (var_list)) then
         call var_list%set_int (var_str ("seed"), next_rng_seed, is_known=.true.)
      end if
    end subroutine update_rng_seed_in_var_list
```

8.5.1 Unit tests

Test module, followed by the corresponding implementation module.

⟨dispatch_rng_ut.f90⟩≡
  ⟨*File header*⟩

```
  module dispatch_rng_ut
    use unit_tests
    use dispatch_rng_uti
```

  ⟨*Standard module head*⟩

  ⟨*Dispatch rng: public test*⟩

  ⟨*Dispatch rng: public test auxiliary*⟩

```
  contains
```

  ⟨*Dispatch rng: test driver*⟩

```
  end module dispatch_rng_ut
```

⟨dispatch_rng_uti.f90⟩≡
  ⟨*File header*⟩

```
  module dispatch_rng_uti
```

  ⟨*Use strings*⟩
```
    use variables
    use diagnostics
    use rng_base
    use dispatch_rng
```

⟨*Standard module head*⟩

⟨*Dispatch rng: public test auxiliary*⟩

⟨*Dispatch rng: test declarations*⟩

```
contains
```

⟨*Dispatch rng: tests*⟩

⟨*Dispatch rng: test auxiliary*⟩

```
end module dispatch_rng_uti
```

API: driver for the unit tests below.

⟨*Dispatch rng: public test*⟩≡
```
    public ::dispatch_rng_test
```

⟨*Dispatch rng: test driver*⟩≡
```
    subroutine dispatch_rng_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
```
⟨*Dispatch rng: execute tests*⟩
```
    end subroutine dispatch_rng_test
```

Select type: random number generator

This is an extra dispatcher that enables the test RNG. This procedure should be assigned to the `dispatch_rng_factory_fallback` hook before any tests are executed.

The test generator does not use the seed at all, but it does increment it to be consistent with the other implementations.

⟨*Dispatch rng: public test auxiliary*⟩≡
```
    public :: dispatch_rng_factory_test
```

⟨*Dispatch rng: test auxiliary*⟩≡
```
    subroutine dispatch_rng_factory_test (rng_factory, var_list, next_rng_seed)
      use rng_base
      use rng_base_ut, only: rng_test_factory_t
      class(rng_factory_t), allocatable, intent(inout) :: rng_factory
      type(var_list_t), intent(in) :: var_list
      integer, intent(out) :: next_rng_seed
      type(string_t) :: rng_method
      if (var_list%contains (var_str ("$rng_method"))) then
         rng_method = var_list%get_sval (var_str ("$rng_method"))
      else
         rng_method = "unit_test"
      end if
      next_rng_seed = &
           var_list%get_ival (var_str ("seed")) + 1
      select case (char (rng_method))
```

349

```
    case ("unit_test")
       allocate (rng_test_factory_t :: rng_factory)
       call msg_message ("RNG: Initializing Test random-number generator")
    end select
 end subroutine dispatch_rng_factory_test
```

This is the analog for the TAO RNG, for the unit tests we need a full generator.
(The seed is to be zero or a small integer.)

⟨*Dispatch rng: public test auxiliary*⟩+≡
```
    public :: dispatch_rng_factory_tao
```

⟨*Dispatch rng: test auxiliary*⟩+≡
```
    subroutine dispatch_rng_factory_tao (rng_factory, var_list, next_rng_seed)
      use kinds, only: i16
      use rng_base
      use rng_tao, only: rng_tao_factory_t
      class(rng_factory_t), allocatable, intent(inout) :: rng_factory
      type(var_list_t), intent(in) :: var_list
      integer, intent(out) :: next_rng_seed
      type(string_t) :: rng_method
      integer(i16) :: s
      if (var_list%contains (var_str ("$rng_method"))) then
         rng_method = var_list%get_sval (var_str ("$rng_method"))
      else
         rng_method = "tao"
      end if
      s = var_list%get_ival (var_str ("seed"))
      select case (char (rng_method))
      case ("tao")
         allocate (rng_tao_factory_t :: rng_factory)
         call rng_factory%init (s)
      end select
      next_rng_seed = s + 1
    end subroutine dispatch_rng_factory_tao
```

Create RNG factories for different algorithms. Note that the seed is updated
after each rng factory call.

⟨*Dispatch rng: execute tests*⟩≡
```
    call test (dispatch_rng_1, "dispatch_rng_1", &
         "random-number generator", &
         u, results)
```

⟨*Dispatch rng: test declarations*⟩≡
```
    public :: dispatch_rng_1
```

⟨*Dispatch rng: tests*⟩≡
```
    subroutine dispatch_rng_1 (u)
      integer, intent(in) :: u
      type(var_list_t) :: var_list
      integer :: next_rng_seed
      class(rng_factory_t), allocatable :: rng_factory

      write (u, "(A)")  "* Test output: dispatch_rng_1"
      write (u, "(A)")  "*   Purpose: select random-number generator"
```

```fortran
    write (u, "(A)")

    call var_list%init_defaults (0)

    write (u, "(A)")  "* Allocate RNG factory as rng_test_factory_t"
    write (u, "(A)")

         var_str ("$rng_method"), &
         var_str ("unit_test"), is_known = .true.)
    call var_list%set_int (&
         var_str ("seed"), 1, is_known = .true.)

    call dispatch_rng_factory (rng_factory, var_list, next_rng_seed)

    call rng_factory%write (u)
    deallocate (rng_factory)

    write (u, "(A)")
    write (u, "(A)")  "* Allocate RNG factory as rng_tao_factory_t"
    write (u, "(A)")

    call var_list%set_string (&
         var_str ("$rng_method"), &
         var_str ("tao"), is_known = .true.)
    call update_rng_seed_in_var_list (var_list, next_rng_seed)
    call dispatch_rng_factory (rng_factory, var_list, next_rng_seed)

    call rng_factory%write (u)
    deallocate (rng_factory)

    write (u, "(A)")
    write (u, "(A)")  "* Allocate RNG factory as rng_stream_factory_t"
    write (u, "(A)")

    call var_list%set_string (&
         var_str ("$rng_method"), &
         var_str ("rng_stream"), is_known = .true.)
    call update_rng_seed_in_var_list (var_list, next_rng_seed)
    call dispatch_rng_factory (rng_factory, var_list, next_rng_seed)

    call rng_factory%write (u)
    deallocate (rng_factory)

    call var_list%final ()

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: dispatch_rng_1"

  end subroutine dispatch_rng_1
```

Chapter 9

Physics

Here we collect definitions and functions that we need for (particle) physics in general, to make them available for the more specific needs of WHIZARD.

physics_defs Physical constants.

c_particles A simple data type for particles which is C compatible.

lorentz Define three-vectors, four-vectors and Lorentz transformations and common operations for them.

sm_physics Here, running functions are stored for special kinematical setup like running coupling constants, Catani-Seymour dipoles, or Sudakov factors.

sm_qcd Definitions and methods for dealing with the running QCD coupling.

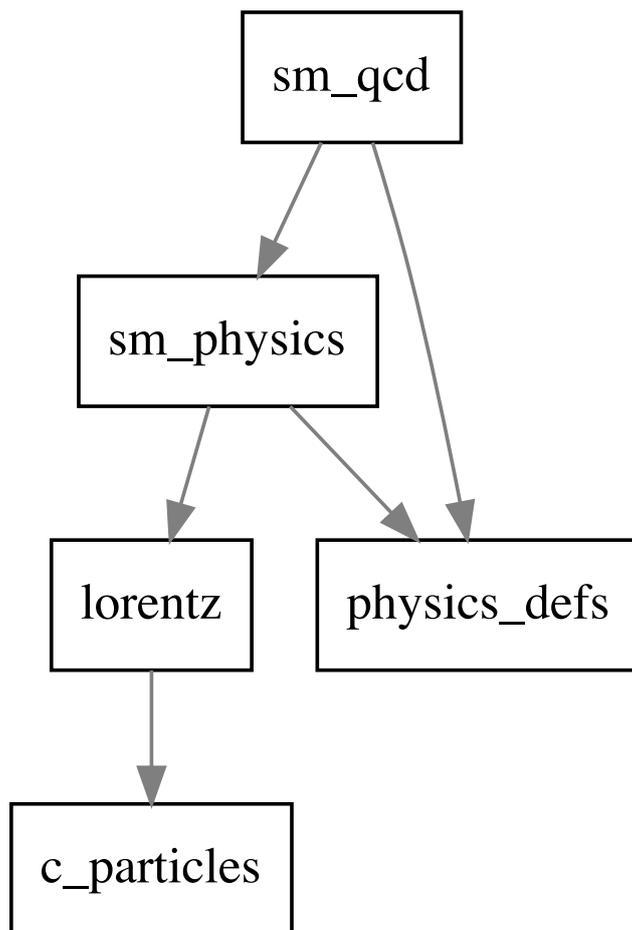
shower_algorithms Algorithms typically used in Parton Showers as well as in their matching to NLO computations, e.g. with the POWHEG method.


Figure 9.1: Module dependencies in `src/physics`.

9.1 Physics Constants

There is also the generic `constants` module. The constants listed here are more specific for particle physics.

⟨`physics_defs.f90`⟩≡
  ⟨*File header*⟩

  ```
  module physics_defs
  ```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
  ```
    use constants, only: one, two, three
  ```

  ⟨*Standard module head*⟩

  ⟨*Physics defs: public parameters*⟩

  ⟨*Physics defs: public*⟩

  ⟨*Physics defs: interfaces*⟩

  ```
  contains
  ```

  ⟨*Physics defs: procedures*⟩

  ```
  end module physics_defs
  ```

9.1.1 Units

Conversion from energy units to cross-section units.

⟨*Physics defs: public parameters*⟩≡
```
    real(default), parameter, public :: &
        conv = 0.38937966e12_default
```

Conversion from millimeter to nanoseconds for lifetimes.

⟨*Physics defs: public parameters*⟩+≡
```
    real(default), parameter, public :: &
        ns_per_mm = 1.e6_default / 299792458._default
```

Rescaling factor.

⟨*Physics defs: public parameters*⟩+≡
```
    real(default), parameter, public :: &
        pb_per_fb = 1.e-3_default
```

String for the default energy and cross-section units.

⟨*Physics defs: public parameters*⟩+≡
```
    character(*), parameter, public :: &
        energy_unit = "GeV"
    character(*), parameter, public :: &
        cross_section_unit = "fb"
```

9.1.2 SM and QCD constants

⟨*Physics defs: public parameters*⟩+≡
```
    real(default), parameter, public :: &
        NC = three, &
        CF = (NC**2 - one) / two / NC, &
        CA = NC, &
        TR = one / two
```

9.1.3 Parameter Reference values

These are used exclusively in the context of running QCD parameters. In other contexts, we rely on the uniform parameter set as provided by the model definition, modifiable by the user.

⟨*Physics defs: public parameters*⟩+≡
```
    real(default), public, parameter :: MZ_REF = 91.188_default
    real(default), public, parameter :: ALPHA_QCD_MZ_REF = 0.1178_default
    real(default), public, parameter :: LAMBDA_QCD_REF = 200.e-3_default
```

9.1.4 Particle codes

Let us define a few particle codes independent of the model.
    We need an UNDEFINED value:

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: UNDEFINED = 0
```

SM fermions:

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: DOWN_Q = 1
    integer, parameter, public :: UP_Q = 2
    integer, parameter, public :: STRANGE_Q = 3
    integer, parameter, public :: CHARM_Q = 4
    integer, parameter, public :: BOTTOM_Q = 5
    integer, parameter, public :: TOP_Q = 6
    integer, parameter, public :: ELECTRON = 11
    integer, parameter, public :: ELECTRON_NEUTRINO = 12
    integer, parameter, public :: MUON = 13
    integer, parameter, public :: MUON_NEUTRINO = 14
    integer, parameter, public :: TAU = 15
    integer, parameter, public :: TAU_NEUTRINO = 16
```

Gauge bosons:

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: GLUON = 21
    integer, parameter, public :: PHOTON = 22
    integer, parameter, public :: Z_BOSON = 23
    integer, parameter, public :: W_BOSON = 24
```

Light mesons:

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: PION = 111
    integer, parameter, public :: PIPLUS = 211
    integer, parameter, public :: PIMINUS = - PIPLUS
```

Di-Quarks:

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: UD0 = 2101
    integer, parameter, public :: UD1 = 2103
    integer, parameter, public :: UU1 = 2203
```

Mesons:

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: K0L = 130
    integer, parameter, public :: K0S = 310
    integer, parameter, public :: K0 = 311
    integer, parameter, public :: KPLUS = 321
    integer, parameter, public :: DPLUS = 411
    integer, parameter, public :: D0 = 421
    integer, parameter, public :: B0 = 511
    integer, parameter, public :: BPLUS = 521
```

Light baryons:

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: PROTON = 2212
    integer, parameter, public :: NEUTRON = 2112
    integer, parameter, public :: DELTAPLUSPLUS = 2224
    integer, parameter, public :: DELTAPLUS = 2214
    integer, parameter, public :: DELTA0 = 2114
    integer, parameter, public :: DELTAMINUS = 1114
```

Strange baryons:

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: SIGMAPLUS = 3222
    integer, parameter, public :: SIGMA0 = 3212
    integer, parameter, public :: SIGMAMINUS = 3112
```

Charmed baryons:

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: SIGMACPLUSPLUS = 4222
    integer, parameter, public :: SIGMACPLUS = 4212
    integer, parameter, public :: SIGMAC0 = 4112
```

Bottom baryons:

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: SIGMAB0 = 5212
    integer, parameter, public :: SIGMABPLUS = 5222
```

81-100 are reserved for internal codes. Hadron and beam remnants:

⟨*Physics defs: public parameters*⟩+≡
```
integer, parameter, public :: BEAM_REMNANT = 9999
integer, parameter, public :: HADRON_REMNANT = 90
integer, parameter, public :: HADRON_REMNANT_SINGLET = 91
integer, parameter, public :: HADRON_REMNANT_TRIPLET = 92
integer, parameter, public :: HADRON_REMNANT_OCTET = 93
```

Further particle codes for internal use:

⟨*Physics defs: public parameters*⟩+≡
```
integer, parameter, public :: INTERNAL = 94
integer, parameter, public :: INVALID = 97

integer, parameter, public :: COMPOSITE = 99
```

9.1.5 Spin codes

Somewhat redundant, but for better readability we define named constants for spin types. If the mass is nonzero, this is equal to the number of degrees of freedom.

⟨*Physics defs: public parameters*⟩+≡
```
integer, parameter, public:: UNKNOWN = 0
integer, parameter, public :: SCALAR = 1, SPINOR = 2, VECTOR = 3, &
                              VECTORSPINOR = 4, TENSOR = 5
```

Isospin types and charge types are counted in an analogous way, where charge type 1 is charge 0, 2 is charge 1/3, and so on. Zero always means unknown. Note that charge and isospin types have an explicit sign.

Color types are defined as the dimension of the representation.

9.1.6 NLO status codes

Used to specify whether a `term_instance_t` of a `process_instance_t` is associated with a Born, real-subtracted, virtual-subtracted or subtraction-dummy matrix element.

⟨*Physics defs: public parameters*⟩+≡
```
integer, parameter, public :: BORN = 0
integer, parameter, public :: NLO_REAL = 1
integer, parameter, public :: NLO_VIRTUAL = 2
integer, parameter, public :: NLO_MISMATCH = 3
integer, parameter, public :: NLO_DGLAP = 4
integer, parameter, public :: NLO_SUBTRACTION = 5
integer, parameter, public :: NLO_FULL = 6
integer, parameter, public :: GKS = 7
integer, parameter, public :: COMPONENT_UNDEFINED = 99
```

NLO_FULL is not strictly a component status code but having it is convenient. We define the number of additional subtractions for beam-involved NLO calculations. Each subtraction refers to a rescaling of one of two beams. Obviously,

this approach is not flexible enough to support setups with just a single beam described by a structure function.

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: n_beams_rescaled = 2
```

⟨*Physics defs: public*⟩≡
```
    public :: component_status
```
⟨*Physics defs: interfaces*⟩≡
```
    interface component_status
       module procedure component_status_of_string
       module procedure component_status_to_string
    end interface
```
⟨*Physics defs: procedures*⟩≡
```
    elemental function component_status_of_string (string) result (i)
      integer :: i
      type(string_t), intent(in) :: string
      select case (char(string))
      case ("born")
         i = BORN
      case ("real")
         i = NLO_REAL
      case ("virtual")
         i = NLO_VIRTUAL
      case ("mismatch")
         i = NLO_MISMATCH
      case ("dglap")
         i = NLO_DGLAP
      case ("subtraction")
         i = NLO_SUBTRACTION
      case ("full")
         i = NLO_FULL
      case ("GKS")
         i = GKS
      case default
         i = COMPONENT_UNDEFINED
      end select
    end function component_status_of_string

    elemental function component_status_to_string (i) result (string)
      type(string_t) :: string
      integer, intent(in) :: i
      select case (i)
      case (BORN)
         string = "born"
      case (NLO_REAL)
         string = "real"
      case (NLO_VIRTUAL)
         string = "virtual"
      case (NLO_MISMATCH)
         string = "mismatch"
      case (NLO_DGLAP)
         string = "dglap"
      case (NLO_SUBTRACTION)
```

```
           string = "subtraction"
        case (NLO_FULL)
           string = "full"
        case (GKS)
           string = "GKS"
        case default
           string = "undefined"
        end select
      end function component_status_to_string
```

⟨*Physics defs: public*⟩+≡
```
    public :: is_nlo_component
```

⟨*Physics defs: procedures*⟩+≡
```
    elemental function is_nlo_component (comp) result (is_nlo)
      logical :: is_nlo
      integer, intent(in) :: comp
      select case (comp)
      case (BORN : GKS)
         is_nlo = .true.
      case default
         is_nlo = .false.
      end select
    end function is_nlo_component
```

⟨*Physics defs: public*⟩+≡
```
    public :: is_subtraction_component
```

⟨*Physics defs: procedures*⟩+≡
```
    function is_subtraction_component (emitter, nlo_type) result (is_subtraction)
      logical :: is_subtraction
      integer, intent(in) :: emitter, nlo_type
      is_subtraction = nlo_type == NLO_REAL .and. emitter < 0
    end function is_subtraction_component
```

9.1.7 Threshold

Some commonly used variables for the threshold computation

⟨*Physics defs: public parameters*⟩+≡
```
    integer, parameter, public :: THR_POS_WP = 3
    integer, parameter, public :: THR_POS_WM = 4
    integer, parameter, public :: THR_POS_B = 5
    integer, parameter, public :: THR_POS_BBAR = 6
    integer, parameter, public :: THR_POS_GLUON = 7

    integer, parameter, public :: THR_EMITTER_OFFSET = 4

    integer, parameter, public :: NO_FACTORIZATION = 0
    integer, parameter, public :: FACTORIZATION_THRESHOLD = 1

    integer, dimension(2), parameter, public :: ass_quark = [5, 6]
    integer, dimension(2), parameter, public :: ass_boson = [3, 4]
```

```
integer, parameter, public :: PROC_MODE_UNDEFINED = 0
integer, parameter, public :: PROC_MODE_TT = 1
integer, parameter, public :: PROC_MODE_WBWB = 2
```

⟨*Physics defs: public*⟩+≡
```
public :: thr_leg
```

⟨*Physics defs: procedures*⟩+≡
```
function thr_leg (emitter) result (leg)
  integer :: leg
  integer, intent(in) :: emitter
  leg = emitter - THR_EMITTER_OFFSET
end function thr_leg
```

9.2 C-compatible Particle Type

For easy communication with C code, we introduce a simple C-compatible type for particles. The components are either default C integers or default C doubles.

The `c_prt` type is transparent, and its contents should be regarded as part of the interface.

⟨c_particles.f90⟩≡
  ⟨*File header*⟩

```
  module c_particles

    use, intrinsic :: iso_c_binding !NODEP!

    use io_units
    use format_defs, only: FMT_14, FMT_19
```

  ⟨*Standard module head*⟩

  ⟨*C Particles: public*⟩

  ⟨*C Particles: types*⟩

```
  contains
```

  ⟨*C Particles: procedures*⟩
```
  end module c_particles
```

⟨*C Particles: public*⟩≡
```
    public :: c_prt_t
```

⟨*C Particles: types*⟩≡
```
    type, bind(C) :: c_prt_t
       integer(c_int) :: type = 0
       integer(c_int) :: pdg = 0
       integer(c_int) :: polarized = 0
       integer(c_int) :: h = 0
       real(c_double) :: pe = 0
       real(c_double) :: px = 0
       real(c_double) :: py = 0
       real(c_double) :: pz = 0
       real(c_double) :: p2 = 0
    end type c_prt_t
```

This is for debugging only, there is no C binding. It is a simplified version of `prt_write`.

⟨*C Particles: public*⟩+≡
```
    public :: c_prt_write
```

⟨*C Particles: procedures*⟩≡
```
    subroutine c_prt_write (prt, unit)
      type(c_prt_t), intent(in) :: prt
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
```

```
  write (u, "(1x,A)", advance="no")  "prt("
  write (u, "(I0,':')", advance="no")  prt%type
  if (prt%polarized /= 0) then
     write (u, "(I0,'/',I0,'|')", advance="no")  prt%pdg, prt%h
  else
     write (u, "(I0,'|')", advance="no") prt%pdg
  end if
  write (u, "(" // FMT_14 // ",';'," // FMT_14 // ",',',"  // &
        FMT_14 // ",',',"  // FMT_14 // ")", advance="no") &
        prt%pe, prt%px, prt%py, prt%pz
  write (u, "('|'," // FMT_19 // ")", advance="no")  prt%p2
  write (u, "(A)")  ")"
end subroutine c_prt_write
```

9.3 Lorentz algebra

Define Lorentz vectors, three-vectors, boosts, and some functions to manipulate them.

To make maximum use of this, all functions, if possible, are declared elemental (or pure, if this is not possible).

⟨`lorentz.f90`⟩≡

　⟨*File header*⟩

```
module lorentz
```

　⟨*Use kinds with double*⟩
```
  use numeric_utils
  use io_units
  use constants, only: pi, twopi, degree, zero, one, two, eps0, tiny_07
  use format_defs, only: FMT_11, FMT_13, FMT_15, FMT_19
  use format_utils, only: pac_fmt
  use diagnostics
  use c_particles
```

　⟨*Standard module head*⟩

　⟨*Lorentz: public*⟩

　⟨*Lorentz: public operators*⟩

　⟨*Lorentz: public functions*⟩

　⟨*Lorentz: types*⟩

　⟨*Lorentz: parameters*⟩

　⟨*Lorentz: interfaces*⟩

```
contains
```

　⟨*Lorentz: procedures*⟩
```
end module lorentz
```

9.3.1 Three-vectors

First of all, let us introduce three-vectors in a trivial way. The functions and overloaded elementary operations clearly are too much overhead, but we like to keep the interface for three-vectors and four-vectors exactly parallel. By the way, we might attach a label to a vector by extending the type definition later.

⟨*Lorentz: public*⟩≡
```
    public :: vector3_t
```

⟨*Lorentz: types*⟩≡
```
    type :: vector3_t
       real(default), dimension(3) :: p
    end type vector3_t
```

Output a vector

⟨*Lorentz: public*⟩+≡
```
    public :: vector3_write
```

⟨*Lorentz: procedures*⟩≡
```
    subroutine vector3_write (p, unit, testflag)
      type(vector3_t), intent(in) :: p
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: testflag
      character(len=7) :: fmt
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      call pac_fmt (fmt, FMT_19, FMT_15, testflag)
      write(u, "(1x,A,3(1x," // fmt // "))") 'P = ', p%p
    end subroutine vector3_write
```

This is a three-vector with zero components

⟨*Lorentz: public*⟩+≡
```
    public :: vector3_null
```

⟨*Lorentz: parameters*⟩≡
```
    type(vector3_t), parameter :: vector3_null = &
        vector3_t ([ zero, zero, zero ])
```

Canonical three-vector:

⟨*Lorentz: public*⟩+≡
```
    public :: vector3_canonical
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_canonical (k) result (p)
      type(vector3_t) :: p
      integer, intent(in) :: k
      p = vector3_null
      p%p(k) = 1
    end function vector3_canonical
```

A moving particle (*k*-axis, or arbitrary axis). Note that the function for the generic momentum cannot be elemental.

⟨*Lorentz: public*⟩+≡
```
    public :: vector3_moving
```

⟨*Lorentz: interfaces*⟩≡
```
    interface vector3_moving
       module procedure vector3_moving_canonical
       module procedure vector3_moving_generic
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_moving_canonical (p, k) result(q)
      type(vector3_t) :: q
      real(default), intent(in) :: p
      integer, intent(in) :: k
      q = vector3_null
      q%p(k) = p
```

```
    end function vector3_moving_canonical
    pure function vector3_moving_generic (p) result(q)
      real(default), dimension(3), intent(in) :: p
      type(vector3_t) :: q
      q%p = p
    end function vector3_moving_generic
```

Equality and inequality

⟨*Lorentz: public operators*⟩≡
```
    public :: operator(==), operator(/=)
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(==)
       module procedure vector3_eq
    end interface
    interface operator(/=)
       module procedure vector3_neq
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_eq (p, q) result (r)
      logical :: r
      type(vector3_t), intent(in) :: p,q
      r = all (abs (p%p - q%p) < eps0)
    end function vector3_eq
    elemental function vector3_neq (p, q) result (r)
      logical :: r
      type(vector3_t), intent(in) :: p,q
      r = any (abs(p%p - q%p) > eps0)
    end function vector3_neq
```

Define addition and subtraction

⟨*Lorentz: public operators*⟩+≡
```
    public :: operator(+), operator(-)
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(+)
       module procedure add_vector3
    end interface
    interface operator(-)
       module procedure sub_vector3
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function add_vector3 (p, q) result (r)
      type(vector3_t) :: r
      type(vector3_t), intent(in) :: p,q
      r%p = p%p + q%p
    end function add_vector3
    elemental function sub_vector3 (p, q) result (r)
      type(vector3_t) :: r
      type(vector3_t), intent(in) :: p,q
      r%p = p%p - q%p
    end function sub_vector3
```

The multiplication sign is overloaded with scalar multiplication; similarly division:

⟨*Lorentz: public operators*⟩+≡
```
    public :: operator(*), operator(/)
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(*)
       module procedure prod_integer_vector3, prod_vector3_integer
       module procedure prod_real_vector3, prod_vector3_real
    end interface
    interface operator(/)
       module procedure div_vector3_real, div_vector3_integer
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function prod_real_vector3 (s, p) result (q)
      type(vector3_t) :: q
      real(default), intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = s * p%p
    end function prod_real_vector3
    elemental function prod_vector3_real (p, s) result (q)
      type(vector3_t) :: q
      real(default), intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = s * p%p
    end function prod_vector3_real
    elemental function div_vector3_real (p, s) result (q)
      type(vector3_t) :: q
      real(default), intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = p%p/s
    end function div_vector3_real
    elemental function prod_integer_vector3 (s, p) result (q)
      type(vector3_t) :: q
      integer, intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = s * p%p
    end function prod_integer_vector3
    elemental function prod_vector3_integer (p, s) result (q)
      type(vector3_t) :: q
      integer, intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = s * p%p
    end function prod_vector3_integer
    elemental function div_vector3_integer (p, s) result (q)
      type(vector3_t) :: q
      integer, intent(in) :: s
      type(vector3_t), intent(in) :: p
      q%p = p%p/s
    end function div_vector3_integer
```

The multiplication sign can also indicate scalar products:

⟨*Lorentz: interfaces*⟩+≡

366

```
    interface operator(*)
       module procedure prod_vector3
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function prod_vector3 (p, q) result (s)
      real(default) :: s
      type(vector3_t), intent(in) :: p,q
      s = dot_product (p%p, q%p)
    end function prod_vector3
```

⟨*Lorentz: public functions*⟩≡
```
    public :: cross_product
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface cross_product
       module procedure vector3_cross_product
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector3_cross_product (p, q) result (r)
      type(vector3_t) :: r
      type(vector3_t), intent(in) :: p,q
      integer :: i
      do i=1,3
         r%p(i) = dot_product (p%p, matmul(epsilon_three(i,:,:), q%p))
      end do
    end function vector3_cross_product
```

Exponentiation is defined only for integer powers. Odd powers mean take the square root; so p**1 is the length of p.

⟨*Lorentz: public operators*⟩+≡
```
    public :: operator(**)
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(**)
       module procedure power_vector3
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function power_vector3 (p, e) result (s)
      real(default) :: s
      type(vector3_t), intent(in) :: p
      integer, intent(in) :: e
      s = dot_product (p%p, p%p)
      if (e/=2) then
         if (mod(e,2)==0) then
            s = s**(e/2)
         else
            s = sqrt(s)**e
         end if
      end if
    end function power_vector3
```

Finally, we need a negation.

⟨Lorentz: interfaces⟩+≡
```
    interface operator(-)
       module procedure negate_vector3
    end interface
```

⟨Lorentz: procedures⟩+≡
```
    elemental function negate_vector3 (p) result (q)
      type(vector3_t) :: q
      type(vector3_t), intent(in) :: p
      integer :: i
      do i = 1, 3
         if (abs (p%p(i)) < eps0) then
            q%p(i) = 0
         else
            q%p(i) = -p%p(i)
         end if
      end do
    end function negate_vector3
```

The sum function can be useful:

⟨Lorentz: public functions⟩+≡
```
    public :: sum
```

⟨Lorentz: interfaces⟩+≡
```
    interface sum
       module procedure sum_vector3
    end interface
```

⟨Lorentz: public⟩+≡
```
    public :: vector3_set_component
```

⟨Lorentz: procedures⟩+≡
```
    subroutine vector3_set_component (p, i, value)
      type(vector3_t), intent(inout) :: p
      integer, intent(in) :: i
      real(default), intent(in) :: value
      p%p(i) = value
    end subroutine vector3_set_component
```

⟨Lorentz: procedures⟩+≡
```
    pure function sum_vector3 (p) result (q)
      type(vector3_t) :: q
      type(vector3_t), dimension(:), intent(in) :: p
      integer :: i
      do i=1, 3
         q%p(i) = sum (p%p(i))
      end do
    end function sum_vector3
```

Any component:

⟨Lorentz: public⟩+≡
```
    public :: vector3_get_component
```

⟨*Lorentz: procedures*⟩+≡

```
elemental function vector3_get_component (p, k) result (c)
  type(vector3_t), intent(in) :: p
  integer, intent(in) :: k
  real(default) :: c
  c = p%p(k)
end function vector3_get_component
```

Extract all components. This is not elemental.

⟨*Lorentz: public*⟩+≡

```
public :: vector3_get_components
```

⟨*Lorentz: procedures*⟩+≡

```
pure function vector3_get_components (p) result (a)
  type(vector3_t), intent(in) :: p
  real(default), dimension(3) :: a
  a = p%p
end function vector3_get_components
```

This function returns the direction of a three-vector, i.e., a normalized three-vector. If the vector is null, we return a null vector.

⟨*Lorentz: public functions*⟩+≡

```
public :: direction
```

⟨*Lorentz: interfaces*⟩+≡

```
interface direction
   module procedure vector3_get_direction
end interface
```

⟨*Lorentz: procedures*⟩+≡

```
elemental function vector3_get_direction (p) result (q)
  type(vector3_t) :: q
  type(vector3_t), intent(in) :: p
  real(default) :: pp
  pp = p**1
  if (pp > eps0) then
     q%p = p%p / pp
  else
     q%p = 0
  end if
end function vector3_get_direction
```

9.3.2 Four-vectors

In four-vectors the zero-component needs special treatment, therefore we do not use the standard operations. Sure, we pay for the extra layer of abstraction by losing efficiency; so we have to assume that the time-critical applications do not involve four-vector operations.

⟨*Lorentz: public*⟩+≡

```
public :: vector4_t
```

⟨*Lorentz: types*⟩+≡
```
type :: vector4_t
   real(default), dimension(0:3) :: p = &
      [zero, zero, zero, zero]
contains
```
⟨*Lorentz: vector4: TBP*⟩
```
end type vector4_t
```

Output a vector

⟨*Lorentz: public*⟩+≡
```
public :: vector4_write
```

⟨*Lorentz: vector4: TBP*⟩≡
```
procedure :: write => vector4_write
```

⟨*Lorentz: procedures*⟩+≡
```
subroutine vector4_write &
      (p, unit, show_mass, testflag, compressed, ultra)
  class(vector4_t), intent(in) :: p
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: show_mass, testflag, compressed, ultra
  logical :: comp, sm, tf, extreme
  integer :: u
  character(len=7) :: fmt
  real(default) :: m
  comp = .false.; if (present (compressed))  comp = compressed
  sm = .false.;  if (present (show_mass))  sm = show_mass
  tf = .false.;  if (present (testflag))  tf = testflag
  extreme = .false.; if (present (ultra))  extreme = ultra
  if (extreme) then
     call pac_fmt (fmt, FMT_19, FMT_11, testflag)
  else
     call pac_fmt (fmt, FMT_19, FMT_13, testflag)
  end if
  u = given_output_unit (unit);  if (u < 0)  return
  if (comp) then
     write (u, "(4(F12.3,1X))", advance="no")  p%p(0:3)
  else
     write (u, "(1x,A,1x," // fmt // ")") 'E = ', p%p(0)
     write (u, "(1x,A,3(1x," // fmt // "))") 'P = ', p%p(1:)
     if (sm) then
        m = p**1
        if (tf)  call pacify (m, tolerance = 1E-6_default)
        write (u, "(1x,A,1x," // fmt // ")") 'M = ', m
     end if
  end if
end subroutine vector4_write
```

Binary I/O

⟨*Lorentz: public*⟩+≡
```
public :: vector4_write_raw
public :: vector4_read_raw
```

⟨*Lorentz: procedures*⟩+≡
```
subroutine vector4_write_raw (p, u)
```

```
    type(vector4_t), intent(in) :: p
    integer, intent(in) :: u
    write (u) p%p
  end subroutine vector4_write_raw

  subroutine vector4_read_raw (p, u, iostat)
    type(vector4_t), intent(out) :: p
    integer, intent(in) :: u
    integer, intent(out), optional :: iostat
    read (u, iostat=iostat) p%p
  end subroutine vector4_read_raw
```

This is a four-vector with zero components

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_null
```

⟨*Lorentz: parameters*⟩+≡
```
    type(vector4_t), parameter :: vector4_null = &
         vector4_t ([ zero, zero, zero, zero ])
```

Canonical four-vector:

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_canonical
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_canonical (k) result (p)
      type(vector4_t) :: p
      integer, intent(in) :: k
      p = vector4_null
      p%p(k) = 1
    end function vector4_canonical
```

A particle at rest:

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_at_rest
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_at_rest (m) result (p)
      type(vector4_t) :: p
      real(default), intent(in) :: m
      p = vector4_t ([ m, zero, zero, zero ])
    end function vector4_at_rest
```

A moving particle (*k*-axis, or arbitrary axis)

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_moving
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface vector4_moving
       module procedure vector4_moving_canonical
       module procedure vector4_moving_generic
    end interface
```

⟨*Lorentz: procedures*⟩+≡

```
elemental function vector4_moving_canonical (E, p, k) result (q)
  type(vector4_t) :: q
  real(default), intent(in) :: E, p
  integer, intent(in) :: k
  q = vector4_at_rest(E)
  q%p(k) = p
end function vector4_moving_canonical
elemental function vector4_moving_generic (E, p) result (q)
  type(vector4_t) :: q
  real(default), intent(in) :: E
  type(vector3_t), intent(in) :: p
  q%p(0) = E
  q%p(1:) = p%p
end function vector4_moving_generic
```

Equality and inequality

⟨*Lorentz: interfaces*⟩+≡

```
interface operator(==)
   module procedure vector4_eq
end interface
interface operator(/=)
   module procedure vector4_neq
end interface
```

⟨*Lorentz: procedures*⟩+≡

```
elemental function vector4_eq (p, q) result (r)
  logical :: r
  type(vector4_t), intent(in) :: p,q
  r = all (abs (p%p - q%p) < eps0)
end function vector4_eq
elemental function vector4_neq (p, q) result (r)
  logical :: r
  type(vector4_t), intent(in) :: p,q
  r = any (abs (p%p - q%p) > eps0)
end function vector4_neq
```

Addition and subtraction:

⟨*Lorentz: interfaces*⟩+≡

```
interface operator(+)
   module procedure add_vector4
end interface
interface operator(-)
   module procedure sub_vector4
end interface
```

⟨*Lorentz: procedures*⟩+≡

```
elemental function add_vector4 (p,q) result (r)
  type(vector4_t) :: r
  type(vector4_t), intent(in) :: p,q
  r%p = p%p + q%p
end function add_vector4
elemental function sub_vector4 (p,q) result (r)
  type(vector4_t) :: r
```

```
      type(vector4_t), intent(in) :: p,q
      r%p = p%p - q%p
    end function sub_vector4
```

We also need scalar multiplication and division:

⟨*Lorentz: interfaces*⟩+≡
```
    interface operator(*)
       module procedure prod_real_vector4, prod_vector4_real
       module procedure prod_integer_vector4, prod_vector4_integer
    end interface
    interface operator(/)
       module procedure div_vector4_real
       module procedure div_vector4_integer
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function prod_real_vector4 (s, p) result (q)
      type(vector4_t) :: q
      real(default), intent(in) :: s
      type(vector4_t), intent(in) :: p
      q%p = s * p%p
    end function prod_real_vector4
    elemental function prod_vector4_real (p, s) result (q)
      type(vector4_t) :: q
      real(default), intent(in) :: s
      type(vector4_t), intent(in) :: p
      q%p = s * p%p
    end function prod_vector4_real
    elemental function div_vector4_real (p, s) result (q)
      type(vector4_t) :: q
      real(default), intent(in) :: s
      type(vector4_t), intent(in) :: p
      q%p = p%p/s
    end function div_vector4_real
    elemental function prod_integer_vector4 (s, p) result (q)
      type(vector4_t) :: q
      integer, intent(in) :: s
      type(vector4_t), intent(in) :: p
      q%p = s * p%p
    end function prod_integer_vector4
    elemental function prod_vector4_integer (p, s) result (q)
      type(vector4_t) :: q
      integer, intent(in) :: s
      type(vector4_t), intent(in) :: p
      q%p = s * p%p
    end function prod_vector4_integer
    elemental function div_vector4_integer (p, s) result (q)
      type(vector4_t) :: q
      integer, intent(in) :: s
      type(vector4_t), intent(in) :: p
      q%p = p%p/s
    end function div_vector4_integer
```

Scalar products and squares in the Minkowski sense:

⟨Lorentz: interfaces⟩+≡

```
interface operator(*)
   module procedure prod_vector4
end interface
interface operator(**)
   module procedure power_vector4
end interface
```

⟨Lorentz: procedures⟩+≡

```
elemental function prod_vector4 (p, q) result (s)
  real(default) :: s
  type(vector4_t), intent(in) :: p,q
  s = p%p(0)*q%p(0) - dot_product(p%p(1:), q%p(1:))
end function prod_vector4
```

The power operation for four-vectors is signed, i.e., `p**1` is positive for timelike and negative for spacelike vectors. Note that `(p**1)**2` is not necessarily equal to `p**2`.

⟨Lorentz: procedures⟩+≡

```
elemental function power_vector4 (p, e) result (s)
  real(default) :: s
  type(vector4_t), intent(in) :: p
  integer, intent(in) :: e
  s = p * p
  if (e /= 2) then
     if (mod(e, 2) == 0) then
        s = s**(e / 2)
     else if (s >= 0) then
        s = sqrt(s)**e
     else
        s = -(sqrt(abs(s))**e)
     end if
  end if
end function power_vector4
```

Finally, we introduce a negation

⟨Lorentz: interfaces⟩+≡

```
interface operator(-)
   module procedure negate_vector4
end interface
```

⟨Lorentz: procedures⟩+≡

```
elemental function negate_vector4 (p) result (q)
  type(vector4_t) :: q
  type(vector4_t), intent(in) :: p
  integer :: i
  do i = 0, 3
     if (abs (p%p(i)) < eps0) then
        q%p(i) = 0
     else
        q%p(i) = -p%p(i)
     end if
```

```
        end do
    end function negate_vector4
```

The sum function can be useful:

⟨*Lorentz: interfaces*⟩+≡
```
    interface sum
        module procedure sum_vector4, sum_vector4_mask
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    pure function sum_vector4 (p) result (q)
      type(vector4_t) :: q
      type(vector4_t), dimension(:), intent(in) :: p
      integer :: i
      do i = 0, 3
          q%p(i) = sum (p%p(i))
      end do
    end function sum_vector4

    pure function sum_vector4_mask (p, mask) result (q)
      type(vector4_t) :: q
      type(vector4_t), dimension(:), intent(in) :: p
      logical, dimension(:), intent(in) :: mask
      integer :: i
      do i = 0, 3
          q%p(i) = sum (p%p(i), mask=mask)
      end do
    end function sum_vector4_mask
```

9.3.3   Conversions

Manually set a component of the four-vector:

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_set_component
```

⟨*Lorentz: procedures*⟩+≡
```
    subroutine vector4_set_component (p, k, c)
      type(vector4_t), intent(inout) :: p
      integer, intent(in) :: k
      real(default), intent(in) :: c
      p%p(k) = c
    end subroutine vector4_set_component
```

Any component:

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_get_component
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_get_component (p, k) result (c)
      real(default) :: c
      type(vector4_t), intent(in) :: p
      integer, intent(in) :: k
```

```
      c = p%p(k)
    end function vector4_get_component
```

Extract all components. This is not elemental.

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_get_components
```

⟨*Lorentz: procedures*⟩+≡
```
    pure function vector4_get_components (p) result (a)
      real(default), dimension(0:3) :: a
      type(vector4_t), intent(in) :: p
      a = p%p
    end function vector4_get_components
```

This function returns the space part of a four-vector, such that we can apply three-vector operations on it:

⟨*Lorentz: public functions*⟩+≡
```
    public :: space_part
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface space_part
       module procedure vector4_get_space_part
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_get_space_part (p) result (q)
      type(vector3_t) :: q
      type(vector4_t), intent(in) :: p
      q%p = p%p(1:)
    end function vector4_get_space_part
```

This function returns the direction of a four-vector, i.e., a normalized three-vector. If the four-vector has zero space part, we return a null vector.

⟨*Lorentz: interfaces*⟩+≡
```
    interface direction
       module procedure vector4_get_direction
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_get_direction (p) result (q)
      type(vector3_t) :: q
      type(vector4_t), intent(in) :: p
      real(default) :: qq
      q%p = p%p(1:)
      qq = q**1
      if (abs(qq) > eps0) then
         q%p = q%p / qq
      else
         q%p = 0
      end if
    end function vector4_get_direction
```

Change the sign of the spatial part of a four-vector

⟨*Lorentz: public*⟩+≡

```
    public :: vector4_invert_direction
```

⟨*Lorentz: procedures*⟩+≡

```
    elemental subroutine vector4_invert_direction (p)
      type(vector4_t), intent(inout) :: p
      p%p(1:3) = -p%p(1:3)
    end subroutine vector4_invert_direction
```

This function returns the four-vector as an ordinary array. A second version for an array of four-vectors.

⟨*Lorentz: public*⟩+≡

```
    public :: assignment (=)
```

⟨*Lorentz: interfaces*⟩+≡

```
    interface assignment (=)
       module procedure array_from_vector4_1, array_from_vector4_2, &
             array_from_vector3_1, array_from_vector3_2, &
             vector4_from_array, vector3_from_array
    end interface
```

⟨*Lorentz: procedures*⟩+≡

```
    pure subroutine array_from_vector4_1 (a, p)
      real(default), dimension(:), intent(out) :: a
      type(vector4_t), intent(in) :: p
      a = p%p
    end subroutine array_from_vector4_1

    pure subroutine array_from_vector4_2 (a, p)
      type(vector4_t), dimension(:), intent(in) :: p
      real(default), dimension(:,:), intent(out) :: a
      integer :: i
      forall (i=1:size(p))
         a(:,i) = p(i)%p
      end forall
    end subroutine array_from_vector4_2

    pure subroutine array_from_vector3_1 (a, p)
      real(default), dimension(:), intent(out) :: a
      type(vector3_t), intent(in) :: p
      a = p%p
    end subroutine array_from_vector3_1

    pure subroutine array_from_vector3_2 (a, p)
      type(vector3_t), dimension(:), intent(in) :: p
      real(default), dimension(:,:), intent(out) :: a
      integer :: i
      forall (i=1:size(p))
         a(:,i) = p(i)%p
      end forall
    end subroutine array_from_vector3_2

    pure subroutine vector4_from_array (p, a)
      type(vector4_t), intent(out) :: p
```

```
      real(default), dimension(:), intent(in) :: a
      p%p(0:3) = a
    end subroutine vector4_from_array

    pure subroutine vector3_from_array (p, a)
      type(vector3_t), intent(out) :: p
      real(default), dimension(:), intent(in) :: a
      p%p(1:3) = a
    end subroutine vector3_from_array
```

⟨*Lorentz: public*⟩+≡
```
    public :: vector4
```

⟨*Lorentz: procedures*⟩+≡
```
    pure function vector4 (a) result (p)
      type(vector4_t) :: p
      real(default), intent(in), dimension(4) :: a
      p%p = a
    end function vector4
```

⟨*Lorentz: vector4: TBP*⟩+≡
```
    procedure :: to_pythia6 => vector4_to_pythia6
```

⟨*Lorentz: procedures*⟩+≡
```
    pure function vector4_to_pythia6 (vector4, m) result (p)
      real(double), dimension(1:5) :: p
      class(vector4_t), intent(in) :: vector4
      real(default), intent(in), optional :: m
      p(1:3) = vector4%p(1:3)
      p(4) = vector4%p(0)
      if (present (m)) then
         p(5) = m
      else
         p(5) = vector4 ** 1
      end if
    end function vector4_to_pythia6
```

Transform the momentum of a c_prt object into a four-vector and vice versa:

⟨*Lorentz: interfaces*⟩+≡
```
    interface assignment (=)
       module procedure vector4_from_c_prt, c_prt_from_vector4
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    pure subroutine vector4_from_c_prt (p, c_prt)
      type(vector4_t), intent(out) :: p
      type(c_prt_t), intent(in) :: c_prt
      p%p(0) = c_prt%pe
      p%p(1) = c_prt%px
      p%p(2) = c_prt%py
      p%p(3) = c_prt%pz
    end subroutine vector4_from_c_prt

    pure subroutine c_prt_from_vector4 (c_prt, p)
```

```
      type(c_prt_t), intent(out) :: c_prt
      type(vector4_t), intent(in) :: p
      c_prt%pe = p%p(0)
      c_prt%px = p%p(1)
      c_prt%py = p%p(2)
      c_prt%pz = p%p(3)
      c_prt%p2 = p ** 2
    end subroutine c_prt_from_vector4
```

Initialize a **c_prt_t** object with the components of a four-vector as its kinematical entries. Compute the invariant mass, or use the optional mass-squared value instead.

⟨*Lorentz: public*⟩+≡
```
    public :: vector4_to_c_prt
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function vector4_to_c_prt (p, p2) result (c_prt)
      type(c_prt_t) :: c_prt
      type(vector4_t), intent(in) :: p
      real(default), intent(in), optional :: p2
      c_prt%pe = p%p(0)
      c_prt%px = p%p(1)
      c_prt%py = p%p(2)
      c_prt%pz = p%p(3)
      if (present (p2)) then
         c_prt%p2 = p2
      else
         c_prt%p2 = p ** 2
      end if
    end function vector4_to_c_prt
```

⟨*Lorentz: public*⟩+≡
```
    public :: phs_point_t
```

⟨*Lorentz: types*⟩+≡
```
    type :: phs_point_t
       type(vector4_t), dimension(:), allocatable :: p

end function lorentz_transformation_get_components
```

9.3.7 Functions of Lorentz transformations

For the inverse, we make use of the fact that $\Lambda^{\mu\nu}\Lambda_{\mu\rho} = \delta^{\nu}_{\rho}$. So, lowering the indices and transposing is sufficient.

⟨*Lorentz: public functions*⟩+≡
```
    public :: inverse
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface inverse
       module procedure lorentz_transformation_inverse
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function lorentz_transformation_inverse (L) result (IL)
      type(lorentz_transformation_t) :: IL
      type(lorentz_transformation_t), intent(in) :: L
      IL%L(0,0) = L%L(0,0)
      IL%L(0,1:) = -L%L(1:,0)
      IL%L(1:,0) = -L%L(0,1:)
      IL%L(1:,1:) = transpose(L%L(1:,1:))
    end function lorentz_transformation_inverse
```

9.3.8 Invariants

These are used below. The first array index is varying fastest in FORTRAN; therefore the extra minus in the odd-rank tensor epsilon.

⟨*Lorentz: parameters*⟩+≡
```
    integer, dimension(3,3), parameter :: delta_three = &
        & reshape( source = [ 1,0,0, 0,1,0, 0,0,1 ], &
        &          shape  = [3,3] )
    integer, dimension(3,3,3), parameter :: epsilon_three = &
        & reshape( source = [ 0, 0,0,  0,0,-1,   0,1,0, &
        &                     0, 0,1,  0,0, 0,  -1,0,0, &
        &                     0,-1,0,  1,0, 0,   0,0,0 ],&
        &          shape = [3,3,3] )
```

This could be of some use:

⟨*Lorentz: public*⟩+≡
```
    public :: identity
```

⟨*Lorentz: parameters*⟩+≡
```
    type(lorentz_transformation_t), parameter :: &
        & identity = &
        & lorentz_transformation_t ( &
        & reshape( source = [ one, zero, zero, zero, &
        &                     zero, one, zero, zero, &
        &                     zero, zero, one, zero, &
        &                     zero, zero, zero, one ],&
        &          shape = [4,4] ) )
```

⟨*Lorentz: public*⟩+≡
```
    public :: space_reflection
```

⟨*Lorentz: parameters*⟩+≡
```
    type(lorentz_transformation_t), parameter :: &
        & space_reflection = &
        & lorentz_transformation_t ( &
        & reshape( source = [ one, zero, zero, zero, &
        &                     zero,-one, zero, zero, &
        &                     zero, zero,-one, zero, &
        &                     zero, zero, zero,-one ],&
        &            shape = [4,4] ) )
```

Builds a unit vector orthogal to the input vector in the xy-plane.

    end function create_two_particle_decay
```

This function creates a phase-space point for a $1 \to 3$ decay in the decaying particle's rest frame. There are three rest frames for this system, corresponding to s-, t,- and u-channel momentum exchange, also referred to as Gottfried-Jackson frames. Below, we choose the momentum with index 1 to be aligned along the z-axis. We then have

$$s_1 = (p_1 + p_2)^2 \,,$$
$$s_2 = (p_2 + p_3)^2 \,,$$
$$s_3 = (p_1 + p_3)^2 \,,$$
$$s_1 + s_2 + s_3 = s + m_1^2 + m_2^2 + m_3^2.$$

From these we can construct

$$E_1^{R23} = \frac{s - s_2 - m_1^2}{2\sqrt{s_2}} \quad P_1^{R23} = \frac{\lambda^{1/2}(s, s_2, m_1^2)}{2\sqrt{s_2}},$$
$$E_2^{R23} = \frac{s_2 + m_2^2 - m_3^2}{2\sqrt{s_2}} \quad P_2^{R23} = \frac{\lambda^{1/2}(s_2, m_2^2, m_3^2)}{2\sqrt{s_2}},$$
$$E_3^{R23} = \frac{s_2 + m_3^2 - m_2^2}{2\sqrt{s_2}} \quad P_3^{R23} = P_2^{R23},$$

where $R23$ denotes the Gottfried-Jackson frame of our choice. Finally, the scattering angle θ_{12}^{R23} between momentum 1 and 2 can be determined to be

$$\cos\theta_{12}^{R23} = \frac{(s - s_2 - m_1^2)(s_2 + m_2^2 - m_3^2) + 2s_2(m_1^2 + m_2^2 - s_1)}{\lambda^{1/2}(s, s_2, m_1^2)\lambda^{1/2}(s_2, m_2^2, m_3^2)}$$

        real(default), intent(in) :: E, p
        type(vector3_t) :: vec
        vec = p_in%p(1:3) / space_part_norm (p_in)
        p_out = vector4_moving (E, p * vec)
      end function shift_momentum

    end subroutine evaluate_one_to_two_splitting
```

9.3.9 Boosts

We build Lorentz transformations from boosts and rotations. In both cases we can supply a three-vector which defines the axis and (hyperbolic) angle. For a boost, this is the vector $\vec{\beta} = \vec{p}/E$, such that a particle at rest with mass m is boosted to a particle with three-vector $\vec{p}$. Here, we have

$$\beta = \tanh\chi = p/E, \qquad \gamma = \cosh\chi = E/m, \qquad \beta\gamma = \sinh\chi = p/m \qquad (9.1)$$

⟨*Lorentz: public functions*⟩+≡
```
    public :: boost
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface boost
       module procedure boost_from_rest_frame
       module procedure boost_from_rest_frame_vector3
       module procedure boost_generic
       module procedure boost_canonical
    end interface
```

In the first form, the argument is some four-momentum, the space part of which determines a direction, and the associated mass (which is not checked against the four-momentum). The boost vector $\gamma\vec{\beta}$ is then given by $\vec{p}/m$. This boosts from the rest frame of a particle to the current frame. To be explicit, if $\vec{p}$ is

the momentum of a particle and m its mass, $L(\vec{p}/m)$ is the transformation that turns $(m; \vec{0})$ into $(E; \vec{p})$. Conversely, the inverse transformation boosts a vector *into* the rest frame of a particle, in particular $(E; \vec{p})$ into $(m; \vec{0})$.

⟨*Lorentz: procedures*⟩+≡

```
elemental function boost_from_rest_frame (p, m) result (L)
  type(lorentz_transformation_t) :: L
  type(vector4_t), intent(in) :: p
  real(default), intent(in) :: m
  L = boost_from_rest_frame_vector3 (space_part (p), m)
end function boost_from_rest_frame
elemental function boost_from_rest_frame_vector3 (p, m) result (L)
  type(lorentz_transformation_t) :: L
  type(vector3_t), intent(in) :: p
  real(default), intent(in) :: m
  type(vector3_t) :: beta_gamma
  real(default) :: bg2, g, c
  integer :: i,j
  if (m > eps0) then
     beta_gamma = p / m
     bg2 = beta_gamma**2
  else
     bg2 = 0
     L = identity
     return
  end if
  if (bg2 > eps0) then
     g = sqrt(1 + bg2);   c = (g-1)/bg2
  else
     g = one + bg2 / two
     c = one / two
  end if
  L%L(0,0)  = g
  L%L(0,1:) = beta_gamma%p
  L%L(1:,0) = L%L(0,1:)
  do i=1,3
     do j=1,3
        L%L(i,j) = delta_three(i,j) + c*beta_gamma%p(i)*beta_gamma%p(j)
     end do
  end do
end function boost_from_rest_frame_vector3
```

A canonical boost is a boost along one of the coordinate axes, which we may supply as an integer argument. Here, $\gamma\beta$ is scalar.

⟨*Lorentz: procedures*⟩+≡

```
elemental function boost_canonical (beta_gamma, k) result (L)
  type(lorentz_transformation_t) :: L
  real(default), intent(in) :: beta_gamma
  integer, intent(in) :: k
  real(default) :: g
  g = sqrt(1 + beta_gamma**2)
  L = identity
  L%L(0,0) = g
  L%L(0,k) = beta_gamma
  L%L(k,0) = L%L(0,k)
```

```
        L%L(k,k) = L%L(0,0)
    end function boost_canonical
```

Instead of a canonical axis, we can supply an arbitrary axis which need not be normalized. If it is zero, return the unit matrix.

⟨*Lorentz: procedures*⟩+≡
```
    elemental function boost_generic (beta_gamma, axis) result (L)
      type(lorentz_transformation_t) :: L
      real(default), intent(in) :: beta_gamma
      type(vector3_t), intent(in) :: axis
      if (any (abs (axis%p) > 0)) then
         L = boost_from_rest_frame_vector3 (beta_gamma * axis, axis**1)
      else
         L = identity
      end if
    end function boost_generic
```

9.3.10 Rotations

For a rotation, the vector defines the rotation axis, and its length the rotation angle. All of these rotations rotate counterclockwise in a right-handed coordinate system.

⟨*Lorentz: public functions*⟩+≡
```
    public :: rotation
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface rotation
       module procedure rotation_generic
       module procedure rotation_canonical
       module procedure rotation_generic_cs
       module procedure rotation_canonical_cs
    end interface
```

If $\cos\phi$ and $\sin\phi$ is already known, we do not have to calculate them. Of course, the user has to ensure that $\cos^2\phi + \sin^2\phi = 1$, and that the given axis n is normalized to one. In the second form, the length of `axis` is the rotation angle.

⟨*Lorentz: procedures*⟩+≡
```
    elemental function rotation_generic_cs (cp, sp, axis) result (R)
      type(lorentz_transformation_t) :: R
      real(default), intent(in) :: cp, sp
      type(vector3_t), intent(in) :: axis
      integer :: i,j
      R = identity
      do i=1,3
         do j=1,3
            R%L(i,j) = cp*delta_three(i,j) + (1-cp)*axis%p(i)*axis%p(j)  &
                 &    - sp*dot_product(epsilon_three(i,j,:), axis%p)
         end do
      end do
    end function rotation_generic_cs
    elemental function rotation_generic (axis) result (R)
      type(lorentz_transformation_t) :: R
```

```
    type(vector3_t), intent(in) :: axis
    real(default) :: phi
    if (any (abs(axis%p) > 0)) then
        phi = abs(axis**1)
        R = rotation_generic_cs (cos(phi), sin(phi), axis/phi)
    else
        R = identity
    end if
end function rotation_generic
```

Alternatively, give just the angle and label the coordinate axis by an integer.

⟨*Lorentz: procedures*⟩+≡
```
    elemental function rotation_canonical_cs (cp, sp, k) result (R)
      type(lorentz_transformation_t) :: R
      real(default), intent(in) :: cp, sp
      integer, intent(in) :: k
      integer :: i,j
      R = identity
      do i=1,3
          do j=1,3
              R%L(i,j) = -sp*epsilon_three(i,j,k)
          end do
          R%L(i,i) = cp
      end do
      R%L(k,k) = 1
    end function rotation_canonical_cs
    elemental function rotation_canonical (phi, k) result (R)
      type(lorentz_transformation_t) :: R
      real(default), intent(in) :: phi
      integer, intent(in) :: k
      R = rotation_canonical_cs(cos(phi), sin(phi), k)
    end function rotation_canonical
```

This is viewed as a method for the first argument (three-vector): Reconstruct the rotation that rotates it into the second three-vector.

⟨*Lorentz: public functions*⟩+≡
```
    public :: rotation_to_2nd
```

⟨*Lorentz: interfaces*⟩+≡
```
    interface rotation_to_2nd
       module procedure rotation_to_2nd_generic
       module procedure rotation_to_2nd_canonical
    end interface
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function rotation_to_2nd_generic (p, q) result (R)
      type(lorentz_transformation_t) :: R
      type(vector3_t), intent(in) :: p, q
      type(vector3_t) :: a, b, ab
      real(default) :: ct, st
      if (any (abs (p%p) > 0) .and. any (abs (q%p) > 0)) then
          a = direction (p)
          b = direction (q)
          ab = cross_product(a,b)
          ct = a * b;   st = ab**1
          if (abs(st) > eps0) then
```

```
            R = rotation_generic_cs (ct, st, ab / st)
        else if (ct < 0) then
            R = space_reflection
        else
            R = identity
        end if
    else
        R = identity
    end if
end function rotation_to_2nd_generic
```

The same for a canonical axis: The function returns the transformation that rotates the k-axis into the direction of p.

⟨*Lorentz: procedures*⟩+≡
```
    elemental function rotation_to_2nd_canonical (k, p) result (R)
      type(lorentz_transformation_t) :: R
      integer, intent(in) :: k
      type(vector3_t), intent(in) :: p
      type(vector3_t) :: b, ab
      real(default) :: ct, st
      integer :: i, j
      if (any (abs (p%p) > 0)) then
         b = direction (p)
         ab%p = 0
         do i = 1, 3
            do j = 1, 3
               ab%p(j) = ab%p(j) + b%p(i) * epsilon_three(i,j,k)
            end do
         end do
         ct = b%p(k);   st = ab**1
         if (abs(st) > eps0) then
            R = rotation_generic_cs (ct, st, ab / st)
         else if (ct < 0) then
            R = space_reflection
         else
            R = identity
         end if
      else
         R = identity
      end if
    end function rotation_to_2nd_canonical
```

9.3.11   Composite Lorentz transformations

This function returns the transformation that, given a pair of vectors $p_{1,2}$, (a) boosts from the rest frame of the c.m. system (with invariant mass m) into the lab frame where p_i are defined, and (b) turns the given axis (or the canonical vectors $\pm e_k$) in the rest frame into the directions of $p_{1,2}$ in the lab frame. Note that the energy components are not used; for a consistent result one should have $(p_1 + p_2)^2 = m^2$.

⟨*Lorentz: public functions*⟩+≡
```
    public :: transformation
```

⟨*Lorentz: interfaces*⟩+≡
```
interface transformation
   module procedure transformation_rec_generic
   module procedure transformation_rec_canonical
end interface
```

⟨*Lorentz: procedures*⟩+≡
```
elemental function transformation_rec_generic (axis, p1, p2, m) result (L)
  type(vector3_t), intent(in) :: axis
  type(vector4_t), intent(in) :: p1, p2
  real(default), intent(in) :: m
  type(lorentz_transformation_t) :: L
  L = boost (p1 + p2, m)
  L = L * rotation_to_2nd (axis, space_part (inverse (L) * p1))
end function transformation_rec_generic
elemental function transformation_rec_canonical (k, p1, p2, m) result (L)
  integer, intent(in) :: k
  type(vector4_t), intent(in) :: p1, p2
  real(default), intent(in) :: m
  type(lorentz_transformation_t) :: L
  L = boost (p1 + p2, m)
  L = L * rotation_to_2nd (k, space_part (inverse (L) * p1))
end function transformation_rec_canonical
```

9.3.12 Applying Lorentz transformations

Multiplying vectors and Lorentz transformations is straightforward.

⟨*Lorentz: interfaces*⟩+≡
```
interface operator(*)
   module procedure prod_LT_vector4
   module procedure prod_LT_LT
   module procedure prod_vector4_LT
end interface
```

⟨*Lorentz: procedures*⟩+≡
```
elemental function prod_LT_vector4 (L, p) result (np)
  type(vector4_t) :: np
  type(lorentz_transformation_t), intent(in) :: L
  type(vector4_t), intent(in) :: p
  np%p = matmul (L%L, p%p)
end function prod_LT_vector4
elemental function prod_LT_LT (L1, L2) result (NL)
  type(lorentz_transformation_t) :: NL
  type(lorentz_transformation_t), intent(in) :: L1,L2
  NL%L = matmul (L1%L, L2%L)
end function prod_LT_LT
elemental function prod_vector4_LT (p, L) result (np)
  type(vector4_t) :: np
  type(vector4_t), intent(in) :: p
  type(lorentz_transformation_t), intent(in) :: L
  np%p = matmul (p%p, L%L)
end function prod_vector4_LT
```

9.3.13 Special Lorentz transformations

These routines have their application in the generation and extraction of angles in the phase-space sampling routine. Since this part of the program is time-critical, we calculate the composition of transformations directly instead of multiplying rotations and boosts.

This Lorentz transformation is the composition of a rotation by ϕ around the 3 axis, a rotation by θ around the 2 axis, and a boost along the 3 axis:

$$L = B_3(\beta\gamma)\,R_2(\theta)\,R_3(\phi) \tag{9.2}$$

Instead of the angles we provide sine and cosine.

⟨*Lorentz: public functions*⟩+≡
```
    public :: LT_compose_r3_r2_b3
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function LT_compose_r3_r2_b3 &
        (cp, sp, ct, st, beta_gamma) result (L)
      type(lorentz_transformation_t) :: L
      real(default), intent(in) :: cp, sp, ct, st, beta_gamma
      real(default) :: gamma
      if (abs(beta_gamma) < eps0) then
         L%L(0,0)  = 1
         L%L(1:,0) = 0
         L%L(0,1:) = 0
         L%L(1,1:) = [  ct*cp, -ct*sp, st ]
         L%L(2,1:) = [     sp,     cp, zero ]
         L%L(3,1:) = [ -st*cp,  st*sp, ct ]
      else
         gamma = sqrt(1 + beta_gamma**2)
         L%L(0,0)  = gamma
         L%L(1,0)  = 0
         L%L(2,0)  = 0
         L%L(3,0)  = beta_gamma
         L%L(0,1:) = beta_gamma * [ -st*cp,  st*sp, ct ]
         L%L(1,1:) =              [  ct*cp, -ct*sp, st ]
         L%L(2,1:) =              [     sp,     cp, zero ]
         L%L(3,1:) = gamma       * [ -st*cp,  st*sp, ct ]
      end if
    end function LT_compose_r3_r2_b3
```

Different ordering:

$$L = B_3(\beta\gamma)\,R_3(\phi)\,R_2(\theta) \tag{9.3}$$

⟨*Lorentz: public functions*⟩+≡
```
    public :: LT_compose_r2_r3_b3
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function LT_compose_r2_r3_b3 &
        (ct, st, cp, sp, beta_gamma) result (L)
      type(lorentz_transformation_t) :: L
      real(default), intent(in) :: ct, st, cp, sp, beta_gamma
      real(default) :: gamma
      if (abs(beta_gamma) < eps0) then
         L%L(0,0)  = 1
```

```
    L%L(1:,0) = 0
    L%L(0,1:) = 0
    L%L(1,1:) = [  ct*cp,    -sp,     st*cp ]
    L%L(2,1:) = [  ct*sp,     cp,     st*sp ]
    L%L(3,1:) = [ -st   ,    zero,     ct    ]
  else
    gamma = sqrt(1 + beta_gamma**2)
    L%L(0,0)  = gamma
    L%L(1,0)  = 0
    L%L(2,0)  = 0
    L%L(3,0)  = beta_gamma
    L%L(0,1:) = beta_gamma * [ -st   ,    zero,     ct    ]
    L%L(1,1:) =              [  ct*cp,    -sp,     st*cp ]
    L%L(2,1:) =              [  ct*sp,     cp,     st*sp ]
    L%L(3,1:) = gamma      * [ -st   ,    zero,     ct    ]
  end if
end function LT_compose_r2_r3_b3
```

This function returns the previous Lorentz transformation applied to an arbitrary four-momentum and extracts the space part of the result:

$$\vec{n} = [B_3(\beta\gamma)\, R_2(\theta)\, R_3(\phi)\, p]_{\text{space part}} \qquad (9.4)$$

The second variant applies if there is no rotation

⟨*Lorentz: public functions*⟩+≡

      n%p = p%p(1:3)
      if (abs(beta_gamma) > eps0) then
         gamma = sqrt(1 + beta_gamma**2)
         n%p(3) = n%p(3) * gamma + p%p(0) * beta_gamma
```

```
    end if
end function axis_from_p_b3
```

9.3.14 Special functions

The Källén function, mostly used for the phase space. This is equivalent to
$\lambda(x, y, z) = x^2 + y^2 + z^2 - 2xy - 2xz - 2yz$.

⟨*Lorentz: public functions*⟩+≡
```
    public :: lambda
```

⟨*Lorentz: procedures*⟩+≡
```
    elemental function lambda (m1sq, m2sq, m3sq)
      real(default) :: lambda
      real(default), intent(in) :: m1sq, m2sq, m3sq
      lambda = (m1sq - m2sq - m3sq)**2 - 4*m2sq*m3sq
    end function lambda
```

Return a pair of head-to-head colliding momenta, given the collider energy,
particle masses, and optionally the momentum of the c.m. system.

⟨*Lorentz: public functions*⟩+≡
```
    public :: colliding_momenta
```

⟨*Lorentz: procedures*⟩+≡
```
    function colliding_momenta (sqrts, m, p_cm) result (p)
      type(vector4_t), dimension(2) :: p
      real(default), intent(in) :: sqrts
      real(default), dimension(2), intent(in), optional :: m
      real(default), intent(in), optional :: p_cm
      real(default), dimension(2) :: dmsq
      real(default) :: ch, sh
      real(default), dimension(2) :: E0, p0
      integer, dimension(2), parameter :: sgn = [1, -1]
      if (abs(sqrts) < eps0) then
         call msg_fatal (" Colliding beams: sqrts is zero (please set sqrts)")
         p = vector4_null;  return
      else if (sqrts <= 0) then
         call msg_fatal (" Colliding beams: sqrts is negative")
         p = vector4_null;  return
      end if
      if (present (m)) then
         dmsq = sgn * (m(1)**2-m(2)**2)
         E0 = (sqrts + dmsq/sqrts) / 2
         if (any (E0 < m)) then
            call msg_fatal &
                 (" Colliding beams: beam energy is less than particle mass")
            p = vector4_null;  return
         end if
         p0 = sgn * sqrt (E0**2 - m**2)
      else
         E0 = sqrts / 2
         p0 = sgn * E0
      end if
```

```
      if (present (p_cm)) then
         sh = p_cm / sqrts
         ch = sqrt (1 + sh**2)
         p = vector4_moving (E0 * ch + p0 * sh, E0 * sh + p0 * ch, 3)
      else
         p = vector4_moving (E0, p0, 3)
      end if
   end function colliding_momenta
```

This subroutine is for the purpose of numerical checks and comparisons. The idea is to set a number to zero if it is numerically equivalent with zero. The equivalence is established by comparing with a `tolerance` argument. We implement this for vectors and transformations.

⟨*Lorentz: public functions*⟩+≡
```
   public :: pacify
```

```

This computes the quantities

$$\langle ij \rangle = \sqrt{|S_{ij}|}e^{i\phi_{ij}}, [ij] \qquad\qquad = \sqrt{|S_{ij}|}e^{i\tilde{\phi}_{ij}},$$

with $S_{ij} = (p_i + p_j)^2$. The phase space factor ϕ_{ij} is determined by

$$\cos\phi_{ij} = \frac{p_i^1 p_j^+ - p_j^1 p_i^+}{\sqrt{p_i^+ p_j^+ S_{ij}}}, \sin\phi_{ij} \qquad\qquad = \frac{p_i^2 p_j^+ - p_j^2 p_i^+}{\sqrt{p_i^+ p_j^+ S_{ij}}}.$$

After $\langle ij \rangle$ has been computed according to these formulae, $[ij]$ can be obtained by using the relation $S_{ij} = \langle ij \rangle [ji]$ and taking into account that $[ij] = -[ji]$. Thus, a minus-sign has to be applied.

9.4 Special Physics functions

Here, we declare functions that are specific for the Standard Model, including QCD: fixed and running α_s, Catani-Seymour dipole terms, loop functions, etc.

To make maximum use of this, all functions, if possible, are declared elemental (or pure, if this is not possible).

9.4.1 Running α_s

Then we define the coefficients of the beta function of QCD (as a reference cf. the Particle Data Group), where n_f is the number of active flavors in two different schemes:

$$\beta_0 = 11 - \frac{2}{3}n_f \tag{9.5}$$

$$\beta_1 = 51 - \frac{19}{3}n_f \tag{9.6}$$

$$\beta_2 = 2857 - \frac{5033}{9}n_f + \frac{325}{27}n_f^2 \tag{9.7}$$

$$b_0 = \frac{1}{12\pi}\left(11C_A - 2n_f\right) \tag{9.8}$$

$$b_1 = \frac{1}{24\pi^2}\left(17C_A^2 - 5C_A n_f - 3C_F n_f\right) \tag{9.9}$$

$$b_2 = \frac{1}{(4\pi)^3}\left(\frac{2857}{54}C_A^3 - \frac{1415}{54} * C_A^2 n_f - \frac{205}{18}C_A C_F n_f + C_F^2 n_f + \frac{79}{54}C_A n_f **2 + \frac{11}{9}C_F n_f **2\right) \tag{9.10}$$

⟨*SM physics: public*⟩≡

    end function coeff_b2
```

There should be two versions of running α_s, one which takes the scale and Λ_{QCD} as input, and one which takes the scale and e.g. $\alpha_s(m_Z)$ as input. Here, we take the one which takes the QCD scale and scale as inputs from the PDG book.

9.4.2 Catani-Seymour Parameters

These are fundamental constants of the Catani-Seymour dipole formalism. Since
the corresponding parameters for the gluon case depend on the number of flavors
which is treated as an argument, there we do have functions and not parameters.

$$\gamma_q = \gamma_{\bar{q}} = \frac{3}{2}C_F \qquad \gamma_g = \frac{11}{6}C_A - \frac{2}{3}T_R N_f \tag{9.11}$$

$$K_q = K_{\bar{q}} = \left(\frac{7}{2} - \frac{\pi^2}{6}\right)C_F \qquad K_g = \left(\frac{67}{18} - \frac{\pi^2}{6}\right)C_A - \frac{10}{9}T_R N_f \tag{9.12}$$

⟨*SM physics: parameters*⟩≡
```
    real(kind=default), parameter, public ::  gamma_q = three/two * CF, &
       k_q = (7.0_default/two - pi**2/6.0_default) * CF

      real(kind=default) :: kg
      kg = (67.0_default/18.0_default - pi**2/6.0_default) * CA - &
                10.0_default/9.0_default * TR * nf
   end function k_g
```

9.4.3 Mathematical Functions

The dilogarithm. This simplified version is bound to double precision, and
restricted to argument values less or equal to unity, so we do not need complex
algebra. The wrapper converts it to default precision (which is, of course, a
no-op if double=default).

   The routine calculates the dilogarithm through mapping on the area where
there is a quickly convergent series (adapted from an F77 routine by Hans
Kuijf, 1988): Map x such that x is not in the neighbourhood of 1. Note that
$|z| = -\ln(1-x)$ is always smaller than 1.10, but $\frac{1 \cdot 10^{19}}{19!}$Bernoulli$_{19} = 2.7 \times 10^{-15}$.

9.4.6 Functions for Catani-Seymour dipoles

For the automated Catani-Seymour dipole subtraction, we need the following
functions.

⟨*SM physics: public*⟩+≡
```
    public :: ff_dipole
```

⟨*SM physics: procedures*⟩+≡
```
    pure subroutine ff_dipole (v_ijk,y_ijk,p_ij,pp_k,p_i,p_j,p_k)
        type(vector4_t), intent(in) :: p_i, p_j, p_k
        type(vector4_t), intent(out) :: p_ij, pp_k
        real(kind=default), intent(out) :: y_ijk
        real(kind=default) :: z_i
        real(kind=default), intent(out) :: v_ijk
        z_i   = (p_i*p_k) / ((p_k*p_j) + (p_k*p_i))
        y_ijk = (p_i*p_j) / ((p_i*p_j) + (p_i*p_k) + (p_j*p_k))
        p_ij  = p_i + p_j - y_ijk/(1.0_default - y_ijk) * p_k
        pp_k  = (1.0/(1.0_default - y_ijk)) * p_k
        !!! We don't multiply by alpha_s right here:
        v_ijk = 8.0_default * PI * CF * &
            (2.0 / (1.0 - z_i*(1.0 - y_ijk)) - (1.0 + z_i))
    end subroutine ff_dipole
```

⟨*SM physics: public*⟩+≡
```
    public :: fi_dipole
```

⟨*SM physics: procedures*⟩+≡
```
    pure subroutine fi_dipole (v_ija,x_ija,p_ij,pp_a,p_i,p_j,p_a)
      type(vector4_t), intent(in) :: p_i, p_j, p_a
      type(vector4_t), intent(out) :: p_ij, pp_a
      real(kind=default), intent(out) :: x_ija
      real(kind=default) :: z_i
      real(kind=default), intent(out) :: v_ija
      z_i   = (p_i*p_a) / ((p_a*p_j) + (p_a*p_i))
      x_ija = ((p_i*p_a) + (p_j*p_a) - (p_i*p_j)) &
```

```
        / ((p_i*p_a) + (p_j*p_a))
    p_ij = p_i + p_j - (1.0_default - x_ija) * p_a
    pp_a = x_ija * p_a
    !!! We don't not multiply by alpha_s right here:
    v_ija = 8.0_default * PI * CF * &
          (2.0 / (1.0 - z_i + (1.0 - x_ija)) - (1.0 + z_i)) / x_ija
  end subroutine fi_dipole
```

⟨*SM physics: public*⟩+≡
```
    public :: if_dipole
```

⟨*SM physics: procedures*⟩+≡
```
    pure subroutine if_dipole (v_kja,u_j,p_aj,pp_k,p_k,p_j,p_a)
      type(vector4_t), intent(in) :: p_k, p_j, p_a
      type(vector4_t), intent(out) :: p_aj, pp_k
      real(kind=default), intent(out) :: u_j
      real(kind=default) :: x_kja
      real(kind=default), intent(out) :: v_kja
      u_j   = (p_a*p_j) / ((p_a*p_j) + (p_a*p_k))
      x_kja = ((p_a*p_k) + (p_a*p_j) - (p_j*p_k)) &
            / ((p_a*p_j) + (p_a*p_k))
      p_aj  = x_kja * p_a
      pp_k  = p_k + p_j - (1.0_default - x_kja) * p_a
      v_kja = 8.0_default * PI * CF * &
            (2.0 / (1.0 - x_kja + u_j) - (1.0 + x_kja)) / x_kja
    end subroutine if_dipole
```

This function depends on a variable number of final state particles whose kinematics all get changed by the initial-initial dipole insertion.

⟨*SM physics: public*⟩+≡
```
    public :: ii_dipole
```

⟨*SM physics: procedures*⟩+≡
```
    pure subroutine ii_dipole (v_jab,v_j,p_in,p_out,flag_1or2)
        type(vector4_t), dimension(:), intent(in) :: p_in
        type(vector4_t), dimension(size(p_in)-1), intent(out) :: p_out
        logical, intent(in) :: flag_1or2
        real(kind=default), intent(out) :: v_j
        real(kind=default), intent(out) :: v_jab
        type(vector4_t) :: p_a, p_b, p_j
        type(vector4_t) :: k, kk
        type(vector4_t) :: p_aj
        real(kind=default) :: x_jab
        integer :: i
        !!! flag_1or2 decides whether this a 12 or 21 dipole
        if (flag_1or2) then
           p_a = p_in(1)
           p_b = p_in(2)
        else
           p_b = p_in(1)
           p_a = p_in(2)
        end if
        !!! We assume that the unresolved particle has always the last
        !!! momentum
```

```
      p_j = p_in(size(p_in))
      x_jab = ((p_a*p_b) - (p_a*p_j) - (p_b*p_j)) / (p_a*p_b)
      v_j = (p_a*p_j) / (p_a * p_b)
      p_aj  = x_jab * p_a
      k     = p_a + p_b - p_j
      kk    = p_aj + p_b
      do i = 3, size(p_in)-1
         p_out(i) = p_in(i) - 2.0*((k+kk)*p_in(i))/((k+kk)*(k+kk)) * (k+kk) + &
               (2.0 * (k*p_in(i)) / (k*k)) * kk
      end do
      if (flag_1or2) then
         p_out(1) = p_aj
         p_out(2) = p_b
      else

         p_out(2) = p_aj
      end if
      v_jab = 8.0_default * PI * CF * &
            (2.0 / (1.0 - x_jab) - (1.0 + x_jab)) / x_jab
   end subroutine ii_dipole
```

9.4.7   Distributions for integrated dipoles and such

Note that the following formulae are only meaningful for $0 \le x \le 1$.

The Dirac delta distribution, modified for Monte-Carlo sampling, centered at $x = 1 - \frac{\epsilon}{2}$:

⟨*SM physics: public*⟩+≡
```
   public :: delta
```

⟨*SM physics: procedures*⟩+≡
```
   elemental function delta (x,eps) result (z)
     real(kind=default), intent(in) :: x, eps
     real(kind=default) :: z
     if (x > one - eps) then
        z = one / eps
     else
        z = 0
     end if
   end function delta
```

The +-distribution, $P_+(x) = \left(\frac{1}{1-x}\right)_+$, for the regularization of soft-collinear singularities. The constant part for the Monte-Carlo sampling is the integral over the splitting function divided by the weight for the WHIZARD numerical integration over the interval.

⟨*SM physics: public*⟩+≡
```
   public :: plus_distr
```

⟨*SM physics: procedures*⟩+≡
```
   elemental function plus_distr (x,eps) result (plusd)
     real(kind=default), intent(in) :: x, eps
     real(kind=default) :: plusd
     if (x > one - eps) then
        plusd = log(eps) / eps
```

```
        else
            plusd = one / (one - x)
        end if
    end function plus_distr
```

The splitting function in $D = 4$ dimensions, regularized as $+$-distributions if necessary:

$$P^{qq}(x) = P^{\bar{q}\bar{q}}(x) = C_F \cdot \left(\frac{1+x^2}{1-x}\right)_+ \tag{9.13}$$

$$P^{qg}(x) = P^{\bar{q}g}(x) = C_F \cdot \frac{1+(1-x)^2}{x} \tag{9.14}$$

$$P^{gq}(x) = P^{g\bar{q}}(x) = T_R \cdot \left[x^2 + (1-x)^2\right] \tag{9.15}$$

$$P^{gg}(x) = 2C_A\left[\left(\frac{1}{1-x}\right)_+ + \frac{1-x}{x} - 1 + x(1-x)\right]$$
$$+ \delta(1-x)\left(\frac{11}{6}C_A - \frac{2}{3}N_f T_R\right) \tag{9.16}$$

Since the number of flavors summed over in the gluon splitting function might depend on the physics case under consideration, it is implemented as an input variable.

⟨*SM physics: public*⟩+≡
```
    public :: pqq
```

⟨*SM physics: procedures*⟩+≡
```
    elemental function pqq (x,eps) result (pqqx)
      real(kind=default), intent(in) :: x, eps
      real(kind=default) :: pqqx
      if (x > (1.0_default - eps)) then
        pqqx = (eps - one) / two + two * log(eps) / eps - &
             three * (eps - one) / eps / two
      else
        pqqx = (one + x**2) / (one - x)
      end if
      pqqx = CF * pqqx
    end function pqq
```

⟨*SM physics: public*⟩+≡
```
    public :: pgq
```

⟨*SM physics: procedures*⟩+≡
```
    elemental function pgq (x) result (pgqx)
      real(kind=default), intent(in) :: x
      real(kind=default) :: pgqx
      pgqx = TR * (x**2 + (one - x)**2)
    end function pgq
```

⟨*SM physics: public*⟩+≡
```
    public :: pqg
```

⟨*SM physics: procedures*⟩+≡
```
elemental function pqg (x) result (pqgx)
   real(kind=default), intent(in) :: x
   real(kind=default) :: pqgx
   pqgx = CF * (one + (one - x)**2) / x
end function pqg
```

⟨*SM physics: public*⟩+≡
```
public :: pgg
```

⟨*SM physics: procedures*⟩+≡
```
elemental function pgg (x, nf, eps) result (pggx)
  real(kind=default), intent(in) :: x, nf, eps
  real(kind=default) :: pggx
  pggx = two * CA * ( plus_distr (x, eps) + (one-x)/x - one + &
                  x*(one-x)) + delta (x, eps)  * gamma_g(nf)
end function pgg
```

For the *qq* and *gg* cases, there exist "regularized" versions of the splitting functions:

$$P_{\text{reg}}^{qq}(x) = -C_F \cdot (1 + x) \tag{9.17}$$

$$P_{\text{reg}}^{gg}(x) = 2C_A \left[\frac{1-x}{x} - 1 + x(1-x) \right] \tag{9.18}$$

⟨*SM physics: public*⟩+≡
```
public :: pqq_reg
```

⟨*SM physics: procedures*⟩+≡
```
elemental function pqq_reg (x) result (pqqregx)
   real(kind=default), intent(in) :: x
   real(kind=default) :: pqqregx
   pqqregx = - CF * (one + x)
end function pqq_reg
```

⟨*SM physics: public*⟩+≡
```
public :: pgg_reg
```

⟨*SM physics: procedures*⟩+≡
```
elemental function pgg_reg (x) result (pggregx)
   real(kind=default), intent(in) :: x
   real(kind=default) :: pggregx
   pggregx = two * CA * ((one - x)/x - one + x*(one - x))
end function pgg_reg
```

Here, we collect the expressions needed for integrated Catani-Seymour dipoles, and the so-called flavor kernels. We always distinguish between the "ordinary" Catani-Seymour version, and the one including a phase-space slicing parameter, α.

The standard flavor kernels $\overline{K}^{ab}$ are:

$$\overline{K}^{qg}(x) = \overline{K}^{\bar{q}g}(x) = P^{qg}(x)\log((1-x)/x) + CF \times x \qquad (9.19)$$

$$\overline{K}^{gq}(x) = \overline{K}^{g\bar{q}}(x) = P^{gq}(x)\log((1-x)/x) + TR \times 2x(1-x) \qquad (9.20)$$

$$\overline{K}^{qq} = C_F\left[\left(\frac{2}{1-x}\log\frac{1-x}{x}\right)_+ - (1+x)\log((1-x)/x) + (1-x)\right]$$
$$- (5 - \pi^2) \cdot C_F \cdot \delta(1-x) \qquad (9.21)$$

$$\overline{K}^{gg} = 2C_A\left[\left(\frac{1}{1-x}\log\frac{1-x}{x}\right)_+ + \left(\frac{1-x}{x} - 1 + x(1-x)\right)\log((1-x)/x)\right]$$
$$- \delta(1-x)\left[\left(\frac{50}{9} - \pi^2\right)C_A - \frac{16}{9}T_R N_f\right] \qquad (9.22)$$

⟨*SM physics: public*⟩+≡
```
    public :: kbarqg
```

⟨*SM physics: procedures*⟩+≡
```
    function kbarqg (x) result (kbarqgx)
      real(kind=default), intent(in) :: x
      real(kind=default) :: kbarqgx
      kbarqgx = pqg(x) * log((one-x)/x) + CF * x
    end function kbarqg
```

⟨*SM physics: public*⟩+≡
```
    public :: kbargq
```

⟨*SM physics: procedures*⟩+≡
```
    function kbargq (x) result (kbargqx)
      real(kind=default), intent(in) :: x
      real(kind=default) :: kbargqx
      kbargqx = pgq(x) * log((one-x)/x) + two * TR * x * (one - x)
    end function kbargq
```

⟨*SM physics: public*⟩+≡
```
    public :: kbarqq
```

⟨*SM physics: procedures*⟩+≡
```
    function kbarqq (x,eps) result (kbarqqx)
      real(kind=default), intent(in) :: x, eps
      real(kind=default) :: kbarqqx
      kbarqqx = CF*(log_plus_distr(x,eps) - (one+x) * log((one-x)/x) + (one - &
           x) - (five - pi**2) * delta(x,eps))
    end function kbarqq
```

⟨*SM physics: public*⟩+≡
```
    public :: kbargg
```

⟨*SM physics: procedures*⟩+≡
```
    function kbargg (x,eps,nf) result (kbarggx)
      real(kind=default), intent(in) :: x, eps, nf
      real(kind=default) :: kbarggx
      kbarggx = CA * (log_plus_distr(x,eps) + two * ((one-x)/x - one + &
```

```
                             x*(one-x) * log((1-x)/x))) - delta(x,eps) * &
                             ((50.0_default/9.0_default - pi**2) * CA - &
                             16.0_default/9.0_default * TR * nf)
        end function kbargg
```

The $\tilde{K}$ are used when two identified hadrons participate:

$$\tilde{K}^{ab}(x) = P_{\mathrm{reg}}^{ab}(x) \cdot \log(1-x) + \delta^{ab} \mathbf{T}_a^2 \left[\left(\frac{2}{1-x} \log(1-x) \right)_+ - \frac{\pi^2}{3} \delta(1-x) \right] \quad (9.23)$$

⟨*SM physics: public*⟩+≡
```

          real(kind=default) :: ktildeqgx
          ktildeqgx = pqg (x) * log(one-x)
        end function ktildeqg
```

⟨*SM physics: public*⟩+≡
```
        public :: ktildegq
```

⟨*SM physics: procedures*⟩+≡
```
        function ktildegq (x,eps) result (ktildegqx)
          real(kind=default), intent(in) :: x, eps
          real(kind=default) :: ktildegqx
          ktildegqx = pgq (x) * log(one-x)
        end function ktildegq
```

⟨*SM physics: public*⟩+≡
```
        public :: ktildegg
```

⟨*SM physics: procedures*⟩+≡
```
        function ktildegg (x,eps) result (ktildeggx)
          real(kind=default), intent(in) :: x, eps
          real(kind=default) :: ktildeggx
          ktildeggx = pgg_reg (x) * log(one-x) + CA * ( - &
              log2_plus_distr (x,eps) - pi**2/three * delta(x,eps))
        end function ktildegg
```

The insertion operator might not be necessary for a GOLEM interface but is demanded by the Les Houches NLO accord. It is a three-dimensional array, where the index always gives the inverse power of the DREG expansion parameter, ϵ.

⟨*SM physics: public*⟩+≡
```
public :: insert_q
```

⟨*SM physics: procedures*⟩+≡
```
pure function insert_q ()
  real(kind=default), dimension(0:2) :: insert_q
  insert_q(0) = gamma_q + k_q - pi**2/three * CF
  insert_q(1) = gamma_q
  insert_q(2) = CF
end function insert_q
```

⟨*SM physics: public*⟩+≡
```
public :: insert_g
```

⟨*SM physics: procedures*⟩+≡
```
pure function insert_g (nf)
  real(kind=default), intent(in) :: nf
  real(kind=default), dimension(0:2) :: insert_g
  insert_g(0) = gamma_g (nf) + k_g (nf) - pi**2/three * CA
  insert_g(1) = gamma_g (nf)
  insert_g(2) = CA
end function insert_g
```

For better convergence, one can exclude regions of phase space with a slicing parameter from the dipole subtraction procedure. First of all, the K functions get modified:

$$K_i(\alpha) = K_i - \mathbf{T}_i^2 \log^2 \alpha + \gamma_i(\alpha - 1 - \log \alpha) \tag{9.24}$$

⟨*SM physics: public*⟩+≡
```
public :: k_q_al, k_g_al
```

⟨*SM physics: procedures*⟩+≡
```
pure function k_q_al (alpha)
  real(kind=default), intent(in) :: alpha
  real(kind=default) :: k_q_al
  k_q_al = k_q - CF * (log(alpha))**2 + gamma_q * &
                  (alpha - one - log(alpha))
end function k_q_al

pure function k_g_al (alpha, nf)
  real(kind=default), intent(in) :: alpha, nf
  real(kind=default) :: k_g_al
  k_g_al = k_g (nf) - CA * (log(alpha))**2 + gamma_g (nf) * &
                  (alpha - one - log(alpha))
end function k_g_al
```

The +-distribution, but with a phase-space slicing parameter, α, $P_{1-\alpha}(x) = \left(\frac{1}{1-x}\right)_{1-x}$. Since we need the fatal error message here, this function cannot be elemental.

⟨*SM physics: public*⟩+≡
```
public :: plus_distr_al
```

⟨*SM physics: procedures*⟩+≡

```
function plus_distr_al (x,alpha,eps) result (plusd_al)
   real(kind=default), intent(in) :: x,  eps, alpha
   real(kind=default) :: plusd_al
   if ((one - alpha) >= (one - eps)) then
      plusd_al = zero
      call msg_fatal ('sm_physics, plus_distr_al: alpha and epsilon chosen wrongly')
   elseif (x < (1.0_default - alpha)) then
      plusd_al = 0
   else if (x > (1.0_default - eps)) then
      plusd_al = log(eps/alpha)/eps
   else
      plusd_al = one/(one-x)
   end if
 end function plus_distr_al
```

Introducing phase-space slicing parameters, these standard flavor kernels $\overline{K}^{ab}$ become:

$$\overline{K}_\alpha^{qg}(x) = \overline{K}_\alpha^{\bar{q}g}(x) = P^{qg}(x)\log(\alpha(1-x)/x) + C_F \times x \tag{9.25}$$

$$\overline{K}_\alpha^{gq}(x) = \overline{K}_\alpha^{g\bar{q}}(x) = P^{gq}(x)\log(\alpha(1-x)/x) + T_R \times 2x(1-x) \tag{9.26}$$

$$\overline{K}_\alpha^{qq} = C_F(1-x) + P_{\text{reg}}^{qq}(x)\log\frac{\alpha(1-x)}{x}$$
$$+ C_F\delta(1-x)\log^2\alpha + C_F\left(\frac{2}{1-x}\log\frac{1-x}{x}\right)_+$$
$$- \left(\gamma_q + K_q(\alpha) - \frac{5}{6}\pi^2 C_F\right)\cdot\delta(1-x)\,C_F\left[+\frac{2}{1-x}\log\left(\frac{\alpha(2-x)}{1+\alpha-x}\right) - \theta(1-\alpha-x)\cdot\left(\frac{2}{1-\right.}\right.$$
$$\tag{9.27}$$

$$\overline{K}_\alpha^{gg} = P_{\text{reg}}^{gg}(x)\log\frac{\alpha(1-x)}{x} + C_A\delta(1-x)\log^2\alpha$$
$$+ C_A\left(\frac{2}{1-x}\log\frac{1-x}{x}\right)_+ - \left(\gamma_g + K_g(\alpha) - \frac{5}{6}\pi^2 C_A\right)\cdot\delta(1-x)\,C_A\left[+\frac{2}{1-x}\log\left(\frac{\alpha(2-}{1+\alpha-}\right.\right.$$
$$\tag{9.28}$$

       ktildeqqx = pqq_reg(x) * log((one-x)/alpha) + CF*( &
            - log2_plus_distr_al(x,alpha,eps) - Pi**2/three * delta(x,eps) &
            + (one+x**2)/(one-x) * log(min(one,(alpha/(one-x)))) &
            + two/(one-x) * log((one+alpha-x)/alpha))
       if (x > (one-alpha)) then
          ktildeqqx = ktildeqqx - CF*two/(one-x)*log(two-x)
       end if
    end function ktildeqq_al
```

This is a logarithmic +-distribution, $\left(\frac{\log((1-x)/x)}{1-x}\right)_+$. For the sampling, we need the integral over this function over the incomplete sampling interval $[0, 1 - \epsilon]$, which is $\log^2(x) + 2Li_2(x) - \frac{\pi^2}{3}$. As this function is negative definite for $\epsilon > 0.1816$, we take a hard upper limit for that sampling parameter, irrespective of the fact what the user chooses.

⟨*SM physics: public*⟩+≡
```
    public :: log_plus_distr
```

⟨*SM physics: procedures*⟩+≡
```
    function log_plus_distr (x,eps) result (lpd)

         lpd_al = two*log(one/(one-x))/(one-x)
```

```
      end if
   end function log2_plus_distr_al
```

9.4.8 Splitting Functions

Analogue to the regularized distributions of the last subsection, we give here the unregularized splitting functions, relevant for the parton shower algorithm. We can use this unregularized version since there will be a cut-off ϵ that ensures that $\{z, 1-z\} > \epsilon(t)$. This cut-off seperates resolvable from unresolvable emissions.

p_xxx are the kernels that are summed over helicity:

⟨*SM physics: public*⟩+≡
```
   public :: p_qqg
   public :: p_gqq
   public :: p_ggg
```

$q \to qg$

⟨*SM physics: procedures*⟩+≡
```
   elemental function p_qqg (z) result (P)
     real(default), intent(in) :: z
     real(default) :: P
     P = CF * (one + z**2) / (one - z)
   end function p_qqg
```

$g \to q\bar{q}$

⟨*SM physics: procedures*⟩+≡
```
   elemental function p_gqq (z) result (P)
     real(default), intent(in) :: z
     real(default) :: P
     P = TR * (z**2 + (one - z)**2)
   end function p_gqq
```

$g \to gg$

⟨*SM physics: procedures*⟩+≡
```
   elemental function p_ggg (z) result (P)
     real(default), intent(in) :: z
     real(default) :: P
     P = NC * ((one - z) / z + z / (one - z) + z * (one - z))
   end function p_ggg
```

Analytically integrated splitting kernels:

⟨*SM physics: public*⟩+≡
```
   public :: integral_over_p_qqg
   public :: integral_over_p_gqq
   public :: integral_over_p_ggg
```

⟨*SM physics: procedures*⟩+≡
```
   pure function integral_over_p_qqg (zmin, zmax) result (integral)
     real(default), intent(in) :: zmin, zmax
     real(default) :: integral
     integral = (two / three) * (- zmax**2 + zmin**2 - &
          two * (zmax - zmin) + four * log((one - zmin) / (one - zmax)))
   end function integral_over_p_qqg
```

```
pure function integral_over_p_gqq (zmin, zmax) result (integral)
  real(default), intent(in) :: zmin, zmax
  real(default) :: integral
  integral = 0.5_default * ((two / three) * &
       (zmax**3 - zmin**3) - (zmax**2 - zmin**2) + (zmax - zmin))
end function integral_over_p_gqq

pure function integral_over_p_ggg (zmin, zmax) result (integral)
  real(default), intent(in) :: zmin, zmax
  real(default) :: integral
  integral = three * ((log(zmax) - two * zmax - &
       log(one - zmax) + zmax**2 / two - zmax**3 / three) - &
       (log(zmin) - zmin - zmin - log(one - zmin) + zmin**2 &
       / two - zmin**3 / three) )
end function integral_over_p_ggg
```

We can also use (massless) helicity dependent splitting functions:

⟨*SM physics: public*⟩+≡

```
public :: p_qqg_pol
```

$q_a \to q_b g_c$, the helicity of the quark is not changed by gluon emission and the gluon is preferably polarized in the branching plane ($l_c = 1$):

⟨*SM physics: procedures*⟩+≡

```
elemental function p_qqg_pol (z, l_a, l_b, l_c) result (P)
  real(default), intent(in) :: z
  integer, intent(in) :: l_a, l_b, l_c
  real(default) :: P
  if (l_a /= l_b) then
     P = zero
     return
  end if
  if (l_c == -1) then
     P = one - z
  else
     P = (one + z)**2 / (one - z)
  end if
  P = P * CF
end function p_qqg_pol
```

9.4.9 Top width

In order to produce sensible results, the widths have to be recomputed for each parameter and order. We start with the LO-expression for the top width given by the decay $t \to W^+, b$, cf. `doi:10.1016/0550-3213(91)90530-B`:
The analytic formula given there is

$$\Gamma = \frac{G_F m_t^2}{16\sqrt{2}\pi} \left[\mathcal{F}_0(\varepsilon, \xi^{-1/2}) - \frac{2\alpha_s}{3\pi} \mathcal{F}_1(\varepsilon, \xi^{-1/2}) \right],$$

with

$$\mathcal{F}_0 = \frac{\sqrt{\lambda}}{2} f_0,$$
$$f_0 = 4 \left[(1 - \varepsilon^2)^2 + w^2(1 + \varepsilon^2) - 2w^4 \right],$$
$$\lambda = 1 + w^4 + \varepsilon^4 - 2(w^2 + \varepsilon^2 + w^2\varepsilon^2).$$

Defining

$$u_q = \frac{1 + \varepsilon^2 - w^2 - \lambda^{1/2}}{1 + \varepsilon^2 - w^2 + \lambda^{1/2}}$$

and

$$u_w = \frac{1 - \varepsilon^2 + w^2 - \lambda^{1/2}}{1 - \varepsilon^2 + w^2 + \lambda^{1/2}}$$

the factor $\mathcal{F}_1$ can be expressed as

$$
\begin{aligned}
\mathcal{F}_1 = \frac{1}{2} f_0 (1 + \varepsilon^2 - w^2) \Big[& \pi^2 + 2Li_2(u_w) - 2Li_2(1 - u_w) - 4Li_2(u_q) \\
& - 4Li_2(u_q u_w) + \log\left(\frac{1 - u_q}{w^2}\right)\log(1 - u_q) - \log^2(1 - u_q u_w) \\
& + \frac{1}{4}\log^2\left(\frac{w^2}{u_w}\right) - \log(u_w)\log\left[\frac{(1 - u_q u_w)^2}{1 - u_q}\right] - 2\log(u_q)\log\left[(1 - u_q)(1 - u_q u_w)\right] \Big] \\
& - \sqrt{\lambda} f_0 (2\log(w) + 3\log(\varepsilon) - 2\log\lambda) \\
& + 4(1 - \varepsilon^2)\left[(1 - \varepsilon^2)^2 + w^2(1 + \varepsilon^2) - 4w^4\right]\log(u_w) \\
& \left[(3 - \varepsilon^2 + 11\varepsilon^4 - \varepsilon^6) + w^2(6 - 12\varepsilon^2 + 2\varepsilon^4) - w^4(21 + 5\varepsilon^2) + 12w^6\right]\log(u_q) \\
& 6\sqrt{\lambda}(1 - \varepsilon^2)(1 + \varepsilon^2 - w^2)\log(\varepsilon) + \sqrt{\lambda}\left[-5 + 22\varepsilon^2 - 5\varepsilon^4 - 9w^2(1 + \varepsilon^2) + 6w^4\right].
\end{aligned}
$$

⟨*SM physics: public*⟩+≡
```
    public :: top_width_sm_lo
```

9.5 QCD Coupling

We provide various distinct implementations of the QCD coupling. In this module, we define an abstract data type and three implementations: fixed, running with $\alpha_s(M_Z)$ as input, and running with Λ_{QCD} as input. We use the functions defined above in the module sm_physics but provide a common interface. Later modules may define additional implementations.

⟨sm_qcd.f90⟩≡
  ⟨*File header*⟩

  module sm_qcd

  ⟨*Use kinds*⟩
    use io_units
    use format_defs, only: FMT_12
    use numeric_utils
    use diagnostics
    use md5
    use physics_defs
    use sm_physics

  ⟨*Standard module head*⟩

  ⟨*SM qcd: public*⟩

  ⟨*SM qcd: types*⟩

  ⟨*SM qcd: interfaces*⟩

  contains

  ⟨*SM qcd: procedures*⟩

  end module sm_qcd

9.5.1 Coupling: Abstract Data Type

This is the abstract version of the QCD coupling implementation.

⟨*SM qcd: public*⟩≡
    public :: alpha_qcd_t

⟨*SM qcd: types*⟩≡
    type, abstract :: alpha_qcd_t
     contains
     ⟨*SM qcd: alpha qcd: TBP*⟩
    end type alpha_qcd_t

There must be an output routine.

⟨*SM qcd: alpha qcd: TBP*⟩≡
    procedure (alpha_qcd_write), deferred :: write

⟨*SM qcd: interfaces*⟩≡
```
abstract interface
   subroutine alpha_qcd_write (object, unit)
      import
      class(alpha_qcd_t), intent(in) :: object
      integer, intent(in), optional :: unit
   end subroutine alpha_qcd_write
end interface
```

This method computes the running coupling, given a certain scale. All parameters (reference value, order of the approximation, etc.) must be set before calling this.

⟨*SM qcd: alpha qcd: TBP*⟩+≡
```
procedure (alpha_qcd_get), deferred :: get
```

⟨*SM qcd: interfaces*⟩+≡
```
abstract interface
   function alpha_qcd_get (alpha_qcd, scale) result (alpha)
      import
      class(alpha_qcd_t), intent(in) :: alpha_qcd
      real(default), intent(in) :: scale
      real(default) :: alpha
   end function alpha_qcd_get
end interface
```

9.5.2 Fixed Coupling

In this version, the α_s value is fixed, the `scale` argument of the `get` method is ignored. There is only one parameter, the value. By default, this is the value at M_Z.

⟨*SM qcd: public*⟩+≡
```
public :: alpha_qcd_fixed_t
```

⟨*SM qcd: types*⟩+≡
```
type, extends (alpha_qcd_t) :: alpha_qcd_fixed_t
   real(default) :: val = ALPHA_QCD_MZ_REF
 contains
 ⟨SM qcd: alpha qcd fixed: TBP⟩
end type alpha_qcd_fixed_t
```

Output.
⟨*SM qcd: alpha qcd fixed: TBP*⟩≡
```
procedure :: write => alpha_qcd_fixed_write
```

⟨*SM qcd: procedures*⟩≡
```
subroutine alpha_qcd_fixed_write (object, unit)
  class(alpha_qcd_fixed_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit);  if (u < 0)  return
  write (u, "(3x,A)")  "QCD parameters (fixed coupling):"
  write (u, "(5x,A," // FMT_12 // ")")  "alpha = ", object%val
```

```
        end subroutine alpha_qcd_fixed_write
```

Calculation: the scale is ignored in this case.

⟨*SM qcd: alpha qcd fixed: TBP*⟩+≡
```
    procedure :: get => alpha_qcd_fixed_get
```

⟨*SM qcd: procedures*⟩+≡
```
    function alpha_qcd_fixed_get (alpha_qcd, scale) result (alpha)
      class(alpha_qcd_fixed_t), intent(in) :: alpha_qcd
      real(default), intent(in) :: scale
      real(default) :: alpha
      alpha = alpha_qcd%val
    end function alpha_qcd_fixed_get
```

9.5.3   Running Coupling

In this version, the α_s value runs relative to the value at a given reference scale. There are two parameters: the value of this scale (default: M_Z), the value of α_s at this scale, and the number of effective flavors. Furthermore, we have the order of the approximation.

⟨*SM qcd: public*⟩+≡
```
    public :: alpha_qcd_from_scale_t
```

⟨*SM qcd: types*⟩+≡
```
    type, extends (alpha_qcd_t) :: alpha_qcd_from_scale_t
       real(default) :: mu_ref = MZ_REF
       real(default) :: ref = ALPHA_QCD_MZ_REF
       integer :: order = 0
       integer :: nf = 5
     contains
```
    ⟨*SM qcd: alpha qcd from scale: TBP*⟩
```
    end type alpha_qcd_from_scale_t
```

Output.

⟨*SM qcd: alpha qcd from scale: TBP*⟩≡
```
    procedure :: write => alpha_qcd_from_scale_write
```

⟨*SM qcd: procedures*⟩+≡
```
    subroutine alpha_qcd_from_scale_write (object, unit)
      class(alpha_qcd_from_scale_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "(3x,A)")  "QCD parameters (running coupling):"
      write (u, "(5x,A," // FMT_12 // ")")  "Scale mu  = ", object%mu_ref
      write (u, "(5x,A," // FMT_12 // ")")  "alpha(mu) = ", object%ref
      write (u, "(5x,A,I0)")      "LL order  = ", object%order
      write (u, "(5x,A,I0)")      "N(flv)    = ", object%nf
    end subroutine alpha_qcd_from_scale_write
```

Calculation: here, we call the function for running α_s that was defined in sm_physics above. The function does not take into account thresholds, so the number of flavors should be the correct one for the chosen scale. Normally, this should be the Z boson mass.

⟨*SM qcd: alpha qcd from scale: TBP*⟩+≡
```
    procedure :: get => alpha_qcd_from_scale_get
```

⟨*SM qcd: procedures*⟩+≡
```
    function alpha_qcd_from_scale_get (alpha_qcd, scale) result (alpha)
      class(alpha_qcd_from_scale_t), intent(in) :: alpha_qcd
      real(default), intent(in) :: scale
      real(default) :: alpha
      alpha = running_as (scale, &
          alpha_qcd%ref, alpha_qcd%mu_ref, alpha_qcd%order, &
          real (alpha_qcd%nf, kind=default))
    end function alpha_qcd_from_scale_get
```

9.5.4   Running Coupling, determined by $\Lambda_{\mathbf{QCD}}$

In this version, the input are the value Λ_{QCD} and the order of the approximation.

⟨*SM qcd: public*⟩+≡
```
    public :: alpha_qcd_from_lambda_t
```

⟨*SM qcd: types*⟩+≡
```
    type, extends (alpha_qcd_t) :: alpha_qcd_from_lambda_t
      real(default) :: lambda = LAMBDA_QCD_REF
      integer :: order = 0
      integer :: nf = 5
     contains
```
     ⟨*SM qcd: alpha qcd from lambda: TBP*⟩
```
    end type alpha_qcd_from_lambda_t
```

Output.

⟨*SM qcd: alpha qcd from lambda: TBP*⟩≡
```
    procedure :: write => alpha_qcd_from_lambda_write
```

⟨*SM qcd: procedures*⟩+≡
```
    subroutine alpha_qcd_from_lambda_write (object, unit)
      class(alpha_qcd_from_lambda_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "(3x,A)")  "QCD parameters (Lambda_QCD as input):"
      write (u, "(5x,A," // FMT_12 // ")")  "Lambda_QCD = ", object%lambda
      write (u, "(5x,A,I0)")     "LL order   = ", object%order
      write (u, "(5x,A,I0)")     "N(flv)     = ", object%nf
    end subroutine alpha_qcd_from_lambda_write
```

Calculation: here, we call the second function for running α_s that was defined in sm_physics above. The Λ value should be the one that is appropriate for the chosen number of effective flavors. Again, thresholds are not incorporated.

⟨*SM qcd: alpha qcd from lambda: TBP*⟩+≡
```
    procedure :: get => alpha_qcd_from_lambda_get
```

⟨*SM qcd: procedures*⟩+≡
```
    function alpha_qcd_from_lambda_get (alpha_qcd, scale) result (alpha)
      class(alpha_qcd_from_lambda_t), intent(in) :: alpha_qcd
      real(default), intent(in) :: scale
      real(default) :: alpha
      alpha = running_as_lam (real (alpha_qcd%nf, kind=default), scale, &
           alpha_qcd%lambda, alpha_qcd%order)
    end function alpha_qcd_from_lambda_get
```

9.5.5 Wrapper type

We could get along with a polymorphic QCD type, but a monomorphic wrapper type with a polymorphic component is easier to handle and probably safer (w.r.t. compiler bugs). However, we keep the object transparent, so we can set the type-specific parameters directly (by a `dispatch` routine).

⟨*SM qcd: public*⟩+≡
```
    public :: qcd_t
```

⟨*SM qcd: types*⟩+≡
```
    type :: qcd_t
      class(alpha_qcd_t), allocatable :: alpha
      character(32) :: md5sum = ""
      integer :: n_f = -1
     contains
     ⟨SM qcd: qcd: TBP⟩
    end type qcd_t
```

Output. We first print the polymorphic `alpha` which contains a headline, then any extra components.

⟨*SM qcd: qcd: TBP*⟩≡
```
    procedure :: write => qcd_write
```

⟨*SM qcd: procedures*⟩+≡
```
    subroutine qcd_write (qcd, unit, show_md5sum)
      class(qcd_t), intent(in) :: qcd
      integer, intent(in), optional :: unit
      logical, intent(in), optional :: show_md5sum
      logical :: show_md5
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      show_md5 = .true.;  if (present (show_md5sum))  show_md5 = show_md5sum
      if (allocated (qcd%alpha)) then
         call qcd%alpha%write (u)
      else
         write (u, "(3x,A)")  "QCD parameters (coupling undefined)"
      end if
      if (show_md5 .and. qcd%md5sum /= "") &
           write (u, "(5x,A,A,A)") "md5sum = '", qcd%md5sum, "'"
    end subroutine qcd_write
```

Compute an MD5 sum for the `alpha_s` setup. This is done by writing them to a temporary file, using a standard format.

⟨*SM qcd: qcd: TBP*⟩+≡
```
    procedure :: compute_alphas_md5sum => qcd_compute_alphas_md5sum
```

⟨*SM qcd: procedures*⟩+≡
```
    subroutine qcd_compute_alphas_md5sum (qcd)
      class(qcd_t), intent(inout) :: qcd
      integer :: unit
      if (allocated (qcd%alpha)) then
         unit = free_unit ()
         open (unit, status="scratch", action="readwrite")
         call qcd%alpha%write (unit)
         rewind (unit)
         qcd%md5sum = md5sum (unit)
         close (unit)
      end if
    end subroutine qcd_compute_alphas_md5sum
```

Retrieve the MD5 sum of the qcd setup.

⟨*SM qcd: qcd: TBP*⟩+≡
```
    procedure :: get_md5sum => qcd_get_md5sum
```

⟨*SM qcd: procedures*⟩+≡
```
    function qcd_get_md5sum (qcd) result (md5sum)
      character(32) :: md5sum
      class(qcd_t), intent(inout) :: qcd
      md5sum = qcd%md5sum
    end function qcd_get_md5sum
```

  end module shower_algorithms
  ```

We want to generate emission variables x∈ $\mathbb{R}^d$ proportional to

$$f(x)\,\Delta(f, h(x)) \quad \text{with} \tag{9.30}$$

$$\Delta(f, H) = \exp\left\{-\int \mathrm{d}^d x' f(x')\Theta(h(x') - H)\right\} \tag{9.31}$$

The `true_function` f is however too complicated and we are only able to generate x according to the `overestimator` F. This algorithm is described in Appendix B of 0709.2092 and is proven e.g. in 1211.7204 and hep-ph/0606275. Intuitively speaking, we overestimate the emission probability and can therefore set `scale_max = scale` if the emission is rejected.

⟨*shower algorithms: procedures*⟩≡
```
    subroutine generate_vetoed (x, overestimator, true_function, &
          sudakov, inverse_sudakov, scale_min)
      real(default), dimension(:), intent(out) :: x

```

Chapter 10

QED Parton Distribution Functions

We start with a module that gives access to the ISR structure function:

electron_pdfs

10.1 Electron PDFs

This module contains the formulae for the numerical evaluation of different incarnations of the QED initial-state radiation (ISR) structure functions (a.k.a. electron PDFs).

⟨*electron_pdfs.f90*⟩≡
  ⟨*File header*⟩

  ```
  module electron_pdfs
  ```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
  ```
    use io_units
    use constants, only: pi
    use format_defs, only: FMT_19
    use numeric_utils
    use sm_physics, only: Li2
  ```

  ⟨*Standard module head*⟩

  ⟨*Electron PDFs: public*⟩

  ⟨*Electron PDFs: types*⟩

  ```
  contains
  ```

  ⟨*Electron PDFs: procedures*⟩

  ```
  end module electron_pdfs
  ```

Figure 10.1: Module dependencies in `src/qed_pdf`.

10.1.1 The physics for electron beam structure functions

The ISR structure function is in the most crude approximation (LLA without α corrections, i.e. ϵ^0)

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \qquad \text{with} \qquad \epsilon = \frac{\alpha}{\pi} q_e^2 \ln \frac{s}{m^2}, \qquad (10.1)$$

where m is the mass of the incoming (and outgoing) particle, which is initially assumed on-shell.

Here, the form of ϵ results from the kinematical bounds for the momentum squared of the outgoing particle, which in the limit $m^2 \ll s$ are given by

$$t_0 = -2\bar{x}E(E+p) + m^2 \approx -\bar{x}s, \qquad (10.2)$$

$$t_1 = -2\bar{x}E(E-p) + m^2 \approx xm^2, \qquad (10.3)$$

so the integration over the propagator $1/(t-m^2)$ yields

$$\ln \frac{t_0 - m^2}{t_1 - m^2} = \ln \frac{s}{m^2}. \qquad (10.4)$$

The structure function has three parameters: α, m_{in} of the incoming particle and s, the hard scale. Internally, we store the exponent ϵ which is the relevant parameter. (In conventional notation, $\epsilon = \beta/2$.) As defaults, we take the actual values of α (which is probably $\alpha(s)$), the actual mass m_{in} and the squared total c.m. energy s.

Including ϵ, ϵ^2, and ϵ^3 corrections, the successive approximation of the ISR

structure function read

$$f_0(x) = \epsilon(1-x)^{-1+\epsilon} \tag{10.5}$$

$$f_1(x) = g_1(\epsilon)\, f_0(x) - \frac{\epsilon}{2}(1+x) \tag{10.6}$$

$$\begin{aligned}
f_2(x) = {}& g_2(\epsilon)\, f_0(x) - \frac{\epsilon}{2}(1+x) \\
& - \frac{\epsilon^2}{8}\left(\frac{1+3x^2}{1-x}\ln x + 4(1+x)\ln(1-x) + 5 + x \right)
\end{aligned} \tag{10.7}$$

$$\begin{aligned}
f_3(x) = {}& g_3(\epsilon)\, f_0(x) - \frac{\epsilon}{2}(1+x) \\
& - \frac{\epsilon^2}{8}\left(\frac{1+3x^2}{1-x}\ln x + 4(1+x)\ln(1-x) + 5 + x \right) \\
& - \frac{\epsilon^3}{48}\Bigg((1+x)\left[6\,\mathrm{Li}_2(x) + 12\ln^2(1-x) - 3\pi^2 \right] + 6(x+5)\ln(1-x) \\
& \qquad + \frac{1}{1-x}\left[\frac{3}{2}(1+8x+3x^2)\ln x + 12(1+x^2)\ln x\ln(1-x) \right. \\
& \qquad\qquad \left. - \frac{1}{2}(1+7x^2)\ln^2 x + \frac{1}{4}(39-24x-15x^2) \right] \Bigg)
\end{aligned} \tag{10.8}$$

where the successive approximations to the prefactor of the leading singularity

$$g(\epsilon) = \frac{\exp\left(\epsilon(-\gamma_E + \frac{3}{4})\right)}{\Gamma(1+\epsilon)}, \tag{10.9}$$

are given by

$$g_0(\epsilon) = 1 \tag{10.10}$$

$$g_1(\epsilon) = 1 + \frac{3}{4}\epsilon \tag{10.11}$$

$$g_2(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 \tag{10.12}$$

$$g_3(\epsilon) = 1 + \frac{3}{4}\epsilon + \frac{27 - 8\pi^2}{96}\epsilon^2 + \frac{27 - 24\pi^2 + 128\zeta(3)}{384}\epsilon^3, \tag{10.13}$$

where, numerically

$$\zeta(3) = 1.2020569031595942853997381615\ldots \tag{10.14}$$

Although one could calculate the function $g(\epsilon)$ exactly, truncating its Taylor expansion ensures the exact normalization of the truncated structure function at each given order:

$$\int_0^1 dx\, f_i(x) = 1 \qquad \text{for all } i. \tag{10.15}$$

Effectively, the $O(\epsilon)$ correction reduces the low-x tail of the structure function by 50% while increasing the coefficient of the singularity by $O(\epsilon)$. Relative to this, the $O(\epsilon^2)$ correction slightly enhances $x > \frac{1}{2}$ compared to $x < \frac{1}{2}$. At $x = 0$, $f_2(x)$ introduces a logarithmic singularity which should be cut off at

$x_0 = O(e^{-1/\epsilon})$: for lower x the perturbative series breaks down. The f_3 correction is slightly positive for low x values and negative near $x = 1$, where the Li_2 piece slightly softens the singularity at $x = 1$.

Instead of the definition for ϵ given above, it is customary to include a universal nonlogarithmic piece:

$$\epsilon = \frac{\alpha}{\pi} q_e^2 \left(\ln \frac{s}{m^2} - 1 \right) \tag{10.16}$$

10.1.2 Implementation

The basic type for lepton beam (QED) structure functions:

⟨*Electron PDFs: public*⟩≡
```
    public :: qed_pdf_t
```

⟨*Electron PDFs: types*⟩≡
```
    type :: qed_pdf_t
       private
       integer :: flv = 0
       real(default) :: mass = 0
       real(default) :: q_max = 0
       real(default) :: alpha = 0
       real(default) :: eps = 0
       integer :: order
     contains
     ⟨Electron PDFs: QED PDF: TBP⟩
    end type qed_pdf_t
```

⟨*Electron PDFs: QED PDF: TBP*⟩≡
```
    procedure :: init => qed_pdf_init
```

⟨*Electron PDFs: procedures*⟩≡
```
    subroutine qed_pdf_init &
        (qed_pdf, mass, alpha, charge, q_max, order)
      class(qed_pdf_t), intent(out) :: qed_pdf
      real(default), intent(in) :: mass, alpha, q_max, charge
      integer, intent(in) :: order
      qed_pdf%mass = mass
      qed_pdf%q_max = q_max
      qed_pdf%alpha = alpha
      qed_pdf%order = order
      qed_pdf%eps = alpha/pi * charge**2 &
          * (2 * log (q_max / mass) - 1)
    end subroutine qed_pdf_init
```

Write routine.

⟨*Electron PDFs: QED PDF: TBP*⟩+≡

Chapter 11

Quantum Field Theory Concepts

The objects and methods defined here implement concepts and data for the underlying quantum field theory that we use for computing matrix elements and processes.

model_data Fields and coupling parameters, operators as vertex structures, for a specific model.

model_testbed Provide hooks to deal with a `model_data` extension without referencing it explicitly.

helicities Types and methods for spin density matrices.

colors Dealing with colored particles, using the color-flow representation.

flavors PDG codes and particle properties, depends on the model.

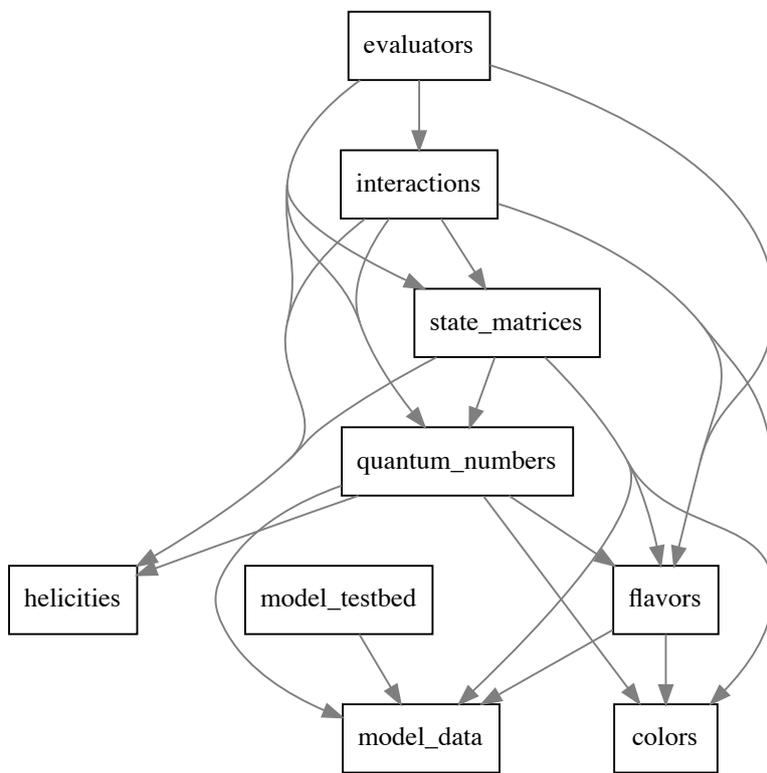
quantum_numbers Quantum numbers and density matrices for entangled particle systems.


Figure 11.1: Module dependencies in `src/qft`.

11.1 Model Data

These data represent a specific Lagrangian in numeric terms. That is, we have the fields with their quantum numbers, the masses, widths and couplings as numerical values, and the vertices as arrays of fields.

We do not store the relations between coupling parameters. They should be represented by expressions for evaluation, implemented as Sindarin objects in a distinct data structure. Neither do we need the algebraic structure of vertices. The field content of vertices is required for the sole purpose of setting up phase space.

11.1.1 Physics Parameters

Couplings, masses, and widths are physics parameters. Each parameter has a unique name (used, essentially, for diagnostics output and debugging) and a value. The value may be a real or a complex number, so we provide to implementations of an abstract type.

⟨*Model data: public*⟩≡
    public :: modelpar_data_t

⟨*Model data: types*⟩≡
    type, abstract :: modelpar_data_t

463

```
      private
      type(string_t) :: name
    contains
    ⟨Model data: par data: TBP⟩
    end type modelpar_data_t

    type, extends (modelpar_data_t) :: modelpar_real_t
       private
       real(default) :: value
    end type modelpar_real_t

    type, extends (modelpar_data_t) :: modelpar_complex_t
       private
       complex(default) :: value
    end type modelpar_complex_t
```

Output for diagnostics. Non-advancing.

⟨Model data: par data: TBP⟩≡
```
    procedure :: write => par_write
```

⟨Model data: procedures⟩≡
```
    subroutine par_write (par, unit)
      class(modelpar_data_t), intent(in) :: par
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit)
      write (u, "(1x,A,1x,A)", advance="no")  char (par%name), "= "
      select type (par)
      type is (modelpar_real_t)
         write (u, "(" // FMT_19 // ")", advance="no")  par%value
      type is (modelpar_complex_t)
         write (u, "(" // FMT_19 // ",1x,'+',1x," // FMT_19 // ",1x,'I')", &
               advance="no")  par%value
      end select
    end subroutine par_write
```

Pretty-printed on separate line, with fixed line length

⟨Model data: par data: TBP⟩+≡
```
    procedure :: show => par_show
```

⟨Model data: procedures⟩+≡
```
    subroutine par_show (par, l, u)
      class(modelpar_data_t), intent(in) :: par
      integer, intent(in) :: l, u
      character(len=l) :: buffer
      buffer = par%name
      select type (par)
      type is (modelpar_real_t)
         write (u, "(4x,A,1x,'=',1x," // FMT_19 // ")")  buffer, par%value
      type is (modelpar_complex_t)
         write (u, "(4x,A,1x,'=',1x," // FMT_19 // ",1x,'+',1x," &
               // FMT_19 // ",1x,'I')")  buffer, par%value
      end select
    end subroutine par_show
```

Initialize with name and value. The type depends on the argument type. If the
type does not match, the value is converted following Fortran rules.

⟨*Model data: par data: TBP*⟩+≡
```
generic :: init => modelpar_data_init_real, modelpar_data_init_complex
procedure, private :: modelpar_data_init_real
procedure, private :: modelpar_data_init_complex
```

⟨*Model data: procedures*⟩+≡
```
subroutine modelpar_data_init_real (par, name, value)
  class(modelpar_data_t), intent(out) :: par
  type(string_t), intent(in) :: name
  real(default), intent(in) :: value
  par%name = name
  par = value
end subroutine modelpar_data_init_real

subroutine modelpar_data_init_complex (par, name, value)
  class(modelpar_data_t), intent(out) :: par
  type(string_t), intent(in) :: name
  complex(default), intent(in) :: value
  par%name = name
  par = value
end subroutine modelpar_data_init_complex
```

Modify the value. We assume that the parameter has been initialized. The type
(real or complex) must not be changed, and the name is also fixed.

⟨*Model data: par data: TBP*⟩+≡
```
generic :: assignment(=) => modelpar_data_set_real, modelpar_data_set_complex
procedure, private :: modelpar_data_set_real
procedure, private :: modelpar_data_set_complex
```

⟨*Model data: procedures*⟩+≡
```
elemental subroutine modelpar_data_set_real (par, value)
  class(modelpar_data_t), intent(inout) :: par
  real(default), intent(in) :: value
  select type (par)
  type is (modelpar_real_t)
     par%value = value
  type is (modelpar_complex_t)
     par%value = value
  end select
end subroutine modelpar_data_set_real

elemental subroutine modelpar_data_set_complex (par, value)
  class(modelpar_data_t), intent(inout) :: par
  complex(default), intent(in) :: value
  select type (par)
  type is (modelpar_real_t)
     par%value = value
  type is (modelpar_complex_t)
     par%value = value
  end select
end subroutine modelpar_data_set_complex
```

Return the parameter name.

⟨Model data: par data: TBP⟩+≡
```
    procedure :: get_name => modelpar_data_get_name
```

⟨Model data: procedures⟩+≡
```
    function modelpar_data_get_name (par) result (name)
      class(modelpar_data_t), intent(in) :: par
      type(string_t) :: name
      name = par%name
    end function modelpar_data_get_name
```

Return the value. In case of a type mismatch, follow Fortran conventions.

⟨Model data: par data: TBP⟩+≡
```
    procedure, pass :: get_real => modelpar_data_get_real
    procedure, pass :: get_complex => modelpar_data_get_complex
```

⟨Model data: procedures⟩+≡
```
    elemental function modelpar_data_get_real (par) result (value)
      class(modelpar_data_t), intent(in), target :: par
      real(default) :: value
      select type (par)
      type is (modelpar_real_t)
         value = par%value
      type is (modelpar_complex_t)
         value = par%value
      end select
    end function modelpar_data_get_real

    elemental function modelpar_data_get_complex (par) result (value)
      class(modelpar_data_t), intent(in), target :: par
      complex(default) :: value
      select type (par)
      type is (modelpar_real_t)
         value = par%value
      type is (modelpar_complex_t)
         value = par%value
      end select
    end function modelpar_data_get_complex
```

Return a pointer to the value. This makes sense only for matching types.

⟨Model data: par data: TBP⟩+≡
```
    procedure :: get_real_ptr => modelpar_data_get_real_ptr
    procedure :: get_complex_ptr => modelpar_data_get_complex_ptr
```

⟨Model data: procedures⟩+≡
```
    function modelpar_data_get_real_ptr (par) result (ptr)
      class(modelpar_data_t), intent(in), target :: par
      real(default), pointer :: ptr
      select type (par)
      type is (modelpar_real_t)
         ptr => par%value
      class default
         ptr => null ()
```

```
      end select
    end function modelpar_data_get_real_ptr

    function modelpar_data_get_complex_ptr (par) result (ptr)
      class(modelpar_data_t), intent(in), target :: par
      complex(default), pointer :: ptr
      select type (par)
      type is (modelpar_complex_t)
         ptr => par%value
      class default
         ptr => null ()
      end select
    end function modelpar_data_get_complex_ptr
```

11.1.2 Field Data

The field-data type holds all information that pertains to a particular field (or
particle) within a particular model. Information such as spin type, particle code
etc. is stored within the object itself, while mass and width are associated to
parameters, otherwise assumed zero.

⟨*Model data: public*⟩+≡
```
    public :: field_data_t
```

⟨*Model data: types*⟩+≡
```
    type :: field_data_t
      private
      type(string_t) :: longname
      integer :: pdg = UNDEFINED
      logical :: visible = .true.
      logical :: parton = .false.
      logical :: gauge = .false.
      logical :: left_handed = .false.
      logical :: right_handed = .false.
      logical :: has_anti = .false.
      logical :: p_is_stable = .true.
      logical :: p_decays_isotropically = .false.
      logical :: p_decays_diagonal = .false.
      logical :: p_has_decay_helicity = .false.
      integer :: p_decay_helicity = 0
      logical :: a_is_stable = .true.
      logical :: a_decays_isotropically = .false.
      logical :: a_decays_diagonal = .false.
      logical :: a_has_decay_helicity = .false.
      integer :: a_decay_helicity = 0
      logical :: p_polarized = .false.
      logical :: a_polarized = .false.
      type(string_t), dimension(:), allocatable :: name, anti
      type(string_t) :: tex_name, tex_anti
      integer :: spin_type = UNDEFINED
      integer :: isospin_type = 1
      integer :: charge_type = 1
      integer :: color_type = 1
      real(default), pointer :: mass_val => null ()
```

```
    class(modelpar_data_t), pointer :: mass_data => null ()
    real(default), pointer :: width_val => null ()
    class(modelpar_data_t), pointer :: width_data => null ()
    integer :: multiplicity = 1
    type(string_t), dimension(:), allocatable :: p_decay
    type(string_t), dimension(:), allocatable :: a_decay
  contains
⟨Model data: field data: TBP⟩
end type field_data_t
```

Initialize field data with PDG long name and PDG code. TeX names should be initialized to avoid issues with accessing unallocated string contents.

⟨*Model data: field data: TBP*⟩≡
```
    procedure :: init => field_data_init
```

⟨*Model data: procedures*⟩+≡
```
    subroutine field_data_init (prt, longname, pdg)
      class(field_data_t), intent(out) :: prt
      type(string_t), intent(in) :: longname
      integer, intent(in) :: pdg
      prt%longname = longname
      prt%pdg = pdg
      prt%tex_name = ""
      prt%tex_anti = ""
    end subroutine field_data_init
```

Copy quantum numbers from another particle. Do not compute the multiplicity yet, because this depends on the association of the mass_data pointer.

⟨*Model data: field data: TBP*⟩+≡
```
    procedure :: copy_from => field_data_copy_from
```

⟨*Model data: procedures*⟩+≡

  end subroutine find_model
```

11.1.3 Vertex data

The vertex object contains an array of particle-data pointers, for which we need
a separate type. (We could use the flavor type defined in another module.)

The program does not (yet?) make use of vertex definitions, so they are not
stored here.

⟨*Model data: types*⟩+≡
```
    type :: field_data_p
       type(field_data_t), pointer :: p => null ()
    end type field_data_p
```

⟨*Model data: types*⟩+≡
```
    type :: vertex_t
       private
       logical :: trilinear
       integer, dimension(:), allocatable :: pdg
       type(field_data_p), dimension(:), allocatable :: prt
     contains
     ⟨Model data: vertex: TBP⟩
    end type vertex_t
```

⟨*Model data: vertex: TBP*⟩≡
```
    procedure :: write => vertex_write
```
⟨*Model data: procedures*⟩+≡
```
    subroutine vertex_write (vtx, unit)
      class(vertex_t), intent(in) :: vtx
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit)
      write (u, "(3x,A)", advance="no")  "vertex"
      do i = 1, size (vtx%prt)
         if (associated (vtx%prt(i)%p)) then
            write (u, "(1x,A)", advance="no") &
                 '"' // char (vtx%prt(i)%p%get_name (vtx%pdg(i) < 0)) &
                    // '"'
         else
            write (u, "(1x,I7)", advance="no") vtx%pdg(i)
         end if
      end do
      write (u, *)
    end subroutine vertex_write
```

Initialize using PDG codes. The model is used for finding particle data pointers
associated with the pdg codes.

⟨*Model data: vertex: TBP*⟩+≡
```
    procedure :: init => vertex_init
```

⟨*Model data: procedures*⟩+≡
```
subroutine vertex_init (vtx, pdg, model)
  class(vertex_t), intent(out) :: vtx
  integer, dimension(:), intent(in) :: pdg
  type(model_data_t), intent(in), target, optional :: model
  integer :: i
  allocate (vtx%pdg (size (pdg)))
  allocate (vtx%prt (size (pdg)))
  vtx%trilinear = size (pdg) == 3
  vtx%pdg = pdg
  if (present (model)) then
     do i = 1, size (pdg)
        vtx%prt(i)%p => model%get_field_ptr (pdg(i))
     end do
  end if
end subroutine vertex_init
```

Copy vertex: we must reassign the field-data pointer to a new model.

⟨*Model data: vertex: TBP*⟩+≡
```
procedure :: copy_from => vertex_copy_from
```

⟨*Model data: procedures*⟩+≡
```
subroutine vertex_copy_from (vtx, old_vtx, new_model)
  class(vertex_t), intent(out) :: vtx
  class(vertex_t), intent(in) :: old_vtx
  type(model_data_t), intent(in), target, optional :: new_model
  call vtx%init (old_vtx%pdg, new_model)
end subroutine vertex_copy_from
```

Single-particle lookup: Given a particle code, we return matching codes if present, otherwise zero. Actually, we return the antiparticles of the matching codes, as appropriate for computing splittings.

⟨*Model data: vertex: TBP*⟩+≡
```
procedure :: get_match => vertex_get_match
```

⟨*Model data: procedures*⟩+≡
```
subroutine vertex_get_match (vtx, pdg1, pdg2)
  class(vertex_t), intent(in) :: vtx
  integer, intent(in) :: pdg1
  integer, dimension(:), allocatable, intent(out) :: pdg2
  integer :: i, j
  do i = 1, size (vtx%pdg)
     if (vtx%pdg(i) == pdg1) then
        allocate (pdg2 (size (vtx%pdg) - 1))
        do j = 1, i-1
           pdg2(j) = anti (j)
        end do
        do j = i, size (pdg2)
           pdg2(j) = anti (j+1)
        end do
        exit
     end if
  end do
contains
```

484

```
      function anti (i) result (pdg)
        integer, intent(in) :: i
        integer :: pdg
        if (vtx%prt(i)%p%has_antiparticle ()) then
           pdg = - vtx%pdg(i)
        else
           pdg = vtx%pdg(i)
        end if
      end function anti
    end subroutine vertex_get_match
```

To access this from the outside, we create an iterator. The iterator has the sole purpose of returning the matching particles for a given array of PDG codes.

⟨*Model data: public*⟩+≡
```
    public :: vertex_iterator_t
```

⟨*Model data: types*⟩+≡
```
    type :: vertex_iterator_t
      private
      class(model_data_t), pointer :: model => null ()
      integer, dimension(:), allocatable :: pdg
      integer :: vertex_index = 0
      integer :: pdg_index = 0
      logical :: save_pdg_index
    contains
      procedure :: init => vertex_iterator_init
      procedure :: get_next_match => vertex_iterator_get_next_match
    end type vertex_iterator_t
```

We initialize the iterator for a particular model with the `pdg` index of the particle we are looking at.

⟨*Model data: procedures*⟩+≡
```
    subroutine vertex_iterator_init (it, model, pdg, save_pdg_index)
      class(vertex_iterator_t), intent(out) :: it
      class(model_data_t), intent(in), target :: model
      integer, dimension(:), intent(in) :: pdg
      logical, intent(in) :: save_pdg_index
      it%model => model
      allocate (it%pdg (size (pdg)), source = pdg)
      it%save_pdg_index = save_pdg_index
    end subroutine vertex_iterator_init

    subroutine vertex_iterator_get_next_match (it, pdg_match)
      class(vertex_iterator_t), intent(inout) :: it
      integer, dimension(:), allocatable, intent(out) :: pdg_match
      integer :: i, j
      do i = it%vertex_index + 1, size (it%model%vtx)
         do j = it%pdg_index + 1, size (it%pdg)
            call it%model%vtx(i)%get_match (it%pdg(j), pdg_match)
            if (it%save_pdg_index) then
               if (allocated (pdg_match) .and. j < size (it%pdg)) then
                  it%pdg_index = j
                  return
```

```
              else if (allocated (pdg_match) .and. j == size (it%pdg)) then
                 it%vertex_index = i
                 it%pdg_index = 0
                 return
              end if
           else if (allocated (pdg_match)) then
              it%vertex_index = i
              return
           end if
        end do
     end do
     it%vertex_index = 0
     it%pdg_index = 0
  end subroutine vertex_iterator_get_next_match
```

11.1.4 Vertex lookup table

The vertex lookup table is a hash table: given two particle codes, we check which codes are allowed for the third one.

The size of the hash table should be large enough that collisions are rare. We first select a size based on the number of vertices (multiplied by six because all permutations count), with some margin, and then choose the smallest integer power of two larger than this.

⟨*Model data: parameters*⟩≡
```
    integer, parameter :: VERTEX_TABLE_SCALE_FACTOR = 60
```

⟨*Model data: procedures*⟩+≡
```
    function vertex_table_size (n_vtx) result (n)
      integer(i32) :: n
      integer, intent(in) :: n_vtx
      integer :: i, s
      s = VERTEX_TABLE_SCALE_FACTOR * n_vtx
      n = 1
      do i = 1, 31
         n = ishft (n, 1)
         s = ishft (s,-1)
         if (s == 0)  exit
      end do
    end function vertex_table_size
```

The specific hash function takes two particle codes (arbitrary integers) and returns a 32-bit integer. It makes use of the universal function `hash` which operates on a byte array.

⟨*Model data: procedures*⟩+≡
```
    function hash2 (pdg1, pdg2)
      integer(i32) :: hash2
      integer, intent(in) :: pdg1, pdg2
      integer(i8), dimension(1) :: mold
      hash2 = hash (transfer ([pdg1, pdg2], mold))
    end function hash2
```

Each entry in the vertex table stores the two particle codes and an array of possibilities for the third code.

⟨*Model data: types*⟩+≡

```
    type :: vertex_table_entry_t
       private
       integer :: pdg1 = 0, pdg2 = 0
       integer :: n = 0
       integer, dimension(:), allocatable :: pdg3
    end type vertex_table_entry_t
```

The vertex table:

⟨*Model data: types*⟩+≡

```
    type :: vertex_table_t
       type(vertex_table_entry_t), dimension(:), allocatable :: entry
       integer :: n_collisions = 0
       integer(i32) :: mask
     contains
     ⟨Model data: vertex table: TBP⟩
    end type vertex_table_t
```

Output.

⟨*Model data: vertex table: TBP*⟩≡

```
    procedure :: write => vertex_table_write
```

⟨*Model data: procedures*⟩+≡

```
    subroutine vertex_table_write (vt, unit)
      class(vertex_table_t), intent(in) :: vt
      integer, intent(in), optional :: unit
      integer :: u, i
      character(9) :: size_pdg3
      u = given_output_unit (unit)
      write (u, "(A)") "vertex hash table:"
      write (u, "(A,I7)") "  size = ", size (vt%entry)
      write (u, "(A,I7)") "  used = ", count (vt%entry%n /= 0)
      write (u, "(A,I7)") "  coll = ", vt%n_collisions
      do i = lbound (vt%entry, 1), ubound (vt%entry, 1)
         if (vt%entry(i)%n /= 0) then
            write (size_pdg3, "(I7)") size (vt%entry(i)%pdg3)
            write (u, "(A,1x,I7,1x,A,2(1x,I7),A," // &
                 size_pdg3 // "(1x,I7))")  &
                 "  ", i, ":", vt%entry(i)%pdg1, &
                 vt%entry(i)%pdg2, "->", vt%entry(i)%pdg3
         end if
      end do
    end subroutine vertex_table_write
```

Initializing the vertex table: This is done in two passes. First, we scan all permutations for all vertices and count the number of entries in each bucket of the hashtable. Then, the buckets are allocated accordingly and filled.

Collision resolution is done by just incrementing the hash value until an empty bucket is found. The vertex table size is fixed, since we know from the beginning the number of entries.

⟨*Model data: vertex table: TBP*⟩+≡

```
      procedure :: init => vertex_table_init
⟨Model data: procedures⟩+≡
    subroutine vertex_table_init (vt, prt, vtx)
      class(vertex_table_t), intent(out) :: vt
      type(field_data_t), dimension(:), intent(in) :: prt
      type(vertex_t), dimension(:), intent(in) :: vtx
      integer :: n_vtx, vt_size, i, p1, p2, p3
      integer, dimension(3) :: p
      n_vtx = size (vtx)
      vt_size = vertex_table_size (count (vtx%trilinear))
      vt%mask = vt_size - 1
      allocate (vt%entry (0:vt_size-1))
      do i = 1, n_vtx
         if (vtx(i)%trilinear) then
            p = vtx(i)%pdg
            p1 = p(1);  p2 = p(2)

```

11.1.5 Model Data Record

This type collects the model data as defined above.

We deliberately implement the parameter arrays as pointer arrays. We thus
avoid keeping track of TARGET attributes.

The scheme identifier provides meta information. It doesn't give the client
code an extra parameter, but it tells something about the interpretation of the
parameters. If the scheme ID is left as default (zero), it is ignored.

⟨*Model data: public*⟩+≡

```
      public :: model_data_t
```

⟨*Model data: types*⟩+≡
```
    type :: model_data_t
       private
       type(string_t) :: name
       integer :: scheme = 0
       type(modelpar_real_t), dimension(:), pointer :: par_real => null ()
       type(modelpar_complex_t), dimension(:), pointer :: par_complex => null ()
       type(field_data_t), dimension(:), allocatable :: field
       type(vertex_t), dimension(:), allocatable :: vtx
       type(vertex_table_t) :: vt
     contains
     ⟨Model data: model data: TBP⟩
    end type model_data_t
```

Finalizer, deallocate pointer arrays.

⟨*Model data: model data: TBP*⟩≡
```
    procedure :: final => model_data_final
```

⟨*Model data: procedures*⟩+≡
```
    subroutine model_data_final (model)
      class(model_data_t), intent(inout) :: model
      if (associated (model%par_real)) then
         deallocate (model%par_real)
      end if
      if (associated (model%par_complex)) then
         deallocate (model%par_complex)
      end if
    end subroutine model_data_final
```

Output. The signature matches the signature of the high-level `model_write`
procedure, so some of the options don't actually apply.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: write => model_data_write
```

⟨*Model data: procedures*⟩+≡
```
    subroutine model_data_write (model, unit, verbose, &
        show_md5sum, show_variables, show_parameters, &
        show_particles, show_vertices, show_scheme)

         write (u, "(A)")
         call model%write_vertices (u, verbose)
      end if
    end subroutine model_data_write
```

Initialize, allocating pointer arrays. The second version makes a deep copy.

⟨*Model data: model data: TBP*⟩+≡
```
    generic :: init => model_data_init
    procedure, private :: model_data_init
```

⟨*Model data: procedures*⟩+≡
```
    subroutine model_data_init (model, name, &
         n_par_real, n_par_complex, n_field, n_vtx)
      class(model_data_t), intent(out) :: model
      type(string_t), intent(in) :: name
      integer, intent(in) :: n_par_real, n_par_complex
      integer, intent(in) :: n_field
      integer, intent(in) :: n_vtx
      model%name = name
      allocate (model%par_real (n_par_real))
      allocate (model%par_complex (n_par_complex))
      allocate (model%field (n_field))
      allocate (model%vtx (n_vtx))
    end subroutine model_data_init
```

Set the scheme ID.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: set_scheme_num => model_data_set_scheme_num
```

⟨*Model data: procedures*⟩+≡
```
    subroutine model_data_set_scheme_num (model, scheme)
      class(model_data_t), intent(inout) :: model
      integer, intent(in) :: scheme
      model%scheme = scheme
    end subroutine model_data_set_scheme_num
```

Complete model data initialization.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: freeze_fields => model_data_freeze_fields
```

⟨*Model data: procedures*⟩+≡
```
    subroutine model_data_freeze_fields (model)
      class(model_data_t), intent(inout) :: model
      call model%field%freeze ()
    end subroutine model_data_freeze_fields
```

Deep copy. The new model should already be initialized, so we do not allocate memory.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: copy_from => model_data_copy
```

⟨*Model data: procedures*⟩+≡
```
    subroutine model_data_copy (model, src)
      class(model_data_t), intent(inout), target :: model
      class(model_data_t), intent(in), target :: src
      class(modelpar_data_t), pointer :: data, src_data
      integer :: i
      model%scheme = src%scheme
      model%par_real = src%par_real
      model%par_complex = src%par_complex
      do i = 1, size (src%field)
         associate (field => model%field(i), src_field => src%field(i))
           call field%init (src_field%get_longname (), src_field%get_pdg ())
           call field%copy_from (src_field)
           src_data => src_field%mass_data
           if (associated (src_data)) then
              data => model%get_par_data_ptr (src_data%get_name ())
              call field%set (mass_data = data)
           end if
           src_data => src_field%width_data
           if (associated (src_data)) then
              data => model%get_par_data_ptr (src_data%get_name ())
              call field%set (width_data = data)
           end if
           call field%set_multiplicity ()
         end associate
      end do
      do i = 1, size (src%vtx)
         call model%vtx(i)%copy_from (src%vtx(i), model)
      end do
      call model%freeze_vertices ()
    end subroutine model_data_copy
```

Return the model name and numeric scheme.

⟨Model data: model data: TBP⟩+≡

```
procedure :: get_name => model_data_get_name
procedure :: get_scheme_num => model_data_get_scheme_num
```

⟨Model data: procedures⟩+≡

```
function model_data_get_name (model) result (name)
  class(model_data_t), intent(in) :: model
  type(string_t) :: name
  name = model%name
end function model_data_get_name

function model_data_get_scheme_num (model) result (scheme)
  class(model_data_t), intent(in) :: model
  integer :: scheme
  scheme = model%scheme
end function model_data_get_scheme_num
```

Retrieve a MD5 sum for the current model parameter values and decay/polarization settings. This is done by writing them to a temporary file, using a standard format. If the model scheme is nonzero, it is also written.

⟨Model data: model data: TBP⟩+≡

```
procedure :: get_parameters_md5sum => model_data_get_parameters_md5sum
```

⟨Model data: procedures⟩+≡

```
function model_data_get_parameters_md5sum (model) result (par_md5sum)
  character(32) :: par_md5sum
  class(model_data_t), intent(in) :: model
  real(default), dimension(:), allocatable :: par
  type(field_data_t), pointer :: field
  integer :: unit, i
  allocate (par (model%get_n_real ()))
  call model%real_parameters_to_array (par)
  unit = free_unit ()
  open (unit, status="scratch", action="readwrite")
  if (model%scheme /= 0)  write (unit, "(I0)")  model%scheme
  write (unit, "(" // FMT_19 // ")")  par
  do i = 1, model%get_n_field ()
     field => model%get_field_ptr_by_index (i)
     if (.not. field%is_stable (.false.) .or. .not. field%is_stable (.true.) &
          .or. field%is_polarized (.false.) .or. field%is_polarized (.true.))&
          then
        write (unit, "(3x,A)") char (field%get_longname ())
        call field%write_decays (unit)
     end if
  end do
  rewind (unit)
  par_md5sum = md5sum (unit)
  close (unit)
end function model_data_get_parameters_md5sum
```

Return the MD5 sum. This is a placeholder, to be overwritten for the complete model definition.

⟨Model data: model data: TBP⟩+≡

```
    procedure :: get_md5sum => model_data_get_md5sum
```

⟨*Model data: procedures*⟩+≡
```
    function model_data_get_md5sum (model) result (md5sum)
      class(model_data_t), intent(in) :: model
      character(32) :: md5sum
      md5sum = model%get_parameters_md5sum ()
    end function model_data_get_md5sum
```

Initialize a real or complex parameter.

⟨*Model data: model data: TBP*⟩+≡
```
    generic :: init_par => model_data_init_par_real, model_data_init_par_complex
    procedure, private :: model_data_init_par_real
    procedure, private :: model_data_init_par_complex
```

```
    subroutine model_data_init_par_real (model, i, name, value)
      class(model_data_t), intent(inout) :: model
      integer, intent(in) :: i
      type(string_t), intent(in) :: name
      real(default), intent(in) :: value
      call model%par_real(i)%init (name, value)
    end subroutine model_data_init_par_real

    subroutine model_data_init_par_complex (model, i, name, value)
      class(model_data_t), intent(inout) :: model
      integer, intent(in) :: i
      type(string_t), intent(in) :: name
      complex(default), intent(in) :: value
      call model%par_complex(i)%init (name, value)
    end subroutine model_data_init_par_complex
```

After initialization, return size of parameter array.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: get_n_real => model_data_get_n_real
    procedure :: get_n_complex => model_data_get_n_complex
```

⟨*Model data: procedures*⟩+≡
```
    function model_data_get_n_real (model) result (n)
      class(model_data_t), intent(in) :: model
      integer :: n
      n = size (model%par_real)
    end function model_data_get_n_real

    function model_data_get_n_complex (model) result (n)
      class(model_data_t), intent(in) :: model
      integer :: n
      n = size (model%par_complex)
    end function model_data_get_n_complex
```

After initialization, extract the whole parameter array.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: real_parameters_to_array &
         => model_data_real_par_to_array
```

```
    procedure :: complex_parameters_to_array &
        => model_data_complex_par_to_array
```

⟨*Model data: procedures*⟩+≡
```
    subroutine model_data_real_par_to_array (model, array)
      class(model_data_t), intent(in) :: model
      real(default), dimension(:), intent(inout) :: array
      array = model%par_real%get_real ()
    end subroutine model_data_real_par_to_array

    subroutine model_data_complex_par_to_array (model, array)

      complex(default), dimension(:), intent(inout) :: array
      array = model%par_complex%get_complex ()
    end subroutine model_data_complex_par_to_array
```

After initialization, set the whole parameter array.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: real_parameters_from_array &
        => model_data_real_par_from_array
    procedure :: complex_parameters_from_array &
        => model_data_complex_par_from_array
```

⟨*Model data: procedures*⟩+≡
```
    subroutine model_data_real_par_from_array (model, array)
      class(model_data_t), intent(inout) :: model
      real(default), dimension(:), intent(in) :: array
      model%par_real = array
    end subroutine model_data_real_par_from_array

    subroutine model_data_complex_par_from_array (model, array)
      class(model_data_t), intent(inout) :: model
      complex(default), dimension(:), intent(in) :: array
      model%par_complex = array
    end subroutine model_data_complex_par_from_array
```

Analogous, for a C parameter array.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: real_parameters_to_c_array &
        => model_data_real_par_to_c_array
```

⟨*Model data: procedures*⟩+≡
```
    subroutine model_data_real_par_to_c_array (model, array)
      class(model_data_t), intent(in) :: model
      real(c_default_float), dimension(:), intent(inout) :: array
      array = model%par_real%get_real ()
    end subroutine model_data_real_par_to_c_array
```

After initialization, set the whole parameter array.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: real_parameters_from_c_array &
        => model_data_real_par_from_c_array
```

⟨*Model data: procedures*⟩+≡
```
    subroutine model_data_real_par_from_c_array (model, array)
      class(model_data_t), intent(inout) :: model
      real(c_default_float), dimension(:), intent(in) :: array
      model%par_real = real (array, default)
    end subroutine model_data_real_par_from_c_array
```

After initialization, get pointer to a real or complex parameter, directly by index.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: get_par_real_ptr => model_data_get_par_real_ptr_index
    procedure :: get_par_complex_ptr => model_data_get_par_complex_ptr_index
```

⟨*Model data: procedures*⟩+≡
```
    function model_data_get_par_real_ptr_index (model, i) result (ptr)
      class(model_data_t), intent(inout) :: model

           else if (field%matches_name (name, .true.)) then
              pdg = - field%get_pdg ()
              return
           end if
         end associate
```

```
      end do
      pdg = 0
      call model%field_error (check, name)
   end function model_data_get_field_pdg_name
```

Return an array of all PDG codes, including antiparticles. The antiparticle are sorted after all particles.

⟨*Model data: model data: TBP*⟩+≡
```
   procedure :: get_all_pdg => model_data_get_all_pdg
```

⟨*Model data: procedures*⟩+≡
```
   subroutine model_data_get_all_pdg (model, pdg)
     class(model_data_t), intent(in) :: model
     integer, dimension(:), allocatable, intent(inout) :: pdg
     integer :: n0, n1, i, k
     n0 = size (model%field)
     n1 = n0 + count (model%field%has_antiparticle ())
     allocate (pdg (n1))
     pdg(1:n0) = model%field%get_pdg ()
     k = n0
     do i = 1, size (model%field)
        associate (field => model%field(i))
          if (field%has_antiparticle ()) then
             k = k + 1
             pdg(k) = - field%get_pdg ()
          end if
        end associate
     end do
   end subroutine model_data_get_all_pdg
```

Return pointer to the field array.

⟨*Model data: model data: TBP*⟩+≡
```
   procedure :: get_field_array_ptr => model_data_get_field_array_ptr
```

⟨*Model data: procedures*⟩+≡
```
   function model_data_get_field_array_ptr (model) result (ptr)
     class(model_data_t), intent(in), target :: model
     type(field_data_t), dimension(:), pointer :: ptr
     ptr => model%field
   end function model_data_get_field_array_ptr
```

Return pointer to a field. The identifier should be the unique long name, the PDG code, or the index.

We can issue an error message, if the `check` flag is set. We never return an error if the PDG code is zero, this yields just a null pointer.

⟨*Model data: model data: TBP*⟩+≡
```
   generic :: get_field_ptr => &

```

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: check_vertex => model_data_check_vertex
```

⟨*Model data: procedures*⟩+≡
```
    function model_data_check_vertex (model, pdg1, pdg2, pdg3) result (flag)
      logical :: flag
      class(model_data_t), intent(in) :: model
      integer, intent(in) :: pdg1, pdg2, pdg3
      flag = model%vt%check (pdg1, pdg2, pdg3)
    end function model_data_check_vertex
```

11.1.6   Toy Models

This is a stripped-down version of the (already trivial) model 'Test'.

⟨*Model data: model data: TBP*⟩+≡
```
    procedure :: init_test => model_data_init_test
```

⟨*Model data: procedures*⟩+≡

```
    subroutine model_data_init_test (model)
      class(model_data_t), intent(out) :: model
      type(field_data_t), pointer :: field
      integer, parameter :: n_real = 4
      integer, parameter :: n_field = 2
      integer, parameter :: n_vertex = 2
      integer :: i
      call model%init (var_str ("Test"), &
           n_real, 0, n_field, n_vertex)
      i = 0
      i = i + 1
      call model%init_par (i, var_str ("gy"), 1._default)
      i = i + 1
      call model%init_par (i, var_str ("ms"), 125._default)
      i = i + 1
      call model%init_par (i, var_str ("ff"), 1.5_default)
      i = i + 1
      call model%init_par (i, var_str ("mf"), 1.5_default * 125._default)
      i = 0
      i = i + 1
      field => model%get_field_ptr_by_index (i)
      call field%init (var_str ("SCALAR"), 25)
      call field%set (spin_type=1)
      call field%set (mass_data=model%get_par_real_ptr (2))
      call field%set (name = [var_str ("s")])
      i = i + 1
      field => model%get_field_ptr_by_index (i)
      call field%init (var_str ("FERMION"), 6)
      call field%set (spin_type=2)
      call field%set (mass_data=model%get_par_real_ptr (4))
      call field%set (name = [var_str ("f")], anti = [var_str ("fbar")])
      call model%freeze_fields ()
      i = 0
      i = i + 1
      call model%set_vertex (i, [var_str ("fbar"), var_str ("f"), var_str ("s")])
      i = i + 1
      call model%set_vertex (i, [var_str ("s"), var_str ("s"), var_str ("s")])
      call model%freeze_vertices ()
    end subroutine model_data_init_test
```

This procedure prepares a subset of QED for testing purposes.

⟨*Model data: model data: TBP*⟩+≡

```
    procedure :: init_qed_test => model_data_init_qed_test
```

⟨*Model data: procedures*⟩+≡

```
    subroutine model_data_init_qed_test (model)
      class(model_data_t), intent(out) :: model
      type(field_data_t), pointer :: field
      integer, parameter :: n_real = 1
      integer, parameter :: n_field = 2
      integer :: i
      call model%init (var_str ("QED_test"), &
           n_real, 0, n_field, 0)
```

```
      i = 0
      i = i + 1

11.2 Model Testbed

The standard way of defining a model uses concrete variables and expressions to interpret the model file. Some of this is not available at the point of use. This is no problem for the WHIZARD program as a whole, but unit tests are kept local to their respective module and don't access all definitions.

Instead, we introduce a separate module that provides hooks, one for initializing a model and one for finalizing a model. The main program can assign real routines to the hooks (procedure pointers of abstract type) before unit tests are called. The unit tests can call the abstract routines without knowing about their implementation.

⟨model_testbed.f90⟩≡
  ⟨*File header*⟩

```
  module model_testbed
```

  ⟨*Use strings*⟩
```
    use model_data
    use var_base
```

  ⟨*Standard module head*⟩

  ⟨*Model testbed: public*⟩

  ⟨*Model testbed: variables*⟩

  ⟨*Model testbed: interfaces*⟩

```
  end module model_testbed
```

11.2.1 Abstract Model Handlers

Both routines take a polymorphic model (data) target, which is not allocated/deallocated inside the subroutine. The model constructor **prepare_model** requires the model name as input. It can, optionally, return a link to the variable list of the model.

⟨*Model testbed: public*⟩≡
```
    public :: prepare_model
    public :: cleanup_model
```

⟨*Model testbed: variables*⟩≡
```
    procedure (prepare_model_proc), pointer :: prepare_model => null ()
    procedure (cleanup_model_proc), pointer :: cleanup_model => null ()
```

⟨*Model testbed: interfaces*⟩≡
```
    abstract interface
      subroutine prepare_model_proc (model, name, vars)
        import
        class(model_data_t), intent(inout), pointer :: model
        type(string_t), intent(in) :: name
        class(vars_t), pointer, intent(out), optional :: vars
      end subroutine prepare_model_proc
    end interface
```

```fortran
abstract interface
   subroutine cleanup_model_proc (model)
     import
     class(model_data_t), intent(inout), target :: model
   end subroutine cleanup_model_proc
end interface
```

11.3 Helicities

This module defines types and tools for dealing with helicity information.

⟨`helicities.f90`⟩≡
```
⟨File header⟩

module helicities

  use io_units

⟨Standard module head⟩

⟨Helicities: public⟩

⟨Helicities: types⟩

⟨Helicities: interfaces⟩

contains

⟨Helicities: procedures⟩

end module helicities
```

11.3.1 Helicity types

Helicities may be defined or undefined, corresponding to a polarized or unpolarized state. Each helicity is actually a pair of helicities, corresponding to an entry in the spin density matrix. Obviously, diagonal entries are distinguished.

⟨Helicities: public⟩≡
```
public :: helicity_t
```

⟨Helicities: types⟩≡
```
type :: helicity_t
  private
  logical :: defined = .false.
  integer :: h1, h2
 contains
 ⟨Helicities: helicity: TBP⟩
end type helicity_t
```

Constructor functions, for convenience:

⟨Helicities: public⟩+≡
```
public :: helicity
```

⟨Helicities: interfaces⟩≡
```
interface helicity
  module procedure helicity0, helicity1, helicity2
end interface helicity
```

⟨*Helicities: procedures*⟩≡
```
    pure function helicity0 () result (hel)
      type(helicity_t) :: hel
    end function helicity0

    elemental function helicity1 (h) result (hel)
      type(helicity_t) :: hel
      integer, intent(in) :: h
      call hel%init (h)
    end function helicity1

    elemental function helicity2 (h2, h1) result (hel)
      type(helicity_t) :: hel
      integer, intent(in) :: h1, h2
      call hel%init (h2, h1)
    end function helicity2
```

Initializers.

Note: conceptually, the argument to initializers should be INTENT(OUT).
However, Interp. F08/0033 prohibited this. The reason is that, in principle, the
call could result in the execution of an impure finalizer for a type extension of
`hel` (ugh).

⟨*Helicities: helicity: TBP*⟩≡
```
    generic :: init => helicity_init_empty, helicity_init_same, helicity_init_different
    procedure, private :: helicity_init_empty
    procedure, private :: helicity_init_same
    procedure, private :: helicity_init_different
```

⟨*Helicities: procedures*⟩+≡
```
    elemental subroutine helicity_init_empty (hel)
      class(helicity_t), intent(inout) :: hel
      hel%defined = .false.
    end subroutine helicity_init_empty

    elemental subroutine helicity_init_same (hel, h)
      class(helicity_t), intent(inout) :: hel
      integer, intent(in) :: h
      hel%defined = .true.
      hel%h1 = h
      hel%h2 = h
    end subroutine helicity_init_same

    elemental subroutine helicity_init_different (hel, h2, h1)
      class(helicity_t), intent(inout) :: hel
      integer, intent(in) :: h1, h2
      hel%defined = .true.
      hel%h2 = h2
      hel%h1 = h1
    end subroutine helicity_init_different
```

Undefine:

⟨*Helicities: helicity: TBP*⟩+≡
```
    procedure :: undefine => helicity_undefine
```

515

⟨*Helicities: procedures*⟩+≡
```
    elemental subroutine helicity_undefine (hel)
      class(helicity_t), intent(inout) :: hel
      hel%defined = .false.
    end subroutine helicity_undefine
```

Diagonalize by removing the second entry (use with care!)
⟨*Helicities: helicity: TBP*⟩+≡
```
    procedure :: diagonalize => helicity_diagonalize
```

⟨*Helicities: procedures*⟩+≡
```
    elemental subroutine helicity_diagonalize (hel)
      class(helicity_t), intent(inout) :: hel
      hel%h2 = hel%h1
    end subroutine helicity_diagonalize
```

Flip helicity indices by sign.
⟨*Helicities: helicity: TBP*⟩+≡
```
    procedure :: flip => helicity_flip
```

⟨*Helicities: procedures*⟩+≡
```
    elemental subroutine helicity_flip (hel)
      class(helicity_t), intent(inout) :: hel
      hel%h1 = - hel%h1
      hel%h2 = - hel%h2
    end subroutine helicity_flip
```

⟨*Helicities: helicity: TBP*⟩+≡
```
    procedure :: get_indices => helicity_get_indices
```

⟨*Helicities: procedures*⟩+≡
```
    subroutine helicity_get_indices (hel, h1, h2)
      class(helicity_t), intent(in) :: hel
      integer, intent(out) :: h1, h2
      h1 = hel%h1; h2 = hel%h2
     end subroutine helicity_get_indices
```

Output (no linebreak). No output if undefined.
⟨*Helicities: helicity: TBP*⟩+≡
```
    procedure :: write => helicity_write
```

⟨*Helicities: procedures*⟩+≡
```
    subroutine helicity_write (hel, unit)
      class(helicity_t), intent(in) :: hel
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      if (hel%defined) then
         write (u, "(A)", advance="no")  "h("
         write (u, "(I0)", advance="no")  hel%h1
         if (hel%h1 /= hel%h2) then
            write (u, "(A)", advance="no") "|"
            write (u, "(I0)", advance="no")  hel%h2
```

```
      end if
      write (u, "(A)", advance="no")  ")"
    end if
  end subroutine helicity_write
```

Binary I/O. Write contents only if defined.

⟨*Helicities: helicity: TBP*⟩+≡
```
    procedure :: write_raw => helicity_write_raw
    procedure :: read_raw => helicity_read_raw
```

⟨*Helicities: procedures*⟩+≡
```
    subroutine helicity_write_raw (hel, u)
      class(helicity_t), intent(in) :: hel
      integer, intent(in) :: u
      write (u) hel%defined
      if (hel%defined) then
         write (u) hel%h1, hel%h2
      end if
    end subroutine helicity_write_raw

    subroutine helicity_read_raw (hel, u, iostat)
      class(helicity_t), intent(out) :: hel
      integer, intent(in) :: u
      integer, intent(out), optional :: iostat
      read (u, iostat=iostat) hel%defined
      if (hel%defined) then
         read (u, iostat=iostat) hel%h1, hel%h2
      end if
    end subroutine helicity_read_raw
```

11.3.2 Predicates

Check if the helicity is defined:

⟨*Helicities: helicity: TBP*⟩+≡
```
    procedure :: is_defined => helicity_is_defined
```

⟨*Helicities: procedures*⟩+≡
```
    elemental function helicity_is_defined (hel) result (defined)
      logical :: defined
      class(helicity_t), intent(in) :: hel
      defined = hel%defined
    end function helicity_is_defined
```

Return true if the two helicities are equal or the particle is unpolarized:

⟨*Helicities: helicity: TBP*⟩+≡
```
    procedure :: is_diagonal => helicity_is_diagonal
```

⟨*Helicities: procedures*⟩+≡
```
    elemental function helicity_is_diagonal (hel) result (diagonal)
      logical :: diagonal
      class(helicity_t), intent(in) :: hel
      if (hel%defined) then
```

```
        diagonal = hel%h1 == hel%h2
    else
        diagonal = .true.
    end if
end function helicity_is_diagonal
```

11.3.3 Accessing contents

This returns a two-element array and thus cannot be elemental. The result is unpredictable if the helicity is undefined.

⟨*Helicities: helicity: TBP*⟩+≡
```
    procedure :: to_pair => helicity_to_pair
```

⟨*Helicities: procedures*⟩+≡
```
    pure function helicity_to_pair (hel) result (h)
      integer, dimension(2) :: h
      class(helicity_t), intent(in) :: hel
      h(1) = hel%h2
      h(2) = hel%h1
    end function helicity_to_pair
```

11.3.4 Comparisons

When comparing helicities, if either one is undefined, they are considered to match. In other words, an unpolarized particle matches any polarization. In the `dmatch` variant, it matches only diagonal helicity.

⟨*Helicities: helicity: TBP*⟩+≡
```
    generic :: operator(.match.) => helicity_match
    generic :: operator(.dmatch.) => helicity_match_diagonal
    generic :: operator(==) => helicity_eq
    generic :: operator(/=) => helicity_neq
    procedure, private ::  helicity_match
    procedure, private ::  helicity_match_diagonal
    procedure, private ::  helicity_eq
    procedure, private ::  helicity_neq
```

⟨*Helicities: procedures*⟩+≡
```
    elemental function helicity_match (hel1, hel2) result (eq)
      logical :: eq
      class(helicity_t), intent(in) :: hel1, hel2
      if (hel1%defined .and. hel2%defined) then
          eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
      else
          eq = .true.
      end if
    end function helicity_match

    elemental function helicity_match_diagonal (hel1, hel2) result (eq)
      logical :: eq
      class(helicity_t), intent(in) :: hel1, hel2
      if (hel1%defined .and. hel2%defined) then
```

```
        eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
    else if (hel1%defined) then
        eq = hel1%h1 == hel1%h2
    else if (hel2%defined) then
        eq = hel2%h1 == hel2%h2
    else
        eq = .true.
    end if
end function helicity_match_diagonal
```

⟨*Helicities: procedures*⟩+≡
```
    elemental function helicity_eq (hel1, hel2) result (eq)
      logical :: eq
      class(helicity_t), intent(in) :: hel1, hel2
      if (hel1%defined .and. hel2%defined) then
          eq = (hel1%h1 == hel2%h1) .and. (hel1%h2 == hel2%h2)
      else if (.not. hel1%defined .and. .not. hel2%defined) then
          eq = .true.
      else
          eq = .false.
      end if
    end function helicity_eq
```

⟨*Helicities: procedures*⟩+≡
```
    elemental function helicity_neq (hel1, hel2) result (neq)
      logical :: neq
      class(helicity_t), intent(in) :: hel1, hel2
      if (hel1%defined .and. hel2%defined) then
          neq = (hel1%h1 /= hel2%h1) .or. (hel1%h2 /= hel2%h2)
      else if (.not. hel1%defined .and. .not. hel2%defined) then
          neq = .false.
      else
          neq = .true.
      end if
    end function helicity_neq
```

11.3.5 Tools

Merge two helicity objects by taking the first entry from the first and the second
entry from the second argument. Makes sense only if the input helicities were
defined and diagonal. The handling of ghost flags is not well-defined; one should
verify beforehand that they match.

⟨*Helicities: helicity: TBP*⟩+≡
```
    generic :: operator(.merge.) => merge_helicities
    procedure, private ::  merge_helicities
```

⟨*Helicities: procedures*⟩+≡
```
    elemental function merge_helicities (hel1, hel2) result (hel)
      type(helicity_t) :: hel
      class(helicity_t), intent(in) :: hel1, hel2
      if (hel1%defined .and. hel2%defined) then
          call hel%init (hel2%h1, hel1%h1)
```

```
   else if (hel1%defined) then
      call hel%init (hel1%h2, hel1%h1)
   else if (hel2%defined) then
      call hel%init (hel2%h2, hel2%h1)
   end if
end function merge_helicities
```

11.4 Colors

This module defines a type and tools for dealing with color information.

Each particle can have zero or more (in practice, usually not more than two) color indices. Color indices are positive; flow direction can be determined from the particle nature.

While parton shower matrix elements are diagonal in color, some special applications (e.g., subtractions for NLO matrix elements) require non-diagonal color matrices.

⟨colors.f90⟩≡
  ⟨*File header*⟩

  ```
  module colors
```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
  ```
    use io_units
    use diagnostics
```

  ⟨*Standard module head*⟩

  ⟨*Colors: public*⟩

  ⟨*Colors: types*⟩

  ⟨*Colors: interfaces*⟩

  ```
  contains
```

  ⟨*Colors: procedures*⟩

  ```
  end module colors
```

11.4.1 The color type

A particle may have an arbitrary number of color indices (in practice, from zero to two, but more are possible). This object acts as a container. (The current implementation has a fixed array of length two.)

The fact that color comes as an array prohibits elemental procedures in some places. (May add interfaces and multi versions where necessary.)

The color may be undefined.

NOTE: Due to a compiler bug in nagfor 5.2, we do not use allocatable but fixed-size arrays with dimension 2. Only nonzero entries count. This may be more efficient anyway, but gives up some flexibility. However, the squaring algorithm currently works only for singlets, (anti)triplets and octets anyway, so two components are enough.

This type has to be generalized (abstract type and specific implementations) when trying to pursue generalized color flows or Monte Carlo over continuous color.

⟨*Colors: public*⟩≡
  ```
    public :: color_t
```

⟨*Colors: types*⟩≡
```
type :: color_t
   private
   logical :: defined = .false.
   integer, dimension(2) :: c1 = 0, c2 = 0
   logical :: ghost = .false.
 contains
 ⟨Colors: color: TBP⟩
end type color_t
```

Initializers:

⟨*Colors: color: TBP*⟩≡
```
generic :: init => &
     color_init_trivial, color_init_trivial_ghost, &
     color_init_array, color_init_array_ghost, &
     color_init_arrays, color_init_arrays_ghost
procedure, private :: color_init_trivial
procedure, private :: color_init_trivial_ghost
procedure, private :: color_init_array
procedure, private :: color_init_array_ghost
procedure, private :: color_init_arrays
procedure, private :: color_init_arrays_ghost
```

Undefined color: array remains unallocated

⟨*Colors: procedures*⟩≡
```
pure subroutine color_init_trivial (col)
  class(color_t), intent(inout) :: col
  col%defined = .true.
  col%c1 = 0
  col%c2 = 0
  col%ghost = .false.
end subroutine color_init_trivial

pure subroutine color_init_trivial_ghost (col, ghost)
  class(color_t), intent(inout) :: col
  logical, intent(in) :: ghost
  col%defined = .true.
  col%c1 = 0
  col%c2 = 0
  col%ghost = ghost
end subroutine color_init_trivial_ghost
```

This defines color from an arbitrary length color array, suitable for any representation. We may have two color arrays (non-diagonal matrix elements). This cannot be elemental. The third version assigns an array of colors, using a two-dimensional array as input.

⟨*Colors: procedures*⟩+≡
```
pure subroutine color_init_array (col, c1)
  class(color_t), intent(inout) :: col
  integer, dimension(:), intent(in) :: c1
  col%defined = .true.
  col%c1 = pack (c1, c1 /= 0, [0,0])
  col%c2 = col%c1
```

522

```
    col%ghost = .false.
  end subroutine color_init_array

  pure subroutine color_init_array_ghost (col, c1, ghost)
    class(color_t), intent(inout) :: col
    integer, dimension(:), intent(in) :: c1
    logical, intent(in) :: ghost
    call color_init_array (col, c1)
    col%ghost = ghost
  end subroutine color_init_array_ghost

  pure subroutine color_init_arrays (col, c1, c2)
    class(color_t), intent(inout) :: col
    integer, dimension(:), intent(in) :: c1, c2
    col%defined = .true.
    if (size (c1) == size (c2)) then
       col%c1 = pack (c1, c1 /= 0, [0,0])
       col%c2 = pack (c2, c2 /= 0, [0,0])
    else if (size (c1) /= 0) then
       col%c1 = pack (c1, c1 /= 0, [0,0])
       col%c2 = col%c1
    else if (size (c2) /= 0) then
       col%c1 = pack (c2, c2 /= 0, [0,0])
       col%c2 = col%c1
    end if
    col%ghost = .false.
  end subroutine color_init_arrays

  pure subroutine color_init_arrays_ghost (col, c1, c2, ghost)
    class(color_t), intent(inout) :: col
    integer, dimension(:), intent(in) :: c1, c2
    logical, intent(in) :: ghost
    call color_init_arrays (col, c1, c2)
    col%ghost = ghost
  end subroutine color_init_arrays_ghost
```

This version is restricted to singlets, triplets, antitriplets, and octets: The input contains the color and anticolor index, each of the may be zero.

⟨*Colors: color: TBP*⟩+≡
```
    procedure :: init_col_acl => color_init_col_acl
```

⟨*Colors: procedures*⟩+≡
```
    elemental subroutine color_init_col_acl (col, col_in, acl_in)
      class(color_t), intent(inout) :: col
      integer, intent(in) :: col_in, acl_in
      integer, dimension(0) :: null_array
      select case (col_in)
      case (0)
         select case (acl_in)
         case (0)
            call color_init_array (col, null_array)
         case default
            call color_init_array (col, [-acl_in])
         end select
```

```
      case default
         select case (acl_in)
         case (0)
            call color_init_array (col, [col_in])
         case default
            call color_init_array (col, [col_in, -acl_in])
         end select
      end select
   end subroutine color_init_col_acl
```

This version is used for the external interface. We convert a fixed-size array of colors (for each particle) to the internal form by packing only the nonzero entries.

Some of these procedures produce an arry, so they can't be all type-bound. We implement them as ordinary procedures.

⟨*Colors: public*⟩+≡
```
   public :: color_init_from_array
```

⟨*Colors: interfaces*⟩≡
```
   interface color_init_from_array
      module procedure color_init_from_array1
      module procedure color_init_from_array1g
      module procedure color_init_from_array2
      module procedure color_init_from_array2g
   end interface color_init_from_array
```

⟨*Colors: procedures*⟩+≡
```
   pure subroutine color_init_from_array1 (col, c1)
     type(color_t), intent(inout) :: col
     integer, dimension(:), intent(in) :: c1
     logical, dimension(size(c1)) :: mask
     mask = c1 /= 0
     col%defined = .true.
     col%c1 = pack (c1, mask, col%c1)
     col%c2 = col%c1
     col%ghost = .false.
   end subroutine color_init_from_array1

   pure subroutine color_init_from_array1g (col, c1, ghost)
     type(color_t), intent(inout) :: col
     integer, dimension(:), intent(in) :: c1
     logical, intent(in) :: ghost
     call color_init_from_array1 (col, c1)
     col%ghost = ghost
   end subroutine color_init_from_array1g

   pure subroutine color_init_from_array2 (col, c1)
     integer, dimension(:,:), intent(in) :: c1
     type(color_t), dimension(:), intent(inout) :: col
     integer :: i
     do i = 1, size (c1,2)
        call color_init_from_array1 (col(i), c1(:,i))
     end do
```

```
      end subroutine color_init_from_array2

      pure subroutine color_init_from_array2g (col, c1, ghost)
        integer, dimension(:,:), intent(in) :: c1
        type(color_t), dimension(:), intent(out) :: col
        logical, intent(in), dimension(:) :: ghost
        call color_init_from_array2 (col, c1)
        col%ghost = ghost
      end subroutine color_init_from_array2g
```

Set the ghost property

⟨*Colors: color: TBP*⟩+≡
```
      procedure :: set_ghost => color_set_ghost
```

⟨*Colors: procedures*⟩+≡
```
      elemental subroutine color_set_ghost (col, ghost)
        class(color_t), intent(inout) :: col
        logical, intent(in) :: ghost
        col%ghost = ghost
      end subroutine color_set_ghost
```

Undefine the color state:

⟨*Colors: color: TBP*⟩+≡
```
      procedure :: undefine => color_undefine
```

⟨*Colors: procedures*⟩+≡
```
      elemental subroutine color_undefine (col, undefine_ghost)
        class(color_t), intent(inout) :: col
        logical, intent(in), optional :: undefine_ghost
        col%defined = .false.
        if (present (undefine_ghost)) then
           if (undefine_ghost)  col%ghost = .false.
        else
           col%ghost = .false.
        end if
      end subroutine color_undefine
```

Output. As dense as possible, no linebreak. If color is undefined, no output.
    The separate version for a color array suggest two distinct interfaces.

⟨*Colors: public*⟩+≡
```
      public :: color_write
```

⟨*Colors: interfaces*⟩+≡
```
      interface color_write
         module procedure color_write_single
         module procedure color_write_array
      end interface color_write
```

⟨*Colors: color: TBP*⟩+≡
```
      procedure :: write => color_write_single
```

⟨Colors: procedures⟩+≡

```fortran
    subroutine color_write_single (col, unit)
      class(color_t), intent(in) :: col
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      if (col%ghost) then
         write (u, "(A)", advance="no")  "c*"
      else if (col%defined) then
         write (u, "(A)", advance="no")  "c("
         if (col%c1(1) /= 0)  write (u, "(I0)", advance="no")  col%c1(1)
         if (any (col%c1 /= 0))  write (u, "(1x)", advance="no")
         if (col%c1(2) /= 0)  write (u, "(I0)", advance="no")  col%c1(2)
         if (.not. col%is_diagonal ()) then
            write (u, "(A)", advance="no")  "|"
            if (col%c2(1) /= 0)  write (u, "(I0)", advance="no")  col%c2(1)
            if (any (col%c2 /= 0))  write (u, "(1x)", advance="no")
            if (col%c2(2) /= 0)  write (u, "(I0)", advance="no")  col%c2(2)
         end if
         write (u, "(A)", advance="no") ")"
      end if
    end subroutine color_write_single

    subroutine color_write_array (col, unit)
      type(color_t), dimension(:), intent(in) :: col
      integer, intent(in), optional :: unit
      integer :: u
      integer :: i
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "(A)", advance="no") "["
      do i = 1, size (col)
         if (i > 1)  write (u, "(1x)", advance="no")
         call color_write_single (col(i), u)
      end do
      write (u, "(A)", advance="no") "]"
    end subroutine color_write_array
```

Binary I/O. For allocatable colors, this would have to be modified.

⟨Colors: color: TBP⟩+≡

```fortran
    procedure :: write_raw => color_write_raw
    procedure :: read_raw => color_read_raw
```

⟨Colors: procedures⟩+≡

```fortran
    subroutine color_write_raw (col, u)
      class(color_t), intent(in) :: col
      integer, intent(in) :: u
      logical :: defined
      defined = col%is_defined () .or. col%is_ghost ()
      write (u) defined
      if (defined) then
         write (u) col%c1, col%c2
         write (u) col%ghost
      end if
    end subroutine color_write_raw
```

```
subroutine color_read_raw (col, u, iostat)
  class(color_t), intent(inout) :: col
  integer, intent(in) :: u
  integer, intent(out), optional :: iostat
  logical :: defined
  read (u, iostat=iostat) col%defined
  if (col%defined) then
      read (u, iostat=iostat) col%c1, col%c2
      read (u, iostat=iostat) col%ghost
  end if
end subroutine color_read_raw
```

11.4.2 Predicates

Return the definition status. A color state may be defined but trivial.

⟨*Colors: color: TBP*⟩+≡
```
    procedure :: is_defined => color_is_defined
    procedure :: is_nonzero => color_is_nonzero
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_is_defined (col) result (defined)
      logical :: defined
      class(color_t), intent(in) :: col
      defined = col%defined
    end function color_is_defined

    elemental function color_is_nonzero (col) result (flag)
      logical :: flag
      class(color_t), intent(in) :: col
      flag = col%defined &
           .and. .not. col%ghost &
           .and. any (col%c1 /= 0 .or. col%c2 /= 0)
    end function color_is_nonzero
```

Diagonal color objects have only one array allocated:

⟨*Colors: color: TBP*⟩+≡
```
    procedure :: is_diagonal => color_is_diagonal
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_is_diagonal (col) result (diagonal)
      logical :: diagonal
      class(color_t), intent(in) :: col
      if (col%defined) then
         diagonal = all (col%c1 == col%c2)
      else
         diagonal = .true.
      end if
    end function color_is_diagonal
```

Return the ghost flag

⟨*Colors: color: TBP*⟩+≡
```
    procedure :: is_ghost => color_is_ghost
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_is_ghost (col) result (ghost)
      logical :: ghost
      class(color_t), intent(in) :: col
      ghost = col%ghost
    end function color_is_ghost
```

The ghost parity: true if the color-ghost flag is set. Again, no TBP since this is an array.

⟨*Colors: procedures*⟩+≡
```
    pure function color_ghost_parity (col) result (parity)
      type(color_t), dimension(:), intent(in) :: col
      logical :: parity
      parity = mod (count (col%ghost), 2) == 1
    end function color_ghost_parity
```

Determine the color representation, given a color object. We allow only singlet (1), (anti)triplet (±3), and octet states (8). A color ghost must not have color assigned, but the color type is 8. For non-diagonal color, representations must match. If the color type is undefined, return 0. If it is invalid or unsupported, return −1.

Assumption: nonzero entries precede nonzero ones.

⟨*Colors: color: TBP*⟩+≡
```
    procedure :: get_type => color_get_type
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_get_type (col) result (ctype)
      class(color_t), intent(in) :: col
      integer :: ctype
      if (col%defined) then
         ctype = -1
         if (col%ghost) then
            if (all (col%c1 == 0 .and. col%c2 == 0)) then
               ctype = 8
            end if
         else
            if (all ((col%c1 == 0 .and. col%c2 == 0) &
                 & .or. (col%c1 > 0 .and. col%c2 > 0) &
                 & .or. (col%c1 < 0 .and. col%c2 < 0))) then
               if (all (col%c1 == 0)) then
                  ctype = 1
               else if ((col%c1(1) > 0 .and. col%c1(2) == 0)) then
                  ctype = 3
               else if ((col%c1(1) < 0 .and. col%c1(2) == 0)) then
                  ctype = -3
               else if ((col%c1(1) > 0 .and. col%c1(2) < 0) &
                    .or.(col%c1(1) < 0 .and. col%c1(2) > 0)) then
                  ctype = 8
               end if
            end if
         end if
      else

11.4.3   Accessing contents

Return the number of color indices. We assume that it is identical for both arrays.

⟨*Colors: color: TBP*⟩+≡
```
    procedure, private :: get_number_of_indices => color_get_number_of_indices
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_get_number_of_indices (col) result (n)
      integer :: n
      class(color_t), intent(in) :: col
      if (col%defined .and. .not. col%ghost) then
         n = count (col%c1 /= 0)
      else
         n = 0
      end if
    end function color_get_number_of_indices
```

Return the (first) color/anticolor entry (assuming that color is diagonal). The result is a positive color index.

⟨*Colors: color: TBP*⟩+≡
```
    procedure :: get_col => color_get_col
    procedure :: get_acl => color_get_acl
```

⟨*Colors: procedures*⟩+≡
```
    elemental function color_get_col (col) result (c)
      integer :: c
      class(color_t), intent(in) :: col
      integer :: i
      if (col%defined .and. .not. col%ghost) then
         do i = 1, size (col%c1)
            if (col%c1(i) > 0) then
               c = col%c1(i)
               return
            end if
         end do
      end if
      c = 0
    end function color_get_col

    elemental function color_get_acl (col) result (c)

      end if
    end do
  end function find
end subroutine color_canonicalize
```

Return an array of different color indices from an array of colors. The last argument is a pseudo-color array, where the color entries correspond to the position of the corresponding index entry in the index array. The colors are assumed to be diagonal.

The algorithm works directly on the contents of the color objects.

⟨*Colors: procedures*⟩+≡

```
subroutine extract_color_line_indices (col, c_index, col_pos)
  type(color_t), dimension(:), intent(in) :: col
  integer, dimension(:), intent(out), allocatable :: c_index
  type(color_t), dimension(size(col)), intent(out) :: col_pos
  integer, dimension(:), allocatable :: c_tmp
  integer :: i, j, k, n, c
  allocate (c_tmp (sum (col%get_number_of_indices ())), source=0)
  n = 0
  SCAN1: do i = 1, size (col)
    if (col(i)%defined .and. .not. col(i)%ghost) then
      SCAN2: do j = 1, 2
        c = abs (col(i)%c1(j))
        if (c /= 0) then
          do k = 1, n
            if (c_tmp(k) == c) then
              col_pos(i)%c1(j) = k
              cycle SCAN2
            end if
          end do
          n = n + 1
          c_tmp(n) = c
          col_pos(i)%c1(j) = n
        end if
      end do SCAN2
```

```
      end if
   end do SCAN1
   allocate (c_index (n))
   c_index = c_tmp(1:n)
 end subroutine extract_color_line_indices
```

Given a color array, pairwise contract the color lines in all possible ways and return the resulting array of arrays. The input color array must be diagonal, and each color should occur exactly twice, once as color and once as anticolor.

Gluon entries with equal color and anticolor are explicitly excluded.

This algorithm is generic, but for long arrays it is neither efficient, nor does it avoid duplicates. It is intended for small arrays, in particular for the state matrix of a structure-function pair.

The algorithm works directly on the contents of the color objects, it thus depends on the implementation.

⟨*Colors: public*⟩+≡
```
    public :: color_array_make_contractions

Merge two color objects by taking the first entry from the first and the first entry from the second argument. Makes sense only if the input colors are defined (and diagonal). If either one is undefined, transfer the defined one.

⟨*Colors: color: TBP*⟩+≡

```
   generic :: operator(.merge.) => merge_colors
   procedure, private ::  merge_colors
```

⟨*Colors: procedures*⟩+≡

```
   elemental function merge_colors (col1, col2) result (col)

   else if (color_is_defined (col2)) then
      call color_init_array (col, col2%c1)
   end if
end function merge_colors
```

Merge up to two (diagonal!) color objects. The result inherits the unmatched color lines of the input colors. If one of the input colors is undefined, the output is undefined as well. It must be in a supported color representation.

A color-ghost object should not actually occur in real-particle events, but for completeness we define its behavior. For simplicity, it is identified as a color-octet with zero color/anticolor. It can only couple to a triplet or antitriplet. A fusion of triplet with matching antitriplet will yield a singlet, not a ghost, however.

If the fusion fails, the result is undefined.

NOTE: The `select type` casting is required by gfortran 4.8. It may not be required by the standard.

    end function compute_color_factor
```

We have a pair of color index arrays which corresponds to a squared matrix
element. We want to determine the number of color loops in this square matrix
element. So we first copy the colors (stored in a single color array with a pair
of color lists in each entry) to a temporary where the color indices are shifted
by some offset. We then recursively follow each loop, starting at the first color
that has the offset, resetting the first color index to the loop index and each
further index to zero as we go. We check that (a) each color index occurs twice
within the left (right) color array, (b) the loops are closed, so we always come
back to a line which has the loop index.

   In order for the algorithm to work we have to conjugate the colors of initial
state particles (one for decays, two for scatterings) into their corresponding
anticolors of outgoing particles.

11.4.7   The Madgraph color model

This section describes the method for matrix element and color flow calculation within Madgraph.

For each Feynman diagram, the colorless amplitude for a specified helicity and momentum configuration (in- and out- combined) is computed:

$$A_d(p, h) \tag{11.1}$$

Inserting color, the squared matrix element for definite helicity and momentum is

$$M^2(p, h) = \sum_{dd'} A_d(p, h) \, C_{dd'} \, A_{d'}^*(p, h) \tag{11.2}$$

where $C_{dd'}$ describes the color interference of the two diagrams A_d and A'_d, which is independent of momentum and helicity and can be calculated for each Feynman diagram pair by reducing it to the corresponding color graph. Obviously, one could combine all diagrams with identical color structure, such that the index d runs only over different color graphs. For colorless diagrams all elements of $C_{dd'}$ are equal to unity.

The hermitian matrix $C_{dd'}$ is diagonalized once and for all, such that it can be written in the form

$$C_{dd'} = \sum_\lambda c_d^\lambda \lambda \, c_d^{\lambda*}, \tag{11.3}$$

where the eigenvectors c_d are normalized,

$$\sum_d |c_d^\lambda|^2 = 1, \tag{11.4}$$

and the λ values are the corresponding eigenvalues. In the colorless case, this means $c_d = 1/\sqrt{N_d}$ for all diagrams (N_d = number of diagrams), and $\lambda = N_d$ is the only nonzero eigenvalue.

Consequently, the squared matrix element for definite helicity and momentum can also be written as

$$M^2(p, h) = \sum_\lambda A_\lambda(p, h) \, \lambda \, A_\lambda(p, h)^* \tag{11.5}$$

with

$$A_\lambda(p, h) = \sum_d c_d^\lambda A_d(p, h). \tag{11.6}$$

For generic spin density matrices, this is easily generalized to

$$M^2(p, h, h') = \sum_\lambda A_\lambda(p, h) \, \lambda \, A_\lambda(p, h')^* \tag{11.7}$$

To determine the color flow probabilities of a given momentum-helicity configuration, the color flow amplitudes are calculated as

$$a_f(p, h) = \sum_d \beta_d^f A_d(p, h), \tag{11.8}$$

where the coefficients β_d^f describe the amplitude for a given Feynman diagram (or color graph) d to correspond to a definite color flow f. They are computed from $C_{dd'}$ by transforming this matrix into the color flow basis and neglecting all off-diagonal elements. Again, these coefficients do not depend on momentum or helicity and can therefore be calculated in advance. This gives the color flow transition matrix

$$F^f(p, h, h') = a_f(p, h) \, a_f^*(p, h') \tag{11.9}$$

which is assumed diagonal in color flow space and is separate from the color-summed transition matrix M^2. They are, however, equivalent (up to a factor) to leading order in $1/N_c$, and using the color flow transition matrix is appropriate for matching to hadronization.

Note that the color flow transition matrix is not normalized at this stage. To make use of it, we have to fold it with the in-state density matrix to get a pseudo density matrix

$$\hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}}) = \sum_{h_{\text{in}} h'_{\text{in}}} F^f(p, h, h') \, \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}) \tag{11.10}$$

which gets a meaning only after contracted with projections on the outgoing helicity states k_{out}, given as linear combinations of helicity states with the unitary coefficient matrix $c(k_{\text{out}}, h_{\text{out}})$. Then the probability of finding color flow f when the helicity state k_{out} is measured is given by

$$P^f(p, k_{\text{out}}) = Q^f(p, k_{\text{out}}) / \sum_f Q^f(p, k_{\text{out}}) \tag{11.11}$$

where

$$Q^f(p, k_{\text{out}}) = \sum_{h_{\text{out}} h'_{\text{out}}} c(k_{\text{out}}, h_{\text{out}}) \, \hat{\rho}_{\text{out}}^f(p, h_{\text{out}}, h'_{\text{out}}) \, c^*(k_{\text{out}}, h'_{\text{out}}) \tag{11.12}$$

However, if we can assume that the out-state helicity basis is the canonical one, we can throw away the off diagonal elements in the color flow density matrix and normalize the ones on the diagonal to obtain

$$P^f(p, h_{\text{out}}) = \hat{\rho}^f_{\text{out}}(p, h_{\text{out}}, h_{\text{out}}) / \sum_f \hat{\rho}^f_{\text{out}}(p, h_{\text{out}}, h_{\text{out}}) \qquad (11.13)$$

Finally, the color-summed out-state density matrix is computed by the scattering formula

$$\rho_{\text{out}}(p, h_{\text{out}}, h'_{\text{out}}) = \sum_{h_{\text{in}} h'_{\text{in}}} M^2(p, h, h') \, \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}) \qquad (11.14)$$

$$= \sum_{h_{\text{in}} h'_{\text{in}} \lambda} A_\lambda(p, h) \, \lambda \, A_\lambda(p, h')^* \, \rho_{\text{in}}(p, h_{\text{in}}, h'_{\text{in}}), \qquad (11.15)$$

The trace of ρ_{out} is the squared matrix element, summed over all internal degrees of freedom. To get the squared matrix element for a definite helicity k_{out} and color flow f, one has to project the density matrix onto the given helicity state and multiply with $P^f(p, k_{\text{out}})$.

For diagonal helicities the out-state density reduces to

$$\rho_{\text{out}}(p, h_{\text{out}}) = \sum_{h_{\text{in}} \lambda} \lambda |A_\lambda(p, h)|^2 \rho_{\text{in}}(p, h_{\text{in}}). \qquad (11.16)$$

Since no basis transformation is involved, we can use the normalized color flow probability $P^f(p, h_{\text{out}})$ and express the result as

$$\rho^f_{\text{out}}(p, h_{\text{out}}) = \rho_{\text{out}}(p, h_{\text{out}}) \, P^f(p, h_{\text{out}}) \qquad (11.17)$$

$$= \sum_{h_{\text{in}} \lambda} \frac{|a^f(p, h)|^2}{\sum_f |a^f(p, h)|^2} \lambda |A_\lambda(p, h)|^2 \rho_{\text{in}}(p, h_{\text{in}}). \qquad (11.18)$$

From these considerations, the following calculation strategy can be derived:

- Before the first event is generated, the color interference matrix $C_{dd'}$ is computed and diagonalized, so the eigenvectors c^λ_d, eigenvalues λ and color flow coefficients β^f_d are obtained. In practice, these calculations are done when the matrix element code is generated, and the results are hardcoded in the matrix element subroutine as `DATA` statements.

- For each event, one loops over helicities once and stores the matrices $A_\lambda(p, h)$ and $a^f(p, h)$. The allowed color flows, helicity combinations and eigenvalues are each labeled by integer indices, so one has to store complex matrices of dimension $N_\lambda \times N_h$ and $N_f \times N_h$, respectively.

- The further strategy depends on the requested information.

    1. If colorless diagonal helicity amplitudes are required, the eigenvalues $A_\lambda(p, h)$ are squared, summed with weight λ, and the result contracted with the in-state probability vector $\rho_{\text{in}}(p, h_{\text{in}})$. The result is a probability vector $\rho_{\text{out}}(p, h_{\text{out}})$.

2. For colored diagonal helicity amplitudes, the color coefficients $a^f(p, h)$ are also squared and used as weights to obtain the color-flow probability vector $\rho^f_{\mathrm{out}}(p, h_{\mathrm{out}})$.

3. For colorless non-diagonal helicity amplitudes, we contract the tensor product of $A_\lambda(p, h)$ with $A_\lambda(p, h')$, weighted with λ, with the correlated in-state density matrix, to obtain a correlated out-state density matrix.

4. In the general (colored, non-diagonal) case, we do the same as in the colorless case, but return the un-normalized color flow density matrix $\hat{\rho}^f_{\mathrm{out}}(p, h_{\mathrm{out}}, h'_{\mathrm{out}})$ in addition. When the relevant helicity basis is known, the latter can be used by the caller program to determine flow probabilities. (In reality, we assume the canonical basis and reduce the correlated out-state density to its diagonal immediately.)

11.5 Flavors: Particle properties

This module contains a type for holding the flavor code, and all functions that depend on the model, i.e., that determine particle properties.

The PDG code is packed in a special `flavor` type. (This prohibits meaningless operations, and it allows for a different implementation, e.g., some non-PDG scheme internally, if appropiate at some point.)

There are lots of further particle properties that depend on the model. Implementing a flyweight pattern, the associated field data object is to be stored in a central area, the `flavor` object just receives a pointer to this, so all queries can be delegated.

⟨`flavors.f90`⟩≡

11.5.1 The flavor type

The flavor type is an integer representing the PDG code, or undefined (zero). Negative codes represent antiflavors. They should be used only for particles which do have a distinct antiparticle.

The `hard_process` flag can be set for particles that are participating in the hard interaction.

The `radiated` flag can be set for particles that are the result of a beam-structure interaction (hadron beam remnant, ISR photon, etc.), not of the hard

interaction itself.

Further properties of the given flavor can be retrieved via the particle-data pointer, if it is associated.

⟨*Flavors: public*⟩≡
```
    public :: flavor_t
```

⟨*Flavors: types*⟩≡
```
    type :: flavor_t
      private
      integer :: f = UNDEFINED
      logical :: hard_process = .false.
      logical :: radiated = .false.
      type(field_data_t), pointer :: field_data => null ()
    contains
    ⟨Flavors: flavor: TBP⟩
    end type flavor_t
```

Initializer form. If the model is assigned, the procedure is impure, therefore we have to define a separate array version.

Note: The pure elemental subroutines can't have an intent(out) CLASS argument (because of the potential for an impure finalizer in a type extension), so we stick to intent(inout) and (re)set all components explicitly.

⟨*Flavors: flavor: TBP*⟩≡
```
    generic :: init => &
        flavor_init_empty, &

  write (u) flv%f
  write (u) flv%radiated
end subroutine flavor_write_raw

subroutine flavor_read_raw (flv, u, iostat)
  class(flavor_t), intent(out) :: flv
  integer, intent(in) :: u
  integer, intent(out), optional :: iostat
  read (u, iostat=iostat) flv%f
  if (present (iostat)) then
     if (iostat /= 0)  return
  end if
  read (u, iostat=iostat)  flv%radiated
end subroutine flavor_read_raw
```

Assignment

Default assignment of flavor objects is possible, but cannot be used in pure procedures, because a pointer assignment is involved.

Assign the particle pointer separately. This cannot be elemental, so we define a scalar and an array version explicitly. We refer to an array of flavors, not an array of models.

⟨*Flavors: flavor: TBP*⟩+≡

```
procedure :: set_model => flavor_set_model_single
```

⟨*Flavors: procedures*⟩+≡

```
impure elemental subroutine flavor_set_model_single (flv, model)
  class(flavor_t), intent(inout) :: flv
  class(model_data_t), intent(in), target :: model
```

```
    if (flv%f /= UNDEFINED) &
        flv%field_data => model%get_field_ptr (flv%f)
  end subroutine flavor_set_model_single
```

Predicates

Return the definition status. By definition, the flavor object is defined if the
flavor PDG code is nonzero.

⟨*Flavors: flavor: TBP*⟩+≡
```
    procedure :: is_defined => flavor_is_defined
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_is_defined (flv) result (defined)
      class(flavor_t), intent(in) :: flv
      logical :: defined
      defined = flv%f /= UNDEFINED
    end function flavor_is_defined
```

Check for valid flavor (including undefined). This is distinct from the is_defined
status. Invalid flavor is actually a specific PDG code.

⟨*Flavors: flavor: TBP*⟩+≡
```
    procedure :: is_valid => flavor_is_valid
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_is_valid (flv) result (valid)
      class(flavor_t), intent(in) :: flv
      logical :: valid
      valid = flv%f /= INVALID
    end function flavor_is_valid
```

Return true if the particle-data pointer is associated. (Debugging aid)

⟨*Flavors: flavor: TBP*⟩+≡
```
    procedure :: is_associated => flavor_is_associated
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_is_associated (flv) result (flag)
      class(flavor_t), intent(in) :: flv
      logical :: flag
      flag = associated (flv%field_data)
    end function flavor_is_associated
```

Check the radiated flag. A radiated particle has a definite PDG flavor status,
but it is actually a pseudoparticle (a beam remnant) which may be subject to
fragmentation.

⟨*Flavors: flavor: TBP*⟩+≡
```
    procedure :: is_radiated => flavor_is_radiated
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_is_radiated (flv) result (flag)
      class(flavor_t), intent(in) :: flv
      logical :: flag
      flag = flv%radiated
```

```
      end function flavor_is_radiated
```

Check the **hard_process** flag. A particle is tagged with this flag if it participates in the hard interaction and is not a beam remnant.

⟨*Flavors: flavor: TBP*⟩+≡
```
    procedure :: is_hard_process => flavor_is_hard_process
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_is_hard_process (flv) result (flag)
      class(flavor_t), intent(in) :: flv
      logical :: flag
      flag = flv%hard_process
    end function flavor_is_hard_process
```

Accessing contents

With the exception of the PDG code, all particle property enquiries are delegated to the **field_data** pointer. If this is unassigned, some access function will crash.

Return the flavor as an integer

⟨*Flavors: flavor: TBP*⟩+≡
```
    procedure :: get_pdg => flavor_get_pdg
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_get_pdg (flv) result (f)
      integer :: f
      class(flavor_t), intent(in) :: flv
      f = flv%f
    end function flavor_get_pdg
```

Return the flavor of the antiparticle

⟨*Flavors: flavor: TBP*⟩+≡
```
    procedure :: get_pdg_anti => flavor_get_pdg_anti
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_get_pdg_anti (flv) result (f)
      integer :: f
      class(flavor_t), intent(in) :: flv
      if (associated (flv%field_data)) then
         if (flv%field_data%has_antiparticle ()) then
            f = -flv%f
         else
            f = flv%f
         end if
      else
         f = 0
      end if
    end function flavor_get_pdg_anti
```

Absolute value:

⟨*Flavors: flavor: TBP*⟩+≡
```
    procedure :: get_pdg_abs => flavor_get_pdg_abs
```

⟨*Flavors: procedures*⟩+≡
```
    elemental function flavor_get_pdg_abs (flv) result (f)
      integer :: f
      class(flavor_t), intent(in) :: flv
      f = abs (flv%f)
    end function flavor_get_pdg_abs
```

Generic properties

⟨*Flavors: flavor: TBP*⟩+≡
```
    procedure :: is_visible => flavor_is_visible
    procedure :: is_parton => flavor_is_parton
    procedure :: is_beam_remnant => flavor_is_beam_remnant

```

```
      else
         neq = .true.
      end if
   end function flavor_neq
```

Tools

Merge two flavor indices. This works only if both are equal or either one is undefined, because we have no off-diagonal flavor entries. Otherwise, generate an invalid flavor.

We cannot use elemental procedures because of the pointer component.

⟨*Flavors: public*⟩+≡
```
   public :: operator(.merge.)
```

⟨*Flavors: interfaces*⟩≡
```
   interface operator(.merge.)
      module procedure merge_flavors0
      module procedure merge_flavors1
   end interface
```

⟨*Flavors: procedures*⟩+≡
```
   function merge_flavors0 (flv1, flv2) result (flv)
     type(flavor_t) :: flv
     type(flavor_t), intent(in) :: flv1, flv2
     if (flavor_is_defined (flv1) .and. flavor_is_defined (flv2)) then
        if (flv1 == flv2) then
           flv = flv1
        else
           flv%f = INVALID
        end if
     else if (flavor_is_defined (flv1)) then
        flv = flv1
     else if (flavor_is_defined (flv2)) then
        flv = flv2
     end if
   end function merge_flavors0

   function merge_flavors1 (flv1, flv2) result (flv)
     type(flavor_t), dimension(:), intent(in) :: flv1, flv2
     type(flavor_t), dimension(size(flv1)) :: flv
     integer :: i
     do i = 1, size (flv1)
        flv(i) = flv1(i) .merge. flv2(i)
     end do
   end function merge_flavors1
```

Generate consecutive color indices for a given flavor. The indices are counted starting with the stored value of c, so new indices are created each time this (impure) function is called. The counter can be reset by the optional argument c_seed if desired. The optional flag **reverse** is used only for octets. If set, the color and anticolor entries of the octet particle are exchanged.

⟨*Flavors: public*⟩+≡

```
    public :: color_from_flavor
```

⟨*Flavors: interfaces*⟩+≡

```
    interface color_from_flavor
       module procedure color_from_flavor0
       module procedure color_from_flavor1
    end interface
```

⟨*Flavors: procedures*⟩+≡

```
    function color_from_flavor0 (flv, c_seed, reverse) result (col)
      type(color_t) :: col
      type(flavor_t), intent(in) :: flv

    contains
    ⟨Quantum numbers: quantum numbers: TBP⟩
    end type quantum_numbers_t
```

Define quantum numbers: Initializer form. All arguments may be present or absent.

Some elemental initializers are impure because they set the `flv` component. This implies transfer of a pointer behind the scenes.

⟨*Quantum numbers: quantum numbers: TBP*⟩≡

```

11.6.2   I/O

Write the quantum numbers in condensed form, enclosed by square brackets.
Color is written only if nontrivial. For convenience, introduce also an array
version.

If the col_verbose option is set, show the quantum number color also if it
is zero, but defined. Otherwise, suppress zero color.

⟨*Quantum numbers: public*⟩+≡
```

11.6.3   Accessing contents

Color and helicity can be done by elemental functions. Flavor needs impure
elemental. We export also the functions directly, this allows us to avoid tempo-
raries in some places.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_get_flavor
    public :: quantum_numbers_get_color
    public :: quantum_numbers_get_helicity
```

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
    procedure :: get_flavor => quantum_numbers_get_flavor
    procedure :: get_color => quantum_numbers_get_color
    procedure :: get_helicity => quantum_numbers_get_helicity
    procedure :: get_sub => quantum_numbers_get_sub
```

⟨*Quantum numbers: procedures*⟩+≡
```
    impure elemental function quantum_numbers_get_flavor (qn) result (flv)
      type(flavor_t) :: flv
      class(quantum_numbers_t), intent(in) :: qn
      flv = qn%f
    end function quantum_numbers_get_flavor

    elemental function quantum_numbers_get_color (qn) result (col)
      type(color_t) :: col
      class(quantum_numbers_t), intent(in) :: qn
      col = qn%c
    end function quantum_numbers_get_color

    elemental function quantum_numbers_get_helicity (qn) result (hel)
      type(helicity_t) :: hel
      class(quantum_numbers_t), intent(in) :: qn
      hel = qn%h
    end function quantum_numbers_get_helicity
```

```
elemental function quantum_numbers_get_sub (qn) result (sub)
  integer :: sub
  class(quantum_numbers_t), intent(in) :: qn
  sub = qn%sub
end function quantum_numbers_get_sub
```

This just resets the ghost property of the color part:

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
procedure :: set_color_ghost => quantum_numbers_set_color_ghost
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental subroutine quantum_numbers_set_color_ghost (qn, ghost)
  class(quantum_numbers_t), intent(inout) :: qn
  logical, intent(in) :: ghost
  call qn%c%set_ghost (ghost)
end subroutine quantum_numbers_set_color_ghost
```

Assign a model to the flavor part of quantum numbers.

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
procedure :: set_model => quantum_numbers_set_model
```

⟨*Quantum numbers: procedures*⟩+≡
```
impure elemental subroutine quantum_numbers_set_model (qn, model)
  class(quantum_numbers_t), intent(inout) :: qn
  class(model_data_t), intent(in), target :: model
  call qn%f%set_model (model)
end subroutine quantum_numbers_set_model
```

Set the `radiated` flag for the flavor component.

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
procedure :: tag_radiated => quantum_numbers_tag_radiated
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental subroutine quantum_numbers_tag_radiated (qn)
  class(quantum_numbers_t), intent(inout) :: qn
  call qn%f%tag_radiated ()
end subroutine quantum_numbers_tag_radiated
```

Set the `hard_process` flag for the flavor component.

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
procedure :: tag_hard_process => quantum_numbers_tag_hard_process
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental subroutine quantum_numbers_tag_hard_process (qn)
  class(quantum_numbers_t), intent(inout) :: qn
  call qn%f%tag_hard_process ()
end subroutine quantum_numbers_tag_hard_process
```

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
procedure :: set_subtraction_index => quantum_numbers_set_subtraction_index
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental subroutine quantum_numbers_set_subtraction_index (qn, i)
      class(quantum_numbers_t), intent(inout) :: qn
      integer, intent(in) :: i
      qn%sub = i
    end subroutine quantum_numbers_set_subtraction_index
```

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
    procedure :: get_subtraction_index => quantum_numbers_get_subtraction_index
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_get_subtraction_index (qn) result (sub)
      integer :: sub
      class(quantum_numbers_t), intent(in) :: qn
      sub = qn%sub
    end function quantum_numbers_get_subtraction_index
```

This is a convenience function: return the color type for the flavor (array).

Note: keep the public version temporarily, this will be used in a complicated expression which triggers a compiler bug (nagfor 5.3) in the TBP version.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_get_color_type
```

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
    procedure :: get_color_type => quantum_numbers_get_color_type
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_get_color_type (qn) result (color_type)
      integer :: color_type
      class(quantum_numbers_t), intent(in) :: qn
      color_type = qn%f%get_color_type ()
    end function quantum_numbers_get_color_type
```

11.6.4 Predicates

Check if the flavor index is valid (including UNDEFINED).

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
    procedure :: are_valid => quantum_numbers_are_valid
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_are_valid (qn) result (valid)
      logical :: valid
      class(quantum_numbers_t), intent(in) :: qn
      valid = qn%f%is_valid ()
    end function quantum_numbers_are_valid
```

Check if the flavor part has its particle-data pointer associated (debugging aid).

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
    procedure :: are_associated => quantum_numbers_are_associated
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental function quantum_numbers_are_associated (qn) result (flag)
  logical :: flag
  class(quantum_numbers_t), intent(in) :: qn
  flag = qn%f%is_associated ()
end function quantum_numbers_are_associated
```

Check if the helicity and color quantum numbers are diagonal. (Unpolarized/colorless also counts as diagonal.) Flavor is diagonal by definition.
⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
procedure :: are_diagonal => quantum_numbers_are_diagonal
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental function quantum_numbers_are_diagonal (qn) result (diagonal)
  logical :: diagonal
  class(quantum_numbers_t), intent(in) :: qn
  diagonal = qn%h%is_diagonal () .and. qn%c%is_diagonal ()
end function quantum_numbers_are_diagonal
```

Check if the color part has the ghost property.
⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
procedure :: is_color_ghost => quantum_numbers_is_color_ghost
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental function quantum_numbers_is_color_ghost (qn) result (ghost)
  logical :: ghost
  class(quantum_numbers_t), intent(in) :: qn
  ghost = qn%c%is_ghost ()
end function quantum_numbers_is_color_ghost
```

Check if the flavor participates in the hard interaction.
⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
procedure :: are_hard_process => quantum_numbers_are_hard_process
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental function quantum_numbers_are_hard_process (qn) result (hard_process)
  logical :: hard_process
  class(quantum_numbers_t), intent(in) :: qn
  hard_process = qn%f%is_hard_process ()
end function quantum_numbers_are_hard_process
```

11.6.5 Comparisons

Matching and equality is derived from the individual quantum numbers. The variant **fhmatch** matches only flavor and helicity. The variant **dhmatch** matches only diagonal helicity, if the matching helicity is undefined.
⟨*Quantum numbers: public*⟩+≡
```
public :: quantum_numbers_eq_wo_sub
```

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡

```

      qn_out%f = qn_in%f
      qn_out%c = qn_in%c
      qn_out%h = qn_in%h
      qn_out%sub = qn_in%sub
    end subroutine quantum_numbers_assign
```

Two sets of quantum numbers are compatible if the individual quantum numbers
are compatible, depending on the mask. Flavor has to match, regardless of the
flavor mask.

If the color flag is set, color is compatible if the ghost property is identical.
If the color flag is unset, color has to be identical. I.e., if the flag is set, the color
amplitudes can interfere. If it is not set, they must be identical, and there must
be no ghost. The latter property is used for expanding physical color flows.

Helicity is compatible if the mask is unset, otherwise it has to match. This
determines if two amplitudes can be multiplied (no mask) or traced (mask).

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_are_compatible
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_are_compatible (qn1, qn2, mask) &
       result (flag)
      logical :: flag
      type(quantum_numbers_t), intent(in) :: qn1, qn2
      type(quantum_numbers_mask_t), intent(in) :: mask
      if (mask%h .or. mask%hd) then
         flag = (qn1%f .match. qn2%f) .and. (qn1%h .match. qn2%h)
      else
         flag = (qn1%f .match. qn2%f)
      end if
      if (mask%c) then
         flag = flag .and. (qn1%c%is_ghost () .eqv. qn2%c%is_ghost ())
      else
         flag = flag .and. &
              .not. (qn1%c%is_ghost () .or. qn2%c%is_ghost ()) .and. &
              (qn1%c == qn2%c)
      end if
    end function quantum_numbers_are_compatible
```

This is the analog for a single quantum-number set. We just check for color
ghosts; they are excluded if the color mask is unset (color-flow expansion).

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_are_physical
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_are_physical (qn, mask) result (flag)
      logical :: flag
      type(quantum_numbers_t), intent(in) :: qn
      type(quantum_numbers_mask_t), intent(in) :: mask
      if (mask%c) then
         flag = .true.
      else
         flag = .not. qn%c%is_ghost ()
      end if
    end function quantum_numbers_are_physical
```

11.6.6   Operations

Inherited from the color component: reassign color indices in canonical order.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_canonicalize_color
```

⟨*Quantum numbers: procedures*⟩+≡
```
    subroutine quantum_numbers_canonicalize_color (qn)
      type(quantum_numbers_t), dimension(:), intent(inout) :: qn
      call color_canonicalize (qn%c)
    end subroutine quantum_numbers_canonicalize_color
```

Inherited from the color component: make a color map for two matching quantum-
number arrays.

⟨*Quantum numbers: public*⟩+≡
```
    public :: make_color_map
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface make_color_map
       module procedure quantum_numbers_make_color_map
    end interface make_color_map
```

⟨*Quantum numbers: procedures*⟩+≡
```
    subroutine quantum_numbers_make_color_map (map, qn1, qn2)
      integer, dimension(:,:), intent(out), allocatable :: map
      type(quantum_numbers_t), dimension(:), intent(in) :: qn1, qn2
      call make_color_map (map, qn1%c, qn2%c)
    end subroutine quantum_numbers_make_color_map
```

Inherited from the color component: translate the color part using a color-map
array
⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_translate_color
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface quantum_numbers_translate_color
       module procedure quantum_numbers_translate_color0
       module procedure quantum_numbers_translate_color1
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    subroutine quantum_numbers_translate_color0 (qn, map, offset)
      type(quantum_numbers_t), intent(inout) :: qn
      integer, dimension(:,:), intent(in) :: map
      integer, intent(in), optional :: offset
      call color_translate (qn%c, map, offset)
    end subroutine quantum_numbers_translate_color0

    subroutine quantum_numbers_translate_color1 (qn, map, offset)
      type(quantum_numbers_t), dimension(:), intent(inout) :: qn
      integer, dimension(:,:), intent(in) :: map
      integer, intent(in), optional :: offset
      call color_translate (qn%c, map, offset)
    end subroutine quantum_numbers_translate_color1
```

Inherited from the color component: return the color index with highest absolute
value.

Since the algorithm is not elemental, we keep the separate procedures for
different array rank.
⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_get_max_color_value
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface quantum_numbers_get_max_color_value
       module procedure quantum_numbers_get_max_color_value0
       module procedure quantum_numbers_get_max_color_value1
       module procedure quantum_numbers_get_max_color_value2
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    pure function quantum_numbers_get_max_color_value0 (qn) result (cmax)
      integer :: cmax
      type(quantum_numbers_t), intent(in) :: qn
      cmax = color_get_max_value (qn%c)
    end function quantum_numbers_get_max_color_value0

    pure function quantum_numbers_get_max_color_value1 (qn) result (cmax)
      integer :: cmax
      type(quantum_numbers_t), dimension(:), intent(in) :: qn
      cmax = color_get_max_value (qn%c)
    end function quantum_numbers_get_max_color_value1

    pure function quantum_numbers_get_max_color_value2 (qn) result (cmax)
      integer :: cmax
      type(quantum_numbers_t), dimension(:,:), intent(in) :: qn
      cmax = color_get_max_value (qn%c)
    end function quantum_numbers_get_max_color_value2
```

Inherited from the color component: add an offset to the indices of the color
part

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
    procedure :: add_color_offset => quantum_numbers_add_color_offset
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental subroutine quantum_numbers_add_color_offset (qn, offset)
      class(quantum_numbers_t), intent(inout) :: qn
      integer, intent(in) :: offset
      call qn%c%add_offset (offset)
    end subroutine quantum_numbers_add_color_offset
```

Given a quantum number array, return all possible color contractions, leaving
the other quantum numbers intact.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_number_array_make_color_contractions
```

⟨*Quantum numbers: procedures*⟩+≡
```
    subroutine quantum_number_array_make_color_contractions (qn_in, qn_out)
      type(quantum_numbers_t), dimension(:), intent(in) :: qn_in
      type(quantum_numbers_t), dimension(:,:), intent(out), allocatable :: qn_out
      type(color_t), dimension(:,:), allocatable :: col
      integer :: i
      call color_array_make_contractions (qn_in%c, col)
      allocate (qn_out (size (col, 1), size (col, 2)))
      do i = 1, size (qn_out, 2)
         qn_out(:,i)%f = qn_in%f
         qn_out(:,i)%c = col(:,i)
         qn_out(:,i)%h = qn_in%h
      end do
    end subroutine quantum_number_array_make_color_contractions
```

Inherited from the color component: invert the color, switching particle/antiparticle.

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
    procedure :: invert_color => quantum_numbers_invert_color
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental subroutine quantum_numbers_invert_color (qn)
  class(quantum_numbers_t), intent(inout) :: qn
  call qn%c%invert ()
end subroutine quantum_numbers_invert_color
```

Flip helicity.

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
procedure :: flip_helicity => quantum_numbers_flip_helicity
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental subroutine quantum_numbers_flip_helicity (qn)
  class(quantum_numbers_t), intent(inout) :: qn
  call qn%h%flip ()
end subroutine quantum_numbers_flip_helicity
```

Merge two quantum number sets: for each entry, if both are defined, combine them to an off-diagonal entry (meaningful only if the input was diagonal). If either entry is undefined, take the defined one.

For flavor, off-diagonal entries are invalid, so both flavors must be equal, otherwise an invalid flavor is inserted.

⟨*Quantum numbers: public*⟩+≡
```
public :: operator(.merge.)
```

⟨*Quantum numbers: interfaces*⟩+≡
```
interface operator(.merge.)
   module procedure merge_quantum_numbers0
   module procedure merge_quantum_numbers1
end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
function merge_quantum_numbers0 (qn1, qn2) result (qn3)
  type(quantum_numbers_t) :: qn3
  type(quantum_numbers_t), intent(in) :: qn1, qn2
  qn3%f = qn1%f .merge. qn2%f
  qn3%c = qn1%c .merge. qn2%c
  qn3%h = qn1%h .merge. qn2%h
  qn3%sub = merge_subtraction_index (qn1%sub, qn2%sub)
end function merge_quantum_numbers0

function merge_quantum_numbers1 (qn1, qn2) result (qn3)
  type(quantum_numbers_t), dimension(:), intent(in) :: qn1, qn2
  type(quantum_numbers_t), dimension(size(qn1)) :: qn3
  qn3%f = qn1%f .merge. qn2%f
  qn3%c = qn1%c .merge. qn2%c
  qn3%h = qn1%h .merge. qn2%h
  qn3%sub = merge_subtraction_index (qn1%sub, qn2%sub)
end function merge_quantum_numbers1
```

⟨*Quantum numbers: procedures*⟩+≡
```
elemental function merge_subtraction_index (sub1, sub2) result (sub3)
  integer :: sub3
```

```
   integer, intent(in) :: sub1, sub2
   if (sub1 > 0 .and. sub2 > 0) then
      if (sub1 == sub2) then
         sub3 = sub1
      else
         sub3 = 0
      end if
   else if (sub1 > 0) then
      sub3 = sub1
   else if (sub2 > 0) then
      sub3 = sub2
   else
      sub3 = 0
   end if
end function merge_subtraction_index
```

11.6.7 The quantum number mask

The quantum numbers mask is true for quantum numbers that should be ignored or summed over. The three mandatory entries correspond to flavor, color, and helicity, respectively.

There is an additional entry `cg`: If false, the color-ghosts property should be kept even if color is ignored. This is relevant only if `c` is set, otherwise it is always false.

The flag `hd` tells that only diagonal entries in helicity should be kept. If `h` is set, `hd` is irrelevant and will be kept `.false.`.

⟨*Quantum numbers: public*⟩+≡
```
   public :: quantum_numbers_mask_t
```

⟨*Quantum numbers: types*⟩+≡
```
   type :: quantum_numbers_mask_t
     private
     logical :: f = .false.
     logical :: c = .false.
     logical :: cg = .false.
     logical :: h = .false.
     logical :: hd = .false.
     integer :: sub = 0
    contains
    ⟨Quantum numbers: quantum numbers mask: TBP⟩
   end type quantum_numbers_mask_t
```

Define a quantum number mask: Constructor form

⟨*Quantum numbers: public*⟩+≡
```
   public :: quantum_numbers_mask
```

⟨*Quantum numbers: procedures*⟩+≡
```
   elemental function quantum_numbers_mask &
        (mask_f, mask_c, mask_h, mask_cg, mask_hd) result (mask)
     type(quantum_numbers_mask_t) :: mask
     logical, intent(in) :: mask_f, mask_c, mask_h
     logical, intent(in), optional :: mask_cg
```

```
      logical, intent(in), optional :: mask_hd
      call quantum_numbers_mask_init &
           (mask, mask_f, mask_c, mask_h, mask_cg, mask_hd)
    end function quantum_numbers_mask
```

Define quantum numbers: Initializer form

⟨*Quantum numbers: quantum numbers mask: TBP*⟩≡
```
    procedure :: init => quantum_numbers_mask_init
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental subroutine quantum_numbers_mask_init &
         (mask, mask_f, mask_c, mask_h, mask_cg, mask_hd)
      class(quantum_numbers_mask_t), intent(inout) :: mask
      logical, intent(in) :: mask_f, mask_c, mask_h
      logical, intent(in), optional :: mask_cg, mask_hd
      mask%f = mask_f
      mask%c = mask_c
      mask%h = mask_h
      mask%cg = .false.
      if (present (mask_cg)) then
         if (mask%c)  mask%cg = mask_cg
      else
         mask%cg = mask_c
      end if
      mask%hd = .false.
      if (present (mask_hd)) then
         if (.not. mask%h)  mask%hd = mask_hd
      end if
    end subroutine quantum_numbers_mask_init
```

Write a quantum numbers mask. We need the stand-alone subroutine for the
array case.

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_mask_write
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface quantum_numbers_mask_write
       module procedure quantum_numbers_mask_write_single
       module procedure quantum_numbers_mask_write_array
    end interface
```

⟨*Quantum numbers: quantum numbers mask: TBP*⟩+≡
```
    procedure :: write => quantum_numbers_mask_write_single
```

⟨*Quantum numbers: procedures*⟩+≡
```
    subroutine quantum_numbers_mask_write_single (mask, unit)
      class(quantum_numbers_mask_t), intent(in) :: mask
      integer, intent(in), optional :: unit
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "(A)", advance="no") "["
      write (u, "(L1)", advance="no")  mask%f
      write (u, "(L1)", advance="no")  mask%c
      if (.not.mask%cg)  write (u, "('g')", advance="no")
      write (u, "(L1)", advance="no")  mask%h
```

```
      if (mask%hd)  write (u, "('d')", advance="no")
      write (u, "(A)", advance="no") "]"
    end subroutine quantum_numbers_mask_write_single

    subroutine quantum_numbers_mask_write_array (mask, unit)
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "(A)", advance="no") "["
      do i = 1, size (mask)
         if (i > 1)  write (u, "(A)", advance="no")  "/"
         write (u, "(L1)", advance="no")  mask(i)%f
         write (u, "(L1)", advance="no")  mask(i)%c
         if (.not.mask(i)%cg)  write (u, "('g')", advance="no")
         write (u, "(L1)", advance="no")  mask(i)%h
         if (mask(i)%hd)  write (u, "('d')", advance="no")
      end do
      write (u, "(A)", advance="no") "]"
    end subroutine quantum_numbers_mask_write_array
```

11.6.8   Setting mask components

⟨*Quantum numbers: quantum numbers mask: TBP*⟩+≡
```
    procedure :: set_flavor => quantum_numbers_mask_set_flavor
    procedure :: set_color => quantum_numbers_mask_set_color
    procedure :: set_helicity => quantum_numbers_mask_set_helicity
    procedure :: set_sub => quantum_numbers_mask_set_sub
```
⟨*Quantum numbers: procedures*⟩+≡
```
    elemental subroutine quantum_numbers_mask_set_flavor (mask, mask_f)
      class(quantum_numbers_mask_t), intent(inout) :: mask
      logical, intent(in) :: mask_f
      mask%f = mask_f
    end subroutine quantum_numbers_mask_set_flavor

    elemental subroutine quantum_numbers_mask_set_color (mask, mask_c, mask_cg)
      class(quantum_numbers_mask_t), intent(inout) :: mask
      logical, intent(in) :: mask_c
      logical, intent(in), optional :: mask_cg
      mask%c = mask_c
      if (present (mask_cg)) then
         if (mask%c)  mask%cg = mask_cg
      else
         mask%cg = mask_c
      end if
    end subroutine quantum_numbers_mask_set_color

    elemental subroutine quantum_numbers_mask_set_helicity (mask, mask_h, mask_hd)
      class(quantum_numbers_mask_t), intent(inout) :: mask
      logical, intent(in) :: mask_h
      logical, intent(in), optional :: mask_hd
      mask%h = mask_h
```

```
      if (present (mask_hd)) then
         if (.not. mask%h)  mask%hd = mask_hd
      end if
   end subroutine quantum_numbers_mask_set_helicity

   elemental subroutine quantum_numbers_mask_set_sub (mask, sub)
     class(quantum_numbers_mask_t), intent(inout) :: mask
     integer, intent(in) :: sub
     mask%sub = sub
   end subroutine quantum_numbers_mask_set_sub
```

The following routines assign part of a mask, depending on the flags given.

⟨*Quantum numbers: quantum numbers mask: TBP*⟩+≡
```
   procedure :: assign => quantum_numbers_mask_assign
```

⟨*Quantum numbers: procedures*⟩+≡
```
   elemental subroutine quantum_numbers_mask_assign &
        (mask, mask_in, flavor, color, helicity)
     class(quantum_numbers_mask_t), intent(inout) :: mask
     class(quantum_numbers_mask_t), intent(in) :: mask_in
     logical, intent(in), optional :: flavor, color, helicity
     if (present (flavor)) then
        if (flavor) then
           mask%f = mask_in%f
        end if
     end if
     if (present (color)) then
        if (color) then
           mask%c = mask_in%c
           mask%cg = mask_in%cg
        end if
     end if
     if (present (helicity)) then
        if (helicity) then
           mask%h = mask_in%h
           mask%hd = mask_in%hd
        end if
     end if
   end subroutine quantum_numbers_mask_assign
```

11.6.9   Mask predicates

Return true if either one of the entries is set:

⟨*Quantum numbers: public*⟩+≡
```
   public :: any
```

⟨*Quantum numbers: interfaces*⟩+≡
```
   interface any
      module procedure quantum_numbers_mask_any
   end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    function quantum_numbers_mask_any (mask) result (match)
      logical :: match
      type(quantum_numbers_mask_t), intent(in) :: mask
      match = mask%f .or. mask%c .or. mask%h .or. mask%hd
    end function quantum_numbers_mask_any
```

11.6.10   Operators

The OR operation is applied to all components.

⟨*Quantum numbers: quantum numbers mask: TBP*⟩+≡
```
    generic :: operator(.or.) => quantum_numbers_mask_or
    procedure, private :: quantum_numbers_mask_or
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_mask_or (mask1, mask2) result (mask)
      type(quantum_numbers_mask_t) :: mask
      class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
      mask%f = mask1%f .or. mask2%f
      mask%c = mask1%c .or. mask2%c
      if (mask%c)  mask%cg = mask1%cg .or. mask2%cg
      mask%h = mask1%h .or. mask2%h
      if (.not. mask%h)  mask%hd = mask1%hd .or. mask2%hd
    end function quantum_numbers_mask_or
```

11.6.11   Mask comparisons

Return true if the two masks are equivalent / differ:

⟨*Quantum numbers: quantum numbers mask: TBP*⟩+≡
```
    generic :: operator(.eqv.) => quantum_numbers_mask_eqv
    generic :: operator(.neqv.) => quantum_numbers_mask_neqv
    procedure, private :: quantum_numbers_mask_eqv
    procedure, private :: quantum_numbers_mask_neqv
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_mask_eqv (mask1, mask2) result (eqv)
      logical :: eqv
      class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
      eqv = (mask1%f .eqv. mask2%f) .and. &
           (mask1%c .eqv. mask2%c) .and. &
           (mask1%cg .eqv. mask2%cg) .and. &
           (mask1%h .eqv. mask2%h) .and. &
           (mask1%hd .eqv. mask2%hd)
    end function quantum_numbers_mask_eqv

    elemental function quantum_numbers_mask_neqv (mask1, mask2) result (neqv)
      logical :: neqv
      class(quantum_numbers_mask_t), intent(in) :: mask1, mask2
      neqv = (mask1%f .neqv. mask2%f) .or. &
           (mask1%c .neqv. mask2%c) .or. &
           (mask1%cg .neqv. mask2%cg) .or. &
```

```
        (mask1%h .neqv. mask2%h) .or. &
        (mask1%hd .neqv. mask2%hd)
  end function quantum_numbers_mask_neqv
```

11.6.12   Apply a mask

Applying a mask to the quantum number object means undefining those entries
where the mask is set. The others remain unaffected.

The `hd` mask has the special property that it "diagonalizes" helicity, i.e., the
second helicity entry is dropped and the result is a diagonal helicity quantum
number.

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
    procedure :: undefine => quantum_numbers_undefine
    procedure :: undefined => quantum_numbers_undefined0
```

⟨*Quantum numbers: public*⟩+≡
```
    public :: quantum_numbers_undefined
```

⟨*Quantum numbers: interfaces*⟩+≡
```
    interface quantum_numbers_undefined
       module procedure quantum_numbers_undefined0
       module procedure quantum_numbers_undefined1
       module procedure quantum_numbers_undefined11
    end interface
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental subroutine quantum_numbers_undefine (qn, mask)
      class(quantum_numbers_t), intent(inout) :: qn
      type(quantum_numbers_mask_t), intent(in) :: mask
      if (mask%f)  call qn%f%undefine ()
      if (mask%c)  call qn%c%undefine (undefine_ghost = mask%cg)
      if (mask%h) then
         call qn%h%undefine ()
      else if (mask%hd) then
         if (.not. qn%h%is_diagonal ()) then
            call qn%h%diagonalize ()
         end if
      end if
      if (mask%sub > 0)  qn%sub = 0
    end subroutine quantum_numbers_undefine

    function quantum_numbers_undefined0 (qn, mask) result (qn_new)
      class(quantum_numbers_t), intent(in) :: qn
      type(quantum_numbers_mask_t), intent(in) :: mask
      type(quantum_numbers_t) :: qn_new
      select type (qn)
      type is (quantum_numbers_t);  qn_new = qn
      end select
      call quantum_numbers_undefine (qn_new, mask)
    end function quantum_numbers_undefined0

    function quantum_numbers_undefined1 (qn, mask) result (qn_new)
      type(quantum_numbers_t), dimension(:), intent(in) :: qn
```

```
    type(quantum_numbers_mask_t), intent(in) :: mask
    type(quantum_numbers_t), dimension(size(qn)) :: qn_new
    qn_new = qn
    call quantum_numbers_undefine (qn_new, mask)
  end function quantum_numbers_undefined1

  function quantum_numbers_undefined11 (qn, mask) result (qn_new)
    type(quantum_numbers_t), dimension(:), intent(in) :: qn
    type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
    type(quantum_numbers_t), dimension(size(qn)) :: qn_new
    qn_new = qn
    call quantum_numbers_undefine (qn_new, mask)
  end function quantum_numbers_undefined11
```

Return true if the input quantum number set has entries that would be removed by the applied mask, e.g., if polarization is defined but `mask%h` is set:

⟨*Quantum numbers: quantum numbers: TBP*⟩+≡
```
    procedure :: are_redundant => quantum_numbers_are_redundant
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_are_redundant (qn, mask) &
        result (redundant)
      logical :: redundant
      class(quantum_numbers_t), intent(in) :: qn
      type(quantum_numbers_mask_t), intent(in) :: mask
      redundant = .false.
      if (mask%f) then
         redundant = qn%f%is_defined ()
      end if
      if (mask%c) then
         redundant = qn%c%is_defined ()
      end if
      if (mask%h) then
         redundant = qn%h%is_defined ()
      else if (mask%hd) then
         redundant = .not. qn%h%is_diagonal ()
      end if
      if (mask%sub > 0) redundant = qn%sub >= mask%sub
    end function quantum_numbers_are_redundant
```

Return true if the helicity flag is set or the diagonal-helicity flag is set.

⟨*Quantum numbers: quantum numbers mask: TBP*⟩+≡
```
    procedure :: diagonal_helicity => quantum_numbers_mask_diagonal_helicity
```

⟨*Quantum numbers: procedures*⟩+≡
```
    elemental function quantum_numbers_mask_diagonal_helicity (mask) &
        result (flag)
      logical :: flag
      class(quantum_numbers_mask_t), intent(in) :: mask
      flag = mask%h .or. mask%hd
    end function quantum_numbers_mask_diagonal_helicity
```

Chapter 12

Transition Matrices and Evaluation

The modules in this chapter implement transition matrices and calculations. The functionality is broken down in three modules

state_matrices represent state and transition density matrices built from particle quantum numbers (helicity, color, flavor)

interactions extend state matrices with the record of particle momenta. They also distinguish in- and out-particles and store parent-child relations.

evaluators These objects extend interaction objects by the information how to calculate matrix elements from products and squares of other interactions. They implement the methods to actually compute those matrix elements.

12.1 State matrices

This module deals with the internal state of a particle system, i.e., with its density matrix in flavor, color, and helicity space.

12.1.1 Nodes of the quantum state trie

A quantum state object represents an unnormalized density matrix, i.e., an array of possibilities for flavor, color, and helicity indices with associated complex values. Physically, the trace of this matrix is the summed squared matrix element for an interaction, and the matrix elements divided by this value correspond to the flavor-color-helicity density matrix. (Flavor and color are diagonal.)

We store density matrices as tries, that is, as trees where each branching represents the possible quantum numbers of a particle. The first branching is the first particle in the system. A leaf (the node corresponding to the last particle) contains the value of the matrix element.

Each node contains a flavor, color, and helicity entry. Note that each of those entries may be actually undefined, so we can also represent, e.g., unpolarized particles.

The value is meaningful only for leaves, which have no child nodes. There is a pointer to the parent node which allows for following the trie downwards from a leaf, it is null for a root node. The child nodes are implemented as a list, so there is a pointer to the first and last child, and each node also has a `next` pointer to the next sibling.

The root node does not correspond to a particle, only its children do. The quantum numbers of the root node are irrelevant and will not be set. However, we use a common type for the three classes (root, branch, leaf); they may easily be distinguished by the association status of parent and child.

Node type

The node is linked in all directions: the parent, the first and last in the list of children, and the previous and next sibling. This allows us for adding and removing nodes and whole branches anywhere in the trie. (Circular links are not allowed, however.). The node holds its associated set of quantum numbers. The integer index, which is set only for leaf nodes, is the index of the corresponding matrix element value within the state matrix.

Temporarily, matrix-element values may be stored within a leaf node. This is used during state-matrix factorization. When the state matrix is `freeze`d, these values are transferred to the matrix-element array within the host state matrix.

⟨*State matrices: types*⟩≡

```
type :: node_t
   private
   type(quantum_numbers_t) :: qn
   type(node_t), pointer :: parent => null ()
   type(node_t), pointer :: child_first => null ()
   type(node_t), pointer :: child_last => null ()
   type(node_t), pointer :: next => null ()
   type(node_t), pointer :: previous => null ()
   integer :: me_index = 0
   integer, dimension(:), allocatable :: me_count
   complex(default) :: me = 0
end type node_t
```

Operations on nodes

Recursively deallocate all children of the current node. This includes any values associated with the children.

⟨*State matrices: procedures*⟩≡

```
pure recursive subroutine node_delete_offspring (node)
   type(node_t), pointer :: node
   type(node_t), pointer :: child
   child => node%child_first
   do while (associated (child))
      node%child_first => node%child_first%next
      call node_delete_offspring (child)
      deallocate (child)
      child => node%child_first
   end do
```

```
      node%child_last => null ()
   end subroutine node_delete_offspring
```

Remove a node including its offspring. Adjust the pointers of parent and siblings, if necessary.

⟨State matrices: procedures⟩+≡
```
   pure subroutine node_delete (node)
     type(node_t), pointer :: node
     call node_delete_offspring (node)
     if (associated (node%previous)) then
        node%previous%next => node%next
     else if (associated (node%parent)) then
        node%parent%child_first => node%next
     end if
     if (associated (node%next)) then
        node%next%previous => node%previous
     else if (associated (node%parent)) then
        node%parent%child_last => node%previous
     end if
     deallocate (node)
   end subroutine node_delete
```

Append a child node

⟨State matrices: procedures⟩+≡
```
   subroutine node_append_child (node, child)
     type(node_t), target, intent(inout) :: node
     type(node_t), pointer :: child
     allocate (child)
     if (associated (node%child_last)) then
        node%child_last%next => child
        child%previous => node%child_last
     else
        node%child_first => child
     end if
     node%child_last => child
     child%parent => node
   end subroutine node_append_child
```

I/O

Output of a single node, no recursion. We print the quantum numbers in square brackets, then the value (if any).

⟨State matrices: procedures⟩+≡
```
   subroutine node_write (node, me_array, verbose, unit, col_verbose, testflag)
     type(node_t), intent(in) :: node
     complex(default), dimension(:), intent(in), optional :: me_array
     logical, intent(in), optional :: verbose, col_verbose, testflag
     integer, intent(in), optional :: unit
     logical :: verb
     integer :: u
     character(len=7) :: fmt
```

```
      call pac_fmt (fmt, FMT_19, FMT_17, testflag)
      verb = .false.;  if (present (verbose)) verb = verbose
      u = given_output_unit (unit);  if (u < 0)  return
      call node%qn%write (u, col_verbose)
      if (node%me_index /= 0) then
         write (u, "(A,I0,A)", advance="no")  " => ME(", node%me_index, ")"
         if (present (me_array)) then
            write (u, "(A)", advance="no")  " = "
            write (u, "('(',"  // fmt // ",',',"  // fmt // ",')')", &
                 advance="no") pacify_complex (me_array(node%me_index))
         end if
      end if
      write (u, *)
      if (verb) then
         call ptr_write ("parent     ", node%parent)
         call ptr_write ("child_first", node%child_first)
         call ptr_write ("child_last ", node%child_last)
         call ptr_write ("next       ", node%next)
         call ptr_write ("previous   ", node%previous)
      end if
    contains
      subroutine ptr_write (label, node)
        character(*), intent(in) :: label
        type(node_t), pointer :: node
        if (associated (node)) then
           write (u, "(10x,A,1x,'->',1x)", advance="no") label
           call node%qn%write (u, col_verbose)
           write (u, *)
        end if
      end subroutine ptr_write
    end subroutine node_write
```

Recursive output of a node:

⟨*State matrices: procedures*⟩+≡

```
    recursive subroutine node_write_rec (node, me_array, verbose, &
         indent, unit, col_verbose, testflag)
      type(node_t), intent(in), target :: node

```

```
        end if
    end subroutine node_read_raw_rec
```

12.1.2 State matrix

Definition

The quantum state object is a container that keeps and hides the root node.
For direct accessibility of values, they are stored in a separate array. The leaf
nodes of the quantum-number tree point to those values, once the state matrix
is finalized.

The `norm` component is redefined if a common factor is extracted from all
nodes.

⟨*State matrices: public*⟩≡
```
    public :: state_matrix_t
```

⟨*State matrices: types*⟩+≡
```
    type :: state_matrix_t
      private
      type(node_t), pointer :: root => null ()
      integer :: depth = 0
      integer :: n_matrix_elements = 0
      logical :: leaf_nodes_store_values = .false.
      integer :: n_counters = 0
      complex(default), dimension(:), allocatable :: me
      real(default) :: norm = 1
      integer :: n_sub = -1
    contains
    ⟨State matrices: state matrix: TBP⟩
    end type state_matrix_t
```

This initializer allocates the root node but does not fill anything. We declare
whether values are stored within the nodes during state-matrix construction,
and how many counters should be maintained (default: none).

⟨*State matrices: state matrix: TBP*⟩≡
```
    procedure :: init => state_matrix_init
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_init (state, store_values, n_counters)
      class(state_matrix_t), intent(out) :: state
      logical, intent(in), optional :: store_values
      integer, intent(in), optional :: n_counters
      allocate (state%root)
      if (present (store_values)) &
          state%leaf_nodes_store_values = store_values
      if (present (n_counters)) state%n_counters = n_counters
    end subroutine state_matrix_init
```

This recursively deletes all children of the root node, restoring the initial state.
The matrix element array is not finalized, since it does not contain physical
entries, just pointers.

⟨*State matrices: state matrix: TBP*⟩+≡

```
      procedure :: final => state_matrix_final
```
⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_final (state)
      class(state_matrix_t), intent(inout) :: state
      if (allocated (state%me))  deallocate (state%me)
      if (associated (state%root))  call node_delete (state%root)
      state%depth = 0
      state%n_matrix_elements = 0
    end subroutine state_matrix_final
```

Output: Present the tree as a nested list with appropriate indentation.
⟨*State matrices: state matrix: TBP*⟩+≡
```
    procedure :: write => state_matrix_write
```
⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_write (state, unit, write_value_list, &
         verbose, col_verbose, testflag)
      class(state_matrix_t), intent(in) :: state
      logical, intent(in), optional :: write_value_list, verbose, col_verbose
      logical, intent(in), optional :: testflag
      integer, intent(in), optional :: unit
      complex(default) :: me_dum
      character(len=7) :: fmt
      integer :: u
      integer :: i
      call pac_fmt (fmt, FMT_19, FMT_17, testflag)
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "(1x,A," // fmt // ")") "State matrix:  norm = ", state%norm
      if (associated (state%root)) then

  end function node_get_max_color_value
end function state_matrix_get_max_color_value
```

Building the quantum state

The procedure generates a branch associated to the input array of quantum numbers. If the branch exists already, it is used.

Optionally, we set the matrix-element index, a value (which may be added to the previous one), and increment one of the possible counters. We may also return the matrix element index of the current node.

⟨*State matrices: state matrix: TBP*⟩+≡

         end select
      end subroutine node_make_branch
   end subroutine state_matrix_add_state
```

Remove irrelevant flavor/color/helicity labels and the corresponding branchings.
The masks indicate which particles are affected; the masks length should co-
incide with the depth of the trie (without the root node). Recursively scan
the whole tree, starting from the leaf nodes and working up to the root node.
If a mask entry is set for the current tree level, scan the children there. For
each child within that level make a new empty branch where the masked quan-
tum number is undefined. Then recursively combine all following children with
matching quantum number into this new node and move on.

⟨*State matrices: state matrix: TBP*⟩+≡
```
   procedure :: collapse => state_matrix_collapse
```

⟨*State matrices: procedures*⟩+≡
```
   subroutine state_matrix_collapse (state, mask)
      class(state_matrix_t), intent(inout) :: state
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
      type(state_matrix_t) :: red_state
      if (state%is_defined ()) then
         call state%reduce (mask, red_state)
```

```
      call state%final ()
      state = red_state
   end if
 end subroutine state_matrix_collapse
```

Transform the given state matrix into a reduced state matrix where some quantum numbers are removed, as indicated by the mask. The procedure creates a new state matrix, so the old one can be deleted after this if it is no longer used.

It is said that the matrix element ordering is lost afterwards. We allow to keep the original matrix element index in the new state matrix. If the matrix element indices are kept, we do not freeze the state matrix. After reordering the matrix element indices by state_matrix_reorder_me, the state matrix can be frozen.

⟨*State matrices: state matrix: TBP*⟩+≡
```
    procedure :: reduce => state_matrix_reduce
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_reduce (state, mask, red_state, keep_me_index)
      class(state_matrix_t), intent(in), target :: state
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
      type(state_matrix_t), intent(out) :: red_state
      logical, optional, intent(in)  :: keep_me_index
      logical :: opt_keep_me_index
      type(state_iterator_t) :: it
      type(quantum_numbers_t), dimension(size(mask)) :: qn
      opt_keep_me_index = .false.
      if (present (keep_me_index)) opt_keep_me_index = keep_me_index
      call red_state%init ()

          end do UNSORTED
        end associate
      end subroutine get_me_index_sorted
    end subroutine state_matrix_reorder_me
```

This subroutine sets up the matrix-element array. The leaf nodes aquire the index values that point to the appropriate matrix-element entry.

We recursively scan the trie. Once we arrive at a leaf node, the index is increased and associated to that node. Finally, we allocate the matrix-element array with the appropriate size.

If matrix element values are temporarily stored within the leaf nodes, we scan the state again and transfer them to the matrix-element array.

⟨*State matrices: state matrix: TBP*⟩+≡

```
          procedure :: freeze => state_matrix_freeze
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_freeze (state)
      class(state_matrix_t), intent(inout), target :: state
      type(state_iterator_t) :: it
      if (associated (state%root)) then
         if (allocated (state%me))  deallocate (state%me)
         allocate (state%me (state%n_matrix_elements))
         state%me = 0
         call state%set_n_sub ()
      end if
      if (state%leaf_nodes_store_values) then
         call it%init (state)
         do while (it%is_valid ())
            state%me(it%get_me_index ()) = it%get_matrix_element ()
            call it%advance ()
         end do
         state%leaf_nodes_store_values = .false.
      end if
    end subroutine state_matrix_freeze
```

Direct access to the value array

Several methods for setting a value directly are summarized in this generic:

⟨*State matrices: state matrix: TBP*⟩+≡
```
    generic :: set_matrix_element => set_matrix_element_qn
    generic :: set_matrix_element => set_matrix_element_all
    generic :: set_matrix_element => set_matrix_element_array
    generic :: set_matrix_element => set_matrix_element_single
    generic :: set_matrix_element => set_matrix_element_clone
    procedure :: set_matrix_element_qn => state_matrix_set_matrix_element_qn
    procedure :: set_matrix_element_all => state_matrix_set_matrix_element_all
    procedure :: set_matrix_element_array => &
         state_matrix_set_matrix_element_array
    procedure :: set_matrix_element_single => &
         state_matrix_set_matrix_element_single
    procedure :: set_matrix_element_clone => &
       state_matrix_set_matrix_element_clone
```

Set a value that corresponds to a quantum number array:

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_set_matrix_element_qn (state, qn, value)
      class(state_matrix_t), intent(inout), target :: state
      type(quantum_numbers_t), dimension(:), intent(in) :: qn
      complex(default), intent(in) :: value
      type(state_iterator_t) :: it
      if (.not. allocated (state%me)) then
         allocate (state%me (size(qn)))
      end if
      call it%init (state)
      call it%go_to_qn (qn)
      call it%set_matrix_element (value)
```

```
      end subroutine state_matrix_set_matrix_element_qn
```

Set all matrix elements to a single value

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_set_matrix_element_all (state, value)
      class(state_matrix_t), intent(inout) :: state
      complex(default), intent(in) :: value
      if (.not. allocated (state%me)) then
         allocate (state%me (state%n_matrix_elements))
      end if
      state%me = value
    end subroutine state_matrix_set_matrix_element_all
```

Set the matrix-element array directly.

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_set_matrix_element_array (state, value, range)
      class(state_matrix_t), intent(inout) :: state
      complex(default), intent(in), dimension(:) :: value
      integer, intent(in), dimension(:), optional :: range
      if (present (range)) then
         state%me(range) = value
      else
         if (.not. allocated (state%me)) &
              allocate (state%me (size (value)))
         state%me(:) = value
      end if
    end subroutine state_matrix_set_matrix_element_array
```

Set a matrix element at position i to value.

⟨*State matrices: procedures*⟩+≡
```
    pure subroutine state_matrix_set_matrix_element_single (state, i, value)
      class(state_matrix_t), intent(inout) :: state
      integer, intent(in) :: i
      complex(default), intent(in) :: value
      if (.not. allocated (state%me)) then
         allocate (state%me (state%n_matrix_elements))
      end if
      state%me(i) = value
    end subroutine state_matrix_set_matrix_element_single
```

Clone the matrix elements from another (matching) state matrix.

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_set_matrix_element_clone (state, state1)
      class(state_matrix_t), intent(inout) :: state
      type(state_matrix_t), intent(in) :: state1
      if (.not. allocated (state1%me)) return
      if (.not. allocated (state%me)) allocate (state%me (size (state1%me)))
      state%me = state1%me
    end subroutine state_matrix_set_matrix_element_clone
```

Add a value to a matrix element

⟨State matrices: state matrix: TBP⟩+≡
```
    procedure :: add_to_matrix_element => state_matrix_add_to_matrix_element
```

⟨State matrices: procedures⟩+≡
```
    subroutine state_matrix_add_to_matrix_element (state, qn, value, match_only_flavor)
      class(state_matrix_t), intent(inout), target :: state
      type(quantum_numbers_t), dimension(:), intent(in) :: qn
      complex(default), intent(in) :: value
      logical, intent(in), optional :: match_only_flavor
      type(state_iterator_t) :: it
      call it%init (state)
      call it%go_to_qn (qn, match_only_flavor)
      if (it%is_valid ()) then
         call it%add_to_matrix_element (value)
      else
         call msg_fatal ("Cannot add to matrix element - it%node not allocated")
      end if
    end subroutine state_matrix_add_to_matrix_element
```

12.1.3   State iterators

Accessing the quantum state from outside is best done using a specialized itera-
tor, i.e., a pointer to a particular branch of the quantum state trie. Technically,
the iterator contains a pointer to a leaf node, but via parent pointers it allows
to access the whole branch where the leaf is attached. For quick access, we also
keep the branch depth (which is assumed to be universal for a quantum state).

⟨State matrices: public⟩+≡
```
    public :: state_iterator_t
```

⟨State matrices: types⟩+≡
```
    type :: state_iterator_t
      private
      integer :: depth = 0
      type(state_matrix_t), pointer :: state => null ()
      type(node_t), pointer :: node => null ()
     contains
     ⟨State matrices: state iterator: TBP⟩
    end type state_iterator_t
```

The initializer: Point at the first branch. Note that this cannot be pure, thus
not be elemental, because the iterator can be used to manipulate data in the
state matrix.

⟨State matrices: state iterator: TBP⟩≡
```
    procedure :: init => state_iterator_init
```

⟨State matrices: procedures⟩+≡
```
    subroutine state_iterator_init (it, state)
      class(state_iterator_t), intent(out) :: it
      type(state_matrix_t), intent(in), target :: state
      it%state => state
      it%depth = state%depth
```

```
        if (state%is_defined ()) then
           it%node => state%root
           do while (associated (it%node%child_first))
               it%node => it%node%child_first
           end do
        else
           it%node => null ()
        end if
     end subroutine state_iterator_init
```

Go forward. Recursively programmed: if the next node does not exist, go back
to the parent node and look at its successor (if present), etc.

There is a possible pitfall in the implementation: If the dummy pointer
argument to the find_next routine is used directly, we still get the correct
result for the iterator, but calling the recursion on node%parent means that
we manipulate a parent pointer in the original state in addition to the iterator.
Making a local copy of the pointer avoids this. Using pointer intent would be
helpful, but we do not yet rely on this F2003 feature.

⟨*State matrices: state iterator: TBP*⟩+≡
```
     procedure :: advance => state_iterator_advance
```

⟨*State matrices: procedures*⟩+≡
```
     subroutine state_iterator_advance (it)
       class(state_iterator_t), intent(inout) :: it
       call find_next (it%node)
     contains
       recursive subroutine find_next (node_in)
         type(node_t), intent(in), target :: node_in
         type(node_t), pointer :: node
         node => node_in
         if (associated (node%next)) then
            node => node%next
            do while (associated (node%child_first))
                node => node%child_first
            end do
            it%node => node
         else if (associated (node%parent)) then
            call find_next (node%parent)
         else
            it%node => null ()
         end if
       end subroutine find_next
     end subroutine state_iterator_advance
```

If all has been scanned, the iterator is at an undefined state. Check for this:

⟨*State matrices: state iterator: TBP*⟩+≡
```
     procedure :: is_valid => state_iterator_is_valid
```

⟨*State matrices: procedures*⟩+≡
```
     function state_iterator_is_valid (it) result (defined)
       logical :: defined
       class(state_iterator_t), intent(in) :: it
       defined = associated (it%node)
```

```
      end function state_iterator_is_valid
```

Return the matrix-element index that corresponds to the current node

⟨*State matrices: state iterator: TBP*⟩+≡
```
    procedure :: get_me_index => state_iterator_get_me_index
```

⟨*State matrices: procedures*⟩+≡
```
    function state_iterator_get_me_index (it) result (n)
      integer :: n
      class(state_iterator_t), intent(in) :: it
      n = it%node%me_index
    end function state_iterator_get_me_index
```

Return the number of times this quantum-number state has been added (noting that it is physically inserted only the first time). Note that for each state, there is an array of counters.

⟨*State matrices: state iterator: TBP*⟩+≡
```
    procedure :: get_me_count => state_iterator_get_me_count
```

⟨*State matrices: procedures*⟩+≡
```
    function state_iterator_get_me_count (it) result (n)
      integer, dimension(:), allocatable :: n
      class(state_iterator_t), intent(in) :: it
      if (allocated (it%node%me_count)) then
         allocate (n (size (it%node%me_count)))
         n = it%node%me_count
      else
         allocate (n (0))
      end if
    end function state_iterator_get_me_count
```

⟨*State matrices: state iterator: TBP*⟩+≡
```
    procedure :: get_depth => state_iterator_get_depth
```

⟨*State matrices: procedures*⟩+≡
```
    pure function state_iterator_get_depth (state_iterator) result (depth)
      integer :: depth
      class(state_iterator_t), intent(in) :: state_iterator
      depth = state_iterator%depth
    end function state_iterator_get_depth
```

Proceed to the state associated with the quantum numbers qn.

⟨*State matrices: state iterator: TBP*⟩+≡
```
    procedure :: go_to_qn => state_iterator_go_to_qn
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_iterator_go_to_qn (it, qn, match_only_flavor)
      class(state_iterator_t), intent(inout) :: it
      type(quantum_numbers_t), dimension(:), intent(in) :: qn
      logical, intent(in), optional :: match_only_flavor
      logical :: match_flv
      match_flv = .false.; if (present (match_only_flavor)) match_flv = .true.
      do while (it%is_valid ())
```

```
          if (match_flv) then
             if (all (qn .fmatch. it%get_quantum_numbers ())) then
                return
             else
                call it%advance ()
             end if
          else
             if (all (qn == it%get_quantum_numbers ())) then
                return
             else
                call it%advance ()
             end if
          end if
       end do
    end subroutine state_iterator_go_to_qn
```

Use the iterator to retrieve quantum-number information:

⟨*State matrices: state iterator: TBP*⟩+≡
```
    generic :: get_quantum_numbers => get_qn_multi, get_qn_slice, &
         get_qn_range, get_qn_single
    generic :: get_flavor => get_flv_multi, get_flv_slice, &
         get_flv_range, get_flv_single
    generic :: get_color => get_col_multi, get_col_slice, &
         get_col_range, get_col_single
    generic :: get_helicity => get_hel_multi, get_hel_slice, &
         get_hel_range, get_hel_single
```

⟨*State matrices: state iterator: TBP*⟩+≡
```
    procedure :: get_qn_multi => state_iterator_get_qn_multi
    procedure :: get_qn_slice => state_iterator_get_qn_slice
    procedure :: get_qn_range => state_iterator_get_qn_range
    procedure :: get_qn_single => state_iterator_get_qn_single
    procedure :: get_flv_multi => state_iterator_get_flv_multi
    procedure :: get_flv_slice => state_iterator_get_flv_slice
    procedure :: get_flv_range => state_iterator_get_flv_range
    procedure :: get_flv_single => state_iterator_get_flv_single
    procedure :: get_col_multi => state_iterator_get_col_multi
    procedure :: get_col_slice => state_iterator_get_col_slice
    procedure :: get_col_range => state_iterator_get_col_range
    procedure :: get_col_single => state_iterator_get_col_single
    procedure :: get_hel_multi => state_iterator_get_hel_multi
    procedure :: get_hel_slice => state_iterator_get_hel_slice
    procedure :: get_hel_range => state_iterator_get_hel_range
    procedure :: get_hel_single => state_iterator_get_hel_single
```

These versions return the whole quantum number array

⟨*State matrices: procedures*⟩+≡
```
    function state_iterator_get_qn_multi (it) result (qn)
      class(state_iterator_t), intent(in) :: it
      type(quantum_numbers_t), dimension(it%depth) :: qn
      type(node_t), pointer :: node
      integer :: i
      node => it%node
      do i = it%depth, 1, -1
```

```
      qn(i) = node%qn
      node => node%parent
    end do
  end function state_iterator_get_qn_multi

  function state_iterator_get_flv_multi (it) result (flv)
    class(state_iterator_t), intent(in) :: it
    type(flavor_t), dimension(it%depth) :: flv
    flv = quantum_numbers_get_flavor &
         (it%get_quantum_numbers ())
  end function state_iterator_get_flv_multi

  function state_iterator_get_col_multi (it) result (col)
    class(state_iterator_t), intent(in) :: it
    type(color_t), dimension(it%depth) :: col
    col = quantum_numbers_get_color &
         (it%get_quantum_numbers ())
  end function state_iterator_get_col_multi

  function state_iterator_get_hel_multi (it) result (hel)
    class(state_iterator_t), intent(in) :: it
    type(helicity_t), dimension(it%depth) :: hel
    hel = quantum_numbers_get_helicity &
         (it%get_quantum_numbers ())
  end function state_iterator_get_hel_multi
```

An array slice (derived from the above).

⟨*State matrices: procedures*⟩+≡

```
  function state_iterator_get_qn_slice (it, index) result (qn)
    class(state_iterator_t), intent(in) :: it
    integer, dimension(:), intent(in) :: index
    type(quantum_numbers_t), dimension(size(index)) :: qn
    type(quantum_numbers_t), dimension(it%depth) :: qn_tmp
    qn_tmp = state_iterator_get_qn_multi (it)
    qn = qn_tmp(index)
  end function state_iterator_get_qn_slice

  function state_iterator_get_flv_slice (it, index) result (flv)
    class(state_iterator_t), intent(in) :: it
    integer, dimension(:), intent(in) :: index
    type(flavor_t), dimension(size(index)) :: flv
    flv = quantum_numbers_get_flavor &
         (it%get_quantum_numbers (index))
  end function state_iterator_get_flv_slice

  function state_iterator_get_col_slice (it, index) result (col)
    class(state_iterator_t), intent(in) :: it
    integer, dimension(:), intent(in) :: index
    type(color_t), dimension(size(index)) :: col
    col = quantum_numbers_get_color &
         (it%get_quantum_numbers (index))
  end function state_iterator_get_col_slice

  function state_iterator_get_hel_slice (it, index) result (hel)
```

```
      class(state_iterator_t), intent(in) :: it
      integer, dimension(:), intent(in) :: index
      type(helicity_t), dimension(size(index)) :: hel
      hel = quantum_numbers_get_helicity &
           (it%get_quantum_numbers (index))
    end function state_iterator_get_hel_slice
```

An array range (implemented directly).

⟨*State matrices: procedures*⟩+≡
```
    function state_iterator_get_qn_range (it, k1, k2) result (qn)
      class(state_iterator_t), intent(in) :: it
      integer, intent(in) :: k1, k2
      type(quantum_numbers_t), dimension(k2-k1+1) :: qn
      type(node_t), pointer :: node
      integer :: i
      node => it%node
      SCAN: do i = it%depth, 1, -1
         if (k1 <= i .and. i <= k2) then
            qn(i-k1+1) = node%qn
         else
            node => node%parent
         end if
      end do SCAN
    end function state_iterator_get_qn_range

    function state_iterator_get_flv_range (it, k1, k2) result (flv)
      class(state_iterator_t), intent(in) :: it
      integer, intent(in) :: k1, k2
      type(flavor_t), dimension(k2-k1+1) :: flv
      flv = quantum_numbers_get_flavor &
           (it%get_quantum_numbers (k1, k2))
    end function state_iterator_get_flv_range

    function state_iterator_get_col_range (it, k1, k2) result (col)
      class(state_iterator_t), intent(in) :: it
      integer, intent(in) :: k1, k2
      type(color_t), dimension(k2-k1+1) :: col
      col = quantum_numbers_get_color &
           (it%get_quantum_numbers (k1, k2))
    end function state_iterator_get_col_range

    function state_iterator_get_hel_range (it, k1, k2) result (hel)
      class(state_iterator_t), intent(in) :: it
      integer, intent(in) :: k1, k2
      type(helicity_t), dimension(k2-k1+1) :: hel
      hel = quantum_numbers_get_helicity &
           (it%get_quantum_numbers (k1, k2))
    end function state_iterator_get_hel_range
```

Just a specific single element

⟨*State matrices: procedures*⟩+≡
```
    function state_iterator_get_qn_single (it, k) result (qn)
      class(state_iterator_t), intent(in) :: it
```

```
      integer, intent(in) :: k
      type(quantum_numbers_t) :: qn
      type(node_t), pointer :: node
      integer :: i
      node => it%node
      SCAN: do i = it%depth, 1, -1
         if (i == k) then
            qn = node%qn
            exit SCAN
         else
            node => node%parent

         state%me = state%me / trace
         state%norm = state%norm * trace
      end if
    end subroutine state_matrix_normalize_by_trace
```

Analogous, but renormalize by maximal (absolute) value.

⟨*State matrices: state matrix: TBP*⟩+≡
```
    procedure :: normalize_by_max => state_matrix_normalize_by_max
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_normalize_by_max (state)
      class(state_matrix_t), intent(inout) :: state
      real(default) :: m
      m = maxval (abs (state%me))
      if (m /= 0) then
         state%me = state%me / m
         state%norm = state%norm * m
      end if
    end subroutine state_matrix_normalize_by_max
```

Explicitly set the norm of a state matrix.

⟨*State matrices: state matrix: TBP*⟩+≡
```
    procedure :: set_norm => state_matrix_set_norm
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_set_norm (state, norm)
      class(state_matrix_t), intent(inout) :: state
      real(default), intent(in) :: norm
      state%norm = norm
    end subroutine state_matrix_set_norm
```

Return the sum of all matrix element values.

⟨*State matrices: state matrix: TBP*⟩+≡
```
    procedure :: sum => state_matrix_sum
```

⟨*State matrices: procedures*⟩+≡
```
    pure function state_matrix_sum (state) result (value)
      complex(default) :: value
      class(state_matrix_t), intent(in) :: state
      value = sum (state%me)
    end function state_matrix_sum
```

Return the trace of a state matrix, i.e., the sum over all diagonal values.

If qn_in is provided, only branches that match this quantum-numbers array in flavor and helicity are considered. (This mode is used for selecting a color state.)

⟨*State matrices: state matrix: TBP*⟩+≡
```
    procedure :: trace => state_matrix_trace
```

⟨*State matrices: procedures*⟩+≡
```
    function state_matrix_trace (state, qn_in) result (trace)

         end if
         call it%advance ()
      end do
    end function state_matrix_trace
```

Append new states which are color-contracted versions of the existing states. The matrix element index of each color contraction coincides with the index of its origin, so no new matrix elements are generated. After this operation, no freeze must be performed anymore.

⟨*State matrices: state matrix: TBP*⟩+≡
```
    procedure :: add_color_contractions => state_matrix_add_color_contractions
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_matrix_add_color_contractions (state)
      class(state_matrix_t), intent(inout), target :: state
      type(state_iterator_t) :: it
      type(quantum_numbers_t), dimension(:,:), allocatable :: qn
      type(quantum_numbers_t), dimension(:,:), allocatable :: qn_con
      integer, dimension(:), allocatable :: me_index
      integer :: depth, n_me, i, j
```

```
      depth = state%get_depth ()
      n_me = state%get_n_matrix_elements ()
      allocate (qn (depth, n_me))
      allocate (me_index (n_me))
      i = 0
      call it%init (state)
      do while (it%is_valid ())
         i = i + 1
         qn(:,i) = it%get_quantum_numbers ()
         me_index(i) = it%get_me_index ()
         call it%advance ()
      end do
      do i = 1, n_me
         call quantum_number_array_make_color_contractions (qn(:,i), qn_con)
         do j = 1, size (qn_con, 2)
            call state%add_state (qn_con(:,j), index = me_index(i))
         end do
      end do
   end subroutine state_matrix_add_color_contractions
```

This procedure merges two state matrices of equal depth. For each quantum number (flavor, color, helicity), we take the entry from the first argument where defined, otherwise the second one. (If both are defined, we get an off-diagonal matrix.) The resulting trie combines the information of the input tries in all possible ways. Note that values are ignored, all values in the result are zero.

⟨*State matrices: public*⟩+≡
```
   public :: merge_state_matrices
```

⟨*State matrices: procedures*⟩+≡
```
   subroutine merge_state_matrices (state1, state2, state3)
     type(state_matrix_t), intent(in), target :: state1, state2
     type(state_matrix_t), intent(out) :: state3
     type(state_iterator_t) :: it1, it2
     type(quantum_numbers_t), dimension(state1%depth) :: qn1, qn2
     if (state1%depth /= state2%depth) then
        call state1%write ()
        call state2%write ()
        call msg_bug ("State matrices merge impossible: incompatible depths")
     end if
     call state3%init ()
     call it1%init (state1)
     do while (it1%is_valid ())
        qn1 = it1%get_quantum_numbers ()
        call it2%init (state2)
        do while (it2%is_valid ())
           qn2 = it2%get_quantum_numbers ()
           call state3%add_state (qn1 .merge. qn2)
           call it2%advance ()
        end do
        call it1%advance ()
     end do
     call state3%freeze ()
   end subroutine merge_state_matrices
```

Multiply matrix elements from two state matrices. Choose the elements as given by the integer index arrays, multiply them and store the sum of products in the indicated matrix element. The suffixes mean: c=conjugate first factor; f=include weighting factor.

Note that the `dot_product` intrinsic function conjugates its first complex argument. This is intended for the `c` suffix case, but must be reverted for the plain-product case.

We provide analogous subroutines for just summing over state matrix entries. The `evaluate_sum` variant includes the state-matrix norm in the evaluation, the `evaluate_me_sum` takes into account just the matrix elements proper.

⟨*State matrices: state matrix: TBP*⟩+≡
```
    procedure :: evaluate_product => state_matrix_evaluate_product
    procedure :: evaluate_product_cf => state_matrix_evaluate_product_cf
    procedure :: evaluate_square_c => state_matrix_evaluate_square_c
    procedure :: evaluate_sum => state_matrix_evaluate_sum
    procedure :: evaluate_me_sum => state_matrix_evaluate_me_sum
```

⟨*State matrices: procedures*⟩+≡
```
    pure subroutine state_matrix_evaluate_product &
        (state, i, state1, state2, index1, index2)
      class(state_matrix_t), intent(inout) :: state
      integer, intent(in) :: i
      type(state_matrix_t), intent(in) :: state1, state2
      integer, dimension(:), intent(in) :: index1, index2
      state%me(i) = &
           dot_product (conjg (state1%me(index1)), state2%me(index2))
      state%norm = state1%norm * state2%norm
    end subroutine state_matrix_evaluate_product

    pure subroutine state_matrix_evaluate_product_cf &
        (state, i, state1, state2, index1, index2, factor)
      class(state_matrix_t), intent(inout) :: state
      integer, intent(in) :: i
      type(state_matrix_t), intent(in) :: state1, state2
      integer, dimension(:), intent(in) :: index1, index2
      complex(default), dimension(:), intent(in) :: factor
      state%me(i) = &
           dot_product (state1%me(index1), factor * state2%me(index2))
      state%norm = state1%norm * state2%norm
    end subroutine state_matrix_evaluate_product_cf

    pure subroutine state_matrix_evaluate_square_c (state, i, state1, index1)
      class(state_matrix_t), intent(inout) :: state
      integer, intent(in) :: i
      type(state_matrix_t), intent(in) :: state1
      integer, dimension(:), intent(in) :: index1
      state%me(i) = &
           dot_product (state1%me(index1), state1%me(index1))
      state%norm = abs (state1%norm) ** 2
    end subroutine state_matrix_evaluate_square_c

    pure subroutine state_matrix_evaluate_sum (state, i, state1, index1)
      class(state_matrix_t), intent(inout) :: state
      integer, intent(in) :: i
```

```
      type(state_matrix_t), intent(in) :: state1
      integer, dimension(:), intent(in) :: index1
      state%me(i) = &
            sum (state1%me(index1)) * state1%norm
    end subroutine state_matrix_evaluate_sum

  pure subroutine state_matrix_evaluate_me_sum (state, i, state1, index1)
      class(state_matrix_t), intent(inout) :: state
      integer, intent(in) :: i
      type(state_matrix_t), intent(in) :: state1
      integer, dimension(:), intent(in) :: index1
      state%me(i) = sum (state1%me(index1))
    end subroutine state_matrix_evaluate_me_sum
```

Outer product (of states and matrix elements):

⟨*State matrices: public*⟩+≡
```
    public :: outer_multiply
```

⟨*State matrices: interfaces*⟩+≡
```
    interface outer_multiply
       module procedure outer_multiply_pair
       module procedure outer_multiply_array
    end interface
```

This procedure constructs the outer product of two state matrices.

⟨*State matrices: procedures*⟩+≡
```
    subroutine outer_multiply_pair (state1, state2, state3)
      type(state_matrix_t), intent(in), target :: state1, state2
      type(state_matrix_t), intent(out) :: state3
      type(state_iterator_t) :: it1, it2
      type(quantum_numbers_t), dimension(state1%depth) :: qn1
      type(quantum_numbers_t), dimension(state2%depth) :: qn2
      type(quantum_numbers_t), dimension(state1%depth+state2%depth) :: qn3
      complex(default) :: val1, val2
      call state3%init (store_values = .true.)
      call it1%init (state1)
      do while (it1%is_valid ())
         qn1 = it1%get_quantum_numbers ()
         val1 = it1%get_matrix_element ()
         call it2%init (state2)
         do while (it2%is_valid ())
            qn2 = it2%get_quantum_numbers ()
            val2 = it2%get_matrix_element ()
            qn3(:state1%depth) = qn1
            qn3(state1%depth+1:) = qn2
            call state3%add_state (qn3, value=val1 * val2)
            call it2%advance ()
         end do
         call it1%advance ()
      end do
      call state3%freeze ()
    end subroutine outer_multiply_pair
```

This executes the above routine iteratively for an arbitrary number of state matrices.

⟨*State matrices: procedures*⟩+≡

```
subroutine outer_multiply_array (state_in, state_out)
  type(state_matrix_t), dimension(:), intent(in), target :: state_in
  type(state_matrix_t), intent(out) :: state_out
  type(state_matrix_t), dimension(:), allocatable, target :: state_tmp
  integer :: i, n
  n = size (state_in)
  select case (n)
  case (0)
     call state_out%init ()
  case (1)
     state_out = state_in(1)
  case (2)
     call outer_multiply_pair (state_in(1), state_in(2), state_out)
  case default
     allocate (state_tmp (n-2))
     call outer_multiply_pair (state_in(1), state_in(2), state_tmp(1))
     do i = 2, n - 2
        call outer_multiply_pair (state_tmp(i-1), state_in(i+1), state_tmp(i))
     end do
     call outer_multiply_pair (state_tmp(n-2), state_in(n), state_out)
     do i = 1, size(state_tmp)
        call state_tmp(i)%final ()
     end do
  end select
end subroutine outer_multiply_array
```

12.1.5 Factorization

In physical events, the state matrix is factorized into single-particle state matrices. This is essentially a measurement.

In a simulation, we select one particular branch of the state matrix with a probability that is determined by the matrix elements at the leaves. (This makes sense only if the state matrix represents a squared amplitude.) The selection is based on a (random) value x between 0 and one that is provided as the third argument.

For flavor and color, we select a unique value for each particle. For polarization, we have three options (modes). Option 1 is to drop helicity information altogether and sum over all diagonal helicities. Option 2 is to select a unique diagonal helicity in the same way as flavor and color. Option 3 is, for each particle, to trace over all remaining helicities in order to obtain an array of independent single-particle helicity matrices.

Only branches that match the given quantum-number array qn_in, if present, are considered. For this array, color is ignored.

If the optional correlated_state is provided, it is assigned the correlated density matrix for the selected flavor-color branch, so multi-particle spin correlations remain available even if they are dropped in the single-particle density matrices. This should be done by the caller for the choice FM_CORRELATED_HELICITY, which otherwise is handled as FM_IGNORE_HELICITY.

The algorithm is as follows: First, we determine the normalization by summing over all diagonal matrix elements. In a second scan, we select one of the diagonal matrix elements by a cumulative comparison with the normalized random number. In the corresponding quantum number array, we undefine the helicity entries. Then, we scan the third time. For each branch that matches the selected quantum number array (i.e., definite flavor and color, arbitrary helicity), we determine its contribution to any of the single-particle state matrices. The matrix-element value is added if all other quantum numbers are diagonal, while the helicity of the chosen particle may be arbitrary; this helicity determines the branch in the single-particle state.

As a result, flavor and color quantum numbers are selected with the correct probability. Within this subset of states, each single-particle state matrix results from tracing over all other particles. Note that the single-particle state matrices are not normalized.

The flag `ok` is set to false if the matrix element sum is zero, so factorization is not possible. This can happen if an event did not pass cuts.

⟨*State matrices: parameters*⟩≡
```
integer, parameter, public :: FM_IGNORE_HELICITY = 1
integer, parameter, public :: FM_SELECT_HELICITY = 2
integer, parameter, public :: FM_FACTOR_HELICITY = 3
integer, parameter, public :: FM_CORRELATED_HELICITY = 4
```

Quantum-number matching

This feature allows us to check whether a given string of PDG values matches, in any ordering, any of the flavor combinations that the state matrix provides. We will also request the permutation of the successful match.

This type provides an account of the state's flavor content. We store all flavor combinations, as `pdg` values, in an array, assuming that the length is uniform.

We check only the entries selected by `mask_match`. Among those, only the entries selected by `mask_sort` are sorted and thus matched without respecting array element order. The entries that correspond to a true value in the associated `mask` are sorted. The mapping from the original state to the sorted state is given by the index array `map`.

⟨*State matrices: public*⟩+≡
```
    public :: state_flv_content_t
```

⟨*State matrices: types*⟩+≡
```
    type :: state_flv_content_t
       private
       integer, dimension(:,:), allocatable :: pdg
       integer, dimension(:,:), allocatable :: map
       logical, dimension(:), allocatable :: mask
     contains
     ⟨State matrices: state flv content: TBP⟩
    end type state_flv_content_t
```

Output (debugging aid).

⟨*State matrices: state flv content: TBP*⟩≡
```
    procedure :: write => state_flv_content_write
```

⟨*State matrices: procedures*⟩+≡
```
    subroutine state_flv_content_write (state_flv, unit)
      class(state_flv_content_t), intent(in), target :: state_flv
      integer, intent(in), optional :: unit
      integer :: u, n, d, i, j
      u = given_output_unit (unit)
      d = size (state_flv%pdg, 1)
      n = size (state_flv%pdg, 2)
      do i = 1, n
         write (u, "(2x,'PDG =')", advance="no")
         do j = 1, d
            write (u, "(1x,I0)", advance="no")  state_flv%pdg(j,i)
         end do
         write (u, "(' :: map = (')", advance="no")
         do j = 1, d
            write (u, "(1x,I0)", advance="no")  state_flv%map(j,i)
         end do
         write (u, "(' )')")
      end do
    end subroutine state_flv_content_write
```

Initialize with table length and mask. Each row of the `map` array, of length d, is initialized with $(0, 1, \ldots, d)$.

⟨*State matrices: state flv content: TBP*⟩+≡

```
procedure :: init => state_flv_content_init
```

⟨*State matrices: procedures*⟩+≡

```
subroutine state_flv_content_init (state_flv, n, mask)
  class(state_flv_content_t), intent(out) :: state_flv
  integer, intent(in) :: n
  logical, dimension(:), intent(in) :: mask
  integer :: d, i
  d = size (mask)
  allocate (state_flv%pdg (d, n), source = 0)
  allocate (state_flv%map (d, n), source = spread ([(i, i = 1, d)], 2, n))
  allocate (state_flv%mask (d), source = mask)
end subroutine state_flv_content_init
```

Manually fill the entries, one flavor set and mapping at a time.

⟨*State matrices: state flv content: TBP*⟩+≡

```
procedure :: set_entry => state_flv_content_set_entry
```

⟨*State matrices: procedures*⟩+≡

```
subroutine state_flv_content_set_entry (state_flv, i, pdg, map)
  class(state_flv_content_t), intent(inout) :: state_flv
  integer, intent(in) :: i
  integer, dimension(:), intent(in) :: pdg, map
  state_flv%pdg(:,i) = pdg
  where (map /= 0)
     state_flv%map(:,i) = map
  end where
end subroutine state_flv_content_set_entry
```

Given a state matrix, determine the flavor content. That is, scan the state matrix and extract flavor only, build a new state matrix from that.

⟨*State matrices: state flv content: TBP*⟩+≡

```
procedure :: fill => state_flv_content_fill
```

⟨*State matrices: procedures*⟩+≡

      end do
      call state_tmp%final ()
    end subroutine state_flv_content_fill
```

Match a given flavor string against the flavor content. We sort the input string and check whether it matches any of the stored strings. If yes, return the mapping.

Only PDG entries under the preset mask are sorted before matching. The other entries must match exactly (i.e., without reordering). A zero entry matches anything. In any case, the length of the PDG string must be equal to the length d of the individual flavor-state entries.

⟨*State matrices: state flv content: TBP*⟩+≡

12.2   Interactions

This module defines the `interaction_t` type. It is an extension of the `state_matrix_t` type.

The state matrix is a representation of a multi-particle density matrix. It implements all possible flavor, color, and quantum-number assignments of the entries in a generic density matrix, and it can hold a complex matrix element for each entry. (Note that this matrix can hold non-diagonal entries in color and helicity space.) The `interaction_t` object associates this with a list of momenta, such that the whole object represents a multi-particle state.

The `interaction_t` holds information about which particles are incoming, virtual (i.e., kept for the records), or outgoing. Each particle can be associated to a source within another interaction. This allows us to automatically fill those interaction momenta which have been computed or defined elsewhere. It also contains internal parent-child relations and flags for (virtual) particles which are to be treated as resonances.

A quantum-number mask array summarizes, for each particle within the interaction, the treatment of flavor, color, or helicity (expose or ignore). A list of locks states which particles are bound to have an identical quantum-number mask. This is useful when the mask is changed at one place.

```
end module interactions
```

Given a ordered list of quantum numbers (without any subtraction index) map these list to a state matrix, such that each list index corresponds to index of a set of quantum numbers in the state matrix, hence, the matrix element.

The (unphysical) subtraction index is not a genuine quantum number and as such handled specially.

⟨*Interactions: public*⟩≡
```
    public :: qn_index_map_t
```

⟨*Interactions: types*⟩≡

    contains
    ⟨Interactions: qn index map: TBP⟩
    end type qn_index_map_t
```

Construct a mapping from interaction to an array of (sorted) quantum numbers.

We strip all non-elementary particles (like beam) from the quantum numbers which we retrieve from the interaction.

We consider helicity matrix elements only, when `qn_hel` is allocated. Else the helicity index is handled trivially as `1`.

For the rescaling of the structure functions in the real subtraction and DGLAP components we need a mapping from the real and born flavor structure indices to the structure function chain interaction matrix element with the correct initial state quantum numbers. This is stored in **sf_index_born** and **sf_index_real**. The array **index** is only needed for the initialisation of the Born and real index arrays and is therefore deallocated again.

```

12.2.1   External interaction links

Each particle in an interaction can have a link to a corresponding particle in another interaction. This allows to fetch the momenta of incoming or virtual particles from the interaction where they are defined. The link object consists of a pointer to the interaction and an index.

⟨*Interactions: types*⟩+≡
```
    type :: external_link_t
      private
      type(interaction_t), pointer :: int => null ()
      integer :: i
    end type external_link_t
```

Set an external link.

⟨*Interactions: procedures*⟩+≡
```
    subroutine external_link_set (link, int, i)
      type(external_link_t), intent(out) :: link
      type(interaction_t), target, intent(in) :: int
      integer, intent(in) :: i
      if (i /= 0) then
         link%int => int
         link%i = i
      end if
    end subroutine external_link_set
```

Reassign an external link to a new interaction (which should be an image of the original target).

⟨*Interactions: procedures*⟩+≡
```
    subroutine external_link_reassign (link, int_src, int_target)
      type(external_link_t), intent(inout) :: link
      type(interaction_t), intent(in) :: int_src
      type(interaction_t), intent(in), target :: int_target
      if (associated (link%int)) then
         if (link%int%tag == int_src%tag)  link%int => int_target
      end if
    end subroutine external_link_reassign
```

Return true if the link is set

⟨*Interactions: procedures*⟩+≡
```
    function external_link_is_set (link) result (flag)
      logical :: flag
      type(external_link_t), intent(in) :: link
      flag = associated (link%int)
```

```
    end function external_link_is_set
```

Return the interaction pointer.

⟨*Interactions: public*⟩+≡
```
    public :: external_link_get_ptr
```

⟨*Interactions: procedures*⟩+≡
```
    function external_link_get_ptr (link) result (int)
      type(interaction_t), pointer :: int
      type(external_link_t), intent(in) :: link
      int => link%int
    end function external_link_get_ptr
```

Return the index within that interaction

⟨*Interactions: public*⟩+≡
```
    public :: external_link_get_index
```

⟨*Interactions: procedures*⟩+≡
```
    function external_link_get_index (link) result (i)
      integer :: i
      type(external_link_t), intent(in) :: link
      i = link%i
    end function external_link_get_index
```

Return a pointer to the momentum of the corresponding particle. If there is no
association, return a null pointer.

⟨*Interactions: procedures*⟩+≡
```
    function external_link_get_momentum_ptr (link) result (p)
      type(vector4_t), pointer :: p
      type(external_link_t), intent(in) :: link
      if (associated (link%int)) then
         p => link%int%p(link%i)
      else
         p => null ()
      end if
    end function external_link_get_momentum_ptr
```

12.2.2 Internal relations

In addition to the external links, particles within the interaction have parent-
child relations. Here, more than one link is possible, and we set up an array.

⟨*Interactions: types*⟩+≡
```
    type :: internal_link_list_t
       private
       integer :: length = 0
       integer, dimension(:), allocatable :: link
     contains
     ⟨Interactions: internal link list: TBP⟩
    end type internal_link_list_t
```

Output, non-advancing.

⟨Interactions: internal link list: TBP⟩≡
```
procedure :: write => internal_link_list_write
```

⟨Interactions: procedures⟩+≡
```
subroutine internal_link_list_write (object, unit)
  class(internal_link_list_t), intent(in) :: object
  integer, intent(in), optional :: unit
  integer :: u, i
  u = given_output_unit (unit)
  do i = 1, object%length
      write (u, "(1x,I0)", advance="no")  object%link(i)
  end do
end subroutine internal_link_list_write
```

Append an item. Start with an array size of 2 and double the size if necessary.

Make sure that the indices are stored in ascending order. To this end, shift the existing entries right, starting from the end, as long as they are larger than the new entry.

⟨Interactions: internal link list: TBP⟩+≡
```
procedure :: append => internal_link_list_append
```

⟨Interactions: procedures⟩+≡
```
subroutine internal_link_list_append (link_list, link)
  class(internal_link_list_t), intent(inout) :: link_list
  integer, intent(in) :: link
  integer :: l, j
  integer, dimension(:), allocatable :: tmp
  l = link_list%length
  if (allocated (link_list%link)) then
      if (l == size (link_list%link)) then
          allocate (tmp (2 * l))
          tmp(:l) = link_list%link
          call move_alloc (from = tmp, to = link_list%link)
      end if
  else
      allocate (link_list%link (2))
  end if
  link_list%link(l+1) = link
  SHIFT_LINK_IN_PLACE: do j = l, 1, -1
      if (link >= link_list%link(j)) then
          exit SHIFT_LINK_IN_PLACE
      else
          link_list%link(j+1) = link_list%link(j)
          link_list%link(j) = link
      end if
  end do SHIFT_LINK_IN_PLACE
  link_list%length = l + 1
end subroutine internal_link_list_append
```

Return true if the link list is nonempty:

⟨Interactions: internal link list: TBP⟩+≡
```
procedure :: has_entries => internal_link_list_has_entries
```

⟨*Interactions: procedures*⟩+≡
```

```

12.2.3 The interaction type

An interaction is an entangled system of particles. Thus, the interaction object consists of two parts: the subevent, and the quantum state which technically is a trie. The subnode levels beyond the trie root node are in correspondence to the subevent, so both should be traversed in parallel.

The subevent is implemented as an allocatable array of four-momenta. The first **n_in** particles are incoming, **n_vir** particles in-between can be kept for bookkeeping, and the last **n_out** particles are outgoing.

Distinct interactions are linked by their particles: for each particle, we have the possibility of links to corresponding particles in other interactions. Furthermore, for bookkeeping purposes we have a self-link array **relations** where the parent-child relations are kept, and a flag array **resonant** which is set for an intermediate resonance.

Each momentum is associated with masks for flavor, color, and helicity. If a mask entry is set, the associated quantum number is to be ignored for that particle. If any mask has changed, the flag **update** is set.

We can have particle pairs locked together. If this is the case, the corresponding mask entries are bound to be equal. This is useful for particles that go through the interaction.

The interaction tag serves bookkeeping purposes. In particular, it identifies links in printout.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_t
```

⟨*Interactions: types*⟩+≡
```
    type :: interaction_t
       private
       integer :: tag = 0
       type(state_matrix_t) :: state_matrix
       integer :: n_in = 0
       integer :: n_vir = 0
       integer :: n_out = 0
       integer :: n_tot = 0
       logical, dimension(:), allocatable :: p_is_known
       type(vector4_t), dimension(:), allocatable :: p
       type(external_link_t), dimension(:), allocatable :: source
       type(internal_link_list_t), dimension(:), allocatable :: parents
       type(internal_link_list_t), dimension(:), allocatable :: children
       logical, dimension(:), allocatable :: resonant
       type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
       integer, dimension(:), allocatable :: hel_lock
       logical :: update_state_matrix = .false.
       logical :: update_values = .false.
     contains
     ⟨Interactions: interaction: TBP⟩
    end type interaction_t
```

Initialize the particle array with a fixed size. The first **n_in** particles are incoming, the rest outgoing. Masks are optional. There is also an optional tag. The interaction still needs fixing the values, but that is to be done after all branches have been added.

Interaction tags are assigned consecutively, using a `saved` variable local to this procedure. If desired, we can provide a seed for the interaction tags. Such a seed should be positive. The default seed is one. `tag=0` indicates an empty interaction.

If `set_relations` is set and true, we establish parent-child relations for all incoming and outgoing particles. Virtual particles are skipped; this option is normally used only for interations without virtual particles.

⟨*Interactions: interaction: TBP*⟩≡
```
    procedure :: basic_init => interaction_init
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_init &
         (int, n_in, n_vir, n_out, &
          tag, resonant, mask, hel_lock, set_relations, store_values)
      class(interaction_t), intent(out) :: int
      integer, intent(in) :: n_in, n_vir, n_out
      integer, intent(in), optional :: tag
      logical, dimension(:), intent(in), optional :: resonant
```

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: write_state_matrix => interaction_write_state_matrix
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_write_state_matrix (int, unit, write_value_list, &
       verbose, col_verbose, testflag)
      class(interaction_t), intent(in) :: int
      logical, intent(in), optional :: write_value_list, verbose, col_verbose
      logical, intent(in), optional :: testflag
      integer, intent(in), optional :: unit
      call int%state_matrix%write (write_value_list = verbose, &
          verbose = verbose, unit = unit, col_verbose = col_verbose, &
          testflag = testflag)
    end subroutine interaction_write_state_matrix
```

Reduce the `state_matrix` over the quantum mask. During the reduce procedure
the iterator does not conserve the order of the matrix element respective their
quantum numbers. Setting the `keep_order` results in a reorder state matrix
with reintroduced matrix element indices.

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: reduce_state_matrix => interaction_reduce_state_matrix
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_reduce_state_matrix (int, qn_mask, keep_order)
      class(interaction_t), intent(inout) :: int
      type(quantum_numbers_mask_t), intent(in), dimension(:) :: qn_mask
      logical, optional, intent(in) :: keep_order
      type(state_matrix_t) :: state
```

```
      logical :: opt_keep_order
      opt_keep_order = .false.
      if (present (keep_order)) opt_keep_order = keep_order
      call int%state_matrix%reduce (qn_mask, state, keep_me_index = keep_order)
      int%state_matrix = state

       end if
       int_out%update_state_matrix = int_in%update_state_matrix
       int_out%update_values = int_in%update_values
    end subroutine interaction_assign
```

12.2.4 Methods inherited from the state matrix member

Until F2003 is standard, we cannot implement inheritance directly. Therefore, we need wrappers for "inherited" methods.

Make a new branch in the state matrix if it does not yet exist. This is not just a wrapper but it introduces the interaction mask: where a quantum number is masked, it is not transferred but set undefined. After this, the value array has to be updated.

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: add_state => interaction_add_state
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_add_state &
        (int, qn, index, value, sum_values, counter_index, ignore_sub_for_qn, me_index)
      class(interaction_t), intent(inout) :: int
      type(quantum_numbers_t), dimension(:), intent(in) :: qn
      integer, intent(in), optional :: index
      complex(default), intent(in), optional :: value
      logical, intent(in), optional :: sum_values
      integer, intent(in), optional :: counter_index
      logical, intent(in), optional :: ignore_sub_for_qn
      integer, intent(out), optional :: me_index
      type(quantum_numbers_t), dimension(size(qn)) :: qn_tmp
      qn_tmp = qn
      call qn_tmp%undefine (int%mask)
      call int%state_matrix%add_state (qn_tmp, index, value, sum_values, &
          counter_index, ignore_sub_for_qn, me_index)
      int%update_values = .true.
    end subroutine interaction_add_state
```

Freeze the quantum state: First collapse the quantum state, i.e., remove quantum numbers if any mask has changed, then fix the array of value pointers.

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: freeze => interaction_freeze
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_freeze (int)
      class(interaction_t), intent(inout) :: int
      if (int%update_state_matrix) then
         call int%state_matrix%collapse (int%mask)
         int%update_state_matrix = .false.
         int%update_values = .true.
      end if
      if (int%update_values) then
         call int%state_matrix%freeze ()
         int%update_values = .false.
      end if
    end subroutine interaction_freeze
```

Return true if the state matrix is empty.

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: is_empty => interaction_is_empty
```

⟨*Interactions: procedures*⟩+≡
```
    pure function interaction_is_empty (int) result (flag)
      logical :: flag
      class(interaction_t), intent(in) :: int
      flag = int%state_matrix%is_empty ()
    end function interaction_is_empty
```

Get the number of values stored in the state matrix:

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: get_n_matrix_elements => &
         interaction_get_n_matrix_elements
```

⟨*Interactions: procedures*⟩+≡

  type(interaction_t) :: int_copy
  type(quantum_numbers_mask_t), dimension(:), allocatable :: qn_mask
  type(quantum_numbers_t), dimension(:,:), allocatable :: qn
  integer :: i
  allocate (qn_mask (int%n_tot))
  do i = 1, int%n_tot
     if (i <= int%n_in) then
        call qn_mask(i)%init (.true., .true., .false.)
     else
        call qn_mask(i)%init (.true., .true., .true.)
     end if
  end do
  int_copy = int
  call int_copy%set_mask (qn_mask)
  call int_copy%freeze ()
  allocate (qn (int_copy%state_matrix%get_n_matrix_elements (), &
       int_copy%state_matrix%get_depth ()))
  qn = int_copy%get_quantum_numbers ()
  n_hel = 0
  do i = 1, size (qn, dim=1)
     if (all (qn(:, i)%get_subtraction_index () == 0)) n_hel = n_hel + 1
  end do
  call int_copy%final ()
  deallocate (qn_mask)
  deallocate (qn)
end function interaction_get_n_in_helicities
```

Get the size of the me-array of the associated state matrix for debugging purposes

⟨*Interactions: interaction: TBP*⟩+≡

```
procedure :: get_me_size => interaction_get_me_size
```

⟨*Interactions: procedures*⟩+≡

```
pure function interaction_get_me_size (int) result (n)
  integer :: n
  class(interaction_t), intent(in) :: int
  n = int%state_matrix%get_me_size ()
end function interaction_get_me_size
```

Get the norm of the state matrix (if the norm has been taken out, otherwise this would be unity).

⟨*Interactions: interaction: TBP*⟩+≡

```
procedure :: get_norm => interaction_get_norm
```

⟨*Interactions: procedures*⟩+≡

```
pure function interaction_get_norm (int) result (norm)
  real(default) :: norm
  class(interaction_t), intent(in) :: int
  norm = int%state_matrix%get_norm ()
end function interaction_get_norm
```

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: get_n_sub => interaction_get_n_sub
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_n_sub (int) result (n_sub)
      integer :: n_sub
      class(interaction_t), intent(in) :: int
      n_sub = int%state_matrix%get_n_sub ()
    end function interaction_get_n_sub
```

Get the quantum number array that corresponds to a given index.
⟨*Interactions: interaction: TBP*⟩+≡
```
    generic :: get_quantum_numbers => get_quantum_numbers_single, &

      logical, intent(in), optional :: match_only_flavor
      call int%state_matrix%add_to_matrix_element (qn, value, match_only_flavor)
    end subroutine interaction_add_to_matrix_element
```

Get the indices of any diagonal matrix elements.

⟨Interactions: interaction: TBP⟩+≡
```
    procedure :: get_diagonal_entries => interaction_get_diagonal_entries
```

⟨Interactions: procedures⟩+≡
```
    subroutine interaction_get_diagonal_entries (int, i)
      class(interaction_t), intent(in) :: int
      integer, dimension(:), allocatable, intent(out) :: i
      call int%state_matrix%get_diagonal_entries (i)
    end subroutine interaction_get_diagonal_entries
```

Renormalize the state matrix by its trace, if nonzero. The renormalization is reflected in the state-matrix norm.

⟨Interactions: interaction: TBP⟩+≡
```
    procedure :: normalize_by_trace => interaction_normalize_by_trace
```

⟨Interactions: procedures⟩+≡
```
    subroutine interaction_normalize_by_trace (int)
      class(interaction_t), intent(inout) :: int
      call int%state_matrix%normalize_by_trace ()
    end subroutine interaction_normalize_by_trace
```

Analogous, but renormalize by maximal (absolute) value.

⟨Interactions: interaction: TBP⟩+≡
```
    procedure :: normalize_by_max => interaction_normalize_by_max
```

⟨Interactions: procedures⟩+≡
```
    subroutine interaction_normalize_by_max (int)
      class(interaction_t), intent(inout) :: int
      call int%state_matrix%normalize_by_max ()
    end subroutine interaction_normalize_by_max
```

Explicitly set the norm value (of the state matrix).

⟨Interactions: interaction: TBP⟩+≡
```
    procedure :: set_norm => interaction_set_norm
```

⟨Interactions: procedures⟩+≡
```
    subroutine interaction_set_norm (int, norm)
      class(interaction_t), intent(inout) :: int
      real(default), intent(in) :: norm
      call int%state_matrix%set_norm (norm)
    end subroutine interaction_set_norm
```

⟨Interactions: interaction: TBP⟩+≡
```
    procedure :: set_state_matrix => interaction_set_state_matrix
```

⟨Interactions: procedures⟩+≡
```
    subroutine interaction_set_state_matrix (int, state)
      class(interaction_t), intent(inout) :: int
      type(state_matrix_t), intent(in) :: state
      int%state_matrix = state
    end subroutine interaction_set_state_matrix
```

Return the maximum absolute value of color indices.

⟨Interactions: interaction: TBP⟩+≡
```
    procedure :: get_max_color_value => &
        interaction_get_max_color_value
```

⟨Interactions: procedures⟩+≡
```
    function interaction_get_max_color_value (int) result (cmax)
      class(interaction_t), intent(in) :: int
      integer :: cmax
      cmax = int%state_matrix%get_max_color_value ()
    end function interaction_get_max_color_value
```

Factorize the state matrix into single-particle state matrices, the branch selection depending on a (random) value between 0 and 1; optionally also return a correlated state matrix.

⟨Interactions: interaction: TBP⟩+≡
```
    procedure :: factorize => interaction_factorize
```

⟨Interactions: procedures⟩+≡
```
    subroutine interaction_factorize &
        (int, mode, x, ok, single_state, correlated_state, qn_in)
      class(interaction_t), intent(in), target :: int
      integer, intent(in) :: mode
      real(default), intent(in) :: x
      logical, intent(out) :: ok
      type(state_matrix_t), &
          dimension(:), allocatable, intent(out) :: single_state
      type(state_matrix_t), intent(out), optional :: correlated_state
      type(quantum_numbers_t), dimension(:), intent(in), optional :: qn_in
      call int%state_matrix%factorize &
          (mode, x, ok, single_state, correlated_state, qn_in)
    end subroutine interaction_factorize
```

Sum all matrix element values

⟨Interactions: interaction: TBP⟩+≡
```
    procedure :: sum => interaction_sum
```

⟨Interactions: procedures⟩+≡
```
    function interaction_sum (int) result (value)
      class(interaction_t), intent(in) :: int
      complex(default) :: value
      value = int%state_matrix%sum ()
    end function interaction_sum
```

Append new states which are color-contracted versions of the existing states. The matrix element index of each color contraction coincides with the index of its origin, so no new matrix elements are generated. After this operation, no `freeze` must be performed anymore.

⟨Interactions: interaction: TBP⟩+≡
```
    procedure :: add_color_contractions => &
        interaction_add_color_contractions
```

⟨*Interactions: procedures*⟩+≡

```
    subroutine interaction_add_color_contractions (int)
      class(interaction_t), intent(inout) :: int
      call int%state_matrix%add_color_contractions ()
    end subroutine interaction_add_color_contractions
```

Multiply matrix elements from two interactions. Choose the elements as given by the integer index arrays, multiply them and store the sum of products in the indicated matrix element. The suffixes mean: c=conjugate first factor; f=include weighting factor.

⟨*Interactions: interaction: TBP*⟩+≡

```
    procedure :: evaluate_product => interaction_evaluate_product
    procedure :: evaluate_product_cf => interaction_evaluate_product_cf
    procedure :: evaluate_square_c => interaction_evaluate_square_c
    procedure :: evaluate_sum => interaction_evaluate_sum
    procedure :: evaluate_me_sum => interaction_evaluate_me_sum
```

⟨*Interactions: procedures*⟩+≡

```
    pure subroutine interaction_evaluate_product &
         (int, i, int1, int2, index1, index2)
      class(interaction_t), intent(inout) :: int

```

Return all or just a specific four-momentum.

⟨*Interactions: interaction: TBP*⟩+≡
```
   generic :: get_momenta => get_momenta_all, get_momenta_idx
   procedure :: get_momentum => interaction_get_momentum
   procedure :: get_momenta_all => interaction_get_momenta_all
   procedure :: get_momenta_idx => interaction_get_momenta_idx
```

⟨*Interactions: procedures*⟩+≡
```
   function interaction_get_momenta_all (int, outgoing) result (p)
     class(interaction_t), intent(in) :: int
     type(vector4_t), dimension(:), allocatable :: p
     logical, intent(in), optional :: outgoing
     integer :: i
     if (present (outgoing)) then
        if (outgoing) then
           allocate (p (int%n_out))
        else
           allocate (p (int%n_in))
        end if
     else
        allocate (p (int%n_tot))
     end if
     do i = 1, size (p)
        p(i) = int%p(idx (int, i, outgoing))
     end do
   end function interaction_get_momenta_all

   function interaction_get_momenta_idx (int, jj) result (p)
     class(interaction_t), intent(in) :: int
     type(vector4_t), dimension(:), allocatable :: p
     integer, dimension(:), intent(in) :: jj
     allocate (p (size (jj)))
     p = int%p(jj)
   end function interaction_get_momenta_idx

   function interaction_get_momentum (int, i, outgoing) result (p)
```

```
      class(interaction_t), intent(in) :: int
      type(vector4_t) :: p
      integer, intent(in) :: i
      logical, intent(in), optional :: outgoing
      p = int%p(idx (int, i, outgoing))
   end function interaction_get_momentum
```

This is a variant as a subroutine. Redundant, but the function above fails at times for gfortran 4.5.0 (double allocation, compiler bug).

⟨*Interactions: interaction: TBP*⟩+≡
```
   procedure :: get_momenta_sub => interaction_get_momenta_sub
```

⟨*Interactions: procedures*⟩+≡
```
   subroutine interaction_get_momenta_sub (int, p, outgoing)
     class(interaction_t), intent(in) :: int
     type(vector4_t), dimension(:), intent(out) :: p
     logical, intent(in), optional :: outgoing
     integer :: i
     do i = 1, size (p)
        p(i) = int%p(idx (int, i, outgoing))
     end do
   end subroutine interaction_get_momenta_sub
```

Return a shallow copy of the state matrix:

⟨*Interactions: interaction: TBP*⟩+≡
```
   procedure :: get_state_matrix_ptr => &
        interaction_get_state_matrix_ptr
```

⟨*Interactions: procedures*⟩+≡
```
   function interaction_get_state_matrix_ptr (int) result (state)
     class(interaction_t), intent(in), target :: int
     type(state_matrix_t), pointer :: state
     state => int%state_matrix
   end function interaction_get_state_matrix_ptr
```

Return the array of resonance flags

⟨*Interactions: interaction: TBP*⟩+≡
```
   procedure :: get_resonance_flags => interaction_get_resonance_flags
```

⟨*Interactions: procedures*⟩+≡
```
   function interaction_get_resonance_flags (int) result (resonant)
     class(interaction_t), intent(in) :: int
     logical, dimension(size(int%resonant)) :: resonant
     resonant = int%resonant
   end function interaction_get_resonance_flags
```

Return the quantum-numbers mask (or part of it)

⟨*Interactions: interaction: TBP*⟩+≡
```
   generic :: get_mask => get_mask_all, get_mask_slice
   procedure :: get_mask_all => interaction_get_mask_all
   procedure :: get_mask_slice => interaction_get_mask_slice
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_mask_all (int) result (mask)
      class(interaction_t), intent(in) :: int
      type(quantum_numbers_mask_t), dimension(size(int%mask)) :: mask
      mask = int%mask
    end function interaction_get_mask_all

    function interaction_get_mask_slice (int, index) result (mask)
      class(interaction_t), intent(in) :: int
      integer, dimension(:), intent(in) :: index
      type(quantum_numbers_mask_t), dimension(size(index)) :: mask
      mask = int%mask(index)
    end function interaction_get_mask_slice
```

Compute the invariant mass squared of the incoming particles (if any, otherwise outgoing).

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_s
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_s (int) result (s)
      real(default) :: s
      type(interaction_t), intent(in) :: int
      if (int%n_in /= 0) then
         s = sum (int%p(:int%n_in)) ** 2
      else
         s = sum (int%p(int%n_vir + 1 : )) ** 2
      end if
    end function interaction_get_s
```

Compute the Lorentz transformation that transforms the incoming particles from the center-of-mass frame to the lab frame where they are given. If the c.m. mass squared is negative or zero, return the identity.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_cm_transformation
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_cm_transformation (int) result (lt)
      type(lorentz_transformation_t) :: lt
      type(interaction_t), intent(in) :: int
      type(vector4_t) :: p_cm
      real(default) :: s
      if (int%n_in /= 0) then
         p_cm = sum (int%p(:int%n_in))
      else
         p_cm = sum (int%p(int%n_vir+1:))
      end if
      s = p_cm ** 2
      if (s > 0) then
         lt = boost (p_cm, sqrt (s))
      else
         lt = identity
      end if
    end function interaction_get_cm_transformation
```

Return flavor, momentum, and position of the first outgoing unstable particle present in the interaction. Note that we need not iterate through the state matrix; if there is an unstable particle, it will be present in all state-matrix entries.

⟨*Interactions: public*⟩+≡
```
public :: interaction_get_unstable_particle
```

⟨*Interactions: procedures*⟩+≡
```
subroutine interaction_get_unstable_particle (int, flv, p, i)
  type(interaction_t), intent(in), target :: int
  type(flavor_t), intent(out) :: flv
  type(vector4_t), intent(out) :: p
  integer, intent(out) :: i
  type(state_iterator_t) :: it
  type(flavor_t), dimension(int%n_tot) :: flv_array
  call it%init (int%state_matrix)
  flv_array = it%get_flavor ()
  do i = int%n_in + int%n_vir + 1, int%n_tot
    if (.not. flv_array(i)%is_stable ()) then
      flv = flv_array(i)
      p = int%p(i)
      return
    end if
  end do
end subroutine interaction_get_unstable_particle
```

Return the complete set of *outgoing* flavors, assuming that the flavor quantum number is not suppressed.

⟨*Interactions: public*⟩+≡
```
public :: interaction_get_flv_out
```

⟨*Interactions: procedures*⟩+≡
```
subroutine interaction_get_flv_out (int, flv)
  type(interaction_t), intent(in), target :: int
  type(flavor_t), dimension(:,:), allocatable, intent(out) :: flv
  type(state_iterator_t) :: it
  type(flavor_t), dimension(:), allocatable :: flv_state
  integer :: n_in, n_vir, n_out, n_tot, n_state, i
  n_in = int%get_n_in ()
  n_vir = int%get_n_vir ()
  n_out = int%get_n_out ()
  n_tot = int%get_n_tot ()
  n_state = int%get_n_matrix_elements ()
  allocate (flv (n_out, n_state))
  allocate (flv_state (n_tot))
  i = 1
  call it%init (int%get_state_matrix_ptr ())
  do while (it%is_valid ())
    flv_state = it%get_flavor ()
    flv(:,i) = flv_state(n_in + n_vir + 1 : )
    i = i + 1
    call it%advance ()
```

```
        end do
    end subroutine interaction_get_flv_out
```

Determine the flavor content of the interaction. We analyze the state matrix for this, and we select the outgoing particles of the hard process only for the required mask, which indicates the particles that can appear in any order in a matching event record.

We have to assume that any radiated particles (beam remnants) appear at the beginning of the particles marked as outgoing.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_flv_content
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_get_flv_content (int, state_flv, n_out_hard)
      type(interaction_t), intent(in), target :: int
      type(state_flv_content_t), intent(out) :: state_flv
      integer, intent(in) :: n_out_hard
      logical, dimension(:), allocatable :: mask
      integer :: n_tot
      n_tot = int%get_n_tot ()
      allocate (mask (n_tot), source = .false.)
      mask(n_tot-n_out_hard + 1 : ) = .true.
      call state_flv%fill (int%get_state_matrix_ptr (), mask)
    end subroutine interaction_get_flv_content
```

12.2.6 Modifying contents

Set the quantum numbers mask.

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: set_mask => interaction_set_mask
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_set_mask (int, mask)
      class(interaction_t), intent(inout) :: int
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: mask
      if (size (int%mask) /= size (mask)) &
         call msg_fatal ("Attempting to set mask with unfitting size!")
      int%mask = mask
      int%update_state_matrix = .true.
    end subroutine interaction_set_mask
```

Merge a particular mask entry, respecting a possible helicity lock for this entry. We apply an OR relation, which means that quantum numbers are summed over if either of the two masks requires it.

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_merge_mask_entry (int, i, mask)
      type(interaction_t), intent(inout) :: int
      integer, intent(in) :: i
      type(quantum_numbers_mask_t), intent(in) :: mask
      type(quantum_numbers_mask_t) :: mask_tmp
      integer :: ii
```

```
      ii = idx (int, i)
      if (int%mask(ii) .neqv. mask) then
          int%mask(ii) = int%mask(ii) .or. mask
          if (int%hel_lock(ii) /= 0) then
              call mask_tmp%assign (mask, helicity=.true.)
              int%mask(int%hel_lock(ii)) = int%mask(int%hel_lock(ii)) .or. mask_tmp
          end if
      end if
      int%update_state_matrix = .true.
  end subroutine interaction_merge_mask_entry
```

Fill the momenta array, do not care about the quantum numbers of particles.

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: reset_momenta => interaction_reset_momenta
    procedure :: set_momenta => interaction_set_momenta
    procedure :: set_momentum => interaction_set_momentum
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_reset_momenta (int)
      class(interaction_t), intent(inout) :: int
      int%p = vector4_null
      int%p_is_known = .true.
    end subroutine interaction_reset_momenta

    subroutine interaction_set_momenta (int, p, outgoing)
      class(interaction_t), intent(inout) :: int
      type(vector4_t), dimension(:), intent(in) :: p
      logical, intent(in), optional :: outgoing
      integer :: i, index
      do i = 1, size (p)
          index = idx (int, i, outgoing)
          int%p(index) = p(i)
          int%p_is_known(index) = .true.
      end do
    end subroutine interaction_set_momenta

    subroutine interaction_set_momentum (int, p, i, outgoing)
      class(interaction_t), intent(inout) :: int
      type(vector4_t), intent(in) :: p
      integer, intent(in) :: i
      logical, intent(in), optional :: outgoing
      integer :: index
      index = idx (int, i, outgoing)
      int%p(index) = p
      int%p_is_known(index) = .true.
    end subroutine interaction_set_momentum
```

This more sophisticated version of setting values is used for structure functions, in particular if nontrivial flavor, color, and helicity may be present: set values selectively for the given flavors. If there is more than one flavor, scan the interaction and check for a matching flavor at the specified particle location. If it matches, insert the value that corresponds to this flavor.

⟨*Interactions: public*⟩+≡

```
      public :: interaction_set_flavored_values
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_set_flavored_values (int, value, flv_in, pos)
      type(interaction_t), intent(inout) :: int
      complex(default), dimension(:), intent(in) :: value
      type(flavor_t), dimension(:), intent(in) :: flv_in
      integer, intent(in) :: pos
      type(state_iterator_t) :: it
      type(flavor_t) :: flv
      integer :: i
      if (size (value) == 1) then
         call int%set_matrix_element (value(1))
      else
         call it%init (int%state_matrix)
         do while (it%is_valid ())
            flv = it%get_flavor (pos)
            SCAN_FLV: do i = 1, size (value)
               if (flv == flv_in(i)) then
                  call it%set_matrix_element (value(i))
                  exit SCAN_FLV
               end if
            end do SCAN_FLV
            call it%advance ()
         end do
      end if
    end subroutine interaction_set_flavored_values
```

12.2.7 Handling Linked interactions

Store relations between corresponding particles within one interaction. The first particle is the parent, the second one the child. Links are established in both directions.

These relations have no effect on the propagation of momenta etc., they are rather used for mother-daughter relations in event output.

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: relate => interaction_relate
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_relate (int, i1, i2)
      class(interaction_t), intent(inout), target :: int
      integer, intent(in) :: i1, i2
      if (i1 /= 0 .and. i2 /= 0) then
         call int%children(i1)%append (i2)
         call int%parents(i2)%append (i1)
      end if
    end subroutine interaction_relate
```

Transfer internal parent-child relations defined within interaction `int1` to a new interaction `int` where the particle indices are mapped to. Some particles in `int1` may have no image in `int`. In that case, a child entry maps to zero, and we skip this relation.

Also transfer resonance flags.

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: transfer_relations => interaction_transfer_relations
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_transfer_relations (int1, int2, map)
      class(interaction_t), intent(in) :: int1
      class(interaction_t), intent(inout), target :: int2
      integer, dimension(:), intent(in) :: map
      integer :: i, j, k
      do i = 1, size (map)
         do j = 1, int1%parents(i)%get_length ()
            k = int1%parents(i)%get_link (j)
            call int2%relate (map(k), map(i))
         end do
         if (map(i) /= 0) then
            int2%resonant(map(i)) = int1%resonant(i)
         end if
      end do
    end subroutine interaction_transfer_relations
```

Make up internal parent-child relations for the particle(s) that are connected to
a new interaction `int`.

If `resonant` is defined and true, the connections are marked as resonant in
the result interaction

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: relate_connections => interaction_relate_connections
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_relate_connections &
         (int, int_in, connection_index, &
          map, map_connections, resonant)
      class(interaction_t), intent(inout), target :: int
      class(interaction_t), intent(in) :: int_in
      integer, dimension(:), intent(in) :: connection_index
      integer, dimension(:), intent(in) :: map, map_connections
      logical, intent(in), optional :: resonant
      logical :: reson
      integer :: i, j, i2, k2
      reson = .false.;  if (present (resonant))  reson = resonant
      do i = 1, size (map_connections)
         k2 = connection_index(i)
         do j = 1, int_in%children(k2)%get_length ()
            i2 = int_in%children(k2)%get_link (j)
            call int%relate (map_connections(i), map(i2))
         end do
         int%resonant(map_connections(i)) = reson
      end do
    end subroutine interaction_relate_connections
```

Return the number of source/target links of the internal connections of particle
`i`.

⟨*Interactions: public*⟩+≡

```
    public :: interaction_get_n_children
    public :: interaction_get_n_parents
```
⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_n_children (int, i) result (n)
      integer :: n
      type(interaction_t), intent(in) :: int
      integer, intent(in) :: i
      n = int%children(i)%get_length ()
    end function interaction_get_n_children

    function interaction_get_n_parents (int, i) result (n)
      integer :: n
      type(interaction_t), intent(in) :: int
      integer, intent(in) :: i
      n = int%parents(i)%get_length ()
    end function interaction_get_n_parents
```

Return the source/target links of the internal connections of particle i as an
array.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_get_children
    public :: interaction_get_parents
```
⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_children (int, i) result (idx)
      integer, dimension(:), allocatable :: idx
      type(interaction_t), intent(in) :: int
      integer, intent(in) :: i
      integer :: k, l
      l = int%children(i)%get_length ()
      allocate (idx (l))
      do k = 1, l
         idx(k) = int%children(i)%get_link (k)
      end do
    end function interaction_get_children

    function interaction_get_parents (int, i) result (idx)
      integer, dimension(:), allocatable :: idx
      type(interaction_t), intent(in) :: int
      integer, intent(in) :: i
      integer :: k, l
      l = int%parents(i)%get_length ()
      allocate (idx (l))
      do k = 1, l
         idx(k) = int%parents(i)%get_link (k)
      end do
    end function interaction_get_parents
```

Add a source link from an interaction to a corresponding particle within another
interaction. These links affect the propagation of particles: the two linked
particles are considered as the same particle, outgoing and incoming.

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: set_source_link => interaction_set_source_link
```

686

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_set_source_link (int, i, int1, i1)
      class(interaction_t), intent(inout) :: int
      integer, intent(in) :: i
      class(interaction_t), intent(in), target :: int1
      integer, intent(in) :: i1
      if (i /= 0)  call external_link_set (int%source(i), int1, i1)
    end subroutine interaction_set_source_link
```

Reassign links to a new interaction (which is an image of the current interaction).
⟨*Interactions: public*⟩+≡
```
    public :: interaction_reassign_links
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_reassign_links (int, int_src, int_target)
      type(interaction_t), intent(inout) :: int
      type(interaction_t), intent(in) :: int_src
      type(interaction_t), intent(in), target :: int_target
      integer :: i
      if (allocated (int%source)) then
         do i = 1, size (int%source)
            call external_link_reassign (int%source(i), int_src, int_target)
         end do
      end if
    end subroutine interaction_reassign_links
```

Since links are one-directional, if we want to follow them backwards we have
to scan all possibilities. This procedure returns the index of the particle within
`int` which points to the particle `i1` within interaction `int1`. If unsuccessful,
return zero.
⟨*Interactions: public*⟩+≡
```
    public :: interaction_find_link
```

⟨*Interactions: procedures*⟩+≡
```
    function interaction_find_link (int, int1, i1) result (i)
      integer :: i
      type(interaction_t), intent(in) :: int, int1
      integer, intent(in) :: i1
      type(interaction_t), pointer :: int_tmp
      do i = 1, int%n_tot
         int_tmp => external_link_get_ptr (int%source(i))
         if (int_tmp%tag == int1%tag) then
            if (external_link_get_index (int%source(i)) == i1)  return
         end if
      end do
      i = 0
    end function interaction_find_link
```

The inverse: return interaction pointer and index for the ultimate source of `i`
within `int`.
⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: find_source => interaction_find_source
```

687

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_find_source (int, i, int1, i1)
      class(interaction_t), intent(in) :: int
      integer, intent(in) :: i
      type(interaction_t), intent(out), pointer :: int1
      integer, intent(out) :: i1
      type(external_link_t) :: link
      link = interaction_get_ultimate_source (int, i)
      int1 => external_link_get_ptr (link)
      i1 = external_link_get_index (link)
    end subroutine interaction_find_source
```

Follow source links recursively to return the ultimate source of a particle.

⟨*Interactions: procedures*⟩+≡
```
    function interaction_get_ultimate_source (int, i) result (link)
      type(external_link_t) :: link
      type(interaction_t), intent(in) :: int
      integer, intent(in) :: i
      type(interaction_t), pointer :: int_src
      integer :: i_src
      link = int%source(i)
      if (external_link_is_set (link)) then
         do
            int_src => external_link_get_ptr (link)
            i_src = external_link_get_index (link)
            if (external_link_is_set (int_src%source(i_src))) then
               link = int_src%source(i_src)
            else
               exit
            end if
         end do
      end if
    end function interaction_get_ultimate_source
```

Update mask entries by merging them with corresponding masks in interactions linked to the current one. The mask determines quantum numbers which are summed over.

Note that both the mask of the current interaction and the mask of the linked interaction are updated (side effect!). This ensures that both agree for the linked particle.

⟨*Interactions: public*⟩+≡
```
    public :: interaction_exchange_mask
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_exchange_mask (int)
      type(interaction_t), intent(inout) :: int
      integer :: i, index_link
      type(interaction_t), pointer :: int_link
      do i = 1, int%n_tot
         if (external_link_is_set (int%source(i))) then
            int_link => external_link_get_ptr (int%source(i))
            index_link = external_link_get_index (int%source(i))
            call interaction_merge_mask_entry &
```

```
               (int, i, int_link%mask(index_link))
          call interaction_merge_mask_entry &
               (int_link, index_link, int%mask(i))
       end if
     end do
     call int%freeze ()
   end subroutine interaction_exchange_mask
```

Copy momenta from interactions linked to the current one.

⟨*Interactions: interaction: TBP*⟩+≡
```
   procedure :: receive_momenta => interaction_receive_momenta
```

⟨*Interactions: procedures*⟩+≡
```
   subroutine interaction_receive_momenta (int)
     class(interaction_t), intent(inout) :: int
     integer :: i, index_link
     type(interaction_t), pointer :: int_link
     do i = 1, int%n_tot
        if (external_link_is_set (int%source(i))) then
           int_link => external_link_get_ptr (int%source(i))
           index_link = external_link_get_index (int%source(i))
           call int%set_momentum (int_link%p(index_link), i)
        end if
     end do
   end subroutine interaction_receive_momenta
```

The inverse operation: Copy momenta back to the interactions linked to the current one.

⟨*Interactions: public*⟩+≡
```
   public :: interaction_send_momenta
```

⟨*Interactions: procedures*⟩+≡
```
   subroutine interaction_send_momenta (int)
     type(interaction_t), intent(in) :: int
     integer :: i, index_link
     type(interaction_t), pointer :: int_link
     do i = 1, int%n_tot
        if (external_link_is_set (int%source(i))) then
           int_link => external_link_get_ptr (int%source(i))
           index_link = external_link_get_index (int%source(i))
           call int_link%set_momentum (int%p(i), index_link)
        end if
     end do
   end subroutine interaction_send_momenta
```

For numerical comparisons: pacify all momenta in an interaction.

⟨*Interactions: public*⟩+≡
```
   public :: interaction_pacify_momenta
```

⟨*Interactions: procedures*⟩+≡
```
   subroutine interaction_pacify_momenta (int, acc)
     type(interaction_t), intent(inout) :: int
     real(default), intent(in) :: acc
```

```
      integer :: i
      do i = 1, int%n_tot
         call pacify (int%p(i), acc)
      end do
   end subroutine interaction_pacify_momenta
```

For each subtraction entry starting from `SUB = 0`, we duplicate the original state matrix entries as is.

⟨*Interactions: interaction: TBP*⟩+≡
```
    procedure :: declare_subtraction => interaction_declare_subtraction
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine interaction_declare_subtraction (int, n_sub)
      class(interaction_t), intent(inout), target :: int
      integer, intent(in) :: n_sub
      integer :: i_sub
      type(state_iterator_t) :: it
      type(quantum_numbers_t), dimension(:), allocatable :: qn
      type(state_matrix_t) :: state_matrix
      call state_matrix%init (store_values = .true.)
      allocate (qn (int%get_state_depth ()))
      do i_sub = 0, n_sub
         call it%init (int%state_matrix)
         do while (it%is_valid ())
            qn = it%get_quantum_numbers ()
            call qn%set_subtraction_index (i_sub)
            call state_matrix%add_state (qn, value = it%get_matrix_element ())
            call it%advance ()
         end do
      end do
      call state_matrix%freeze ()
      call state_matrix%set_n_sub ()
      call int%state_matrix%final ()
      int%state_matrix = state_matrix
    end subroutine interaction_declare_subtraction
```

12.2.8 Recovering connections

When creating an evaluator for two interactions, we have to know by which particles they are connected. The connection indices can be determined if we have two linked interactions. We assume that `int1` is the source and `int2` the target, so the connections of interest are stored within `int2`. A connection is found if either the source is `int1`, or the (ultimate) source of a particle within `int2` coincides with the (ultimate) source of a aparticle within `int1`. The result is an array of index pairs.

To make things simple, we scan the interaction twice, once for counting hits, then allocate the array, then scan again and store the connections.

The connections are scanned for `int2`, which has sources in `int1`. It may happen that the order of connections is interchanged (crossed). We require the indices in `int1` to be sorted, so we reorder both index arrays correspondingly

before returning them. (After this, the indices in `int2` may be out of order.)

⟨*Interactions: public*⟩+≡
```
    public :: find_connections
```

⟨*Interactions: procedures*⟩+≡
```
    subroutine find_connections (int1, int2, n, connection_index)
      class(interaction_t), intent(in) :: int1, int2
      integer, intent(out) :: n
      integer, dimension(:,:), intent(out), allocatable :: connection_index
      integer, dimension(:,:), allocatable :: conn_index_tmp
      integer, dimension(:), allocatable :: ordering
      integer :: i, j, k
      type(external_link_t) :: link1, link2
      type(interaction_t), pointer :: int_link1, int_link2
      n = 0
      do i = 1, size (int2%source)
         link2 = interaction_get_ultimate_source (int2, i)
         if (external_link_is_set (link2)) then
            int_link2 => external_link_get_ptr (link2)
            if (int_link2%tag == int1%tag) then
               n = n + 1
            else
               k = external_link_get_index (link2)
               do j = 1, size (int1%source)
                  link1 = interaction_get_ultimate_source (int1, j)

12.3   Matrix element evaluation

The `evaluator_t` type is an extension of the `interaction_t` type. It represents
either a density matrix as the square of a transition matrix element, or the
product of two density matrices. Usually, some quantum numbers are summed
over in the result.

The `interaction_t` subobject represents a multi-particle interaction with
incoming, virtual, and outgoing particles and the associated (not necessarily
diagonal) density matrix of quantum state. When the evaluator is initialized,
this interaction is constructed from the input interaction(s).

In addition, the initialization process sets up a multiplication table. For each
matrix element of the result, it states which matrix elements are to be taken
from the input interaction(s), multiplied (optionally, with an additional weight
factor) and summed over.

Eventually, to a processes we associate a chain of evaluators which are to be
evaluated sequentially. The physical event and its matrix element value(s) can
be extracted from the last evaluator in such a chain.

Evaluators are constructed only once (as long as this is possible) during an
initialization step. Then, for each event, momenta are computed and transferred
among evaluators using the links within the interaction subobject. The multi-
plication tables enable fast evaluation of the result without looking at quantum
numbers anymore.

⟨`evaluators.f90`⟩≡

```
contains
```

⟨*Evaluators: procedures*⟩

```
end module evaluators
```

12.3.1   Array of pairings

The evaluator contains an array of `pairing_array` objects. This makes up the multiplication table.

Each pairing array contains two list of matrix element indices and a list of numerical factors. The matrix element indices correspond to the input interactions. The corresponding matrix elements are to be multiplied and optionally multiplied by a factor. The results are summed over to yield one specific matrix element of the result evaluator.

⟨*Evaluators: types*⟩≡
```
    type :: pairing_array_t
       integer, dimension(:), allocatable :: i1, i2
       complex(default), dimension(:), allocatable :: factor
    end type pairing_array_t
```

⟨*Evaluators: procedures*⟩≡
```
    elemental subroutine pairing_array_init (pa, n, has_i2, has_factor)
      type(pairing_array_t), intent(out) :: pa
      integer, intent(in) :: n
      logical, intent(in) :: has_i2, has_factor
      allocate (pa%i1 (n))
      if (has_i2)  allocate (pa%i2 (n))

    public :: pairing_array_write
```

⟨*Evaluators: procedures*⟩+≡
```
    subroutine pairing_array_write (pa, unit)
      type(pairing_array_t), intent(in) :: pa
      integer, intent(in), optional :: unit
      integer :: i, u
      u = given_output_unit (unit); if (u < 0) return
      write (u, "(A)", advance = "no") "["
      if (allocated (pa%i1)) then
         write (u, "(I0,A)", advance = "no") pa%i1, ","
      else
```

```
            write (u, "(A)", advance = "no") "x,"
         end if
         if (allocated (pa%i2)) then
            write (u, "(I0,A)", advance = "no") pa%i1, ","
         else
            write (u, "(A)", advance = "no") "x,"
         end if
         write (u, "(A)", advance = "no") "]"
         if (allocated (pa%factor)) then
            write (u, "(A,F5.4,A,F5.4,A)") ";(", &
                  real(pa%factor), ",", aimag(pa%factor), ")]"
         else
            write (u, "(A)") ""
         end if
    end subroutine pairing_array_write
```

12.3.2   The evaluator type

Possible variants of evaluators:

⟨*Evaluators: parameters*⟩≡
```
    integer, parameter :: &
         EVAL_UNDEFINED = 0, &
         EVAL_PRODUCT = 1, &
         EVAL_SQUARED_FLOWS = 2, &
         EVAL_SQUARE_WITH_COLOR_FACTORS = 3, &
         EVAL_COLOR_CONTRACTION = 4, &
         EVAL_IDENTITY = 5, &
         EVAL_QN_SUM = 6
```

The evaluator type contains the result interaction and an array of pairing lists, one for each matrix element in the result interaction.

⟨*Evaluators: public*⟩+≡
```
    public :: evaluator_t
```

⟨*Evaluators: types*⟩+≡
```
    type, extends (interaction_t) :: evaluator_t
      private
      integer :: type = EVAL_UNDEFINED
      class(interaction_t), pointer :: int_in1 => null ()
      class(interaction_t), pointer :: int_in2 => null ()
      type(pairing_array_t), dimension(:), allocatable :: pairing_array
    contains
    ⟨Evaluators: evaluator: TBP⟩
    end type evaluator_t
```

Output.

⟨*Evaluators: evaluator: TBP*⟩≡
```
    procedure :: write => evaluator_write
```

⟨*Evaluators: procedures*⟩+≡
```
    subroutine evaluator_write (eval, unit, &
         verbose, show_momentum_sum, show_mass, show_state, show_table, &
         col_verbose, testflag)
```

```

12.3.3 Auxiliary structures for evaluator creation

Creating an evaluator that properly handles all quantum numbers requires some
bookkeeping. In this section, we define several auxiliary types and methods that
organize and simplify this task. More structures are defined within the specific
initializers (as local types and internal subroutines).

These types are currently implemented in a partial object-oriented way: We
define some basic methods for initialization etc. here, but the evaluator routines
below do access their internals as well. This simplifies some things such as index
addressing using array slices, at the expense of losing some clarity.

Index mapping

Index mapping are abundant when constructing an evaluator. To have arrays
of index mappings, we define this:

⟨*Evaluators: types*⟩+≡
```
    type :: index_map_t
       integer, dimension(:), allocatable :: entry
    end type index_map_t
```

⟨*Evaluators: procedures*⟩+≡
```
    elemental subroutine index_map_init (map, n)
      type(index_map_t), intent(out) :: map
      integer, intent(in) :: n
      allocate (map%entry (n))
      map%entry = 0
    end subroutine index_map_init
```

⟨*Evaluators: procedures*⟩+≡
```
    function index_map_exists (map) result (flag)
      logical :: flag
      type(index_map_t), intent(in) :: map
      flag = allocated (map%entry)
    end function index_map_exists
```

⟨*Evaluators: interfaces*⟩+≡
```
    interface size
       module procedure index_map_size
    end interface
```

⟨*Evaluators: procedures*⟩+≡
```
    function index_map_size (map) result (s)
      integer :: s
      type(index_map_t), intent(in) :: map
      if (allocated (map%entry)) then
         s = size (map%entry)
      else
         s = 0
```

```
          end if
       end function index_map_size
```

⟨*Evaluators: interfaces*⟩+≡
```
       interface assignment(=)
          module procedure index_map_assign_int
          module procedure index_map_assign_array
       end interface
```

⟨*Evaluators: procedures*⟩+≡
```
       elemental subroutine index_map_assign_int (map, ival)
         type(index_map_t), intent(inout) :: map
         integer, intent(in) :: ival
         map%entry = ival
       end subroutine index_map_assign_int

       subroutine index_map_assign_array (map, array)
         type(index_map_t), intent(inout) :: map
         integer, dimension(:), intent(in) :: array
         map%entry = array
       end subroutine index_map_assign_array
```

⟨*Evaluators: procedures*⟩+≡
```
       elemental subroutine index_map_set_entry (map, i, ival)
         type(index_map_t), intent(inout) :: map
         integer, intent(in) :: i
         integer, intent(in) :: ival
         map%entry(i) = ival
       end subroutine index_map_set_entry
```

⟨*Evaluators: procedures*⟩+≡
```
       elemental function index_map_get_entry (map, i) result (ival)
         integer :: ival
         type(index_map_t), intent(in) :: map
         integer, intent(in) :: i
         ival = map%entry(i)
       end function index_map_get_entry
```

Index mapping (two-dimensional)

This is a variant with a square matrix instead of an array.

⟨*Evaluators: types*⟩+≡
```
       type :: index_map2_t
          integer :: s = 0
          integer, dimension(:,:), allocatable :: entry
       end type index_map2_t
```

⟨*Evaluators: procedures*⟩+≡
```
       elemental subroutine index_map2_init (map, n)
         type(index_map2_t), intent(out) :: map
```

```
      integer, intent(in) :: n
      map%s = n
      allocate (map%entry (n, n))
    end subroutine index_map2_init
```

⟨*Evaluators: procedures*⟩+≡
```
    function index_map2_exists (map) result (flag)
      logical :: flag
      type(index_map2_t), intent(in) :: map
      flag = allocated (map%entry)
    end function index_map2_exists
```

⟨*Evaluators: interfaces*⟩+≡
```
    interface size
       module procedure index_map2_size
    end interface
```

⟨*Evaluators: procedures*⟩+≡
```
    function index_map2_size (map) result (s)
      integer :: s
      type(index_map2_t), intent(in) :: map
      s = map%s
    end function index_map2_size
```

⟨*Evaluators: interfaces*⟩+≡
```
    interface assignment(=)
       module procedure index_map2_assign_int
    end interface
```

⟨*Evaluators: procedures*⟩+≡
```
    elemental subroutine index_map2_assign_int (map, ival)
      type(index_map2_t), intent(inout) :: map
      integer, intent(in) :: ival
      map%entry = ival
    end subroutine index_map2_assign_int
```

⟨*Evaluators: procedures*⟩+≡
```
    elemental subroutine index_map2_set_entry (map, i, j, ival)
      type(index_map2_t), intent(inout) :: map
      integer, intent(in) :: i, j
      integer, intent(in) :: ival
      map%entry(i,j) = ival
    end subroutine index_map2_set_entry
```

⟨*Evaluators: procedures*⟩+≡
```
    elemental function index_map2_get_entry (map, i, j) result (ival)
      integer :: ival
      type(index_map2_t), intent(in) :: map
      integer, intent(in) :: i, j
      ival = map%entry(i,j)
    end function index_map2_get_entry
```

Auxiliary structures: particle mask

This is a simple container of a logical array.

⟨*Evaluators: types*⟩+≡
```
type :: prt_mask_t
   logical, dimension(:), allocatable :: entry
end type prt_mask_t
```

⟨*Evaluators: procedures*⟩+≡
```
subroutine prt_mask_init (mask, n)
  type(prt_mask_t), intent(out) :: mask
  integer, intent(in) :: n
  allocate (mask%entry (n))
end subroutine prt_mask_init
```

⟨*Evaluators: interfaces*⟩+≡
```
interface size
   module procedure prt_mask_size
end interface
```

⟨*Evaluators: procedures*⟩+≡
```
function prt_mask_size (mask) result (s)
  integer :: s
  type(prt_mask_t), intent(in) :: mask
  s = size (mask%entry)
end function prt_mask_size
```

Quantum number containers

Trivial transparent containers:

⟨*Evaluators: types*⟩+≡
```
type :: qn_list_t
   type(quantum_numbers_t), dimension(:,:), allocatable :: qn
end type qn_list_t

type :: qn_mask_array_t
   type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
end type qn_mask_array_t
```

Auxiliary structures: connection entries

This type is used as intermediate storage when computing the product of two evaluators or the square of an evaluator. The quantum-number array `qn` corresponds to the particles common to both interactions, but irrelevant quantum numbers (color) masked out. The index arrays `index_in` determine the entries in the input interactions that contribute to this connection. `n_index` is the size of these arrays, and `count` is used while filling the entries. Finally, the quantum-number arrays `qn_in_list` are the actual entries in the input interaction that contribute. In the product case, they exclude the connected quantum numbers.

703

Each evaluator has its own `connection_table` which contains an array of `connection_entry` objects, but also has stuff that specifically applies to the evaluator type. Hence, we do not generalize the `connection_table_t` type.

The filling procedure `connection_entry_add_state` is specific to the various evaluator types.

⟨*Evaluators: types*⟩+≡
```
type :: connection_entry_t
   type(quantum_numbers_t), dimension(:), allocatable :: qn_conn
   integer, dimension(:), allocatable :: n_index
   integer, dimension(:), allocatable :: count
   type(index_map_t), dimension(:), allocatable :: index_in
   type(qn_list_t), dimension(:), allocatable :: qn_in_list
end type connection_entry_t
```

⟨*Evaluators: procedures*⟩+≡
```
subroutine connection_entry_init &
    (entry, n_count, n_map, qn_conn, count, n_rest)
  type(connection_entry_t), intent(out) :: entry
  integer, intent(in) :: n_count, n_map
  type(quantum_numbers_t), dimension(:), intent(in) :: qn_conn
  integer, dimension(n_count), intent(in) :: count
  integer, dimension(n_count), intent(in) :: n_rest
  integer :: i
  allocate (entry%qn_conn (size (qn_conn)))
  allocate (entry%n_index (n_count))
  allocate (entry%count (n_count))
  allocate (entry%index_in (n_map))
  allocate (entry%qn_in_list (n_count))
  entry%qn_conn = qn_conn
  entry%n_index = count
  entry%count = 0
  if (size (entry%index_in) == size (count)) then
     call index_map_init (entry%index_in, count)
  else
     call index_map_init (entry%index_in, count(1))
  end if
  do i = 1, n_count
    allocate (entry%qn_in_list(i)%qn (n_rest(i), count(i)))
  end do
end subroutine connection_entry_init
```

⟨*Evaluators: procedures*⟩+≡
```
subroutine connection_entry_write (entry, unit)
  type(connection_entry_t), intent(in) :: entry
  integer, intent(in), optional :: unit
  integer :: i, j
  integer :: u
  u = given_output_unit (unit)
  call quantum_numbers_write (entry%qn_conn, unit)
  write (u, *)
  do i = 1, size (entry%n_index)
     write (u, *)  "Input interaction", i
     do j = 1, entry%n_index(i)
```

```
            if (size (entry%n_index) == size (entry%index_in)) then
               write (u, "(2x,I0,4x,I0,2x)", advance = "no") &
                    j, index_map_get_entry (entry%index_in(i), j)
            else
               write (u, "(2x,I0,4x,I0,2x,I0,2x)", advance = "no") &
                    j, index_map_get_entry (entry%index_in(1), j), &
                       index_map_get_entry (entry%index_in(2), j)
            end if
            call quantum_numbers_write (entry%qn_in_list(i)%qn(:,j), unit)
            write (u, *)
         end do
      end do
  end subroutine connection_entry_write
```

Color handling

For managing color-factor computation, we introduce this local type. The `index` is the index in the color table that corresponds to a given matrix element index in the input interaction. The `col` array stores the color assignments in rows. The `factor` array associates a complex number with each pair of arrays in the color table. The `factor_is_known` array reveals whether a given factor is known already or still has to be computed.

⟨*Evaluators: types*⟩+≡
```
    type :: color_table_t
       integer, dimension(:), allocatable :: index
       type(color_t), dimension(:,:), allocatable :: col
       logical, dimension(:,:), allocatable :: factor_is_known
       complex(default), dimension(:,:), allocatable :: factor
    end type color_table_t
```

This is the initializer. We extract the color states from the given state matrices, establish index mappings between the two states (implemented by the array `me_index`), make an array of color states, and initialize the color-factor table. The latter is two-dimensional (includes interference) and not yet filled.

⟨*Evaluators: procedures*⟩+≡
```
    subroutine color_table_init (color_table, state, n_tot)
      type(color_table_t), intent(out) :: color_table
      type(state_matrix_t), intent(in) :: state
      integer, intent(in) :: n_tot
      type(state_iterator_t) :: it
      type(quantum_numbers_t), dimension(:), allocatable :: qn
      type(state_matrix_t) :: state_col
      integer :: index, n_col_state
      allocate (color_table%index (state%get_n_matrix_elements ()))
      color_table%index = 0
      allocate (qn (n_tot))
      call state_col%init ()
      call it%init (state)
      do while (it%is_valid ())
         index = it%get_me_index ()
         call qn%init (col = it%get_color ())
```

```
      call state_col%add_state (qn, me_index = color_table%index(index))
      call it%advance ()
   end do
   n_col_state = state_col%get_n_matrix_elements ()
   allocate (color_table%col (n_tot, n_col_state))
   call it%init (state_col)
   do while (it%is_valid ())
      index = it%get_me_index ()
      color_table%col(:,index) = it%get_color ()
      call it%advance ()
   end do
   call state_col%final ()
   allocate (color_table%factor_is_known (n_col_state, n_col_state))
   allocate (color_table%factor (n_col_state, n_col_state))
   color_table%factor_is_known = .false.
 end subroutine color_table_init
```

Output (debugging use):

⟨*Evaluators: procedures*⟩+≡

```
   subroutine color_table_write (color_table, unit)
     type(color_table_t), intent(in) :: color_table
     integer, intent(in), optional :: unit
     integer :: i, j
     integer :: u
     u = given_output_unit (unit)
     write (u, *) "Color table:"
     if (allocated (color_table%index)) then
        write (u, *) "  Index mapping state => color table:"
        do i = 1, size (color_table%index)
           write (u, "(3x,I0,2x,I0,2x)")  i, color_table%index(i)
        end do
        write (u, *) "  Color table:"
        do i = 1, size (color_table%col, 2)
           write (u, "(3x,I0,2x)", advance = "no")  i
           call color_write (color_table%col(:,i), unit)
           write (u, *)
        end do
        write (u, *) "  Defined color factors:"
        do i = 1, size (color_table%factor, 1)
           do j = 1, size (color_table%factor, 2)
              if (color_table%factor_is_known(i,j)) then
                 write (u, *)  i, j, color_table%factor(i,j)
              end if
           end do
        end do
     end if
   end subroutine color_table_write
```

This subroutine sets color factors, based on information from the hard matrix element: the list of pairs of color-flow indices (in the basis of the matrix element code), the list of corresponding factors, and the list of mappings from the matrix element index in the input interaction to the color-flow index in the hard matrix element object.

We first determine the mapping of color-flow indices from the hard matrix element code to the current color table. The mapping could be nontrivial because the latter is derived from iterating over a state matrix, which may return states in non-canonical order. The translation table can be determined because we have, for the complete state matrix, both the mapping to the hard interaction (the input col_index_hi) and the mapping to the current color table (the component color_table%index).

Once this mapping is known, we scan the list of index pairs color_flow_index and translate them to valid color-table index pairs. For this pair, the color factor is set using the corresponding entry in the list col_factor.

⟨*Evaluators: procedures*⟩+≡
```
    subroutine color_table_set_color_factors (color_table, &
        col_flow_index, col_factor, col_index_hi)
      type(color_table_t), intent(inout) :: color_table
      integer, dimension(:,:), intent(in) :: col_flow_index
      complex(default), dimension(:), intent(in) :: col_factor
      integer, dimension(:), intent(in) :: col_index_hi
      integer, dimension(:), allocatable :: hi_to_ct
      integer :: n_cflow
      integer :: hi_index, me_index, ct_index, cf_index
      integer, dimension(2) :: hi_index_pair, ct_index_pair
      n_cflow = size (col_index_hi)
      if (size (color_table%index) /= n_cflow) &
          call msg_bug ("Mismatch between hard matrix element and color table")
      allocate (hi_to_ct (n_cflow))
      do me_index = 1, size (color_table%index)
         ct_index = color_table%index(me_index)
         hi_index = col_index_hi(me_index)
         hi_to_ct(hi_index) = ct_index
      end do
      do cf_index = 1, size (col_flow_index, 2)
         hi_index_pair = col_flow_index(:,cf_index)
         ct_index_pair = hi_to_ct(hi_index_pair)
         color_table%factor(ct_index_pair(1), ct_index_pair(2)) = &
             col_factor(cf_index)
         color_table%factor_is_known(ct_index_pair(1), ct_index_pair(2)) = .true.
      end do
    end subroutine color_table_set_color_factors
```

This function returns a color factor, given two indices which point to the matrix elements of the initial state matrix. Internally, we can map them to the corresponding indices in the color table. As a side effect, we store the color factor in the color table for later lookup. (I.e., this function is impure.)

12.3.4   Creating an evaluator: Matrix multiplication

The evaluator for matrix multiplication is the most complicated variant.

The initializer takes two input interactions and constructs the result evaluator, which consists of the interaction and the multiplication table for the product (or convolution) of the two. Normally, the input interactions are connected by one or more common particles (e.g., decay, structure function convolution).

In the result interaction, quantum numbers of the connections can be summed over. This is determined by the `qn_mask_conn` argument. The `qn_mask_rest` argument is its analog for the other particles within the result interaction. (E.g., for the trace of the state matrix, all quantum numbers are summed over.) Finally, the `connections_are_resonant` argument tells whether the connecting particles should be marked as resonant in the final event record. This is useful for decays.

The algorithm consists of the following steps:

1. `find_connections`: Find the particles which are connected, i.e., common to both input interactions. Either they are directly linked, or both are linked to a common source.

2. `compute_index_bounds_and_mappings`: Compute the mappings of particle indices from the input interactions to the result interaction. There is a separate mapping for the connected particles.

3. `accumulate_connected_states`: Create an auxiliary state matrix which lists the possible quantum numbers for the connected particles. When building this matrix, count the number of times each assignment is contained in any of the input states and, for each of the input states, record the index of the matrix element within the new state matrix. For the connected particles, reassign color indices such that no color state is present twice in different color-index assignment. Note that helicity assignments of the connected state can be (and will be) off-diagonal, so no spin correlations are lost in decays.

   Do this for both input interactions.

4. `allocate_connection_entries`: Allocate a table of connections. Each table row corresponds to one state in the auxiliary matrix, and to multiple states of the input interactions. It collects all states of the unconnected particles in the two input interactions that are associated with the particular state (quantum-number assignment) of the connected particles.

5. **fill_connection_table**: Fill the table of connections by scanning both input interactions. When copying states, reassign color indices for the unconnected particles such that they match between all involved particle sets (interaction 1, interaction 2, and connected particles).

6. **make_product_interaction**: Scan the table of connections we have just built. For each entry, construct all possible pairs of states of the unconnected particles and combine them with the specific connected-particle state. This is a possible quantum-number assignment of the result interaction. Now mask all quantum numbers that should be summed over, and append this to the result state matrix. Record the matrix element index of the result. We now have the result interaction.

7. **make_pairing_array**: First allocate the pairing array with the number of entries of the result interaction. Then scan the table of connections again. For each entry, record the indices of the matrix elements which have to be multiplied and summed over in order to compute this particular matrix element. This makes up the multiplication table.

8. **record_links**: Transfer all source pointers from the input interactions to the result interaction. Do the same for the internal parent-child relations and resonance assignments. For the connected particles, make up appropriate additional parent-child relations. This allows for fetching momenta from other interactions when a new event is filled, and to reconstruct the event history when the event is analyzed.

After all this is done, for each event, we just have to evaluate the pairing arrays (multiplication tables) in order to compute the result matrix elements in their proper positions. The quantum-number assignments remain fixed from now on.

12.3.5   Creating an evaluator: square

The generic initializer for an evaluator that squares a matrix element. Depending on the provided mask, we select the appropriate specific initializer for either diagonal or non-diagonal helicity density matrices.

⟨*Evaluators: evaluator: TBP*⟩+≡
```
    procedure :: init_square => evaluator_init_square
```

⟨*Evaluators: procedures*⟩+≡
```
    subroutine evaluator_init_square (eval, int_in, qn_mask, &
        col_flow_index, col_factor, col_index_hi, expand_color_flows, nc)
      class(evaluator_t), intent(out), target :: eval
      class(interaction_t), intent(in), target :: int_in
      type(quantum_numbers_mask_t), dimension(:), intent(in) :: qn_mask
      integer, dimension(:,:), intent(in), optional :: col_flow_index
```

```
      complex(default), dimension(:), intent(in), optional :: col_factor
      integer, dimension(:), intent(in), optional :: col_index_hi
      logical, intent(in), optional :: expand_color_flows
      integer, intent(in), optional :: nc
      if (all (qn_mask%diagonal_helicity ())) then
         call eval%init_square_diag (int_in, qn_mask, &
              col_flow_index, col_factor, col_index_hi, expand_color_flows, nc)
      else
         call eval%init_square_nondiag (int_in, qn_mask, &
              col_flow_index, col_factor, col_index_hi, expand_color_flows, nc)
      end if
    end subroutine evaluator_init_square
```

Color-summed squared matrix (diagonal helicities)

The initializer for an evaluator that squares a matrix element, including color factors. The mask must be such that off-diagonal matrix elements are excluded.

If `color_flows` is set, the evaluator keeps color-flow entries separate and drops all interfering color structures. The color factors are set to unity in this case.

There is only one input interaction. The quantum-number mask is an array, one entry for each particle, so they can be treated individually. For academic purposes, we allow for the number of colors being different from three (but 3 is the default).

The algorithm is analogous to multiplication, with a few notable differences:

1. The connected particles are known, the correspondence is one-to-one. All particles are connected, and the mapping of indices is trivial, which simplifies the following steps.

2. `accumulate_connected_states`: The matrix of connected states encompasses all particles, but color indices are removed. However, ghost states are still kept separate from physical color states. No color-index reassignment is necessary.

3. The table of connections contains single index and quantum-number arrays instead of pairs of them. They are paired with themselves in all possible ways.

4. `make_squared_interaction`: Now apply the predefined quantum-numbers mask, which usually collects all color states (physical and ghosts), and possibly a helicity sum.

5. `make_pairing_array`: For each pair of input states, compute the color factor (including a potential ghost-parity sign) and store this in the pairing array together with the matrix-element indices for multiplication.

6. `record_links`: This is again trivial due to the one-to-one correspondence.

Color-summed squared matrix (support nodiagonal helicities)

The initializer for an evaluator that squares a matrix element, including color factors. Unless requested otherwise by the quantum-number mask, the result contains off-diagonal matrix elements. (The input interaction must be diagonal since it represents an amplitude, not a density matrix.)

There is only one input interaction. The quantum-number mask is an array, one entry for each particle, so they can be treated individually. For academic purposes, we allow for the number of colors being different from three (but 3 is the default).

The algorithm is analogous to the previous one, with some additional complications due to the necessity to loop over two helicity indices.

Copy with additional contracted color states

This evaluator involves no square or multiplication, its matrix elements are just copies of the (single) input interaction. However, the state matrix of the interaction contains additional states that have color indices contracted. This is used for copies of the beam or structure-function interactions that need to match the hard interaction also in the case where its color indices coincide.

Auxiliary procedure for initialization

This will become a standard procedure in F2008. The result is true if the
number of true values in the mask is odd. We use the function for determining
the ghost parity of a quantum-number array.

[tho:] It's not used anymore and `mod (count (mask), 2) == 1` is a cooler
implementation anyway.

⟨*(UNUSED) Evaluators: procedures*⟩≡

```

```
      end function evaluator_get_int_in_ptr
```

12.3.6   Creating an evaluator: identity

The identity evaluator creates a copy of the first input evaluator; the second
input is not used.

   All particles link back to the input evaluatorand the internal relations are
copied. As evaluation does take a shortcut by cloning the matrix elements, the
pairing array is not used and does not have to be set up.

⟨*Evaluators: evaluator: TBP*⟩+≡
```
    procedure :: init_identity => evaluator_init_identity
```

⟨*Evaluators: procedures*⟩+≡
```
    subroutine evaluator_init_identity (eval, int)
      class(evaluator_t), intent(out), target :: eval

      integer :: i
      integer, dimension(:), allocatable :: map
      type(state_matrix_t), pointer :: state
      type(state_iterator_t) :: it
      eval%type = EVAL_IDENTITY
      eval%int_in1 => int
      nullify (eval%int_in2)
      n_in = int%get_n_in ()
      n_out = int%get_n_out ()
      n_vir = int%get_n_vir ()
      n_tot = int%get_n_tot ()
      call eval%interaction_t%basic_init (n_in, n_vir, n_out, &
         mask = int%get_mask (), &
         resonant = int%get_resonance_flags ())
      do i = 1, n_tot
         call eval%set_source_link (i, int, i)
      end do
      allocate (map(n_tot))
      map = [(i, i = 1, n_tot)]
      call int%transfer_relations (eval, map)
      state => int%get_state_matrix_ptr ()
      call it%init (state)
      do while (it%is_valid ())
         call eval%add_state (it%get_quantum_numbers (), &
              it%get_me_index ())
         call it%advance ()
      end do
      call eval%freeze ()

    end subroutine evaluator_init_identity
```

12.3.7 Creating an evaluator: quantum number sum

This evaluator operates on the diagonal of a density matrix and sums over the quantum numbers specified by the mask. The optional argument `drop` allows to drop a particle from the resulting density matrix. The handling of virtuals is not completely sane, especially in connection with dropping particles.

When summing over matrix element entries, we keep the separation into entries and normalization (in the corresponding evaluation routine below).

⟨*Evaluators: evaluator: TBP*⟩+≡
```
procedure :: init_qn_sum => evaluator_init_qn_sum
```

⟨*Evaluators: procedures*⟩+≡
```
subroutine evaluator_init_qn_sum (eval, int, qn_mask, drop)
  class(evaluator_t), intent(out), target :: eval
  class(interaction_t), target, intent(in) :: int
  type(quantum_numbers_mask_t), dimension(:), intent(in) :: qn_mask
  logical, intent(in), optional, dimension(:) :: drop
  type(state_iterator_t) :: it_old, it_new
  integer, dimension(:), allocatable :: pairing_size, pairing_target, i_new
  integer, dimension(:), allocatable :: map
  integer :: n_in, n_out, n_vir, n_tot, n_me_old, n_me_new
  integer :: i, j
  type(state_matrix_t), pointer :: state_new, state_old
  type(quantum_numbers_t), dimension(:), allocatable :: qn
  logical :: matched
  logical, dimension(size (qn_mask)) :: dropped
  integer :: ndropped
  integer, dimension(:), allocatable :: inotdropped
  type(quantum_numbers_mask_t), dimension(:), allocatable :: mask
  logical, dimension(:), allocatable :: resonant

  eval%type = EVAL_QN_SUM
  eval%int_in1 => int
  nullify (eval%int_in2)
  if (present (drop)) then
     dropped = drop
  else
     dropped = .false.
  end if
  ndropped = count (dropped)

  n_in = int%get_n_in ()
  n_out = int%get_n_out () - ndropped
  n_vir = int%get_n_vir ()
  n_tot = int%get_n_tot () - ndropped

  allocate (inotdropped (n_tot))
  i = 1
  do j = 1, n_tot + ndropped
     if (dropped (j)) cycle
     inotdropped(i) = j
     i = i + 1
  end do
```

         eval%pairing_array(j)%i1(i_new(j)) = i
      end if
   end do

 end subroutine evaluator_init_qn_sum
```

12.3.8   Evaluation

When the input interactions (which are pointed to in the pairings stored within the evaluator) are filled with values, we can activate the evaluator, i.e., calculate the result values which are stored in the interaction.

The evaluation of matrix elements can be done in parallel. A `forall` construct is not appropriate, however. We would need `do concurrent` here. Nevertheless, the evaluation functions are marked as `pure`.

⟨*Evaluators: evaluator: TBP*⟩+≡

```
    end subroutine evaluator_test
```

Test: Create two interactions. The interactions are twofold connected. The
first connection has a helicity index that is kept, the second connection has a
helicity index that is summed over. Concatenate the interactions in an evaluator,
which thus contains a result interaction. Fill the input interactions with values,
activate the evaluator and print the result.

Chapter 13

Sindarin Built-In Types

Here, we define a couple of types and objects which are useful both internally for WHIZARD, and visible to the user, so they correspond to Sindarin types.

particle_specifiers Expressions for particles and particle alternatives, involving particle names.

pdg_arrays Integer (PDG) codes for particles. Useful for particle aliases (e.g., 'quark' for u, d, s etc.).

jets Define (pseudo)jets as objects. Functional only if the `fastjet` library is linked. (This may change in the future.)

subevents Particle collections built from event records, for use in analysis and other Sindarin expressions

analysis Observables, histograms, and plots.

13.1 Particle Specifiers

In this module we introduce a type for specifying a particle or particle alternative. In addition to the particle specifiers (strings separated by colons), the type contains an optional flag `polarized` and a string `decay`. If the `polarized` flag is set, particle polarization information should be kept when generating events for this process. If the `decay` string is set, it is the ID of a decay process which should be applied to this particle when generating events.

In input/output form, the `polarized` flag is indicated by an asterisk (`*`) in brackets, and the `decay` is indicated by its ID in brackets.

The `read` and `write` procedures in this module are not type-bound but generic procedures which handle scalar and array arguments.

⟨`particle_specifiers.f90`⟩≡
  ⟨*File header*⟩

  module particle_specifiers

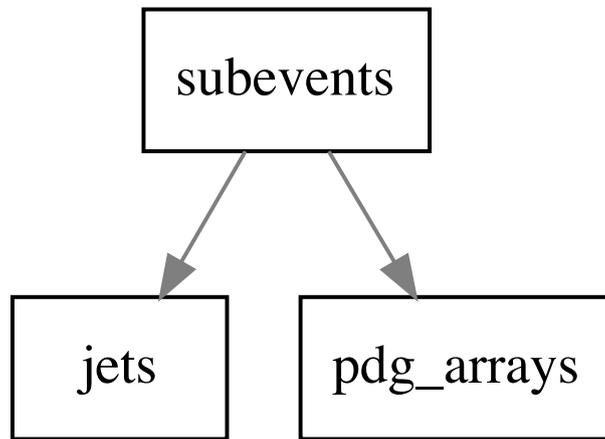
  ⟨*Use strings*⟩
    use io_units
    use diagnostics


Figure 13.1: Module dependencies in `src/types`.

⟨*Standard module head*⟩

⟨*Particle specifiers: public*⟩

⟨*Particle specifiers: types*⟩

⟨*Particle specifiers: interfaces*⟩

```
contains
```

⟨*Particle specifiers: procedures*⟩

```
end module particle_specifiers
```

13.1.1 Base type

This is an abstract type which can hold a single particle or an expression.

⟨*Particle specifiers: types*⟩≡
```
type, abstract :: prt_spec_expr_t
 contains
```
⟨*Particle specifiers: prt spec expr: TBP*⟩
```
end type prt_spec_expr_t
```

Output, as a string.

⟨*Particle specifiers: prt spec expr: TBP*⟩≡
```
procedure (prt_spec_expr_to_string), deferred :: to_string
```

⟨*Particle specifiers: interfaces*⟩≡
```
abstract interface
   function prt_spec_expr_to_string (object) result (string)
     import
     class(prt_spec_expr_t), intent(in) :: object
     type(string_t) :: string
   end function prt_spec_expr_to_string
end interface
```

Call an **expand** method for all enclosed subexpressions (before handling the current expression).

⟨*Particle specifiers: prt spec expr: TBP*⟩+≡
```
procedure (prt_spec_expr_expand_sub), deferred :: expand_sub
```

⟨*Particle specifiers: interfaces*⟩+≡
```
abstract interface
   subroutine prt_spec_expr_expand_sub (object)
     import
     class(prt_spec_expr_t), intent(inout) :: object
   end subroutine prt_spec_expr_expand_sub
end interface
```

13.1.2 Wrapper type

This wrapper can hold a particle expression of any kind. We need it so we can make variadic arrays.

⟨*Particle specifiers: public*⟩≡
```
public :: prt_expr_t
```

⟨*Particle specifiers: types*⟩+≡
```
type :: prt_expr_t
  class(prt_spec_expr_t), allocatable :: x
 contains
 ⟨Particle specifiers: prt expr: TBP⟩
 end type prt_expr_t
```

Output as a string: delegate.

⟨*Particle specifiers: prt expr: TBP*⟩≡
```
procedure :: to_string => prt_expr_to_string
```

⟨*Particle specifiers: procedures*⟩≡
```
recursive function prt_expr_to_string (object) result (string)
  class(prt_expr_t), intent(in) :: object
  type(string_t) :: string
  if (allocated (object%x)) then
     string = object%x%to_string ()
  else
     string = ""
  end if
end function prt_expr_to_string
```

Allocate the expression as a particle specifier and copy the value.

⟨*Particle specifiers: prt expr: TBP*⟩+≡
```
procedure :: init_spec => prt_expr_init_spec
```

⟨*Particle specifiers: procedures*⟩+≡
```
subroutine prt_expr_init_spec (object, spec)
  class(prt_expr_t), intent(out) :: object
  type(prt_spec_t), intent(in) :: spec
  allocate (prt_spec_t :: object%x)
  select type (x => object%x)
  type is (prt_spec_t)
     x = spec
  end select
end subroutine prt_expr_init_spec
```

Allocate as a list/sum and allocate for a given length

⟨*Particle specifiers: prt expr: TBP*⟩+≡
```
procedure :: init_list => prt_expr_init_list
procedure :: init_sum => prt_expr_init_sum
```

⟨*Particle specifiers: procedures*⟩+≡
```
subroutine prt_expr_init_list (object, n)
  class(prt_expr_t), intent(out) :: object
  integer, intent(in) :: n
  allocate (prt_spec_list_t :: object%x)
```

```
      select type (x => object%x)
      type is (prt_spec_list_t)
         allocate (x%expr (n))
      end select
   end subroutine prt_expr_init_list

   subroutine prt_expr_init_sum (object, n)
     class(prt_expr_t), intent(out) :: object
     integer, intent(in) :: n
     allocate (prt_spec_sum_t :: object%x)
     select type (x => object%x)
     type is (prt_spec_sum_t)
        allocate (x%expr (n))
     end select
   end subroutine prt_expr_init_sum
```

Return the number of terms. This is unity, except if the expression is a sum.

⟨*Particle specifiers: prt expr: TBP*⟩+≡
```
   procedure :: get_n_terms => prt_expr_get_n_terms
```

⟨*Particle specifiers: procedures*⟩+≡
```
   function prt_expr_get_n_terms (object) result (n)
     class(prt_expr_t), intent(in) :: object
     integer :: n
     if (allocated (object%x)) then
        select type (x => object%x)
        type is (prt_spec_sum_t)
           n = size (x%expr)
        class default
           n = 1
        end select
     else
        n = 0
     end if
   end function prt_expr_get_n_terms
```

Transform one of the terms, as returned by the previous method, to an array of particle specifiers. The array has more than one entry if the selected term is a list. This makes sense only if the expression has been completely expanded, so the list contains only atoms.

⟨*Particle specifiers: prt expr: TBP*⟩+≡
```
   procedure :: term_to_array => prt_expr_term_to_array
```

⟨*Particle specifiers: procedures*⟩+≡
```
   recursive subroutine prt_expr_term_to_array (object, array, i)
     class(prt_expr_t), intent(in) :: object
     type(prt_spec_t), dimension(:), intent(inout), allocatable :: array
     integer, intent(in) :: i
     integer :: j
     if (allocated (array))  deallocate (array)
     select type (x => object%x)
     type is (prt_spec_t)
        allocate (array (1))
        array(1) = x
```

```
      type is (prt_spec_list_t)
         allocate (array (size (x%expr)))
         do j = 1, size (array)
            select type (y => x%expr(j)%x)
            type is (prt_spec_t)
               array(j) = y
            end select
         end do
      type is (prt_spec_sum_t)
         call x%expr(i)%term_to_array (array, 1)
      end select
    end subroutine prt_expr_term_to_array
```

13.1.3   The atomic type

The trivial case is a single particle, including optional decay and polarization attributes.

Definition

The particle is unstable if the `decay` array is allocated. The `polarized` flag and decays may not be set simultaneously.

⟨*Particle specifiers: public*⟩+≡
```
    public :: prt_spec_t
```

⟨*Particle specifiers: types*⟩+≡
```
    type, extends (prt_spec_expr_t) :: prt_spec_t
      private
      type(string_t) :: name
      logical :: polarized = .false.
      type(string_t), dimension(:), allocatable :: decay
     contains
     ⟨Particle specifiers: prt spec: TBP⟩
    end type prt_spec_t
```

I/O

Output. Old-style subroutines.

⟨*Particle specifiers: public*⟩+≡
```
    public :: prt_spec_write
```

⟨*Particle specifiers: interfaces*⟩+≡
```
    interface prt_spec_write
       module procedure prt_spec_write1
       module procedure prt_spec_write2
    end interface prt_spec_write
```

⟨*Particle specifiers: procedures*⟩+≡
```
    subroutine prt_spec_write1 (object, unit, advance)
      type(prt_spec_t), intent(in) :: object
      integer, intent(in), optional :: unit
      character(len=*), intent(in), optional :: advance
```

```
      character(3) :: adv
      integer :: u
      u = given_output_unit (unit)
      adv = "yes";  if (present (advance))  adv = advance
      write (u, "(A)", advance = adv)  char (object%to_string ())
   end subroutine prt_spec_write1
```

Write an array as a list of particle specifiers.

⟨*Particle specifiers: procedures*⟩+≡
```
   subroutine prt_spec_write2 (prt_spec, unit, advance)
     type(prt_spec_t), dimension(:), intent(in) :: prt_spec
     integer, intent(in), optional :: unit
     character(len=*), intent(in), optional :: advance
     character(3) :: adv
     integer :: u, i
     u = given_output_unit (unit)
     adv = "yes";  if (present (advance))  adv = advance
     do i = 1, size (prt_spec)
        if (i > 1)  write (u, "(A)", advance="no")  ", "
        call prt_spec_write (prt_spec(i), u, advance="no")
     end do
     write (u, "(A)", advance = adv)
   end subroutine prt_spec_write2
```

Read. Input may be string or array of strings.

⟨*Particle specifiers: public*⟩+≡
```
   public :: prt_spec_read
```

⟨*Particle specifiers: interfaces*⟩+≡
```
   interface prt_spec_read
      module procedure prt_spec_read1
      module procedure prt_spec_read2
   end interface prt_spec_read
```

Read a single particle specifier

⟨*Particle specifiers: procedures*⟩+≡
```
   pure subroutine prt_spec_read1 (prt_spec, string)
     type(prt_spec_t), intent(out) :: prt_spec
     type(string_t), intent(in) :: string
     type(string_t) :: arg, buffer
     integer :: b1, b2, c, n, i
     b1 = scan (string, "(")
     b2 = scan (string, ")")
     if (b1 == 0) then
        prt_spec%name = trim (adjustl (string))
     else
        prt_spec%name = trim (adjustl (extract (string, 1, b1-1)))
        arg = trim (adjustl (extract (string, b1+1, b2-1)))
        if (arg == "*") then
           prt_spec%polarized = .true.
        else
           n = 0
           buffer = arg
           do
```

```
                  if (verify (buffer, " ") == 0)  exit
                  n = n + 1
                  c = scan (buffer, "+")
                  if (c == 0)  exit
                  buffer = extract (buffer, c+1)
               end do
               allocate (prt_spec%decay (n))
               buffer = arg
               do i = 1, n
                  c = scan (buffer, "+")
                  if (c == 0)  c = len (buffer) + 1
                  prt_spec%decay(i) = trim (adjustl (extract (buffer, 1, c-1)))
                  buffer = extract (buffer, c+1)
               end do
            end if
         end if
      end subroutine prt_spec_read1
```

Read a particle specifier array, given as a single string. The array is allocated
to the correct size.

⟨*Particle specifiers: procedures*⟩+≡
```
      pure subroutine prt_spec_read2 (prt_spec, string)
        type(prt_spec_t), dimension(:), intent(out), allocatable :: prt_spec
        type(string_t), intent(in) :: string
        type(string_t) :: buffer
        integer :: c, i, n
        n = 0
        buffer = string
        do
           n = n + 1
           c = scan (buffer, ",")
           if (c == 0)  exit
           buffer = extract (buffer, c+1)
        end do
        allocate (prt_spec (n))
        buffer = string
        do i = 1, size (prt_spec)
           c = scan (buffer, ",")
           if (c == 0)  c = len (buffer) + 1
           call prt_spec_read (prt_spec(i), &
                 trim (adjustl (extract (buffer, 1, c-1))))
           buffer = extract (buffer, c+1)
        end do
      end subroutine prt_spec_read2
```

Constructor

Initialize a particle specifier.

⟨*Particle specifiers: public*⟩+≡
```
      public :: new_prt_spec
```

⟨*Particle specifiers: interfaces*⟩+≡
```

```

```
    interface new_prt_spec
       module procedure new_prt_spec
       module procedure new_prt_spec_polarized
       module procedure new_prt_spec_unstable
    end interface new_prt_spec
```

⟨*Particle specifiers: procedures*⟩+≡

```
    elemental function new_prt_spec (name) result (prt_spec)
      type(string_t), intent(in) :: name
      type(prt_spec_t) :: prt_spec
      prt_spec%name = name
    end function new_prt_spec

    elemental function new_prt_spec_polarized (name, polarized) result (prt_spec)
      type(string_t), intent(in) :: name
      logical, intent(in) :: polarized
      type(prt_spec_t) :: prt_spec
      prt_spec%name = name
      prt_spec%polarized = polarized
    end function new_prt_spec_polarized

    pure function new_prt_spec_unstable (name, decay) result (prt_spec)
      type(string_t), intent(in) :: name
      type(string_t), dimension(:), intent(in) :: decay
      type(prt_spec_t) :: prt_spec
      prt_spec%name = name
      allocate (prt_spec%decay (size (decay)))
      prt_spec%decay = decay
    end function new_prt_spec_unstable
```

Access Methods

Return the particle name without qualifiers

⟨*Particle specifiers: prt spec: TBP*⟩≡

```
    procedure :: get_name => prt_spec_get_name
```

⟨*Particle specifiers: procedures*⟩+≡

```
    elemental function prt_spec_get_name (prt_spec) result (name)
      class(prt_spec_t), intent(in) :: prt_spec
      type(string_t) :: name
      name = prt_spec%name
    end function prt_spec_get_name
```

Return the name with qualifiers

⟨*Particle specifiers: prt spec: TBP*⟩+≡

```
    procedure :: to_string => prt_spec_to_string
```

⟨*Particle specifiers: procedures*⟩+≡

```
    function prt_spec_to_string (object) result (string)
      class(prt_spec_t), intent(in) :: object
      type(string_t) :: string
      integer :: i
      string = object%name
```

```
        if (allocated (object%decay)) then
            string = string // "("
            do i = 1, size (object%decay)
                if (i > 1)  string = string // " + "
                string = string // object%decay(i)
            end do
            string = string // ")"
        else if (object%polarized) then
            string = string // "(*)"
        end if
    end function prt_spec_to_string
```

Return the polarization flag

⟨*Particle specifiers: prt spec: TBP*⟩+≡
```
    procedure :: is_polarized => prt_spec_is_polarized
```

⟨*Particle specifiers: procedures*⟩+≡
```
    elemental function prt_spec_is_polarized (prt_spec) result (flag)
      class(prt_spec_t), intent(in) :: prt_spec
      logical :: flag
      flag = prt_spec%polarized
    end function prt_spec_is_polarized
```

The particle is unstable if there is a decay array.

⟨*Particle specifiers: prt spec: TBP*⟩+≡
```
    procedure :: is_unstable => prt_spec_is_unstable
```

⟨*Particle specifiers: procedures*⟩+≡
```
    elemental function prt_spec_is_unstable (prt_spec) result (flag)
      class(prt_spec_t), intent(in) :: prt_spec
      logical :: flag
      flag = allocated (prt_spec%decay)
    end function prt_spec_is_unstable
```

Return the number of decay channels

⟨*Particle specifiers: prt spec: TBP*⟩+≡
```
    procedure :: get_n_decays => prt_spec_get_n_decays
```

⟨*Particle specifiers: procedures*⟩+≡
```
    elemental function prt_spec_get_n_decays (prt_spec) result (n)
      class(prt_spec_t), intent(in) :: prt_spec
      integer :: n
      if (allocated (prt_spec%decay)) then
        n = size (prt_spec%decay)
      else
        n = 0
      end if
    end function prt_spec_get_n_decays
```

Return the decay channels

⟨*Particle specifiers: prt spec: TBP*⟩+≡
```
    procedure :: get_decays => prt_spec_get_decays
```

⟨*Particle specifiers: procedures*⟩+≡
```
subroutine prt_spec_get_decays (prt_spec, decay)
  class(prt_spec_t), intent(in) :: prt_spec
  type(string_t), dimension(:), allocatable, intent(out) :: decay
  if (allocated (prt_spec%decay)) then
     allocate (decay (size (prt_spec%decay)))
     decay = prt_spec%decay
  else
     allocate (decay (0))
  end if
end subroutine prt_spec_get_decays
```

Miscellaneous

There is nothing to expand here:

⟨*Particle specifiers: prt spec: TBP*⟩+≡
```
procedure :: expand_sub => prt_spec_expand_sub
```

⟨*Particle specifiers: procedures*⟩+≡
```
subroutine prt_spec_expand_sub (object)
  class(prt_spec_t), intent(inout) :: object
end subroutine prt_spec_expand_sub
```

13.1.4 List

A list of particle specifiers, indicating, e.g., the final state of a process.

⟨*Particle specifiers: public*⟩+≡
```
public :: prt_spec_list_t
```

⟨*Particle specifiers: types*⟩+≡
```
type, extends (prt_spec_expr_t) :: prt_spec_list_t
   type(prt_expr_t), dimension(:), allocatable :: expr
 contains
 ⟨Particle specifiers: prt spec list: TBP⟩
end type prt_spec_list_t
```

Output: Concatenate the components. Insert brackets if the component is also a list. The components of the `expr` array, if any, should all be filled.

⟨*Particle specifiers: prt spec list: TBP*⟩≡
```
procedure :: to_string => prt_spec_list_to_string
```

⟨*Particle specifiers: procedures*⟩+≡
```
recursive function prt_spec_list_to_string (object) result (string)
  class(prt_spec_list_t), intent(in) :: object
  type(string_t) :: string
  integer :: i
  string = ""
  if (allocated (object%expr)) then
     do i = 1, size (object%expr)
        if (i > 1)  string = string // ", "
        select type (x => object%expr(i)%x)
```

```
            type is (prt_spec_list_t)
               string = string // "(" // x%to_string () // ")"
            class default
               string = string // x%to_string ()
            end select
         end do
      end if
   end function prt_spec_list_to_string
```

Flatten: if there is a subexpression which is also a list, include the components as direct members of the current list.

⟨*Particle specifiers: prt spec list: TBP*⟩+≡
```
   procedure :: flatten => prt_spec_list_flatten
```

⟨*Particle specifiers: procedures*⟩+≡
```
   subroutine prt_spec_list_flatten (object)
     class(prt_spec_list_t), intent(inout) :: object
     type(prt_expr_t), dimension(:), allocatable :: tmp_expr
     integer :: i, n_flat, i_flat
     n_flat = 0
     do i = 1, size (object%expr)
        select type (y => object%expr(i)%x)
        type is (prt_spec_list_t)
           n_flat = n_flat + size (y%expr)
        class default
           n_flat = n_flat + 1
        end select
     end do
     if (n_flat > size (object%expr)) then
        allocate (tmp_expr (n_flat))
        i_flat = 0
        do i = 1, size (object%expr)
           select type (y => object%expr(i)%x)
           type is (prt_spec_list_t)
              tmp_expr (i_flat + 1 : i_flat + size (y%expr)) = y%expr
              i_flat = i_flat + size (y%expr)
           class default
              tmp_expr (i_flat + 1) = object%expr(i)
              i_flat = i_flat + 1
           end select
        end do
     end if
     if (allocated (tmp_expr)) &
          call move_alloc (from = tmp_expr, to = object%expr)
   end subroutine prt_spec_list_flatten
```

Convert a list of sums into a sum of lists. (Subexpressions which are not sums are left untouched.)

⟨*Particle specifiers: procedures*⟩+≡
```
   subroutine distribute_prt_spec_list (object)
     class(prt_spec_expr_t), intent(inout), allocatable :: object
     class(prt_spec_expr_t), allocatable :: new_object
     integer, dimension(:), allocatable :: n, ii
```

```fortran
      integer :: k, n_expr, n_terms, i_term
      select type (object)
      type is (prt_spec_list_t)
         n_expr = size (object%expr)
         allocate (n (n_expr), source = 1)
         allocate (ii (n_expr), source = 1)
         do k = 1, size (object%expr)
            select type (y => object%expr(k)%x)
            type is (prt_spec_sum_t)
               n(k) = size (y%expr)
            end select
         end do
         n_terms = product (n)
         if (n_terms > 1) then
            allocate (prt_spec_sum_t :: new_object)
            select type (new_object)
            type is (prt_spec_sum_t)
               allocate (new_object%expr (n_terms))
               do i_term = 1, n_terms
                  allocate (prt_spec_list_t :: new_object%expr(i_term)%x)
                  select type (x => new_object%expr(i_term)%x)
                  type is (prt_spec_list_t)
                     allocate (x%expr (n_expr))
                     do k = 1, n_expr
                        select type (y => object%expr(k)%x)
                        type is (prt_spec_sum_t)
                           x%expr(k) = y%expr(ii(k))
                        class default
                           x%expr(k) = object%expr(k)
                        end select
                     end do
                  end select
                  INCR_INDEX: do k = n_expr, 1, -1
                     if (ii(k) < n(k)) then
                        ii(k) = ii(k) + 1
                        exit INCR_INDEX
                     else
                        ii(k) = 1
                     end if
                  end do INCR_INDEX
               end do
            end select
         end if
      end select
      if (allocated (new_object)) call move_alloc (from = new_object, to = object)
    end subroutine distribute_prt_spec_list
```

Apply **expand** to all components of the list.

⟨*Particle specifiers: prt spec list: TBP*⟩+≡
```fortran
    procedure :: expand_sub => prt_spec_list_expand_sub
```

⟨*Particle specifiers: procedures*⟩+≡
```fortran
    recursive subroutine prt_spec_list_expand_sub (object)
      class(prt_spec_list_t), intent(inout) :: object
```

```
        integer :: i
        if (allocated (object%expr)) then
           do i = 1, size (object%expr)
              call object%expr(i)%expand ()
           end do
        end if
     end subroutine prt_spec_list_expand_sub
```

13.1.5 Sum

A sum of particle specifiers, indicating, e.g., a sum of final states.

⟨*Particle specifiers: public*⟩+≡
```
     public :: prt_spec_sum_t
```

⟨*Particle specifiers: types*⟩+≡
```
     type, extends (prt_spec_expr_t) :: prt_spec_sum_t
        type(prt_expr_t), dimension(:), allocatable :: expr
      contains
      ⟨Particle specifiers: prt spec sum: TBP⟩
     end type prt_spec_sum_t
```

Output: Concatenate the components. Insert brackets if the component is a list or also a sum. The components of the **expr** array, if any, should all be filled.

⟨*Particle specifiers: prt spec sum: TBP*⟩≡
```
     procedure :: to_string => prt_spec_sum_to_string
```

⟨*Particle specifiers: procedures*⟩+≡
```
     recursive function prt_spec_sum_to_string (object) result (string)
        class(prt_spec_sum_t), intent(in) :: object
        type(string_t) :: string
        integer :: i
        string = ""
        if (allocated (object%expr)) then
           do i = 1, size (object%expr)
              if (i > 1)  string = string // " + "
              select type (x => object%expr(i)%x)
              type is (prt_spec_list_t)
                 string = string // "(" // x%to_string () // ")"
              type is (prt_spec_sum_t)
                 string = string // "(" // x%to_string () // ")"
              class default
                 string = string // x%to_string ()
              end select
           end do
        end if
     end function prt_spec_sum_to_string
```

Flatten: if there is a subexpression which is also a sum, include the components as direct members of the current sum.
    This is identical to **prt_spec_list_flatten** above, except for the type.

⟨*Particle specifiers: prt spec sum: TBP*⟩+≡
```
     procedure :: flatten => prt_spec_sum_flatten
```

⟨*Particle specifiers: procedures*⟩+≡

```
subroutine prt_spec_sum_flatten (object)
  class(prt_spec_sum_t), intent(inout) :: object
  type(prt_expr_t), dimension(:), allocatable :: tmp_expr
  integer :: i, n_flat, i_flat
  n_flat = 0
  do i = 1, size (object%expr)
     select type (y => object%expr(i)%x)
     type is (prt_spec_sum_t)
        n_flat = n_flat + size (y%expr)
        class default
        n_flat = n_flat + 1
     end select
  end do
  if (n_flat > size (object%expr)) then
     allocate (tmp_expr (n_flat))
     i_flat = 0
     do i = 1, size (object%expr)
        select type (y => object%expr(i)%x)
        type is (prt_spec_sum_t)
           tmp_expr (i_flat + 1 : i_flat + size (y%expr)) = y%expr
           i_flat = i_flat + size (y%expr)
        class default
           tmp_expr (i_flat + 1) = object%expr(i)
           i_flat = i_flat + 1
        end select
     end do
  end if
  if (allocated (tmp_expr)) &
       call move_alloc (from = tmp_expr, to = object%expr)
end subroutine prt_spec_sum_flatten
```

Apply expand to all terms in the sum.

⟨*Particle specifiers: prt spec sum: TBP*⟩+≡

```
procedure :: expand_sub => prt_spec_sum_expand_sub
```

⟨*Particle specifiers: procedures*⟩+≡

```
recursive subroutine prt_spec_sum_expand_sub (object)
  class(prt_spec_sum_t), intent(inout) :: object
  integer :: i
  if (allocated (object%expr)) then
     do i = 1, size (object%expr)
        call object%expr(i)%expand ()
     end do
  end if
end subroutine prt_spec_sum_expand_sub
```

13.1.6 Expression Expansion

The `expand` method transforms each particle specifier expression into a sum of lists, according to the rules

$$a, (b, c) \rightarrow a, b, c \qquad (13.1)$$

$$a + (b + c) \rightarrow a + b + c \qquad (13.2)$$

$$a, b + c \rightarrow (a, b) + (a, c) \qquad (13.3)$$

Note that the precedence of comma and plus are opposite to this expansion, so the parentheses in the final expression are necessary.

We assume that subexpressions are filled, i.e., arrays are allocated.

⟨*Particle specifiers: prt expr: TBP*⟩+≡
```
procedure :: expand => prt_expr_expand
```

⟨*Particle specifiers: procedures*⟩+≡
```
recursive subroutine prt_expr_expand (expr)
  class(prt_expr_t), intent(inout) :: expr
  if (allocated (expr%x)) then
     call distribute_prt_spec_list (expr%x)
     call expr%x%expand_sub ()
     select type (x => expr%x)
     type is (prt_spec_list_t)
        call x%flatten ()
     type is (prt_spec_sum_t)
        call x%flatten ()
     end select
  end if
end subroutine prt_expr_expand
```

13.1.7 Unit Tests

Test module, followed by the corresponding implementation module.

⟨`particle_specifiers_ut.f90`⟩≡
  ⟨*File header*⟩

```
module particle_specifiers_ut
  use unit_tests
  use particle_specifiers_uti
```

  ⟨*Standard module head*⟩

  ⟨*Particle specifiers: public test*⟩

```
contains
```

  ⟨*Particle specifiers: test driver*⟩

```
end module particle_specifiers_ut
```

⟨particle_specifiers_uti.f90⟩≡
  ⟨*File header*⟩

  module particle_specifiers_uti

  ⟨*Use strings*⟩

    use particle_specifiers

  ⟨*Standard module head*⟩

  ⟨*Particle specifiers: test declarations*⟩

  contains

  ⟨*Particle specifiers: tests*⟩

  end module particle_specifiers_uti

API: driver for the unit tests below.

⟨*Particle specifiers: public test*⟩≡
    public :: particle_specifiers_test

⟨*Particle specifiers: test driver*⟩≡
```
    subroutine particle_specifiers_test (u, results)

13.2   PDG arrays

For defining aliases, we introduce a special type which holds a set of (integer)
PDG codes.

⟨pdg_arrays.f90⟩≡
  ⟨*File header*⟩

```
  module pdg_arrays

    use io_units
    use sorting
    use physics_defs, only: UNDEFINED
```

  ⟨*Standard module head*⟩

  ⟨*PDG arrays: public*⟩

  ⟨*PDG arrays: types*⟩

  ⟨*PDG arrays: interfaces*⟩

```
  contains
```

⟨PDG arrays: procedures⟩

```
  end module pdg_arrays
```

13.2.1   Type definition

Using an allocatable array eliminates the need for initializer and/or finalizer.

⟨PDG arrays: public⟩≡

```
    public :: pdg_array_t
```

⟨PDG arrays: types⟩≡

```
    type :: pdg_array_t
       private
       integer, dimension(:), allocatable :: pdg
     contains
     ⟨PDG arrays: pdg array: TBP⟩
    end type pdg_array_t
```

Output

⟨PDG arrays: public⟩+≡

```
    public :: pdg_array_write
```

⟨PDG arrays: pdg array: TBP⟩≡

```
    procedure :: write => pdg_array_write
```

⟨PDG arrays: procedures⟩≡

```
    subroutine pdg_array_write (aval, unit)
      class(pdg_array_t), intent(in) :: aval
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit);  if (u < 0)  return
      write (u, "(A)", advance="no")  "PDG("
      if (allocated (aval%pdg)) then
         do i = 1, size (aval%pdg)
            if (i > 1)  write (u, "(A)", advance="no")  ", "
            write (u, "(I0)", advance="no")  aval%pdg(i)
         end do
      end if
      write (u, "(A)", advance="no")  ")"
    end subroutine pdg_array_write
```

⟨PDG arrays: public⟩+≡

```
    public :: pdg_array_write_set
```

⟨PDG arrays: procedures⟩+≡

```
    subroutine pdg_array_write_set (aval, unit)
      type(pdg_array_t), intent(in), dimension(:) :: aval
      integer, intent(in), optional :: unit
      integer :: i
      do i = 1, size (aval)
         call aval(i)%write (unit)
         print *, ''
      end do
    end subroutine pdg_array_write_set
```

13.2.2 Basic operations

Assignment. We define assignment from and to an integer array. Note that the integer array, if it is the l.h.s., must be declared allocatable by the caller.

⟨*PDG arrays: public*⟩+≡

```
public :: assignment(=)
```

⟨*PDG arrays: interfaces*⟩≡

```
interface assignment(=)
   module procedure pdg_array_from_int_array
   module procedure pdg_array_from_int
   module procedure int_array_from_pdg_array
end interface
```

⟨*PDG arrays: procedures*⟩+≡

```
subroutine pdg_array_from_int_array (aval, iarray)
  type(pdg_array_t), intent(out) :: aval
  integer, dimension(:), intent(in) :: iarray
  allocate (aval%pdg (size (iarray)))
  aval%pdg = iarray
end subroutine pdg_array_from_int_array

elemental subroutine pdg_array_from_int (aval, int)
  type(pdg_array_t), intent(out) :: aval
  integer, intent(in) :: int
  allocate (aval%pdg (1))
  aval%pdg = int
end subroutine pdg_array_from_int

subroutine int_array_from_pdg_array (iarray, aval)
  integer, dimension(:), allocatable, intent(out) :: iarray
  type(pdg_array_t), intent(in) :: aval
  if (allocated (aval%pdg)) then
     allocate (iarray (size (aval%pdg)))
     iarray = aval%pdg
  else
     allocate (iarray (0))
  end if
end subroutine int_array_from_pdg_array
```

Allocate space for a PDG array

⟨*PDG arrays: public*⟩+≡

```
public :: pdg_array_init
```

⟨*PDG arrays: procedures*⟩+≡

```
subroutine pdg_array_init (aval, n_elements)
  type(pdg_array_t), intent(inout) :: aval
  integer, intent(in) :: n_elements
  allocate(aval%pdg(n_elements))
end subroutine pdg_array_init
```

Deallocate a previously allocated pdg array

⟨*PDG arrays: public*⟩+≡

```
public :: pdg_array_delete
```

⟨PDG arrays: procedures⟩+≡
```
    subroutine pdg_array_delete (aval)
      type(pdg_array_t), intent(inout) :: aval
      if (allocated (aval%pdg)) deallocate (aval%pdg)
    end subroutine pdg_array_delete
```

Merge two pdg arrays, i.e. append a particle string to another leaving out doublettes

⟨PDG arrays: public⟩+≡
```
    public :: pdg_array_merge
```

⟨PDG arrays: procedures⟩+≡
```
    subroutine pdg_array_merge (aval1, aval2)
      type(pdg_array_t), intent(inout) :: aval1
      type(pdg_array_t), intent(in) :: aval2
      type(pdg_array_t) :: aval
      if (allocated (aval1%pdg) .and. allocated (aval2%pdg)) then
        if (.not. any (aval1%pdg == aval2%pdg)) aval = aval1 // aval2
      else if (allocated (aval1%pdg)) then
        aval = aval1
      else if (allocated (aval2%pdg)) then
        aval = aval2
      end if
      call pdg_array_delete (aval1)
      aval1 = aval%pdg
    end subroutine pdg_array_merge
```

Length of the array.

⟨PDG arrays: public⟩+≡
```
    public :: pdg_array_get_length
```

⟨PDG arrays: pdg array: TBP⟩+≡
```
    procedure :: get_length => pdg_array_get_length
```

⟨PDG arrays: procedures⟩+≡
```
    elemental function pdg_array_get_length (aval) result (n)
      class(pdg_array_t), intent(in) :: aval
      integer :: n
      if (allocated (aval%pdg)) then
        n = size (aval%pdg)
      else
        n = 0
      end if
    end function pdg_array_get_length
```

Return the element with index i.

⟨PDG arrays: public⟩+≡
```
    public :: pdg_array_get
```

⟨PDG arrays: pdg array: TBP⟩+≡
```
    procedure :: get => pdg_array_get
```

⟨*PDG arrays: procedures*⟩+≡
```
    elemental function pdg_array_get (aval, i) result (pdg)
      class(pdg_array_t), intent(in) :: aval
      integer, intent(in), optional :: i
      integer :: pdg
      if (present (i)) then
         pdg = aval%pdg(i)
      else
         pdg = aval%pdg(1)
      end if
    end function pdg_array_get
```

Explicitly set the element with index i.

⟨*PDG arrays: pdg array: TBP*⟩+≡
```
    procedure :: set => pdg_array_set
```

⟨*PDG arrays: procedures*⟩+≡
```
    subroutine pdg_array_set (aval, i, pdg)
      class(pdg_array_t), intent(inout) :: aval
      integer, intent(in) :: i
      integer, intent(in) :: pdg
      aval%pdg(i) = pdg
    end subroutine pdg_array_set
```

⟨*PDG arrays: pdg array: TBP*⟩+≡
```
    procedure :: add => pdg_array_add
```

⟨*PDG arrays: procedures*⟩+≡
```
    function pdg_array_add (aval, aval_add) result (aval_out)
      type(pdg_array_t) :: aval_out
      class(pdg_array_t), intent(in) :: aval
      type(pdg_array_t), intent(in) :: aval_add
      integer :: n, n_add, i
      n = size (aval%pdg)
      n_add = size (aval_add%pdg)
      allocate (aval_out%pdg (n + n_add))
      aval_out%pdg(1:n) = aval%pdg
      do i = 1, n_add
         aval_out%pdg(n+i) = aval_add%pdg(i)
      end do
    end function pdg_array_add
```

Replace element with index i by a new array of elements.

⟨*PDG arrays: public*⟩+≡
```
    public :: pdg_array_replace
```

⟨*PDG arrays: pdg array: TBP*⟩+≡
```
    procedure :: replace => pdg_array_replace
```

⟨*PDG arrays: procedures*⟩+≡
```
    function pdg_array_replace (aval, i, pdg_new) result (aval_new)
      class(pdg_array_t), intent(in) :: aval
      integer, intent(in) :: i
      integer, dimension(:), intent(in) :: pdg_new
```

775

```
      type(pdg_array_t) :: aval_new
      integer :: n, l
      n = size (aval%pdg)
      l = size (pdg_new)
      allocate (aval_new%pdg (n + l - 1))
      aval_new%pdg(:i-1) = aval%pdg(:i-1)
      aval_new%pdg(i:i+l-1) = pdg_new
      aval_new%pdg(i+l:) = aval%pdg(i+1:)
    end function pdg_array_replace
```

Concatenate two PDG arrays

⟨*PDG arrays: public*⟩+≡
```
    public :: operator(//)
```

⟨*PDG arrays: interfaces*⟩+≡
```
    interface operator(//)
       module procedure concat_pdg_arrays
    end interface
```

⟨*PDG arrays: procedures*⟩+≡
```
    function concat_pdg_arrays (aval1, aval2) result (aval)
      type(pdg_array_t) :: aval
      type(pdg_array_t), intent(in) :: aval1, aval2
      integer :: n1, n2
      if (allocated (aval1%pdg) .and. allocated (aval2%pdg)) then
         n1 = size (aval1%pdg)
         n2 = size (aval2%pdg)
         allocate (aval%pdg (n1 + n2))
         aval%pdg(:n1) = aval1%pdg
         aval%pdg(n1+1:) = aval2%pdg
      else if (allocated (aval1%pdg)) then
         aval = aval1
      else if (allocated (aval2%pdg)) then
         aval = aval2
      end if
    end function concat_pdg_arrays
```

13.2.3   Matching

A PDG array matches a given PDG code if the code is present within the array.
If either one is zero (UNDEFINED), the match also succeeds.

⟨*PDG arrays: public*⟩+≡
```
    public :: operator(.match.)
```

⟨*PDG arrays: interfaces*⟩+≡
```
    interface operator(.match.)
       module procedure pdg_array_match_integer
       module procedure pdg_array_match_pdg_array
    end interface
```

Match a single code against the array.

⟨PDG arrays: procedures⟩+≡
```
  elemental function pdg_array_match_integer (aval, pdg) result (flag)
    logical :: flag
    type(pdg_array_t), intent(in) :: aval
    integer, intent(in) :: pdg
    if (allocated (aval%pdg)) then
       flag = pdg == UNDEFINED &
            .or. any (aval%pdg == UNDEFINED) &
            .or. any (aval%pdg == pdg)
    else
       flag = .false.
    end if
  end function pdg_array_match_integer
```

Check if the pdg-number corresponds to a quark

⟨PDG arrays: public⟩+≡
```
  public :: is_quark
```

⟨PDG arrays: procedures⟩+≡
```
  elemental function is_quark (pdg_nr)
    logical :: is_quark
    integer, intent(in) :: pdg_nr
    if (abs (pdg_nr) >= 1 .and. abs (pdg_nr) <= 6) then
       is_quark = .true.
    else
       is_quark = .false.
    end if
  end function is_quark
```

Check if pdg-number corresponds to a gluon

⟨PDG arrays: public⟩+≡
```
  public :: is_gluon
```

⟨PDG arrays: procedures⟩+≡
```
  elemental function is_gluon (pdg_nr)
    logical :: is_gluon
    integer, intent(in) :: pdg_nr
    if (pdg_nr == 21) then
       is_gluon = .true.
    else
       is_gluon = .false.
    end if
  end function is_gluon
```

Check if pdg-number corresponds to a photon

⟨PDG arrays: public⟩+≡
```
  public :: is_photon
```

⟨PDG arrays: procedures⟩+≡
```
  elemental function is_photon (pdg_nr)
    logical :: is_photon
    integer, intent(in) :: pdg_nr
```

```
         if (pdg_nr == 22) then
            is_photon = .true.
         else
            is_photon = .false.
         end if
      end function is_photon
```

Check if pdg-number corresponds to a colored particle

⟨*PDG arrays: public*⟩+≡
```
      public :: is_colored
```

⟨*PDG arrays: procedures*⟩+≡
```
      elemental function is_colored (pdg_nr)
        logical :: is_colored
        integer, intent(in) :: pdg_nr
        is_colored = is_quark (pdg_nr) .or. is_gluon (pdg_nr)
      end function is_colored
```

Check if the pdg-number corresponds to a lepton

⟨*PDG arrays: public*⟩+≡
```
      public :: is_lepton
```

⟨*PDG arrays: procedures*⟩+≡
```
      elemental function is_lepton (pdg_nr)
        logical :: is_lepton
        integer, intent(in) :: pdg_nr
        if (abs (pdg_nr) >= 11 .and. abs (pdg_nr) <= 16) then
          is_lepton = .true.
        else
          is_lepton = .false.
        end if
      end function is_lepton
```

⟨*PDG arrays: public*⟩+≡
```
      public :: is_fermion
```

⟨*PDG arrays: procedures*⟩+≡
```
      elemental function is_fermion (pdg_nr)
        logical :: is_fermion
        integer, intent(in) :: pdg_nr
        is_fermion = is_lepton(pdg_nr) .or. is_quark(pdg_nr)
      end function is_fermion
```

Check if the pdg-number corresponds to a massless vector boson

⟨*PDG arrays: public*⟩+≡
```
      public :: is_massless_vector
```

⟨*PDG arrays: procedures*⟩+≡
```
      elemental function is_massless_vector (pdg_nr)
        integer, intent(in) :: pdg_nr
        logical :: is_massless_vector
        if (pdg_nr == 21 .or. pdg_nr == 22) then
          is_massless_vector = .true.
```

```
        else
          is_massless_vector = .false.
        end if
    end function is_massless_vector
```

Check if pdg-number corresponds to a massive vector boson

⟨*PDG arrays: public*⟩+≡
```
    public :: is_massive_vector
```

⟨*PDG arrays: procedures*⟩+≡
```
    elemental function is_massive_vector (pdg_nr)
      integer, intent(in) :: pdg_nr
      logical :: is_massive_vector
      if (abs (pdg_nr) == 23 .or. abs (pdg_nr) == 24) then
        is_massive_vector = .true.
      else
        is_massive_vector = .false.
      end if
    end function is_massive_vector
```

Check if pdg-number corresponds to a vector boson

⟨*PDG arrays: public*⟩+≡
```
    public :: is_vector
```

⟨*PDG arrays: procedures*⟩+≡
```
    elemental function is_vector (pdg_nr)
      integer, intent(in) :: pdg_nr
      logical :: is_vector
      if (is_massless_vector (pdg_nr) .or. is_massive_vector (pdg_nr)) then
        is_vector = .true.
      else
        is_vector = .false.
      end if
    end function is_vector
```

Check if particle is elementary.

⟨*PDG arrays: public*⟩+≡
```
    public :: is_elementary
```

⟨*PDG arrays: procedures*⟩+≡
```
    elemental function is_elementary (pdg_nr)
      integer, intent(in) :: pdg_nr
      logical :: is_elementary
      if (is_vector (pdg_nr) .or. is_fermion (pdg_nr) .or. pdg_nr == 25) then
         is_elementary = .true.
      else
         is_elementary = .false.
      end if
    end function is_elementary
```

Check if particle is strongly interacting

⟨*PDG arrays: pdg array: TBP*⟩+≡
```
    procedure :: has_colored_particles => pdg_array_has_colored_particles
```

⟨PDG arrays: procedures⟩+≡

```
function pdg_array_has_colored_particles (pdg) result (colored)
  class(pdg_array_t), intent(in) :: pdg
  logical :: colored
  integer :: i, pdg_nr
  colored = .false.
  do i = 1, size (pdg%pdg)
    pdg_nr = pdg%pdg(i)
    if (is_quark (pdg_nr) .or. is_gluon (pdg_nr)) then
      colored = .true.
      exit
    end if
  end do
end function pdg_array_has_colored_particles
```

Match two arrays. Succeeds if any pair of entries matches.

⟨PDG arrays: procedures⟩+≡

```
function pdg_array_match_pdg_array (aval1, aval2) result (flag)
  logical :: flag
  type(pdg_array_t), intent(in) :: aval1, aval2
  if (allocated (aval1%pdg) .and. allocated (aval2%pdg)) then
    flag = any (aval1 .match. aval2%pdg)
  else
    flag = .false.
  end if
end function pdg_array_match_pdg_array
```

Comparison. Here, we take the PDG arrays as-is, assuming that they are sorted.

The ordering is a bit odd: first, we look only at the absolute values of the PDG codes. If they all match, the particle comes before the antiparticle, scanning from left to right.

⟨PDG arrays: public⟩+≡

```
public :: operator(<)
public :: operator(>)
public :: operator(<=)
public :: operator(>=)
public :: operator(==)
public :: operator(/=)
```

⟨PDG arrays: interfaces⟩+≡

```
interface operator(<)
  module procedure pdg_array_lt

    end function pdg_array_inequivalent
```

13.2.4 Sorting

Sort a PDG array by absolute value, particle before antiparticle. After sorting,
we eliminate double entries.

⟨*PDG arrays: public*⟩+≡
```
    public :: sort_abs
```

⟨*PDG arrays: interfaces*⟩+≡
```
    interface sort_abs
       module procedure pdg_array_sort_abs
    end interface
```

⟨*PDG arrays: pdg array: TBP*⟩+≡
```
    procedure :: sort_abs => pdg_array_sort_abs
```

⟨*PDG arrays: procedures*⟩+≡
```
    function pdg_array_sort_abs (aval1, unique) result (aval2)
      class(pdg_array_t), intent(in) :: aval1
      logical, intent(in), optional :: unique
      type(pdg_array_t) :: aval2
      integer, dimension(:), allocatable :: tmp
      logical, dimension(:), allocatable :: mask
      integer :: i, n
      logical :: uni
      uni = .false.;  if (present (unique))  uni = unique
      n = size (aval1%pdg)
      if (uni) then
         allocate (tmp (n), mask(n))
         tmp = sort_abs (aval1%pdg)
         mask(1) = .true.
         do i = 2, n
            mask(i) = tmp(i) /= tmp(i-1)
         end do
         allocate (aval2%pdg (count (mask)))
         aval2%pdg = pack (tmp, mask)
      else
         allocate (aval2%pdg (n))
         aval2%pdg = sort_abs (aval1%pdg)
      end if
    end function pdg_array_sort_abs
```

⟨*PDG arrays: pdg array: TBP*⟩+≡
```
    procedure :: intersect => pdg_array_intersect
```

⟨*PDG arrays: procedures*⟩+≡
```
    function pdg_array_intersect (aval1, match) result (aval2)
      class(pdg_array_t), intent(in) :: aval1
      integer, dimension(:) :: match
      type(pdg_array_t) :: aval2
      integer, dimension(:), allocatable :: isec
```

```
     integer :: i
     isec = pack (aval1%pdg, [(any(aval1%pdg(i) == match), i=1,size(aval1%pdg))])
     aval2 = isec
   end function pdg_array_intersect
```

⟨*PDG arrays: pdg array: TBP*⟩+≡
```

```
⟨*PDG arrays: procedures*⟩+≡
```
    elemental function pdg_array_search_for_particle (pdg, i_part) result (found)
      class(pdg_array_t), intent(in) :: pdg
      integer, intent(in) :: i_part
      logical :: found
      found = any (pdg%pdg == i_part)
    end function pdg_array_search_for_particle
```

⟨*PDG arrays: pdg array: TBP*⟩+≡
```
    procedure :: invert => pdg_array_invert
```
⟨*PDG arrays: procedures*⟩+≡
```
    function pdg_array_invert (pdg) result (pdg_inverse)
      class(pdg_array_t), intent(in) :: pdg
      type(pdg_array_t) :: pdg_inverse
      integer :: i, n
      n = size (pdg%pdg)
      allocate (pdg_inverse%pdg (n))
      do i = 1, n
         select case (pdg%pdg(i))
         case (21, 22, 23, 25)
            pdg_inverse%pdg(i) = pdg%pdg(i)
         case default
            pdg_inverse%pdg(i) = -pdg%pdg(i)
         end select
      end do
    end function pdg_array_invert
```

13.2.5   PDG array list

A PDG array list, or PDG list, is an array of PDG-array objects with some
convenience methods.

⟨*PDG arrays: public*⟩+≡
```
    public :: pdg_list_t
```
⟨*PDG arrays: types*⟩+≡
```
    type :: pdg_list_t
      type(pdg_array_t), dimension(:), allocatable :: a
     contains
```
     ⟨*PDG arrays: pdg list: TBP*⟩
```
    end type pdg_list_t
```

Output, as a comma-separated list without advancing I/O.

⟨*PDG arrays: pdg list: TBP*⟩≡
```
    procedure :: write => pdg_list_write
```

⟨PDG arrays: procedures⟩+≡
```
    subroutine pdg_list_write (object, unit)
      class(pdg_list_t), intent(in) :: object
      integer, intent(in), optional :: unit
      integer :: u, i
      u = given_output_unit (unit)
      if (allocated (object%a)) then
         do i = 1, size (object%a)
            if (i > 1)  write (u, "(A)", advance="no")  ", "
            call object%a(i)%write (u)
         end do
      end if
    end subroutine pdg_list_write
```

Initialize for a certain size. The entries are initially empty PDG arrays.

⟨PDG arrays: pdg list: TBP⟩+≡
```
    generic :: init => pdg_list_init_size
    procedure, private :: pdg_list_init_size
```

⟨PDG arrays: procedures⟩+≡
```
    subroutine pdg_list_init_size (pl, n)
      class(pdg_list_t), intent(out) :: pl
      integer, intent(in) :: n
      allocate (pl%a (n))
    end subroutine pdg_list_init_size
```

Initialize with a definite array of PDG codes. That is, each entry in the list becomes a single-particle PDG array.

⟨PDG arrays: pdg list: TBP⟩+≡
```
    generic :: init => pdg_list_init_int_array
    procedure, private :: pdg_list_init_int_array
```

⟨PDG arrays: procedures⟩+≡
```
    subroutine pdg_list_init_int_array (pl, pdg)
      class(pdg_list_t), intent(out) :: pl
      integer, dimension(:), intent(in) :: pdg
      integer :: i
      allocate (pl%a (size (pdg)))
      do i = 1, size (pdg)
         pl%a(i) = pdg(i)
      end do
    end subroutine pdg_list_init_int_array
```

Set one of the entries. No bounds-check.

⟨PDG arrays: pdg list: TBP⟩+≡
```
    generic :: set => pdg_list_set_int
    generic :: set => pdg_list_set_int_array
    generic :: set => pdg_list_set_pdg_array
    procedure, private :: pdg_list_set_int
    procedure, private :: pdg_list_set_int_array
    procedure, private :: pdg_list_set_pdg_array
```

⟨*PDG arrays: procedures*⟩+≡
```
    subroutine pdg_list_set_int (pl, i, pdg)
      class(pdg_list_t), intent(inout) :: pl
      integer, intent(in) :: i
      integer, intent(in) :: pdg
      pl%a(i) = pdg
    end subroutine pdg_list_set_int

    subroutine pdg_list_set_int_array (pl, i, pdg)
      class(pdg_list_t), intent(inout) :: pl
      integer, intent(in) :: i
      integer, dimension(:), intent(in) :: pdg
      pl%a(i) = pdg
    end subroutine pdg_list_set_int_array

    subroutine pdg_list_set_pdg_array (pl, i, pa)
      class(pdg_list_t), intent(inout) :: pl
      integer, intent(in) :: i
      type(pdg_array_t), intent(in) :: pa
      pl%a(i) = pa
    end subroutine pdg_list_set_pdg_array
```

Array size, not the length of individual entries

⟨*PDG arrays: pdg list: TBP*⟩+≡
```
    procedure :: get_size => pdg_list_get_size
```

⟨*PDG arrays: procedures*⟩+≡
```
    function pdg_list_get_size (pl) result (n)
      class(pdg_list_t), intent(in) :: pl
      integer :: n
      if (allocated (pl%a)) then
         n = size (pl%a)
      else
         n = 0
      end if
    end function pdg_list_get_size
```

Return an entry, as a PDG array.

⟨*PDG arrays: pdg list: TBP*⟩+≡
```
    procedure :: get => pdg_list_get
```

⟨*PDG arrays: procedures*⟩+≡
```
    function pdg_list_get (pl, i) result (pa)
      type(pdg_array_t) :: pa
      class(pdg_list_t), intent(in) :: pl
      integer, intent(in) :: i
      pa = pl%a(i)

           end if
        end if
     end do
  end do
end function pdg_list_is_regular
```

Sort the list. First, each entry gets sorted, including elimination of doublers. Then, we sort the list, using the first member of each PDG array as the marker. No removal of doublers at this stage.

If **n_in** is supplied, we do not reorder the first **n_in** particle entries.

```

Compare sorted lists. The result is undefined if some entries are not allocated.

The ordering is quite complicated. First, a shorter list comes before a longer
list. Comparing entry by entry, a shorter entry comes first. Next, we check
the first PDG code within corresponding entries. This is compared by absolute
value. If equal, particle comes before antiparticle. Finally, if all is equal, the
result is false.

13.3 Jets

The FastJet library is linked externally, if available. The wrapper code is also in a separate directory. Here, we define WHIZARD-specific procedures and tests.

⟨jets.f90⟩≡

  ⟨File header⟩

  module jets

    use fastjet !NODEP!

  ⟨Standard module head⟩

  ⟨Jets: public⟩

  contains

  ⟨Jets: procedures⟩

  end module jets

13.3.1 Re-exported symbols

We use this module as a proxy for the FastJet interface, therefore we re-export some symbols.

⟨Jets: public⟩≡
```
    public :: fastjet_available
    public :: fastjet_init
    public :: jet_definition_t
    public :: pseudojet_t
    public :: pseudojet_vector_t
    public :: cluster_sequence_t
    public :: assignment (=)
```

The initialization routine prints the banner.

⟨Jets: procedures⟩≡
```
    subroutine fastjet_init ()
      call print_banner ()
    end subroutine fastjet_init
```

The jet algorithm codes (actually, integers)

⟨Jets: public⟩+≡
```
    public :: kt_algorithm
    public :: cambridge_algorithm
    public :: antikt_algorithm
    public :: genkt_algorithm
    public :: cambridge_for_passive_algorithm
    public :: genkt_for_passive_algorithm
    public :: ee_kt_algorithm
    public :: ee_genkt_algorithm
    public :: plugin_algorithm
    public :: undefined_jet_algorithm
```

13.3.2 Unit tests

Test module, followed by the corresponding implementation module.

⟨jets_ut.f90⟩≡
  ⟨*File header*⟩

```
module jets_ut
  use unit_tests
  use jets_uti
```

  ⟨*Standard module head*⟩

  ⟨*Jets: public test*⟩

```
contains
```

  ⟨*Jets: test driver*⟩

```
end module jets_ut
```

⟨jets_uti.f90⟩≡
  ⟨*File header*⟩

```
module jets_uti
```

  ⟨*Use kinds*⟩
```
  use fastjet !NODEP!

  use jets
```

  ⟨*Standard module head*⟩

  ⟨*Jets: test declarations*⟩

```
contains
```

  ⟨*Jets: tests*⟩

```
end module jets_uti
```

API: driver for the unit tests below.

⟨*Jets: public test*⟩≡
```
  public :: jets_test
```

⟨*Jets: test driver*⟩≡
```
  subroutine jets_test (u, results)
    integer, intent(in) :: u
    type (test_results_t), intent(inout) :: results
```
  ⟨*Jets: execute tests*⟩
```
  end subroutine jets_test
```

This test is actually the minimal example from the FastJet manual, translated to Fortran.

Note that FastJet creates pseudojet vectors, which we mirror in the `pseudojet_vector_t`, but immediately assign to pseudojet arrays. Without automatic finalization available in the compilers, we should avoid this in actual code and rather introduce intermediate variables for those objects, which we can finalize explicitly.

⟨*Jets: execute tests*⟩≡
```
call test (jets_1, "jets_1", &
     "basic FastJet functionality", &
     u, results)
```

⟨*Jets: test declarations*⟩≡
```
public :: jets_1
```

⟨*Jets: tests*⟩≡
```
subroutine jets_1 (u)
  integer, intent(in) :: u

  type(pseudojet_t), dimension(:), allocatable :: prt, jets, constituents
  type(jet_definition_t) :: jet_def
  type(cluster_sequence_t) :: cs

  integer, parameter :: dp = default
  integer :: i, j

  write (u, "(A)")  "* Test output: jets_1"
  write (u, "(A)")  "*   Purpose: test basic FastJet functionality"
  write (u, "(A)")

  write (u, "(A)")  "* Print banner"
  call print_banner ()

end do
do i = 1, size (jets)
   call jets(i)%final ()
end do
call jet_def%final ()
call cs%final ()

write (u, "(A)")
write (u, "(A)")  "* Test output end: jets_1"

end subroutine jets_1
```

13.4 Subevents

The purpose of subevents is to store the relevant part of the physical event (either partonic or hadronic), and to hold particle selections and combinations which are constructed in cut or analysis expressions.

⟨`subevents.f90`⟩≡
  ⟨*File header*⟩

```
  module subevents

    use, intrinsic :: iso_c_binding !NODEP!
```

  ⟨*Use kinds*⟩
```
    use io_units
    use format_defs, only: FMT_14, FMT_19
    use format_utils, only: pac_fmt
    use physics_defs
    use sorting
    use c_particles
    use lorentz
    use pdg_arrays
    use jets
```

  ⟨*Standard module head*⟩

  ⟨*Subevents: public*⟩

  ⟨*Subevents: parameters*⟩

  ⟨*Subevents: types*⟩

  ⟨*Subevents: interfaces*⟩

```
  contains
```

  ⟨*Subevents: procedures*⟩

```
  end module subevents
```

13.4.1 Particles

For the purpose of this module, a particle has a type which can indicate a beam, incoming, outgoing, or composite particle, flavor and helicity codes (integer, undefined for composite), four-momentum and invariant mass squared. (Other particles types are used in extended event types, but also defined here.) Furthermore, each particle has an allocatable array of ancestors – particle indices which indicate the building blocks of a composite particle. For an incoming/outgoing particle, the array contains only the index of the particle itself.

For incoming particles, the momentum is inverted before storing it in the particle object.

⟨*Subevents: parameters*⟩≡
```
    integer, parameter, public :: PRT_UNDEFINED = 0
```

```
integer, parameter, public :: PRT_BEAM = -9
integer, parameter, public :: PRT_INCOMING = 1
integer, parameter, public :: PRT_OUTGOING = 2
integer, parameter, public :: PRT_COMPOSITE = 3
integer, parameter, public :: PRT_VIRTUAL = 4
integer, parameter, public :: PRT_RESONANT = 5
integer, parameter, public :: PRT_BEAM_REMNANT = 9
```

The type

We initialize only the type here and mark as unpolarized. The initializers below do the rest. The logicals is_b_jet and is_c_jet are true only if prt_t comes out of the subevt_cluster routine and fulfils the correct flavor content.

⟨*Subevents: public*⟩≡
```
public :: prt_t
```

⟨*Subevents: types*⟩≡
```
type :: prt_t
   private
   integer :: type = PRT_UNDEFINED
   integer :: pdg
   logical :: polarized = .false.
   logical :: colorized = .false.
   logical :: clustered = .false.
   logical :: is_b_jet = .false.
   logical :: is_c_jet = .false.
   integer :: h
   type(vector4_t) :: p
   real(default) :: p2
   integer, dimension(:), allocatable :: src
   integer, dimension(:), allocatable :: col
   integer, dimension(:), allocatable :: acl
end type prt_t
```

Initializers. Polarization is set separately. Finalizers are not needed.

⟨*Subevents: procedures*⟩≡
```
subroutine prt_init_beam (prt, pdg, p, p2, src)
  type(prt_t), intent(out) :: prt
  integer, intent(in) :: pdg
  type(vector4_t), intent(in) :: p
  real(default), intent(in) :: p2
  integer, dimension(:), intent(in) :: src
  prt%type = PRT_BEAM
  call prt_set (prt, pdg, - p, p2, src)
end subroutine prt_init_beam

subroutine prt_init_incoming (prt, pdg, p, p2, src)
  type(prt_t), intent(out) :: prt
  integer, intent(in) :: pdg
  type(vector4_t), intent(in) :: p
  real(default), intent(in) :: p2
  integer, dimension(:), intent(in) :: src
```

```
      prt%type = PRT_INCOMING
      call prt_set (prt, pdg, - p, p2, src)
    end subroutine prt_init_incoming

    subroutine prt_init_outgoing (prt, pdg, p, p2, src)
      type(prt_t), intent(out) :: prt
      integer, intent(in) :: pdg
      type(vector4_t), intent(in) :: p
      real(default), intent(in) :: p2
      integer, dimension(:), intent(in) :: src
      prt%type = PRT_OUTGOING
      call prt_set (prt, pdg, p, p2, src)
    end subroutine prt_init_outgoing

    subroutine prt_init_composite (prt, p, src)
      type(prt_t), intent(out) :: prt
      type(vector4_t), intent(in) :: p
      integer, dimension(:), intent(in) :: src
      prt%type = PRT_COMPOSITE
      call prt_set (prt, 0, p, p**2, src)
    end subroutine prt_init_composite
```

This version is for temporary particle objects, so the `src` array is not set.

⟨*Subevents: public*⟩+≡
```
    public :: prt_init_combine
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine prt_init_combine (prt, prt1, prt2)
      type(prt_t), intent(out) :: prt
      type(prt_t), intent(in) :: prt1, prt2
      type(vector4_t) :: p
      integer, dimension(0) :: src
      prt%type = PRT_COMPOSITE
      p = prt1%p + prt2%p
      call prt_set (prt, 0, p, p**2, src)
    end subroutine prt_init_combine
```

Init from a pseudojet object.

⟨*Subevents: procedures*⟩+≡
```
    subroutine prt_init_pseudojet (prt, jet, src, pdg, is_b_jet, is_c_jet)
      type(prt_t), intent(out) :: prt
      type(pseudojet_t), intent(in) :: jet
      integer, dimension(:), intent(in) :: src
      integer, intent(in) :: pdg
      logical, intent(in) :: is_b_jet, is_c_jet
      type(vector4_t) :: p

Setting data

Set the PDG, momentum and momentum squared, and ancestors. If allocate-on-assignment is available, this can be simplified.

⟨Subevents: procedures⟩+≡
```
    subroutine prt_set (prt, pdg, p, p2, src)
      type(prt_t), intent(inout) :: prt
      integer, intent(in) :: pdg
      type(vector4_t), intent(in) :: p
      real(default), intent(in) :: p2
      integer, dimension(:), intent(in) :: src
      prt%pdg = pdg
      prt%p = p
      prt%p2 = p2
      if (allocated (prt%src)) then
         if (size (src) /= size (prt%src)) then
            deallocate (prt%src)
            allocate (prt%src (size (src)))
         end if
      else
         allocate (prt%src (size (src)))
      end if
      prt%src = src
    end subroutine prt_set
```

Set the particle PDG code separately.

⟨Subevents: procedures⟩+≡
```
    elemental subroutine prt_set_pdg (prt, pdg)
      type(prt_t), intent(inout) :: prt
      integer, intent(in) :: pdg
      prt%pdg = pdg
```

```
        end subroutine prt_set_pdg
```

Set the momentum separately.

⟨*Subevents: procedures*⟩+≡
```
    elemental subroutine prt_set_p (prt, p)
      type(prt_t), intent(inout) :: prt
      type(vector4_t), intent(in) :: p
      prt%p = p
    end subroutine prt_set_p
```

Set the squared invariant mass separately.

⟨*Subevents: procedures*⟩+≡
```
    elemental subroutine prt_set_p2 (prt, p2)
      type(prt_t), intent(inout) :: prt
      real(default), intent(in) :: p2
      prt%p2 = p2
    end subroutine prt_set_p2
```

Set helicity (optional).

⟨*Subevents: procedures*⟩+≡
```
    subroutine prt_polarize (prt, h)
      type(prt_t), intent(inout) :: prt
      integer, intent(in) :: h
      prt%polarized = .true.
      prt%h = h
    end subroutine prt_polarize
```

Set color-flow indices (optional).

⟨*Subevents: procedures*⟩+≡
```
    subroutine prt_colorize (prt, col, acl)
      type(prt_t), intent(inout) :: prt
      integer, dimension(:), intent(in) :: col, acl
      prt%colorized = .true.
      prt%col = col
      prt%acl = acl
    end subroutine prt_colorize
```

Conversion

Transform a `prt_t` object into a `c_prt_t` object.

⟨*Subevents: public*⟩+≡
```
    public :: c_prt
```

⟨*Subevents: interfaces*⟩≡
```
    interface c_prt
       module procedure c_prt_from_prt
    end interface
```

⟨*Subevents: procedures*⟩+≡
```fortran
    elemental function c_prt_from_prt (prt) result (c_prt)
      type(c_prt_t) :: c_prt
      type(prt_t), intent(in) :: prt
      c_prt = prt%p
      c_prt%type = prt%type
      c_prt%pdg = prt%pdg
      if (prt%polarized) then
         c_prt%polarized = 1
      else
         c_prt%polarized = 0
      end if
      c_prt%h = prt%h
    end function c_prt_from_prt
```

end subroutine prt_write
```

Tools

Two particles match if their `src` arrays are the same.

⟨*Subevents: public*⟩+≡
```
   public :: operator(.match.)
```

⟨*Subevents: interfaces*⟩+≡
```
   interface operator(.match.)
      module procedure prt_match
   end interface
```

⟨*Subevents: procedures*⟩+≡
```
   elemental function prt_match (prt1, prt2) result (match)
     logical :: match
     type(prt_t), intent(in) :: prt1, prt2
     if (size (prt1%src) == size (prt2%src)) then
        match = all (prt1%src == prt2%src)
     else
        match = .false.
     end if
   end function prt_match
```

The combine operation makes a pseudoparticle whose momentum is the result of adding (the momenta of) the pair of input particles. We trace the particles from which a particle is built by storing a `src` array. Each particle entry in the

`src` list contains a list of indices which indicates its building blocks. The indices refer to an original list of particles. Index lists are sorted, and they contain no element more than once.

We thus require that in a given pseudoparticle, each original particle occurs at most once.

The result is intent(inout), so it will not be initialized when the subroutine is entered.

If the particles carry color, we recall that the combined particle is a composite which is understood as outgoing. If one of the arguments is an incoming particle, is color entries must be reversed.

⟨*Subevents: procedures*⟩+≡

```
subroutine prt_combine (prt, prt_in1, prt_in2, ok)
  type(prt_t), intent(inout) :: prt
  type(prt_t), intent(in) :: prt_in1, prt_in2
  logical :: ok
  integer, dimension(:), allocatable :: src
  integer, dimension(:), allocatable :: col1, acl1, col2, acl2
  call combine_index_lists (src, prt_in1%src, prt_in2%src)
  ok = allocated (src)
  if (ok) then
     call prt_init_composite (prt, prt_in1%p + prt_in2%p, src)
     if (prt_in1%colorized .or. prt_in2%colorized) then
        select case (prt_in1%type)
        case default
           call prt_get_color_indices (prt_in1, col1, acl1)
        case (PRT_BEAM, PRT_INCOMING)
           call prt_get_color_indices (prt_in1, acl1, col1)
        end select
        select case (prt_in2%type)
        case default
           call prt_get_color_indices (prt_in2, col2, acl2)
        case (PRT_BEAM, PRT_INCOMING)
           call prt_get_color_indices (prt_in2, acl2, col2)
        end select
        call prt_colorize (prt, [col1, col2], [acl1, acl2])
     end if
  end if
end subroutine prt_combine
```

This variant does not produce the combined particle, it just checks whether the combination is valid (no common `src` entry).

⟨*Subevents: public*⟩+≡

```
public :: are_disjoint
```

⟨*Subevents: procedures*⟩+≡

```
function are_disjoint (prt_in1, prt_in2) result (flag)
  logical :: flag
  type(prt_t), intent(in) :: prt_in1, prt_in2
  flag = index_lists_are_disjoint (prt_in1%src, prt_in2%src)
end function are_disjoint
```

`src` Lists with length > 1 are built by a `combine` operation which merges the lists

in a sorted manner. If the result would have a duplicate entry, it is discarded, and the result is unallocated.

⟨*Subevents: procedures*⟩+≡
```fortran
    subroutine combine_index_lists (res, src1, src2)
      integer, dimension(:), intent(in) :: src1, src2
      integer, dimension(:), allocatable :: res
      integer :: i1, i2, i
      allocate (res (size (src1) + size (src2)))
      if (size (src1) == 0) then
         res = src2
         return
      else if (size (src2) == 0) then
         res = src1
         return
      end if
      i1 = 1
      i2 = 1
      LOOP: do i = 1, size (res)
         if (src1(i1) < src2(i2)) then
            res(i) = src1(i1);  i1 = i1 + 1
            if (i1 > size (src1)) then
               res(i+1:) = src2(i2:)
               exit LOOP
            end if
         else if (src1(i1) > src2(i2)) then
            res(i) = src2(i2);  i2 = i2 + 1
            if (i2 > size (src2)) then
               res(i+1:) = src1(i1:)
               exit LOOP
            end if
         else
            deallocate (res)
            exit LOOP
         end if
      end do LOOP
    end subroutine combine_index_lists
```

This function is similar, but it does not actually merge the list, it just checks whether they are disjoint (no common `src` entry).

⟨*Subevents: procedures*⟩+≡
```fortran
    function index_lists_are_disjoint (src1, src2) result (flag)
      logical :: flag
      integer, dimension(:), intent(in) :: src1, src2
      integer :: i1, i2, i
      flag = .true.
      i1 = 1
      i2 = 1
      LOOP: do i = 1, size (src1) + size (src2)
         if (src1(i1) < src2(i2)) then
            i1 = i1 + 1
            if (i1 > size (src1)) then
               exit LOOP
            end if
```

```
        else if (src1(i1) > src2(i2)) then
            i2 = i2 + 1
            if (i2 > size (src2)) then
                exit LOOP
            end if
        else
            flag = .false.
            exit LOOP
        end if
      end do LOOP
   end function index_lists_are_disjoint
```

13.4.2   subevents

Particles are collected in subevents. This type is implemented as a dynamically allocated array, which need not be completely filled. The value n_active determines the number of meaningful entries.

Type definition

⟨*Subevents: public*⟩+≡
```
    public :: subevt_t
```

⟨*Subevents: types*⟩+≡
```
    type :: subevt_t
      private
      integer :: n_active = 0
      type(prt_t), dimension(:), allocatable :: prt
     contains
     ⟨Subevents: subevt: TBP⟩
    end type subevt_t
```

Initialize, allocating with size zero (default) or given size. The number of contained particles is set equal to the size.

⟨*Subevents: public*⟩+≡
```
    public :: subevt_init
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine subevt_init (subevt, n_active)
      type(subevt_t), intent(out) :: subevt
      integer, intent(in), optional :: n_active
      if (present (n_active))  subevt%n_active = n_active
      allocate (subevt%prt (subevt%n_active))
    end subroutine subevt_init
```

(Re-)allocate the subevent with some given size. If the size is greater than the previous one, do a real reallocation. Otherwise, just reset the recorded size. Contents are untouched, but become invalid.

⟨*Subevents: public*⟩+≡
```
    public :: subevt_reset
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine subevt_reset (subevt, n_active)
      type(subevt_t), intent(inout) :: subevt
      integer, intent(in) :: n_active
      subevt%n_active = n_active
      if (subevt%n_active > size (subevt%prt)) then
         deallocate (subevt%prt)

Operations with subevents

The join operation joins two subevents. When appending the elements of the
second list, we check for each particle whether it is already in the first list. If
yes, it is discarded. The result list should be initialized already.

If a mask is present, it refers to the second subevent. Particles where the
mask is not set are discarded.

⟨*Subevents: public*⟩+≡
```
    public :: subevt_join
```

⟨*Subevents: procedures*⟩+≡
```
    subroutine subevt_join (subevt, pl1, pl2, mask2)
      type(subevt_t), intent(inout) :: subevt
      type(subevt_t), intent(in) :: pl1, pl2
      logical, dimension(:), intent(in), optional :: mask2
      integer :: n1, n2, i, n
      n1 = pl1%n_active
      n2 = pl2%n_active
      call subevt_reset (subevt, n1 + n2)
      subevt%prt(:n1)   = pl1%prt(:n1)
      n = n1
      if (present (mask2)) then
         do i = 1, pl2%n_active
            if (mask2(i)) then
               if (disjoint (i)) then
                  n = n + 1
                  subevt%prt(n) = pl2%prt(i)
               end if
            end if
         end do
      else
         do i = 1, pl2%n_active
            if (disjoint (i)) then
               n = n + 1
               subevt%prt(n) = pl2%prt(i)
            end if
         end do
      end if
      subevt%n_active = n
```

```
      contains
        function disjoint (i) result (flag)
          integer, intent(in) :: i
          logical :: flag
          integer :: j
          do j = 1, pl1%n_active
             if (.not. are_disjoint (pl1%prt(j), pl2%prt(i))) then
                flag = .false.
                return
             end if
          end do
          flag = .true.
        end function disjoint
      end subroutine subevt_join
```

The combine operation makes a subevent whose entries are the result of adding
(the momenta of) each pair of particles in the input lists. We trace the particles
from which a particles is built by storing a `src` array. Each particle entry in the
`src` list contains a list of indices which indicates its building blocks. The indices
refer to an original list of particles. Index lists are sorted, and they contain no
element more than once.

We thus require that in a given pseudoparticle, each original particle occurs
at most once.

⟨*Subevents: public*⟩+≡
```
      public :: subevt_combine
```

⟨*Subevents: procedures*⟩+≡
```
      subroutine subevt_combine (subevt, pl1, pl2, mask12)
        type(subevt_t), intent(inout) :: subevt
        type(subevt_t), intent(in) :: pl1, pl2
        logical, dimension(:,:), intent(in), optional :: mask12
        integer :: n1, n2, i1, i2, n, j
        logical :: ok
        n1 = pl1%n_active
        n2 = pl2%n_active
        call subevt_reset (subevt, n1 * n2)
        n = 1
        do i1 = 1, n1
           do i2 = 1, n2
              if (present (mask12)) then
                 ok = mask12(i1,i2)
              else
                 ok = .true.
              end if
              if (ok)  call prt_combine &
                   (subevt%prt(n), pl1%prt(i1), pl2%prt(i2), ok)
              if (ok) then
                 CHECK_DOUBLES: do j = 1, n - 1
                    if (subevt%prt(n) .match. subevt%prt(j)) then
                       ok = .false.;  exit CHECK_DOUBLES
                    end if
                 end do CHECK_DOUBLES
                 if (ok)  n = n + 1
```

```
            end if
         end do
      end do
      subevt%n_active = n - 1
   end subroutine subevt_combine
```

The collect operation makes a single-entry subevent which results from combining (the momenta of) all particles in the input list. As above, the result does not contain an original particle more than once; this is checked for each particle when it is collected. Furthermore, each entry has a mask; where the mask is false, the entry is dropped.

   (Thus, if the input particles are already composite, there is some chance that the result depends on the order of the input list and is not as expected. This situation should be avoided.)

           end if
        end if
     end do
   end subroutine subevt_collect
```

The cluster operation is similar to `collect`, but applies a jet algorithm. The result is a subevent consisting of jets and, possibly, unclustered extra particles. As above, the result does not contain an original particle more than once; this is checked for each particle when it is collected. Furthermore, each entry has a mask; where the mask is false, the entry is dropped.

   The algorithm: first determine the (pseudo)particles that participate in the clustering. They should not overlap, and the mask entry must be set. We then cluster the particles, using the given jet definition. The result particles are retrieved from the cluster sequence. We still have to determine the source indices for each jet: for each input particle, we get the jet index. Accumulating the source entries for all particles that are part of a given jet, we derive the jet

source entries. Finally, we delete the C structures that have been constructed by FastJet and its interface.

         end if
      end do
    end subroutine subevt_select_pdg_code
```

13.4.3 Eliminate numerical noise

This is useful for testing purposes: set entries to zero that are smaller in absolute values than a given tolerance parameter.

Note: instead of setting the tolerance in terms of EPSILON (kind-dependent), we fix it to 10^{-16}, which is the typical value for double precision. The reason is that there are situations where intermediate representations (external libraries, files) are limited to double precision, even if the main program uses higher precision.

⟨*Subevents: public*⟩+≡

```

13.5 Analysis tools

This module defines structures useful for data analysis. These include observables, histograms, and plots.

Observables are quantities that are calculated and summed up event by event. At the end, one can compute the average and error.

Histograms have their bins in addition to the observable properties. Histograms are usually written out in tables and displayed graphically.

In plots, each record creates its own entry in a table. This can be used for scatter plots if called event by event, or for plotting dependencies on parameters if called once per integration run.

Graphs are container for histograms and plots, which carry their own graphics options.

The type layout is still somewhat obfuscated. This would become much simpler if type extension could be used.

```

13.5.2   Graph options

These parameters are used for displaying data. They apply to a whole graph, which may contain more than one plot element.

The GAMELAN code chunks are part of both graph_options and drawing_options. The drawing_options copy is used in histograms and plots, also as graph elements. The graph_options copy is used for graph objects as a whole. Both copies are usually identical.

    end subroutine drawing_options_set
```

There are sepate commands for drawing the curve and for drawing errors. The symbols are applied to the latter. First of all, we may have to compute a baseline:

⟨Analysis: procedures⟩+≡

```
function drawing_options_get_calc_command (dro) result (cmd)
  type(string_t) :: cmd
  type(drawing_options_t), intent(in) :: dro
  if (dro%with_base) then
     cmd = "calculate " // dro%dataset // ".base (" // dro%dataset // ") " &
           // "(x, #0);"
  else
     cmd = ""
  end if
end function drawing_options_get_calc_command
```

Return the drawing command.

⟨Analysis: procedures⟩+≡

```
function drawing_options_get_draw_command (dro) result (cmd)
  type(string_t) :: cmd
  type(drawing_options_t), intent(in) :: dro
  if (dro%fill) then
     cmd = "fill"
  else if (dro%draw) then
     cmd = "draw"
  else
     cmd = ""
  end if
  if (dro%fill .or. dro%draw) then
     if (dro%piecewise)  cmd = cmd // " piecewise"
     if (dro%draw .and. dro%with_base)  cmd = cmd // " cyclic"
     cmd = cmd // " from (" // dro%dataset
     if (dro%with_base) then
        if (dro%piecewise) then
           cmd = cmd // ", " // dro%dataset // ".base/\"  ! "
        else
           cmd = cmd // " ~ " // dro%dataset // ".base\"  ! "
        end if
     end if
     cmd = cmd // ")"
     if (dro%fill) then
        cmd = cmd // " " // dro%fill_options
        if (dro%draw)  cmd = cmd // " outlined"
     end if
     if (dro%draw)  cmd = cmd // " " // dro%draw_options
     cmd = cmd // ";"
  end if
end function drawing_options_get_draw_command
```

The error command draws error bars, if any.

⟨Analysis: procedures⟩+≡

```
function drawing_options_get_err_command (dro) result (cmd)
  type(string_t) :: cmd
  type(drawing_options_t), intent(in) :: dro
```

844

```
        if (dro%err) then
           cmd = "draw piecewise " &
                // "from (" // dro%dataset // ".err)" &

       type(string_t) :: cmd
       type(drawing_options_t), intent(in) :: dro
       cmd = dro%gmlcode_fg
     end function drawing_options_get_gml_fg_command
```

13.5.4 Observables

The observable type holds the accumulated observable values and weight sums which are necessary for proper averaging.

⟨*Analysis: types*⟩+≡
```
     type :: observable_t
       private
       real(default) :: sum_values = 0
       real(default) :: sum_squared_values = 0
       real(default) :: sum_weights = 0
       real(default) :: sum_squared_weights = 0
       integer :: count = 0
       type(string_t) :: obs_label
```

```
      type(string_t) :: obs_unit
      type(graph_options_t) :: graph_options
    end type observable_t
```

Initialize with defined properties

⟨*Analysis: procedures*⟩+≡
```
    subroutine observable_init (obs, obs_label, obs_unit, graph_options)
      type(observable_t), intent(out) :: obs
      type(string_t), intent(in), optional :: obs_label, obs_unit
      type(graph_options_t), intent(in), optional :: graph_options
      if (present (obs_label)) then
         obs%obs_label = obs_label
      else
         obs%obs_label = ""
      end if
      if (present (obs_unit)) then
         obs%obs_unit = obs_unit
      else
         obs%obs_unit = ""
      end if
      if (present (graph_options)) then
         obs%graph_options = graph_options
      else
         call graph_options_init (obs%graph_options)
      end if
    end subroutine observable_init
```

Reset all numeric entries.

⟨*Analysis: procedures*⟩+≡
```
    subroutine observable_clear (obs)
      type(observable_t), intent(inout) :: obs
      obs%sum_values = 0
      obs%sum_squared_values = 0
      obs%sum_weights = 0
      obs%sum_squared_weights = 0
      obs%count = 0
    end subroutine observable_clear
```

Record a a value. Always successful for observables.

⟨*Analysis: interfaces*⟩≡
```
    interface observable_record_value
       module procedure observable_record_value_unweighted
       module procedure observable_record_value_weighted
    end interface
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine observable_record_value_unweighted (obs, value, success)
      type(observable_t), intent(inout) :: obs
      real(default), intent(in) :: value
      logical, intent(out), optional :: success
      obs%sum_values = obs%sum_values + value
      obs%sum_squared_values = obs%sum_squared_values + value**2
```

```
    obs%sum_weights = obs%sum_weights + 1
    obs%sum_squared_weights = obs%sum_squared_weights + 1
    obs%count = obs%count + 1
    if (present (success))  success = .true.
  end subroutine observable_record_value_unweighted

  subroutine observable_record_value_weighted (obs, value, weight, success)
    type(observable_t), intent(inout) :: obs
    real(default), intent(in) :: value, weight
    logical, intent(out), optional :: success
    obs%sum_values = obs%sum_values + value * weight
    obs%sum_squared_values = obs%sum_squared_values + value**2 * weight
    obs%sum_weights = obs%sum_weights + abs (weight)
    obs%sum_squared_weights = obs%sum_squared_weights + weight**2
    obs%count = obs%count + 1
    if (present (success))  success = .true.
  end subroutine observable_record_value_weighted
```

Here are the statistics formulas:

1. Unweighted case: Given a sample of n values x_i, the average is

$$\langle x \rangle = \frac{\sum x_i}{n} \tag{13.4}$$

and the error estimate

$$\Delta x = \sqrt{\frac{1}{n-1} \langle \sum (x_i - \langle x \rangle)^2 \rangle} \tag{13.5}$$

$$= \sqrt{\frac{1}{n-1} \left(\frac{\sum x_i^2}{n} - \frac{(\sum x_i)^2}{n^2} \right)} \tag{13.6}$$

2. Weighted case: Instead of weight 1, each event comes with weight w_i.

$$\langle x \rangle = \frac{\sum x_i w_i}{\sum w_i} \tag{13.7}$$

and

$$\Delta x = \sqrt{\frac{1}{n-1} \left(\frac{\sum x_i^2 w_i}{\sum w_i} - \frac{(\sum x_i w_i)^2}{(\sum w_i)^2} \right)} \tag{13.8}$$

For $w_i = 1$, this specializes to the previous formula.

$\langle \textit{Analysis: procedures} \rangle + \equiv$
```
    function observable_get_n_entries (obs) result (n)
      integer :: n
      type(observable_t), intent(in) :: obs

    end type histogram_t
```

Initializer/finalizer

Initialize a histogram. We may provide either the bin width or the number of bins. A finalizer is not needed, since the histogram contains no pointer (sub)components.

⟨*Analysis: interfaces*⟩+≡
```
    interface histogram_init
       module procedure histogram_init_n_bins
       module procedure histogram_init_bin_width
    end interface
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine histogram_init_n_bins (h, id, &
         lower_bound, upper_bound, n_bins, normalize_bins, &
         obs_label, obs_unit, graph_options, drawing_options)
      type(histogram_t), intent(out) :: h
      type(string_t), intent(in) :: id
      real(default), intent(in) :: lower_bound, upper_bound
```

```
    integer, intent(in) :: n_bins
    logical, intent(in) :: normalize_bins
    type(string_t), intent(in), optional :: obs_label, obs_unit
    type(graph_options_t), intent(in), optional :: graph_options
    type(drawing_options_t), intent(in), optional :: drawing_options
    real(default) :: bin_width
    integer :: i
    call observable_init (h%obs_within_bounds, obs_label, obs_unit)
    call observable_init (h%obs, obs_label, obs_unit)
    h%lower_bound = lower_bound
    h%upper_bound = upper_bound
    h%n_bins = max (n_bins, 1)
    h%width = h%upper_bound - h%lower_bound
    h%normalize_bins = normalize_bins
    bin_width = h%width / h%n_bins
    allocate (h%bin (h%n_bins))
    call bin_init (h%underflow, h%lower_bound, 0._default)
    do i = 1, h%n_bins
       call bin_init (h%bin(i), &
            h%lower_bound - bin_width/2 + i * bin_width, bin_width)
    end do
    call bin_init (h%overflow, h%upper_bound, 0._default)
    if (present (graph_options)) then
       h%graph_options = graph_options
    else
       call graph_options_init (h%graph_options)
    end if
    call graph_options_set (h%graph_options, id = id)
    if (present (drawing_options)) then
       h%drawing_options = drawing_options
    else
       call drawing_options_init_histogram (h%drawing_options)
    end if
  end subroutine histogram_init_n_bins

  subroutine histogram_init_bin_width (h, id, &
       lower_bound, upper_bound, bin_width, normalize_bins, &
       obs_label, obs_unit, graph_options, drawing_options)

         lower_bound, upper_bound, n_bins, normalize_bins, &
         obs_label, obs_unit, graph_options, drawing_options)
```

```
    end subroutine histogram_init_bin_width
```

Initialize a histogram by copying another one.

Since `h` has no pointer (sub)components, intrinsic assignment is sufficient. Optionally, we replace the drawing options.

⟨*Analysis: procedures*⟩+≡

```
    subroutine histogram_init_histogram (h, h_in, drawing_options)
      type(histogram_t), intent(out) :: h
      type(histogram_t), intent(in) :: h_in
      type(drawing_options_t), intent(in), optional :: drawing_options
      h = h_in
      if (present (drawing_options)) then
         h%drawing_options = drawing_options
      end if
    end subroutine histogram_init_histogram
```

Fill histograms

Clear the histogram contents, but do not modify the structure.

⟨*Analysis: procedures*⟩+≡

```
    subroutine histogram_clear (h)
      type(histogram_t), intent(inout) :: h
      call observable_clear (h%obs)
      call observable_clear (h%obs_within_bounds)
      call bin_clear (h%underflow)
      if (allocated (h%bin))  call bin_clear (h%bin)
      call bin_clear (h%overflow)
    end subroutine histogram_clear
```

Record a value. Successful if the value is within bounds, otherwise it is recorded as under-/overflow. Optionally, we may provide an excess weight that could be returned by the unweighting procedure.

⟨*Analysis: procedures*⟩+≡

```
    subroutine histogram_record_value_unweighted (h, value, excess, success)
      type(histogram_t), intent(inout) :: h
      real(default), intent(in) :: value
      real(default), intent(in), optional :: excess
      logical, intent(out), optional :: success
      integer :: i_bin
      call observable_record_value (h%obs, value)
      if (h%width /= 0) then
         i_bin = floor (((value - h%lower_bound) / h%width) * h%n_bins) + 1
      else
         i_bin = 0
      end if
      if (i_bin <= 0) then
         call bin_record_value (h%underflow, .false., 1._default, excess)
         if (present (success))  success = .false.
      else if (i_bin <= h%n_bins) then
         call observable_record_value (h%obs_within_bounds, value)
         call bin_record_value &
```

```
          (h%bin(i_bin), h%normalize_bins, 1._default, excess)
       if (present (success))  success = .true.
    else
       call bin_record_value (h%overflow, .false., 1._default, excess)
       if (present (success))  success = .false.
    end if
  end subroutine histogram_record_value_unweighted
```

Weighted events: analogous, but no excess weight.

⟨*Analysis: procedures*⟩+≡
```
  subroutine histogram_record_value_weighted (h, value, weight, success)
    type(histogram_t), intent(inout) :: h
    real(default), intent(in) :: value, weight
    logical, intent(out), optional :: success
    integer :: i_bin
    call observable_record_value (h%obs, value, weight)
    if (h%width /= 0) then
       i_bin = floor (((value - h%lower_bound) / h%width) * h%n_bins) + 1
    else
       i_bin = 0
    end if
    if (i_bin <= 0) then
       call bin_record_value (h%underflow, .false., weight)
       if (present (success))  success = .false.
    else if (i_bin <= h%n_bins) then
       call observable_record_value (h%obs_within_bounds, value, weight)
       call bin_record_value (h%bin(i_bin), h%normalize_bins, weight)
       if (present (success))  success = .true.
    else
       call bin_record_value (h%overflow, .false., weight)
       if (present (success))  success = .false.
    end if
  end subroutine histogram_record_value_weighted
```

Access contents

Inherited from the observable component (all-over average etc.)

⟨*Analysis: procedures*⟩+≡
```
  function histogram_get_n_entries (h) result (n)
    integer :: n
    type(histogram_t), intent(in) :: h
    n = observable_get_n_entries (h%obs)
  end function histogram_get_n_entries

  function histogram_get_average (h) result (avg)
    real(default) :: avg
    type(histogram_t), intent(in) :: h
    avg = observable_get_average (h%obs)
  end function histogram_get_average

  function histogram_get_error (h) result (err)
    real(default) :: err
```

```
      type(histogram_t), intent(in) :: h
      err = observable_get_error (h%obs)
    end function histogram_get_error
```

Analogous, but applied only to events within bounds.

⟨*Analysis: procedures*⟩+≡
```
    function histogram_get_n_entries_within_bounds (h) result (n)
      integer :: n
      type(histogram_t), intent(in) :: h
      n = observable_get_n_entries (h%obs_within_bounds)
    end function histogram_get_n_entries_within_bounds

    function histogram_get_average_within_bounds (h) result (avg)
      real(default) :: avg
      type(histogram_t), intent(in) :: h
      avg = observable_get_average (h%obs_within_bounds)
    end function histogram_get_average_within_bounds

    function histogram_get_error_within_bounds (h) result (err)
      real(default) :: err
      type(histogram_t), intent(in) :: h
      err = observable_get_error (h%obs_within_bounds)
    end function histogram_get_error_within_bounds
```

Get the number of bins

⟨*Analysis: procedures*⟩+≡
```
    function histogram_get_n_bins (h) result (n)
      type(histogram_t), intent(in) :: h
      integer :: n
      n = h%n_bins
    end function histogram_get_n_bins
```

Check bins. If the index is zero or above the limit, return the results for underflow or overflow, respectively.

⟨*Analysis: procedures*⟩+≡
```
    function histogram_get_n_entries_for_bin (h, i) result (n)
      integer :: n
      type(histogram_t), intent(in) :: h
      integer, intent(in) :: i
      if (i <= 0) then

       type(point_t), pointer :: last => null ()
       integer :: count = 0
       type(graph_options_t) :: graph_options
       type(drawing_options_t) :: drawing_options
    end type plot_t
```

Initializer/finalizer

Initialize a plot. We provide the lower and upper bound in the x direction.

⟨*Analysis: interfaces*⟩+≡

```
    interface plot_init
       module procedure plot_init_empty
       module procedure plot_init_plot
    end interface
```

⟨*Analysis: procedures*⟩+≡

```
    subroutine plot_init_empty (p, id, graph_options, drawing_options)
      type(plot_t), intent(out) :: p
      type(string_t), intent(in) :: id
      type(graph_options_t), intent(in), optional :: graph_options
      type(drawing_options_t), intent(in), optional :: drawing_options
      if (present (graph_options)) then
         p%graph_options = graph_options
      else
         call graph_options_init (p%graph_options)
      end if
      call graph_options_set (p%graph_options, id = id)
      if (present (drawing_options)) then
         p%drawing_options = drawing_options
      else
         call drawing_options_init_plot (p%drawing_options)
      end if
    end subroutine plot_init_empty
```

Initialize a plot by copying another one, optionally merging in a new set of drawing options.

Since p has pointer (sub)components, we have to explicitly deep-copy the original.

⟨*Analysis: procedures*⟩+≡

```
    subroutine plot_init_plot (p, p_in, drawing_options)
      type(plot_t), intent(out) :: p
```

```
      type(plot_t), intent(in) :: p_in
      type(drawing_options_t), intent(in), optional :: drawing_options
      type(point_t), pointer :: current, new
      current => p_in%first
      do while (associated (current))
         allocate (new)
         call point_init (new, current)
         if (associated (p%last)) then
            p%last%next => new
         else
            p%first => new
         end if
         p%last => new
         current => current%next
      end do
      p%count = p_in%count
      p%graph_options = p_in%graph_options
      if (present (drawing_options)) then
         p%drawing_options = drawing_options
      else
         p%drawing_options = p_in%drawing_options
      end if
   end subroutine plot_init_plot
```

Finalize the plot by deallocating the list of points.

⟨*Analysis: procedures*⟩+≡

```
   subroutine plot_final (plot)
     type(plot_t), intent(inout) :: plot
     type(point_t), pointer :: current
     do while (associated (plot%first))
        current => plot%first
        plot%first => current%next
        deallocate (current)
     end do
     plot%last => null ()
   end subroutine plot_final
```

Fill plots

Clear the plot contents, but do not modify the structure.

⟨*Analysis: procedures*⟩+≡

```
   subroutine plot_clear (plot)
     type(plot_t), intent(inout) :: plot
     plot%count = 0
     call plot_final (plot)
   end subroutine plot_clear
```

Record a value. Successful if the value is within bounds, otherwise it is recorded as under-/overflow.

⟨*Analysis: procedures*⟩+≡

```
   subroutine plot_record_value (plot, x, y, yerr, xerr, success)
```

```
        type(plot_t), intent(inout) :: plot
        real(default), intent(in) :: x, y
        real(default), intent(in), optional :: yerr, xerr
        logical, intent(out), optional :: success
        type(point_t), pointer :: point
        plot%count = plot%count + 1
        allocate (point)
        call point_init (point, x, y, yerr, xerr)
        if (associated (plot%first)) then
           plot%last%next => point
        else
           plot%first => point
        end if
        plot%last => point
        if (present (success))  success = .true.
     end subroutine plot_record_value
```

Access contents

The number of points.

⟨*Analysis: procedures*⟩+≡
```
     function plot_get_n_entries (plot) result (n)
       integer :: n
       type(plot_t), intent(in) :: plot
       n = plot%count
     end function plot_get_n_entries
```

Return a pointer to the graph options.

⟨*Analysis: procedures*⟩+≡
```
     function plot_get_graph_options_ptr (p) result (ptr)
       type(graph_options_t), pointer :: ptr
       type(plot_t), intent(in), target :: p
       ptr => p%graph_options
     end function plot_get_graph_options_ptr
```

Return a pointer to the drawing options.

⟨*Analysis: procedures*⟩+≡
```
     function plot_get_drawing_options_ptr (p) result (ptr)
       type(drawing_options_t), pointer :: ptr
       type(plot_t), intent(in), target :: p
       ptr => p%drawing_options
     end function plot_get_drawing_options_ptr
```

Output

This output format is used by the GAMELAN driver below.

⟨*Analysis: procedures*⟩+≡
```
     subroutine plot_write (plot, unit)

```

```
        calc_cmd = drawing_options_get_calc_command (p%drawing_options)
        if (calc_cmd /= "")  write (u, "(2x,A)")  char (calc_cmd)
        bg_cmd = drawing_options_get_gml_bg_command (p%drawing_options)
        if (bg_cmd /= "")  write (u, "(2x,A)")  char (bg_cmd)
        draw_cmd = drawing_options_get_draw_command (p%drawing_options)
        if (draw_cmd /= "")  write (u, "(2x,A)")  char (draw_cmd)
        err_cmd = drawing_options_get_err_command (p%drawing_options)
        if (err_cmd /= "")  write (u, "(2x,A)")  char (err_cmd)
        symb_cmd = drawing_options_get_symb_command (p%drawing_options)
        if (symb_cmd /= "")  write (u, "(2x,A)")  char (symb_cmd)
        fg_cmd = drawing_options_get_gml_fg_command (p%drawing_options)
        if (fg_cmd /= "")  write (u, "(2x,A)")  char (fg_cmd)
        write (u, "(2x,A)")  char (graph_options_get_gml_x_label (p%graph_options))
        write (u, "(2x,A)")  char (graph_options_get_gml_y_label (p%graph_options))
        call graph_options_write_tex_footer (p%graph_options, unit)
    end subroutine plot_write_gml_driver
```

Append header for generic data output in ifile format.

⟨*Analysis: procedures*⟩+≡
```
    subroutine plot_get_header (plot, header, comment)
      type(plot_t), intent(in) :: plot
      type(ifile_t), intent(inout) :: header
      type(string_t), intent(in), optional :: comment
      type(string_t) :: c
      if (present (comment)) then
         c = comment
      else
         c = ""
      end if
      call ifile_append (header, c // "WHIZARD plot data")
      call graph_options_get_header (plot%graph_options, header, comment)
      call ifile_append (header, &
           c // "number of points: " &
           // int2char (plot_get_n_entries (plot)))
    end subroutine plot_get_header
```

13.5.8 Graphs

A graph is a container for several graph elements. Each graph element is either a plot or a histogram. There is an appropriate base type below (the **analysis_object_t**), but to avoid recursion, we define a separate base type here. Note that there is no actual recursion: a graph is an analysis object, but a graph cannot contain graphs.

(If we could use type extension, the implementation would be much more transparent.)

Graph elements

Graph elements cannot be filled by the **record** command directly. The contents are always copied from elementary histograms or plots.

⟨*Analysis: types*⟩+≡

```
    type :: graph_element_t
      private
      integer :: type = AN_UNDEFINED
      type(histogram_t), pointer :: h => null ()
      type(plot_t), pointer :: p => null ()
    end type graph_element_t
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_element_final (el)
      type(graph_element_t), intent(inout) :: el
      select case (el%type)
      case (AN_HISTOGRAM)
         deallocate (el%h)
      case (AN_PLOT)
         call plot_final (el%p)
         deallocate (el%p)
      end select
      el%type = AN_UNDEFINED
    end subroutine graph_element_final
```

Return the number of entries in the graph element:

⟨*Analysis: procedures*⟩+≡
```
    function graph_element_get_n_entries (el) result (n)
      integer :: n
      type(graph_element_t), intent(in) :: el
      select case (el%type)
      case (AN_HISTOGRAM);  n = histogram_get_n_entries (el%h)
      case (AN_PLOT);       n = plot_get_n_entries (el%p)
      case default;         n = 0
      end select
    end function graph_element_get_n_entries
```

Return a pointer to the graph / drawing options.

⟨*Analysis: procedures*⟩+≡
```
    function graph_element_get_graph_options_ptr (el) result (ptr)
      type(graph_options_t), pointer :: ptr
      type(graph_element_t), intent(in) :: el
      select case (el%type)
      case (AN_HISTOGRAM);  ptr => histogram_get_graph_options_ptr (el%h)
      case (AN_PLOT);       ptr => plot_get_graph_options_ptr (el%p)
      case default;         ptr => null ()
      end select
    end function graph_element_get_graph_options_ptr

    function graph_element_get_drawing_options_ptr (el) result (ptr)
      type(drawing_options_t), pointer :: ptr
      type(graph_element_t), intent(in) :: el
      select case (el%type)
      case (AN_HISTOGRAM);  ptr => histogram_get_drawing_options_ptr (el%h)
      case (AN_PLOT);       ptr => plot_get_drawing_options_ptr (el%p)
      case default;         ptr => null ()
      end select
```

```
            end function graph_element_get_drawing_options_ptr
```

Output, simple wrapper for the plot/histogram writer.

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_element_write (el, unit)
      type(graph_element_t), intent(in) :: el
      integer, intent(in), optional :: unit
      type(graph_options_t), pointer :: gro
      type(string_t) :: id
      integer :: u
      u = given_output_unit (unit);  if (u < 0)  return
      gro => graph_element_get_graph_options_ptr (el)
      id = graph_options_get_id (gro)
      write (u, "(A,A)")  '#', repeat ("-", 78)
      select case (el%type)
      case (AN_HISTOGRAM)
         write (u, "(A)", advance="no")  "# Histogram: "
         write (u, "(1x,A)")  char (id)
         call histogram_write (el%h, unit)
      case (AN_PLOT)
         write (u, "(A)", advance="no")  "# Plot: "
         write (u, "(1x,A)")  char (id)
         call plot_write (el%p, unit)
      end select
    end subroutine graph_element_write
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_element_write_gml_reader (el, filename, unit)
      type(graph_element_t), intent(in) :: el
      type(string_t), intent(in) :: filename
      integer, intent(in), optional :: unit
      select case (el%type)
      case (AN_HISTOGRAM);  call histogram_write_gml_reader (el%h, filename, unit)
      case (AN_PLOT);       call plot_write_gml_reader (el%p, filename, unit)
      end select
    end subroutine graph_element_write_gml_reader
```

The graph type

The actual graph type contains its own **graph_options**, which override the individual settings. The **drawing_options** are set in the graph elements. This distinction motivates the separation of the two types.

⟨*Analysis: types*⟩+≡
```
    type :: graph_t
      private
      type(graph_element_t), dimension(:), allocatable :: el
      type(graph_options_t) :: graph_options
    end type graph_t
```

Initializer/finalizer

The graph is created with a definite number of elements. The elements are filled
one by one, optionally with modified drawing options.

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_init (g, id, n_elements, graph_options)
      type(graph_t), intent(out) :: g
      type(string_t), intent(in) :: id
      integer, intent(in) :: n_elements
      type(graph_options_t), intent(in), optional :: graph_options
      allocate (g%el (n_elements))
      if (present (graph_options)) then
         g%graph_options = graph_options
      else
         call graph_options_init (g%graph_options)
      end if
      call graph_options_set (g%graph_options, id = id)
    end subroutine graph_init
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_insert_histogram (g, i, h, drawing_options)
      type(graph_t), intent(inout), target :: g
      integer, intent(in) :: i
      type(histogram_t), intent(in) :: h
      type(drawing_options_t), intent(in), optional :: drawing_options
      type(graph_options_t), pointer :: gro
      type(drawing_options_t), pointer :: dro
      type(string_t) :: id
      g%el(i)%type = AN_HISTOGRAM
      allocate (g%el(i)%h)
      call histogram_init_histogram (g%el(i)%h, h, drawing_options)
      gro => histogram_get_graph_options_ptr (g%el(i)%h)
      dro => histogram_get_drawing_options_ptr (g%el(i)%h)
      id = graph_options_get_id (gro)
      call drawing_options_set (dro, dataset = "dat." // id)
    end subroutine graph_insert_histogram
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_insert_plot (g, i, p, drawing_options)
      type(graph_t), intent(inout) :: g
      integer, intent(in) :: i
      type(plot_t), intent(in) :: p
      type(drawing_options_t), intent(in), optional :: drawing_options
      type(graph_options_t), pointer :: gro
      type(drawing_options_t), pointer :: dro
      type(string_t) :: id
      g%el(i)%type = AN_PLOT
      allocate (g%el(i)%p)
      call plot_init_plot (g%el(i)%p, p, drawing_options)
      gro => plot_get_graph_options_ptr (g%el(i)%p)
      dro => plot_get_drawing_options_ptr (g%el(i)%p)
      id = graph_options_get_id (gro)
      call drawing_options_set (dro, dataset = "dat." // id)
```

```
    end subroutine graph_insert_plot
```

Finalizer.

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_final (g)
      type(graph_t), intent(inout) :: g
      integer :: i
      do i = 1, size (g%el)
         call graph_element_final (g%el(i))
      end do
      deallocate (g%el)
    end subroutine graph_final
```

Access contents

The number of elements.

⟨*Analysis: procedures*⟩+≡
```
    function graph_get_n_elements (graph) result (n)
      integer :: n
      type(graph_t), intent(in) :: graph
      n = size (graph%el)
    end function graph_get_n_elements
```

Retrieve a pointer to the drawing options of an element, so they can be modified. (The `target` attribute is not actually needed because the components are pointers.)

⟨*Analysis: procedures*⟩+≡
```
    function graph_get_drawing_options_ptr (g, i) result (ptr)
      type(drawing_options_t), pointer :: ptr
      type(graph_t), intent(in), target :: g
      integer, intent(in) :: i
      ptr => graph_element_get_drawing_options_ptr (g%el(i))
    end function graph_get_drawing_options_ptr
```

Output

The default output format just writes histogram and plot data.

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_write (graph, unit)
      type(graph_t), intent(in) :: graph
      integer, intent(in), optional :: unit
      integer :: i
      do i = 1, size (graph%el)
         call graph_element_write (graph%el(i), unit)
      end do
    end subroutine graph_write
```

The GAMELAN driver is not a simple wrapper, but it writes the plot/histogram contents embedded the complete graph. First, data are read in, global background commands next, then individual elements, then global foreground commands.

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_write_gml_driver (g, filename, unit)
      type(graph_t), intent(in) :: g
      type(string_t), intent(in) :: filename
      type(string_t) :: calc_cmd, bg_cmd, draw_cmd, err_cmd, symb_cmd, fg_cmd
      integer, intent(in), optional :: unit
      type(drawing_options_t), pointer :: dro
      integer :: u, i
      u = given_output_unit (unit);  if (u < 0)  return
      call graph_options_write_tex_header (g%graph_options, unit)
      write (u, "(2x,A)") &
           char (graph_options_get_gml_setup (g%graph_options))
      write (u, "(2x,A)") &
           char (graph_options_get_gml_graphrange (g%graph_options))
      do i = 1, size (g%el)
         call graph_element_write_gml_reader (g%el(i), filename, unit)
         calc_cmd = drawing_options_get_calc_command &
                       (graph_element_get_drawing_options_ptr (g%el(i)))
         if (calc_cmd /= "")  write (u, "(2x,A)")  char (calc_cmd)
      end do
      bg_cmd = graph_options_get_gml_bg_command (g%graph_options)
      if (bg_cmd /= "")  write (u, "(2x,A)")  char (bg_cmd)
      do i = 1, size (g%el)
         dro => graph_element_get_drawing_options_ptr (g%el(i))
         bg_cmd = drawing_options_get_gml_bg_command (dro)
         if (bg_cmd /= "")  write (u, "(2x,A)")  char (bg_cmd)
         draw_cmd = drawing_options_get_draw_command (dro)
         if (draw_cmd /= "")  write (u, "(2x,A)")  char (draw_cmd)
         err_cmd = drawing_options_get_err_command (dro)
         if (err_cmd /= "")  write (u, "(2x,A)")  char (err_cmd)
         symb_cmd = drawing_options_get_symb_command (dro)
         if (symb_cmd /= "")  write (u, "(2x,A)")  char (symb_cmd)
         fg_cmd = drawing_options_get_gml_fg_command (dro)
         if (fg_cmd /= "")  write (u, "(2x,A)")  char (fg_cmd)
      end do
      fg_cmd = graph_options_get_gml_fg_command (g%graph_options)
      if (fg_cmd /= "")  write (u, "(2x,A)")  char (fg_cmd)
      write (u, "(2x,A)")  char (graph_options_get_gml_x_label (g%graph_options))
      write (u, "(2x,A)")  char (graph_options_get_gml_y_label (g%graph_options))
      call graph_options_write_tex_footer (g%graph_options, unit)
    end subroutine graph_write_gml_driver
```

Append header for generic data output in ifile format.

⟨*Analysis: procedures*⟩+≡
```
    subroutine graph_get_header (graph, header, comment)
      type(graph_t), intent(in) :: graph
      type(ifile_t), intent(inout) :: header
      type(string_t), intent(in), optional :: comment
      type(string_t) :: c
```

```
      if (present (comment)) then
         c = comment
      else
         c = ""
      end if
      call ifile_append (header, c // "WHIZARD graph data")
      call graph_options_get_header (graph%graph_options, header, comment)
      call ifile_append (header, &
           c // "number of graph elements: " &
           // int2char (graph_get_n_elements (graph)))
   end subroutine graph_get_header
```

13.5.9   Analysis objects

This data structure holds all observables, histograms and such that are currently
active. We have one global store; individual items are identified by their ID
strings.

(This should rather be coded by type extension.)

⟨*Analysis: parameters*⟩+≡
```
    integer, parameter :: AN_UNDEFINED = 0
    integer, parameter :: AN_OBSERVABLE = 1
    integer, parameter :: AN_HISTOGRAM = 2
    integer, parameter :: AN_PLOT = 3
    integer, parameter :: AN_GRAPH = 4
```

⟨*Analysis: public*⟩+≡
```
    public :: AN_UNDEFINED, AN_HISTOGRAM, AN_OBSERVABLE, AN_PLOT, AN_GRAPH
```

⟨*Analysis: types*⟩+≡
```
    type :: analysis_object_t
       private
       type(string_t) :: id
       integer :: type = AN_UNDEFINED
       type(observable_t), pointer :: obs => null ()
       type(histogram_t), pointer :: h => null ()
       type(plot_t), pointer :: p => null ()
       type(graph_t), pointer :: g => null ()
       type(analysis_object_t), pointer :: next => null ()
    end type analysis_object_t
```

Initializer/finalizer

Allocate with the correct type but do not fill initial values.

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_object_init (obj, id, type)
      type(analysis_object_t), intent(out) :: obj
      type(string_t), intent(in) :: id
      integer, intent(in) :: type
      obj%id = id
      obj%type = type
      select case (obj%type)
```

```
      case (AN_OBSERVABLE);  allocate (obj%obs)
      case (AN_HISTOGRAM);   allocate (obj%h)
      case (AN_PLOT);        allocate (obj%p)
      case (AN_GRAPH);       allocate (obj%g)
      end select
    end subroutine analysis_object_init
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_object_final (obj)
      type(analysis_object_t), intent(inout) :: obj
      select case (obj%type)
      case (AN_OBSERVABLE)
         deallocate (obj%obs)
      case (AN_HISTOGRAM)
         deallocate (obj%h)
      case (AN_PLOT)
         call plot_final (obj%p)
         deallocate (obj%p)
      case (AN_GRAPH)
         call graph_final (obj%g)
         deallocate (obj%g)
      end select
      obj%type = AN_UNDEFINED
    end subroutine analysis_object_final
```

Clear the analysis object, i.e., reset it to its initial state. Not applicable to
graphs, which are always combinations of other existing objects.

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_object_clear (obj)
      type(analysis_object_t), intent(inout) :: obj
      select case (obj%type)
      case (AN_OBSERVABLE)
         call observable_clear (obj%obs)
      case (AN_HISTOGRAM)
         call histogram_clear (obj%h)
      case (AN_PLOT)
         call plot_clear (obj%p)
      end select
    end subroutine analysis_object_clear
```

Fill with data

Record data. The effect depends on the type of analysis object.

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_object_record_data (obj, &
        x, y, yerr, xerr, weight, excess, success)
      type(analysis_object_t), intent(inout) :: obj
      real(default), intent(in) :: x
      real(default), intent(in), optional :: y, yerr, xerr, weight, excess
      logical, intent(out), optional :: success
      select case (obj%type)
```

```
      case (AN_OBSERVABLE)
         if (present (weight)) then
            call observable_record_value_weighted (obj%obs, x, weight, success)
         else
            call observable_record_value_unweighted (obj%obs, x, success)
         end if
      case (AN_HISTOGRAM)
         if (present (weight)) then
            call histogram_record_value_weighted (obj%h, x, weight, success)
         else
            call histogram_record_value_unweighted (obj%h, x, excess, success)
         end if
      case (AN_PLOT)
         if (present (y)) then
            call plot_record_value (obj%p, x, y, yerr, xerr, success)
         else
            if (present (success))  success = .false.
         end if
      case default
         if (present (success))  success = .false.
      end select
    end subroutine analysis_object_record_data
```

Explicitly set the pointer to the next object in the list.

⟨*Analysis: procedures*⟩+≡

```
    subroutine analysis_object_set_next_ptr (obj, next)
      type(analysis_object_t), intent(inout) :: obj
      type(analysis_object_t), pointer :: next
      obj%next => next
    end subroutine analysis_object_set_next_ptr
```

Access contents

Return a pointer to the next object in the list.

⟨*Analysis: procedures*⟩+≡

```
    function analysis_object_get_next_ptr (obj) result (next)
      type(analysis_object_t), pointer :: next
      type(analysis_object_t), intent(in) :: obj
      next => obj%next
    end function analysis_object_get_next_ptr
```

Return data as appropriate for the object type.

⟨*Analysis: procedures*⟩+≡

```
    function analysis_object_get_n_elements (obj) result (n)
      integer :: n
      type(analysis_object_t), intent(in) :: obj
      select case (obj%type)
      case (AN_HISTOGRAM)
         n = 1
      case (AN_PLOT)
         n = 1
```

```
      case (AN_GRAPH)
         n = graph_get_n_elements (obj%g)
      case default
         n = 0
      end select
end function analysis_object_get_n_elements

function analysis_object_get_n_entries (obj, within_bounds) result (n)
  integer :: n
  type(analysis_object_t), intent(in) :: obj
  logical, intent(in), optional :: within_bounds
  logical :: wb
  select case (obj%type)
  case (AN_OBSERVABLE)
     n = observable_get_n_entries (obj%obs)
  case (AN_HISTOGRAM)
     wb = .false.;  if (present (within_bounds)) wb = within_bounds
     if (wb) then
        n = histogram_get_n_entries_within_bounds (obj%h)
     else
        n = histogram_get_n_entries (obj%h)
     end if
  case (AN_PLOT)
     n = plot_get_n_entries (obj%p)
  case default
     n = 0
  end select
end function analysis_object_get_n_entries

function analysis_object_get_average (obj, within_bounds) result (avg)
  real(default) :: avg
  type(analysis_object_t), intent(in) :: obj
  logical, intent(in), optional :: within_bounds
  logical :: wb
  select case (obj%type)
  case (AN_OBSERVABLE)
     avg = observable_get_average (obj%obs)
  case (AN_HISTOGRAM)
     wb = .false.;  if (present (within_bounds)) wb = within_bounds
     if (wb) then
        avg = histogram_get_average_within_bounds (obj%h)
     else
        avg = histogram_get_average (obj%h)
     end if
  case default
     avg = 0
  end select
end function analysis_object_get_average

function analysis_object_get_error (obj, within_bounds) result (err)
  real(default) :: err
  type(analysis_object_t), intent(in) :: obj
  logical, intent(in), optional :: within_bounds
  logical :: wb
```

```
      select case (obj%type)
      case (AN_OBSERVABLE)
         err = observable_get_error (obj%obs)
      case (AN_HISTOGRAM)
         wb = .false.;  if (present (within_bounds)) wb = within_bounds
         if (wb) then
            err = histogram_get_error_within_bounds (obj%h)

        call plot_write_gml_driver (obj%p, filename, unit)
     case (AN_GRAPH)
        call graph_write_gml_driver (obj%g, filename, unit)
     end select
   end subroutine analysis_object_write_driver
```

Return a data header for external formats, in ifile form.

⟨*Analysis: procedures*⟩+≡
```
   subroutine analysis_object_get_header (obj, header, comment)
     type(analysis_object_t), intent(in) :: obj
     type(ifile_t), intent(inout) :: header
     type(string_t), intent(in), optional :: comment
     select case (obj%type)
     case (AN_HISTOGRAM)
        call histogram_get_header (obj%h, header, comment)
     case (AN_PLOT)
        call plot_get_header (obj%p, header, comment)
     end select
   end subroutine analysis_object_get_header
```

13.5.10   Analysis object iterator

Analysis objects are containers which have iterable data structures: histograms/bins
and plots/points. If they are to be treated on a common basis, it is useful to
have an iterator which hides the implementation details.

The iterator is used only for elementary analysis objects that contain plot
data: histograms or plots. It is invalid for meta-objects (graphs) and non-
graphical objects (observables).

⟨*Analysis: public*⟩+≡

```
      public :: analysis_iterator_t
```
⟨*Analysis: types*⟩+≡
```
      type :: analysis_iterator_t
        private
        integer :: type = AN_UNDEFINED
        type(analysis_object_t), pointer :: object => null ()
        integer :: index = 1
        type(point_t), pointer :: point => null ()
      end type
```

The initializer places the iterator at the beginning of the analysis object.

⟨*Analysis: procedures*⟩+≡
```
      subroutine analysis_iterator_init (iterator, object)
        type(analysis_iterator_t), intent(out) :: iterator
        type(analysis_object_t), intent(in), target :: object
        iterator%object => object
        if (associated (iterator%object)) then
            iterator%type = iterator%object%type
            select case (iterator%type)
            case (AN_PLOT)
               iterator%point => iterator%object%p%first
            end select
        end if
      end subroutine analysis_iterator_init
```

The iterator is valid as long as it points to an existing entry. An iterator for a data object without array data (observable) is always invalid.

⟨*Analysis: public*⟩+≡
```
      public :: analysis_iterator_is_valid
```
⟨*Analysis: procedures*⟩+≡
```
      function analysis_iterator_is_valid (iterator) result (valid)
        logical :: valid
        type(analysis_iterator_t), intent(in) :: iterator
        if (associated (iterator%object)) then
            select case (iterator%type)
            case (AN_HISTOGRAM)
               valid = iterator%index <= histogram_get_n_bins (iterator%object%h)
            case (AN_PLOT)
               valid = associated (iterator%point)
            case default
               valid = .false.
            end select
        else
            valid = .false.
        end if
      end function analysis_iterator_is_valid
```

Advance the iterator.

⟨*Analysis: public*⟩+≡
```
      public :: analysis_iterator_advance
```

880

⟨*Analysis: procedures*⟩+≡

```
    subroutine analysis_iterator_advance (iterator)
      type(analysis_iterator_t), intent(inout) :: iterator
      if (associated (iterator%object)) then
         select case (iterator%type)
         case (AN_PLOT)
            iterator%point => iterator%point%next
         end select
         iterator%index = iterator%index + 1
      end if
    end subroutine analysis_iterator_advance
```

Retrieve the object type:

⟨*Analysis: public*⟩+≡

```
    public :: analysis_iterator_get_type
```

⟨*Analysis: procedures*⟩+≡

```
    function analysis_iterator_get_type (iterator) result (type)
      integer :: type
      type(analysis_iterator_t), intent(in) :: iterator
      type = iterator%type
    end function analysis_iterator_get_type
```

Use the iterator to retrieve data. We implement a common routine which takes the data descriptors as optional arguments. Data which do not occur in the selected type trigger to an error condition.

The iterator must point to a valid entry.

⟨*Analysis: public*⟩+≡

```
    public :: analysis_iterator_get_data
```

⟨*Analysis: procedures*⟩+≡

```
    subroutine analysis_iterator_get_data (iterator, &
         x, y, yerr, xerr, width, excess, index, n_total)
      type(analysis_iterator_t), intent(in) :: iterator
      real(default), intent(out), optional :: x, y, yerr, xerr, width, excess
      integer, intent(out), optional :: index, n_total
      select case (iterator%type)
      case (AN_HISTOGRAM)
         if (present (x)) &
              x = bin_get_midpoint (iterator%object%h%bin(iterator%index))
         if (present (y)) &
              y = bin_get_sum (iterator%object%h%bin(iterator%index))
         if (present (yerr)) &
              yerr = bin_get_error (iterator%object%h%bin(iterator%index))
         if (present (xerr)) &
              call invalid ("histogram", "xerr")
         if (present (width)) &
              width = bin_get_width (iterator%object%h%bin(iterator%index))
         if (present (excess)) &
              excess = bin_get_excess (iterator%object%h%bin(iterator%index))
         if (present (index)) &
              index = iterator%index
         if (present (n_total)) &
              n_total = histogram_get_n_bins (iterator%object%h)
```

```
        case (AN_PLOT)
          if (present (x)) &
               x = point_get_x (iterator%point)
          if (present (y)) &
               y = point_get_y (iterator%point)
          if (present (yerr)) &
               yerr = point_get_yerr (iterator%point)
          if (present (xerr)) &
               xerr = point_get_xerr (iterator%point)
          if (present (width)) &
               call invalid ("plot", "width")
          if (present (excess)) &
               call invalid ("plot", "excess")
          if (present (index)) &
               index = iterator%index
          if (present (n_total)) &
               n_total = plot_get_n_entries (iterator%object%p)
        case default
          call msg_bug ("analysis_iterator_get_data: called " &
               // "for unsupported analysis object type")
        end select
      contains
        subroutine invalid (typestr, objstr)
          character(*), intent(in) :: typestr, objstr
          call msg_bug ("analysis_iterator_get_data: attempt to get '" &
               // objstr // "' for type '" // typestr // "'")
        end subroutine invalid
      end subroutine analysis_iterator_get_data
```

13.5.11 Analysis store

This data structure holds all observables, histograms and such that are currently
active. We have one global store; individual items are identified by their ID
strings and types.

⟨*Analysis: variables*⟩≡
```
    type(analysis_store_t), save :: analysis_store
```

⟨*Analysis: types*⟩+≡
```
    type :: analysis_store_t
      private
      type(analysis_object_t), pointer :: first => null ()
      type(analysis_object_t), pointer :: last => null ()
    end type analysis_store_t
```

Delete the analysis store

⟨*Analysis: public*⟩+≡
```
    public :: analysis_final
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_final ()
      type(analysis_object_t), pointer :: current
```

```
      do while (associated (analysis_store%first))
         current => analysis_store%first
         analysis_store%first => current%next
         call analysis_object_final (current)
      end do
      analysis_store%last => null ()
   end subroutine analysis_final
```

Append a new analysis object

⟨*Analysis: procedures*⟩+≡
```
   subroutine analysis_store_append_object (id, type)
     type(string_t), intent(in) :: id
     integer, intent(in) :: type
     type(analysis_object_t), pointer :: obj
     allocate (obj)
     call analysis_object_init (obj, id, type)
     if (associated (analysis_store%last)) then
        analysis_store%last%next => obj
     else
        analysis_store%first => obj
     end if
     analysis_store%last => obj
   end subroutine analysis_store_append_object
```

Return a pointer to the analysis object with given ID.

⟨*Analysis: procedures*⟩+≡
```
   function analysis_store_get_object_ptr (id) result (obj)
     type(string_t), intent(in) :: id
     type(analysis_object_t), pointer :: obj
     obj => analysis_store%first
     do while (associated (obj))
        if (obj%id == id)  return
        obj => obj%next
     end do
   end function analysis_store_get_object_ptr
```

Initialize an analysis object: either reset it if present, or append a new entry.

⟨*Analysis: procedures*⟩+≡
```
   subroutine analysis_store_init_object (id, type, obj)
     type(string_t), intent(in) :: id
     integer, intent(in) :: type
     type(analysis_object_t), pointer :: obj, next
     obj => analysis_store_get_object_ptr (id)
     if (associated (obj)) then
        next => analysis_object_get_next_ptr (obj)
        call analysis_object_final (obj)
        call analysis_object_init (obj, id, type)
        call analysis_object_set_next_ptr (obj, next)
     else
        call analysis_store_append_object (id, type)
        obj => analysis_store%last
     end if
```

```
      end subroutine analysis_store_init_object
```

Get the type of a analysis object

⟨*Analysis: public*⟩+≡
```
    public :: analysis_store_get_object_type
```

⟨*Analysis: procedures*⟩+≡
```
    function analysis_store_get_object_type (id) result (type)
      type(string_t), intent(in) :: id
      integer :: type
      type(analysis_object_t), pointer :: object
      object => analysis_store_get_object_ptr (id)
      if (associated (object)) then
         type = object%type
      else
         type = AN_UNDEFINED
      end if
    end function analysis_store_get_object_type
```

Return the number of objects in the store.

⟨*Analysis: procedures*⟩+≡
```
    function analysis_store_get_n_objects () result (n)
      integer :: n
      type(analysis_object_t), pointer :: current
      n = 0
      current => analysis_store%first
      do while (associated (current))
         n = n + 1
         current => current%next
      end do
    end function analysis_store_get_n_objects
```

Allocate an array and fill it with all existing IDs.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_store_get_ids
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_store_get_ids (id)
      type(string_t), dimension(:), allocatable, intent(out) :: id
      type(analysis_object_t), pointer :: current
      integer :: i
      allocate (id (analysis_store_get_n_objects()))
      i = 0
      current => analysis_store%first
      do while (associated (current))
         i = i + 1
         id(i) = current%id
         current => current%next
      end do
    end subroutine analysis_store_get_ids
```

13.5.12 LATEX driver file

Write a driver file for all objects in the store.

⟨*Analysis: procedures*⟩+≡

```
subroutine analysis_store_write_driver_all (filename_data, unit)
  type(string_t), intent(in) :: filename_data
  integer, intent(in), optional :: unit
  type(analysis_object_t), pointer :: obj
  call analysis_store_write_driver_header (unit)
  obj => analysis_store%first
  do while (associated (obj))
     call analysis_object_write_driver (obj, filename_data, unit)
     obj => obj%next
  end do
  call analysis_store_write_driver_footer (unit)
end subroutine analysis_store_write_driver_all
```

Write a driver file for an array of objects.

⟨*Analysis: procedures*⟩+≡

```
subroutine analysis_store_write_driver_obj (filename_data, id, unit)
  type(string_t), intent(in) :: filename_data
  type(string_t), dimension(:), intent(in) :: id
  integer, intent(in), optional :: unit
  type(analysis_object_t), pointer :: obj
  integer :: i
  call analysis_store_write_driver_header (unit)
  do i = 1, size (id)
     obj => analysis_store_get_object_ptr (id(i))
     if (associated (obj))  &
          call analysis_object_write_driver (obj, filename_data, unit)
  end do
  call analysis_store_write_driver_footer (unit)
end subroutine analysis_store_write_driver_obj
```

The beginning of the driver file.

⟨*Analysis: procedures*⟩+≡

```
subroutine analysis_store_write_driver_header (unit)
  integer, intent(in), optional :: unit
  integer :: u
  u = given_output_unit (unit);  if (u < 0)  return
  write (u, '(A)') "\documentclass[12pt]{article}"
  write (u, *)
  write (u, '(A)') "\usepackage{gamelan}"
  write (u, '(A)') "\usepackage{amsmath}"
  write (u, '(A)') "\usepackage{ifpdf}"
  write (u, '(A)') "\ifpdf"
  write (u, '(A)') "   \DeclareGraphicsRule{*}{mps}{*}{}"
  write (u, '(A)') "\else"
  write (u, '(A)') "   \DeclareGraphicsRule{*}{eps}{*}{}"
  write (u, '(A)') "\fi"
  write (u, *)
  write (u, '(A)') "\begin{document}"
  write (u, '(A)') "\begin{gmlfile}"
```

```
    write (u, *)
    write (u, '(A)') "\begin{gmlcode}"
    write (u, '(A)') "  color col.default, col.excess;"
    write (u, '(A)') "  col.default = 0.9white;"
    write (u, '(A)') "  col.excess  = red;"
    write (u, '(A)') "  boolean show_excess;"
    !!! Future excess options for plots
    ! if (mcs(1)%plot_excess .and. mcs(1)%unweighted) then
    !    write (u, '(A)') "  show_excess = true;"
    ! else
    write (u, '(A)') "  show_excess = false;"
    ! end if
    write (u, '(A)') "\end{gmlcode}"
    write (u, *)
  end subroutine analysis_store_write_driver_header
```

The end of the driver file.

⟨*Analysis: procedures*⟩+≡
```
  subroutine analysis_store_write_driver_footer (unit)
    integer, intent(in), optional :: unit
    integer :: u
    u = given_output_unit (unit);  if (u < 0)  return
    write(u, *)
    write(u, '(A)') "\end{gmlfile}"
    write(u, '(A)') "\end{document}"
  end subroutine analysis_store_write_driver_footer
```

Recording data

This procedure resets an object or the whole store to its initial state.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_clear
```

⟨*Analysis: interfaces*⟩+≡
```
    interface analysis_clear
       module procedure analysis_store_clear_obj
       module procedure analysis_store_clear_all
    end interface
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_store_clear_obj (id)
      type(string_t), intent(in) :: id
      type(analysis_object_t), pointer :: obj
      obj => analysis_store_get_object_ptr (id)
      if (associated (obj)) then
         call analysis_object_clear (obj)
      end if
    end subroutine analysis_store_clear_obj

    subroutine analysis_store_clear_all ()
      type(analysis_object_t), pointer :: obj
      obj => analysis_store%first
      do while (associated (obj))
         call analysis_object_clear (obj)
         obj => obj%next
      end do
    end subroutine analysis_store_clear_all
```

There is one generic recording function whose behavior depends on the type of analysis object.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_record_data
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_record_data (id, x, y, yerr, xerr, &
        weight, excess, success, exist)
      type(string_t), intent(in) :: id
      real(default), intent(in) :: x
      real(default), intent(in), optional :: y, yerr, xerr, weight, excess
      logical, intent(out), optional :: success, exist
      type(analysis_object_t), pointer :: obj
      obj => analysis_store_get_object_ptr (id)
      if (associated (obj)) then
         call analysis_object_record_data (obj, x, y, yerr, xerr, &
              weight, excess, success)
         if (present (exist))  exist = .true.
      else
         if (present (success))  success = .false.
         if (present (exist))  exist = .false.
      end if
    end subroutine analysis_record_data
```

Build a graph

This routine sets up the array of graph elements by copying the graph elements
given as input. The object must exist and already be initialized as a graph.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_fill_graph
```

⟨*Analysis: procedures*⟩+≡
```
    subroutine analysis_fill_graph (id, i, id_in, drawing_options)
      type(string_t), intent(in) :: id
      integer, intent(in) :: i
      type(string_t), intent(in) :: id_in
      type(drawing_options_t), intent(in), optional :: drawing_options
      type(analysis_object_t), pointer :: obj
      type(graph_t), pointer :: g
      type(histogram_t), pointer :: h
      type(plot_t), pointer :: p
      obj => analysis_store_get_object_ptr (id)
      g => analysis_object_get_graph_ptr (obj)
      obj => analysis_store_get_object_ptr (id_in)
      if (associated (obj)) then
         select case (obj%type)
         case (AN_HISTOGRAM)
            h => analysis_object_get_histogram_ptr (obj)
            call graph_insert_histogram (g, i, h, drawing_options)
         case (AN_PLOT)
            p => analysis_object_get_plot_ptr (obj)
            call graph_insert_plot (g, i, p, drawing_options)
         case default
            call msg_error ("Graph '" // char (id) // "': Element '" &
                 // char (id_in) // "' is neither histogram nor plot.")
         end select
      else
         call msg_error ("Graph '" // char (id) // "': Element '" &
```

```
                 // char (id_in) // "' is undefined.")
       end if
    end subroutine analysis_fill_graph
```

Retrieve generic results

Check if a named object exists.

⟨*Analysis: public*⟩+≡
```
    public :: analysis_exists
```

⟨*Analysis: procedures*⟩+≡
```
    function analysis_exists (id) result (flag)
      type(string_t), intent(in) :: id
      logical :: flag
      type(analysis_object_t), pointer :: obj
      flag = .true.
      obj => analysis_store%first
      do while (associated (obj))
         if (obj%id == id)  return
         obj => obj%next
      end do
      flag = .false.
    end function analysis_exists
```

The following functions should work for all kinds of analysis object:

⟨*Analysis: public*⟩+≡
```
    public :: analysis_get_n_elements
    public :: analysis_get_n_entries
    public :: analysis_get_average
    public :: analysis_get_error
```

⟨*Analysis: procedures*⟩+≡
```
    function analysis_get_n_elements (id) result (n)
      integer :: n

Chapter 14

Matrix Element Handling

In this chapter, we support internal and external matrix elements: initialization, automatic generation where necessary, and numerical evaluation. We provide the interface for code generation and linking. Matrix-element code is organized in processes and process libraries.

process_constants A record of static process properties, for easy transfer between various `WHIZARD` modules.

prclib_interfaces This module deals with matrix-element code which is accessible via external libraries (Fortran libraries or generic C-compatible libraries) and must either be generated by the program or provided by the user explicitly.

The module defines and uses an abstract type `prc_writer_t` and two abstract extensions, one for a Fortran module and one for a C-compatible library. The implementation provides the specific methods for writing the appropriate parts in external matrix element code.

prc_core_def This module defines the abstract types `prc_core_def_t` and `prc_driver_t`. The implementation of the former provides the configuration for processes of a certain class, while the latter accesses the corresponding matrix element, in particular those generated by the appropriate `prc_writer_t` object.

process_libraries This module combines the functionality of the previous module with the means for holding processes definitions (the internal counterpart of appropriate declarations in the user interface), for handling matrix elements which do not need external code, and for accessing the matrix elements by the procedures for matrix-element evaluation, integration and event generation.

prclib_stacks Collect process libraries.

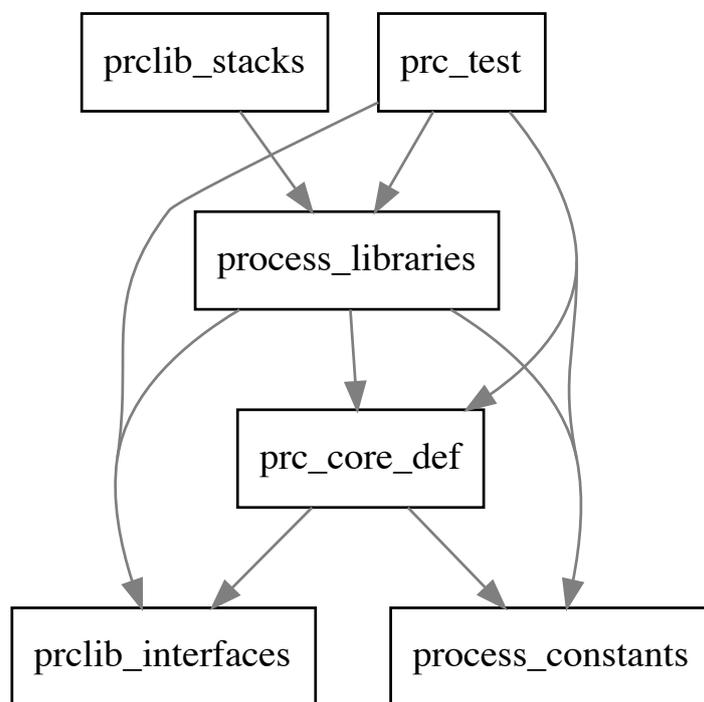
test_me This module provides a test implementation for the abstract types in the `prc_core_def` module. The implementation is intended for self-tests of several later modules. The implementation is internal, i.e., no external code has is generated.


Figure 14.1: Module dependencies in `src/matrix_elements`.

All data structures which are specific for a particular way of generating code or evaluating matrix element are kept abstract and thus generic. Later modules such as `prc_omega` provide implementations, in the form of type extensions for the various abstract types.

14.1 Process data block

We define a simple transparent type that contains universal constant process data. We will reference objects of this type for the phase-space setup, for interfacing with process libraries, for implementing matrix-element generation, and in the master process-handling module.

⟨**process_constants.f90**⟩≡

  ⟨*File header*⟩

```
  module process_constants
```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩

```
    use io_units, only: given_output_unit, free_unit
    use format_utils, only: write_integer_array
    use md5, only: md5sum

    use pdg_arrays
```

  ⟨*Standard module head*⟩

14.2   Process library interface

The module `prclib_interfaces` handles external matrix-element code.

14.2.1   Overview

The top-level data structure is the `prclib_driver_t` data type. The associated type-bound procedures deal with the generation of external code, compilation and linking, and accessing the active external library.

An object of type `prclib_driver_t` consists of the following parts:

1. Metadata that identify name and status of the library driver, etc.

2. An array of process records (`prclib_driver_record_t`), one for each external matrix element.

3. A record of type `dlaccess_t` which handles the operating-system part of linking a dynamically loadable library.

4. A collection of procedure pointers which have a counterpart in the external library interface. Given the unique identifier of a matrix element, the procedures retrieve generic matrix-element information such as the particle content and helicity combination tables. There is also a procedure which returns pointers to the more specific procedures that a matrix element provides, called *features*.

The process records of type `prclib_driver_record_t` handle the individual matrix elements. Each record identifies a process by name (`id`), names the physics model to be loaded for this process, lists the features that the associated matrix-element code provides, and holds a `writer` object which handles all operations that depend on the process type. The numbering of process records is identical to the numbering of matrix-element codes in the external library.

The writer object is of abstract type `prc_writer_t`. The module defines two basic, also abstract, extensions: `prc_writer_f_module_t` and `prc_writer_c_lib_t`. The first version is for matrix-element code that is available in form of Fortran modules. The writer contains type-bound procedures which create appropriate `use` directives and `C`-compatible wrapper functions for the given set of Fortran modules and their features. The second version is for matrix-element code that is available in form of a C-compatible library (this includes Fortran libraries with proper C bindings). The writer needs not write wrapper function, but explicit interface blocks for the matrix-element features.

Each matrix-element variant is encoded in an appropriate extension of `prc_writer_t`. For instance, O'MEGA matrix elements provide an implementation `omega_writer_t` which extends `prc_writer_f_module_t`.

14.2.2 Workflow

We expect that the functionality provided by this module is called in the following order:

1. The caller initializes the `prclib_driver_t` object and fills the array of `prclib_record_t` entries with the appropriate process data and process-specific writer objects.

2. It calls the `generate_makefile` method to set up an appropriate makefile in the current directory. The makefile will handle source generation, compilation and linking both for the individual matrix elements (unless this has to be done manually) and for the common external driver code which interfaces those matrix element.

3. The `generate_driver_code` writes the common driver as source code to file.

4. The methods `make_source`, `make_compile`, and `make_link` individually perform the corresponding steps in building the library. Wherever possible, they simply use the generated makefile. By calling `make`, we make sure that we can avoid unnecessary recompilation. For the compilation and linking steps, the makefile will employ `libtool`.

5. The `load` method loads the library procedures into the corresponding procedure pointers, using the `dlopen` mechanism via the `dlaccess` subobject.

```

14.2.4 Writers

External matrix element code provides externally visible procedures, which we denote as *features*. The features consist of informational subroutines and functions which are mandatory (universal features) and matrix-element specific subroutines and functions (specific features). The driver interfaces the generic features directly, while it returns the specific features in form of bind(C) procedure pointers to the caller. For instance, function `n_in` is generic, while the matrix matrix-element value itself is specific.

To implement these tasks, the driver needs `use` directives for Fortran module procedures, interface blocks for other external stuff, wrapper code, and Makefile snippets.

Generic writer

In the `prc_writer_t` data type, we collect the procedures which implement the writing tasks. The type is abstract. The concrete implementations are defined by an extension which is specific for the process type.

The MD5 sum stored here should be the MD5 checksum of the current process component, which can be calculated once the process is configured completely. It can be used by implementations which work with external files, such as `O'MEGA`.

⟨*Prclib interfaces: public*⟩≡

```
    public :: prc_writer_t
```

⟨*Prclib interfaces: types*⟩≡

```
    type, abstract :: prc_writer_t
       character(32) :: md5sum = ""
     contains
     ⟨Prclib interfaces: prc writer: TBP⟩
    end type prc_writer_t
```

In any case, it is useful to have a string representation of the writer type. This must be implemented by all extensions.

⟨*Prclib interfaces: prc writer: TBP*⟩≡

```
    procedure(get_const_string), nopass, deferred :: type_name
```

⟨*Prclib interfaces: interfaces*⟩≡

```
    abstract interface
       function get_const_string () result (string)
         import
         type(string_t) :: string
       end function get_const_string
```

910

```
          end interface
```

Return the name of a procedure that implements a given feature, as it is provided
by the external matrix-element code. For a reasonable default, we take the
feature name unchanged.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure, nopass :: get_procname => prc_writer_get_procname
```

⟨*Prclib interfaces: procedures*⟩≡
```
    function prc_writer_get_procname (feature) result (name)
      type(string_t) :: name
      type(string_t), intent(in) :: feature
      name = feature
    end function prc_writer_get_procname
```

Return the name of a procedure that implements a given feature with the
bind(C) property, so it can be accessed via a C procedure pointer and handled
by dlopen. We need this for all special features of a matrix element, since the
interface has to return a C function pointer for it. For a default implementation,
we prefix the external procedure name by the process ID.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure :: get_c_procname => prc_writer_get_c_procname
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    function prc_writer_get_c_procname (writer, id, feature) result (name)
      class(prc_writer_t), intent(in) :: writer
      type(string_t), intent(in) :: id, feature
      type(string_t) :: name
      name = id // "_" // feature
    end function prc_writer_get_c_procname
```

Common signature of code-writing procedures. The procedure may use the
process ID, and the feature name. (Not necessarily all of them.)

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
      subroutine write_code_file (writer, id)
        import
        class(prc_writer_t), intent(in) :: writer
        type(string_t), intent(in) :: id
      end subroutine write_code_file
    end interface

    abstract interface
      subroutine write_code (writer, unit, id)
        import
        class(prc_writer_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
      end subroutine write_code
    end interface

    abstract interface
```

```
      subroutine write_code_os &
          (writer, unit, id, os_data, verbose, testflag)
        import
        class(prc_writer_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id
        type(os_data_t), intent(in) :: os_data
        logical, intent(in) :: verbose
        logical, intent(in), optional :: testflag
      end subroutine write_code_os
    end interface

    abstract interface
      subroutine write_feature_code (writer, unit, id, feature)
        import
        class(prc_writer_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id, feature
      end subroutine write_feature_code
    end interface
```

There must be a procedure which writes an interface block for a given feature. If the external matrix element is implemented as a Fortran module, this is required only for the specific features which are returned as procedure pointers.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure(write_feature_code), deferred :: write_interface
```

There must also be a procedure which writes Makefile code which is specific for the current process, but not the feature.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure(write_code_os), deferred :: write_makefile_code
```

This procedure writes code process-specific source-code file (which need not be Fortran). It is called before `make source` is called. It may be a no-op, if the source code is generated by Make instead.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure(write_code_file), deferred :: write_source_code
```

This procedure is executed, once for each process, before (after) `make compile` is called, respectively.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure(write_code_file), deferred :: before_compile
    procedure(write_code_file), deferred :: after_compile
```

Writer for Fortran-module matrix elements

If the matrix element is available as a Fortran module, we have specific requirements: (i) the features are imported via `use` directives, (ii) the specific features require bind(C) wrappers.

The type is still abstract, all methods must be implemented explicitly for a specific matrix-element variant.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_writer_f_module_t
```

⟨*Prclib interfaces: types*⟩+≡
```
    type, extends (prc_writer_t), abstract :: prc_writer_f_module_t
     contains
     ⟨Prclib interfaces: prc writer f module: TBP⟩
    end type prc_writer_f_module_t
```

Return the name of the Fortran module. As a default implementation, we take
the process ID unchanged.

⟨*Prclib interfaces: prc writer f module: TBP*⟩≡
```
    procedure, nopass :: get_module_name => prc_writer_get_module_name
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    function prc_writer_get_module_name (id) result (name)
      type(string_t) :: name
      type(string_t), intent(in) :: id
      name = id
    end function prc_writer_get_module_name
```

Write a `use` directive that associates the driver reference with the procedure in
the matrix element code. By default, we use the C name for this.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
    procedure :: write_use_line => prc_writer_write_use_line
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_write_use_line (writer, unit, id, feature)
      class(prc_writer_f_module_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t) :: id, feature
      write (unit, "(2x,9A)")  "use ", char (writer%get_module_name (id)), &
           ", only: ", char (writer%get_c_procname (id, feature)), &
           " => ", char (writer%get_procname (feature))
    end subroutine prc_writer_write_use_line
```

Write a wrapper routine for a feature. This also associates a C name the module
procedure. The details depend on the writer variant.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
    procedure(prc_write_wrapper), deferred :: write_wrapper
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
      subroutine prc_write_wrapper (writer, unit, id, feature)
        import
        class(prc_writer_f_module_t), intent(in) :: writer
        integer, intent(in) :: unit
        type(string_t), intent(in) :: id, feature
      end subroutine prc_write_wrapper
    end interface
```

This is used for testing only: initialize the writer with a specific MD5 sum string.

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure :: init_test => prc_writer_init_test
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_init_test (writer)
      class(prc_writer_t), intent(out) :: writer
      writer%md5sum = "1234567890abcdef1234567890abcdef"
    end subroutine prc_writer_init_test
```

Writer for C-library matrix elements

This applies if the matrix element is available as a C library or a Fortran library
with bind(C) compatible interface. We can use the basic version.

The type is still abstract, all methods must be implemented explicitly for a
specific matrix-element variant.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_writer_c_lib_t
```

⟨*Prclib interfaces: types*⟩+≡
```
    type, extends (prc_writer_t), abstract :: prc_writer_c_lib_t
     contains
     ⟨Prclib interfaces: prc writer c lib: TBP⟩
    end type prc_writer_c_lib_t
```

14.2.5 Process records in the library driver

A process record holds the process (component) ID, the physics model_name,
and the array of features that are implemented by the corresponding matrix
element code.

The writer component holds procedures. The procedures write source code
for the current record, either for the driver or for the Makefile.

⟨*Prclib interfaces: types*⟩+≡
```
    type :: prclib_driver_record_t
      type(string_t) :: id
      type(string_t) :: model_name
      type(string_t), dimension(:), allocatable :: feature
      class(prc_writer_t), pointer :: writer => null ()
     contains
     ⟨Prclib interfaces: prclib driver record: TBP⟩
    end type prclib_driver_record_t
```

Output routine. We indent the output, so it smoothly integrates into the output
routine for the whole driver.

Note: the pointer writer is introduced as a workaround for a NAG compiler
bug.

⟨*Prclib interfaces: prclib driver record: TBP*⟩≡
```
    procedure :: write => prclib_driver_record_write
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write (object, unit)
      class(prclib_driver_record_t), intent(in) :: object
      integer, intent(in) :: unit
      integer :: j
```

```
        class(prc_writer_t), pointer :: writer
        write (unit, "(3x,A,2x,'[',A,']')")  &
             char (object%id), char (object%model_name)
        if (allocated (object%feature)) then
           writer => object%writer
           write (unit, "(5x,A,A)", advance="no") &
                char (writer%type_name ()), ":"
           do j = 1, size (object%feature)
              write (unit, "(1x,A)", advance="no") &
                   char (object%feature(j))
           end do
           write (unit, *)
        end if
     end subroutine prclib_driver_record_write
```

Get the C procedure name for a feature.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
     procedure :: get_c_procname => prclib_driver_record_get_c_procname
```

⟨*Prclib interfaces: procedures*⟩+≡
```
     function prclib_driver_record_get_c_procname (record, feature) result (name)
       type(string_t) :: name
       class(prclib_driver_record_t), intent(in) :: record
       type(string_t), intent(in) :: feature
       name = record%writer%get_c_procname (record%id, feature)
     end function prclib_driver_record_get_c_procname
```

Write a USE directive for a given feature. Applies only if the record corresponds
to a Fortran module.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
     procedure :: write_use_line => prclib_driver_record_write_use_line
```

⟨*Prclib interfaces: procedures*⟩+≡
```
     subroutine prclib_driver_record_write_use_line (record, unit, feature)
       class(prclib_driver_record_t), intent(in) :: record
       integer, intent(in) :: unit
       type(string_t), intent(in) :: feature
       select type (writer => record%writer)
       class is (prc_writer_f_module_t)
          call writer%write_use_line (unit, record%id, feature)
       end select
     end subroutine prclib_driver_record_write_use_line
```

The alternative: write an interface block for a given feature, unless the record
corresponds to a Fortran module.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
     procedure :: write_interface => prclib_driver_record_write_interface
```

⟨*Prclib interfaces: procedures*⟩+≡
```
     subroutine prclib_driver_record_write_interface (record, unit, feature)
       class(prclib_driver_record_t), intent(in) :: record
       integer, intent(in) :: unit
       type(string_t), intent(in) :: feature
```

```
      select type (writer => record%writer)
      class is (prc_writer_f_module_t)
      class default
         call writer%write_interface (unit, record%id, feature)
      end select
   end subroutine prclib_driver_record_write_interface
```

Write all special feature interfaces for the current record. Do this for all process variants.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
   procedure :: write_interfaces => prclib_driver_record_write_interfaces
```

⟨*Prclib interfaces: procedures*⟩+≡
```
   subroutine prclib_driver_record_write_interfaces (record, unit)
     class(prclib_driver_record_t), intent(in) :: record
     integer, intent(in) :: unit
     integer :: i
     do i = 1, size (record%feature)
        call record%writer%write_interface (unit, record%id, record%feature(i))
     end do
   end subroutine prclib_driver_record_write_interfaces
```

Write the wrapper routines for this record, if it corresponds to a Fortran module.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
   procedure :: write_wrappers => prclib_driver_record_write_wrappers
```

⟨*Prclib interfaces: procedures*⟩+≡
```
   subroutine prclib_driver_record_write_wrappers (record, unit)
     class(prclib_driver_record_t), intent(in) :: record
     integer, intent(in) :: unit
     integer :: i
     select type (writer => record%writer)
     class is (prc_writer_f_module_t)
        do i = 1, size (record%feature)
           call writer%write_wrapper (unit, record%id, record%feature(i))
        end do
     end select
   end subroutine prclib_driver_record_write_wrappers
```

Write the Makefile code for this record.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
   procedure :: write_makefile_code => prclib_driver_record_write_makefile_code
```

⟨*Prclib interfaces: procedures*⟩+≡
```
   subroutine prclib_driver_record_write_makefile_code &
        (record, unit, os_data, verbose, testflag)
     class(prclib_driver_record_t), intent(in) :: record
     integer, intent(in) :: unit
     type(os_data_t), intent(in) :: os_data
     logical, intent(in) :: verbose
     logical, intent(in), optional :: testflag
     call record%writer%write_makefile_code &
          (unit, record%id, os_data, verbose, testflag)
```

```
      end subroutine prclib_driver_record_write_makefile_code
```

Write source-code files for this record. This can be used as an alternative to handling source code via Makefile. In fact, this procedure is executed before `make source` is called. Usually, does nothing.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: write_source_code => prclib_driver_record_write_source_code
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_source_code (record)
      class(prclib_driver_record_t), intent(in) :: record
      call record%writer%write_source_code (record%id)
    end subroutine prclib_driver_record_write_source_code
```

Execute commands for this record that depend on the sources, so they cannot be included in the previous procedure. This procedure is executed before (after) `make compile` is called, respectively. Usually, does nothing.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: before_compile => prclib_driver_record_before_compile
    procedure :: after_compile => prclib_driver_record_after_compile
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_before_compile (record)
      class(prclib_driver_record_t), intent(in) :: record
      call record%writer%before_compile (record%id)
    end subroutine prclib_driver_record_before_compile

    subroutine prclib_driver_record_after_compile (record)
      class(prclib_driver_record_t), intent(in) :: record
      call record%writer%after_compile (record%id)
    end subroutine prclib_driver_record_after_compile
```

14.2.6 The process library driver object

A `prclib_driver_t` object provides the interface to external matrix element code. The code is provided by an external library which is either statically or dynamically linked.

The dynamic and static versions of the library are two different implementations of the abstract base type.

The `basename` identifies the library, both by file names and by Fortran variable names.

The `loaded` flag becomes true once all procedure pointers to the matrix element have been assigned.

For a dynamical external library, the communication proceeds via a `dlaccess` object.

`n_processes` is the number of external process code components that are referenced by this library. The code is addressed by index (`i_lib` in the process library entry above). This number should be equal to the number returned by `get_n_prc`.

For each external process, there is a separate `record` which holds the data that are needed for the driver parts which are specific for a given process component. The actual pointers for the loaded library will be assigned elsewhere.

The remainder is a collection of procedure pointers, which can be assigned once all external code has been compiled and linked. The procedure pointers all take a process component code index as an argument. Most return information about the process component that should match the process definition. The `get_fptr` procedures return a function pointer, which is the actual means to compute matrix elements or retrieve associated data.

Finally, the `unload_hook` and `reload_hook` pointers allow for the insertion of additional code when a library is loaded.

⟨*Prclib interfaces: public*⟩+≡
```
public :: prclib_driver_t
```

⟨*Prclib interfaces: types*⟩+≡
```
type, abstract :: prclib_driver_t

      end if
    end subroutine prclib_driver_write
```

Allocate a library as either static or dynamic. For static libraries, the procedure defers control to an external procedure which knows about the available static libraries. By default, this procedure is empty, but when we build a stand-alone executable, we replace the dummy by an actual dispatcher for the available static libraries. If the static dispatcher was not successful, we allocate a dynamic library.

The default version of `dispatch_prclib_static` resides in the `prebuilt` section of the `WHIZARD` tree, in a separate library. It does nothing, but can be replaced by a different procedure that allocates a static library driver if requested by name.

Note: `intent(out)` for the `driver` argument segfaults with gfortran 4.7.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: dispatch_prclib_driver
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine dispatch_prclib_driver &
        (driver, basename, modellibs_ldflags)
      class(prclib_driver_t), intent(inout), allocatable :: driver
      type(string_t), intent(in) :: basename
      type(string_t), intent(in), optional :: modellibs_ldflags
      procedure(dispatch_prclib_driver) :: dispatch_prclib_static
      if (allocated (driver))  deallocate (driver)
      call dispatch_prclib_static (driver, basename)
      if (.not. allocated (driver)) then
         allocate (prclib_driver_dynamic_t :: driver)
      end if
      driver%basename = basename
      driver%modellibs_ldflags = modellibs_ldflags
    end subroutine dispatch_prclib_driver
```

Initialize the ID array and set **n_processes** accordingly.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: init => prclib_driver_init
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_init (driver, n_processes)
      class(prclib_driver_t), intent(inout) :: driver
      integer, intent(in) :: n_processes
      driver%n_processes = n_processes
      allocate (driver%record (n_processes))
    end subroutine prclib_driver_init
```

Set the MD5 sum. This is separate because the MD5 sum may be known only after initialization.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: set_md5sum => prclib_driver_set_md5sum
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_set_md5sum (driver, md5sum)
      class(prclib_driver_t), intent(inout) :: driver
      character(32), intent(in) :: md5sum
      driver%md5sum = md5sum
    end subroutine prclib_driver_set_md5sum
```

Set the process record for a specific library entry. If the index is zero, we do nothing.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: set_record => prclib_driver_set_record
```
⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_set_record (driver, i, &
        id, model_name, features, writer)
      class(prclib_driver_t), intent(inout) :: driver
      integer, intent(in) :: i
      type(string_t), intent(in) :: id
      type(string_t), intent(in) :: model_name
      type(string_t), dimension(:), intent(in) :: features
      class(prc_writer_t), intent(in), pointer :: writer
      if (i > 0) then
         associate (record => driver%record(i))
           record%id = id
           record%model_name = model_name
           allocate (record%feature (size (features)))
           record%feature = features
           record%writer => writer
         end associate
      end if
    end subroutine prclib_driver_set_record
```

Write all USE directives for a given feature, scanning the array of processes. Only Fortran-module processes count. Then, write interface blocks for the remaining processes.

The `implicit none` statement must go in-between.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_interfaces => prclib_driver_write_interfaces
```
⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_write_interfaces (driver, unit, feature)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: feature
      integer :: i
      do i = 1, driver%n_processes
         call driver%record(i)%write_use_line (unit, feature)
      end do
      write (unit, "(2x,9A)")  "implicit none"
      do i = 1, driver%n_processes
         call driver%record(i)%write_interface (unit, feature)
      end do
    end subroutine prclib_driver_write_interfaces
```

14.2.7   Write makefile

The makefile contains constant parts, parts that depend on the library name, and parts that depend on the specific processes and their types.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: generate_makefile => prclib_driver_generate_makefile
```

⟨*Prclib interfaces: procedures*⟩+≡

14.2.8 Write driver file

This procedure writes the process library driver source code to the specified
output unit. The individual routines for writing source-code procedures are
given below.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: generate_driver_code => prclib_driver_generate_code
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_generate_code (driver, unit)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t) :: prefix
      integer :: i

      prefix = driver%basename // "_"
```

```
          write (unit, "(A)")  "! WHIZARD matrix-element code interface"
          write (unit, "(A)")  "!"
          write (unit, "(A)")  "! Automatically generated file, do not edit"
          call driver%write_module (unit, prefix)
          call driver%write_lib_md5sum_fun (unit, prefix)
          call driver%write_get_n_processes_fun (unit, prefix)
          call driver%write_get_process_id_fun (unit, prefix)
          call driver%write_get_model_name_fun (unit, prefix)
          call driver%write_get_md5sum_fun (unit, prefix)
          call driver%write_string_to_array_fun (unit, prefix)
          call driver%write_get_openmp_status_fun (unit, prefix)
          call driver%write_get_int_fun (unit, prefix, var_str ("n_in"))
          call driver%write_get_int_fun (unit, prefix, var_str ("n_out"))
          call driver%write_get_int_fun (unit, prefix, var_str ("n_flv"))
          call driver%write_get_int_fun (unit, prefix, var_str ("n_hel"))
          call driver%write_get_int_fun (unit, prefix, var_str ("n_col"))
          call driver%write_get_int_fun (unit, prefix, var_str ("n_cin"))
          call driver%write_get_int_fun (unit, prefix, var_str ("n_cf"))
          call driver%write_set_int_sub (unit, prefix, var_str ("flv_state"))
          call driver%write_set_int_sub (unit, prefix, var_str ("hel_state"))
          call driver%write_set_col_state_sub (unit, prefix)
          call driver%write_set_color_factors_sub (unit, prefix)
          call driver%write_get_fptr_sub (unit, prefix)
          do i = 1, driver%n_processes
             call driver%record(i)%write_wrappers (unit)
          end do
        end subroutine prclib_driver_generate_code
```

The driver module is used and required *only* if we intend to link the library
statically. Then, it provides the (static) driver type as a concrete implementa-
tion of the abstract library driver. This type contains the internal dispatcher
for assigning the library procedures to their appropriate procedure pointers. In
the dynamical case, the assignment is done via the base-type dispatcher which
invokes the DL mechanism.

However, compiling this together with the rest in any case should not do
any harm.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡

        character(*), intent(in) :: feature
        write (unit, "(A)")  "    case ('" // feature // "')"
        write (unit, "(A)")  "       c_fptr = c_funloc (" &
            // char (prefix) // feature // ")"
      end subroutine write_case
    end subroutine prclib_driver_write_module
```

This function provides the overall library MD5sum. The function is for internal
use (therefore not bind(C)), the external interface is via the get_md5sum_ptr
procedure with index 0.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_lib_md5sum_fun => prclib_driver_write_lib_md5sum_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_write_lib_md5sum_fun (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      write (unit, "(A)")  ""
      write (unit, "(A)")  "! The MD5 sum of the library"
      write (unit, "(A)")  "function " // char (prefix) &
          // "md5sum () result (md5sum)"
      write (unit, "(A)")  "  implicit none"
      write (unit, "(A)")  "  character(32) :: md5sum"
      write (unit, "(A)")  "  md5sum = '" // driver%md5sum // "'"
      write (unit, "(A)")  "end function " // char (prefix) // "md5sum"
    end subroutine prclib_driver_write_lib_md5sum_fun
```

14.2.9   Interface bodies for informational functions

These interfaces implement the communication between WHIZARD (the main program) and the process-library driver. The procedures are all BIND(C), so they can safely be exposed by the library and handled by the `dlopen` mechanism, which apparently understands only C calling conventions.

In the sections below, for each procedure, we provide both the interface itself and a procedure that writes the correponding procedure as source code to the process library driver.

Process count

Return the number of processes contained in the library.

⟨*Prclib interfaces: public*⟩+≡
```
public :: prc_get_n_processes
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
abstract interface
   function prc_get_n_processes () result (n) bind(C)
     import
     integer(c_int) :: n
   end function prc_get_n_processes
end interface
```

Here is the code.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
procedure :: write_get_n_processes_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
subroutine write_get_n_processes_fun (driver, unit, prefix)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: unit
  type(string_t), intent(in) :: prefix
  write (unit, "(A)")  ""
  write (unit, "(A)")  "! Return the number of processes in this library"
  write (unit, "(A)")  "function " // char (prefix) &
       // "get_n_processes () result (n) bind(C)"
  write (unit, "(A)")  "  use iso_c_binding"
  write (unit, "(A)")  "  implicit none"
  write (unit, "(A)")  "  integer(c_int) :: n"
  write (unit, "(A,I0)")  "  n = ", driver%n_processes
  write (unit, "(A)")  "end function " // char (prefix) &
       // "get_n_processes"
end subroutine write_get_n_processes_fun
```

Informational string functions

These functions return constant information about the matrix-element code.

The following procedures have to return strings. With the BIND(C) constraint, we choose to return the C pointer to a string, and its length, so the procedures implement this interface. They are actually subroutines.

⟨*Prclib interfaces: public*⟩+≡
```
public :: prc_get_stringptr
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
       subroutine prc_get_stringptr (i, cptr, len) bind(C)
         import
         integer(c_int), intent(in) :: i
         type(c_ptr), intent(out) :: cptr
         integer(c_int), intent(out) :: len
       end subroutine prc_get_stringptr
    end interface
```

To hide this complication, we introduce a subroutine that converts the returned
C pointer to a **string_t** object. As a side effect, we deallocate the original after
conversion – otherwise, we might have a memory leak.

For the conversion, we first pointer-convert the C pointer to a Fortran char-
acter array pointer, length 1 and size **len**. Using argument association and an
internal subroutine, we convert this to a character array with length **len** and
size 1. Using ordinary assignment, we finally convert this to **string_t**.

The function takes the pointer-returning function as an argument. The index
i identifies the process in the library.

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine get_string_via_cptr (string, i, get_stringptr)
       type(string_t), intent(out) :: string
       integer, intent(in) :: i
       procedure(prc_get_stringptr) :: get_stringptr
       type(c_ptr) :: cptr
       integer(c_int) :: pid, len
       character(kind=c_char), dimension(:), pointer :: c_array
       pid = i
       call get_stringptr (pid, cptr, len)
       if (c_associated (cptr)) then
          call c_f_pointer (cptr, c_array, shape = [len])
          call set_string (c_array)
          call get_stringptr (0_c_int, cptr, len)
       else
          string = ""
       end if
    contains
       subroutine set_string (buffer)
         character(len, kind=c_char), dimension(1), intent(in) :: buffer
         string = buffer(1)
       end subroutine set_string
    end subroutine get_string_via_cptr
```

Since the module procedures return Fortran strings, we have to convert them.
This is the necessary auxiliary routine. The routine is not BIND(C), it is not
accessed from outside.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure, nopass :: write_string_to_array_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_string_to_array_fun (unit, prefix)
       integer, intent(in) :: unit
       type(string_t), intent(in) :: prefix
```

```
      write (unit, "(A)")   ""
      write (unit, "(A)")   "! Auxiliary: convert character string &
          &to array pointer"
      write (unit, "(A)")   "subroutine " // char (prefix) &
          // "string_to_array (string, a)"
      write (unit, "(A)")   "  use iso_c_binding"
      write (unit, "(A)")   "  implicit none"
      write (unit, "(A)")   "  character(*), intent(in) :: string"
      write (unit, "(A)")   "  character(kind=c_char), dimension(:), &
          &allocatable, intent(out) :: a"
      write (unit, "(A)")   "  integer :: i"
      write (unit, "(A)")   "  allocate (a (len (string)))"
      write (unit, "(A)")   "  do i = 1, size (a)"
      write (unit, "(A)")   "     a(i) = string(i:i)"
      write (unit, "(A)")   "  end do"
      write (unit, "(A)")   "end subroutine " // char (prefix) &
          // "string_to_array"
    end subroutine write_string_to_array_fun
```

The above routine is called by other functions. It is not in a module, so they need its interface explicitly.

⟨*Prclib interfaces: procedures*⟩+≡

```
    subroutine write_string_to_array_interface (unit, prefix)
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      write (unit, "(2x,A)")   "interface"
      write (unit, "(2x,A)")   "  subroutine " // char (prefix) &
          // "string_to_array (string, a)"
      write (unit, "(2x,A)")   "    use iso_c_binding"
      write (unit, "(2x,A)")   "    implicit none"
      write (unit, "(2x,A)")   "    character(*), intent(in) :: string"
      write (unit, "(2x,A)")   "    character(kind=c_char), dimension(:), &
          &allocatable, intent(out) :: a"
      write (unit, "(2x,A)")   "  end subroutine " // char (prefix) &
          // "string_to_array"
      write (unit, "(2x,A)")   "end interface"
    end subroutine write_string_to_array_interface
```

Here are the info functions which return strings, implementing the interface prc_get_stringptr.

Return the process ID for each process.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡

```
    procedure :: write_get_process_id_fun
```

⟨*Prclib interfaces: procedures*⟩+≡

```
    subroutine write_get_process_id_fun (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i
      write (unit, "(A)")   ""
      write (unit, "(A)")   "! Return the process ID of process #i &
          &(as a C pointer to a character array)"
```

```
      write (unit, "(A)")  "subroutine " // char (prefix) &
           // "get_process_id_ptr (i, cptr, len) bind(C)"
      write (unit, "(A)")  "  use iso_c_binding"
      write (unit, "(A)")  "  implicit none"
      write (unit, "(A)")  "  integer(c_int), intent(in) :: i"
      write (unit, "(A)")  "  type(c_ptr), intent(out) :: cptr"
      write (unit, "(A)")  "  integer(c_int), intent(out) :: len"
      write (unit, "(A)")  "  character(kind=c_char), dimension(:), &
           &allocatable, target, save :: a"
      call write_string_to_array_interface (unit, prefix)
      write (unit, "(A)")  "  select case (i)"
      write (unit, "(A)")  "  case (0);  if (allocated (a))  deallocate (a)"
      do i = 1, driver%n_processes
         write (unit, "(A,I0,9A)")  "  case (", i, ");   ", &
              "call ", char (prefix), "string_to_array ('", &
              char (driver%record(i)%id), "', a)"
      end do
      write (unit, "(A)")  "  end select"
      write (unit, "(A)")  "  if (allocated (a)) then"
      write (unit, "(A)")  "     cptr = c_loc (a)"
      write (unit, "(A)")  "     len = size (a)"
      write (unit, "(A)")  "  else"
      write (unit, "(A)")  "     cptr = c_null_ptr"
      write (unit, "(A)")  "     len = 0"
      write (unit, "(A)")  "  end if"
      write (unit, "(A)")  "end subroutine " // char (prefix) &
           // "get_process_id_ptr"
    end subroutine write_get_process_id_fun
```

Return the model name, given explicitly.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_get_model_name_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_get_model_name_fun (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i
      write (unit, "(A)")  ""
      write (unit, "(A)")  "! Return the model name for process #i &
           &(as a C pointer to a character array)"
      write (unit, "(A)")  "subroutine " // char (prefix) &
           // "get_model_name_ptr (i, cptr, len) bind(C)"
      write (unit, "(A)")  "  use iso_c_binding"
      write (unit, "(A)")  "  implicit none"
      write (unit, "(A)")  "  integer(c_int), intent(in) :: i"
      write (unit, "(A)")  "  type(c_ptr), intent(out) :: cptr"
      write (unit, "(A)")  "  integer(c_int), intent(out) :: len"
      write (unit, "(A)")  "  character(kind=c_char), dimension(:), &
           &allocatable, target, save :: a"
      call write_string_to_array_interface (unit, prefix)
      write (unit, "(A)")  "  select case (i)"
      write (unit, "(A)")  "  case (0);  if (allocated (a))  deallocate (a)"
```

```
      do i = 1, driver%n_processes
         write (unit, "(A,I0,9A)")  "  case (", i, ");  ", &
               "call ", char (prefix), "string_to_array ('" , &
               char (driver%record(i)%model_name), &
               "', a)"
      end do
      write (unit, "(A)")  "  end select"
      write (unit, "(A)")  "  if (allocated (a)) then"
      write (unit, "(A)")  "     cptr = c_loc (a)"
      write (unit, "(A)")  "     len = size (a)"
      write (unit, "(A)")  "  else"
      write (unit, "(A)")  "     cptr = c_null_ptr"
      write (unit, "(A)")  "     len = 0"
      write (unit, "(A)")  "  end if"
      write (unit, "(A)")  "end subroutine " // char (prefix) &
            // "get_model_name_ptr"
    end subroutine write_get_model_name_fun
```

Call the MD5 sum function for the process. The function calls the corresponding
function of the matrix-element code, and it returns the C address of a character
array with length 32.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_get_md5sum_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_get_md5sum_fun (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i
      write (unit, "(A)")  ""
      write (unit, "(A)")  "! Return the MD5 sum for the process configuration &
           &(as a C pointer to a character array)"
      write (unit, "(A)")  "subroutine " // char (prefix) &
           // "get_md5sum_ptr (i, cptr, len) bind(C)"
      write (unit, "(A)")  "  use iso_c_binding"
      call driver%write_interfaces (unit, var_str ("md5sum"))
      write (unit, "(A)")  "  interface"
      write (unit, "(A)")  "     function " // char (prefix) &
           // "md5sum () result (md5sum)"
      write (unit, "(A)")  "        character(32) :: md5sum"
      write (unit, "(A)")  "     end function " // char (prefix) // "md5sum"
      write (unit, "(A)")  "  end interface"
      write (unit, "(A)")  "  integer(c_int), intent(in) :: i"
      write (unit, "(A)")  "  type(c_ptr), intent(out) :: cptr"
      write (unit, "(A)")  "  integer(c_int), intent(out) :: len"
      write (unit, "(A)")  "  character(kind=c_char), dimension(32), &
           &target, save :: md5sum"
      write (unit, "(A)")  "  select case (i)"
      write (unit, "(A)")  "  case (0)"
      write (unit, "(A)")  "     call copy (" // char (prefix) // "md5sum ())"
      write (unit, "(A)")  "     cptr = c_loc (md5sum)"
      do i = 1, driver%n_processes
         write (unit, "(A,I0,A)")  "  case (", i, ")"
```

```
      call driver%record(i)%write_md5sum_call (unit)
    end do
    write (unit, "(A)")  "  case default"
    write (unit, "(A)")  "     cptr = c_null_ptr"
    write (unit, "(A)")  "  end select"
    write (unit, "(A)")  "  len = 32"
    write (unit, "(A)")  "contains"
    write (unit, "(A)")  "  subroutine copy (md5sum_tmp)"
    write (unit, "(A)")  "    character, dimension(32), intent(in) :: &
        &md5sum_tmp"
    write (unit, "(A)")  "    md5sum = md5sum_tmp"
    write (unit, "(A)")  "  end subroutine copy"
    write (unit, "(A)")  "end subroutine " // char (prefix) &
        // "get_md5sum_ptr"
  end subroutine write_get_md5sum_fun
```

The actual call depends on the type of matrix element.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: write_md5sum_call => prclib_driver_record_write_md5sum_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_md5sum_call (record, unit)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      call record%writer%write_md5sum_call (unit, record%id)
    end subroutine prclib_driver_record_write_md5sum_call
```

The interface goes into the writer base type:

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure(write_code), deferred :: write_md5sum_call
```

In the Fortran module case, we take a detour. The string returned by the
Fortran function is copied into a fixed-size array. The copy routine is an internal
subroutine of **get_md5sum_ptr**. We return the C address of the target array.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
    procedure :: write_md5sum_call => prc_writer_f_module_write_md5sum_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_f_module_write_md5sum_call (writer, unit, id)
      class(prc_writer_f_module_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
      write (unit, "(5x,9A)")  "call copy (", &
          char (writer%get_c_procname (id, var_str ("md5sum"))), " ())"
      write (unit, "(5x,9A)")  "cptr = c_loc (md5sum)"
    end subroutine prc_writer_f_module_write_md5sum_call
```

In the C library case, the library function returns a C pointer, which we can
just copy.

⟨*Prclib interfaces: prc writer c lib: TBP*⟩≡
```
    procedure :: write_md5sum_call => prc_writer_c_lib_write_md5sum_call
```

⟨*Prclib interfaces: procedures*⟩+≡

```
subroutine prc_writer_c_lib_write_md5sum_call (writer, unit, id)
  class(prc_writer_c_lib_t), intent(in) :: writer
  integer, intent(in) :: unit
  type(string_t), intent(in) :: id
  write (unit, "(5x,9A)") &
       "cptr =  ", &
       char (writer%get_c_procname (id, var_str ("get_md5sum"))), " ()"
end subroutine prc_writer_c_lib_write_md5sum_call
```

Actual references to the info functions

The string-valued info functions return C character arrays. For the API of the library driver, we provide convenience functions which (re)convert those arrays into string_t objects.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡

```
procedure :: get_process_id => prclib_driver_get_process_id
procedure :: get_model_name => prclib_driver_get_model_name
procedure :: get_md5sum => prclib_driver_get_md5sum
```

⟨*Prclib interfaces: procedures*⟩+≡

```
function prclib_driver_get_process_id (driver, i) result (string)
  type(string_t) :: string
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  call get_string_via_cptr (string, i, driver%get_process_id_ptr)
end function prclib_driver_get_process_id

function prclib_driver_get_model_name (driver, i) result (string)
  type(string_t) :: string
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  call get_string_via_cptr (string, i, driver%get_model_name_ptr)
end function prclib_driver_get_model_name

function prclib_driver_get_md5sum (driver, i) result (string)
  type(string_t) :: string
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: i
  call get_string_via_cptr (string, i, driver%get_md5sum_ptr)
end function prclib_driver_get_md5sum
```

Informational logical functions

When returning a logical value, we use the C boolean type, which may differ from Fortran.

⟨*Prclib interfaces: public*⟩+≡

```
public :: prc_get_log
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
abstract interface
   function prc_get_log (pid) result (l) bind(C)
     import
     integer(c_int), intent(in) :: pid
     logical(c_bool) :: l
   end function prc_get_log
end interface
```

Return a logical flag which tells whether OpenMP is supported for a specific process code.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
procedure :: write_get_openmp_status_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
subroutine write_get_openmp_status_fun (driver, unit, prefix)
  class(prclib_driver_t), intent(in) :: driver
  integer, intent(in) :: unit
  type(string_t), intent(in) :: prefix
  integer :: i
  write (unit, "(A)")  ""
  write (unit, "(A)")  "! Return the OpenMP support status"
  write (unit, "(A)")  "function " // char (prefix) &
       // "get_openmp_status (i) result (openmp_status) bind(C)"
  write (unit, "(A)")  "  use iso_c_binding"
  call driver%write_interfaces (unit, var_str ("openmp_supported"))
  write (unit, "(A)")  "  integer(c_int), intent(in) :: i"
  write (unit, "(A)")  "  logical(c_bool) :: openmp_status"
  write (unit, "(A)")  "  select case (i)"
  do i = 1, driver%n_processes
     write (unit, "(A,I0,9A)")  "  case (", i, ");  ", &
            "openmp_status = ", &
            char (driver%record(i)%get_c_procname &
            (var_str ("openmp_supported"))), " ()"
  end do
  write (unit, "(A)")  "  end select"
  write (unit, "(A)")  "end function " // char (prefix) &
       // "get_openmp_status"
end subroutine write_get_openmp_status_fun
```

Informational integer functions

Various process metadata are integer values. We can use a single interface for all of them.

⟨*Prclib interfaces: public*⟩+≡
```
public :: prc_get_int
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
abstract interface
   function prc_get_int (pid) result (n) bind(C)
     import
     integer(c_int), intent(in) :: pid
     integer(c_int) :: n
   end function prc_get_int
```

```
    end interface
```

This function returns any data of type integer, for each process.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_get_int_fun
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_get_int_fun (driver, unit, prefix, feature)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      type(string_t), intent(in) :: feature
      integer :: i
      write (unit, "(A)")  ""
      write (unit, "(9A)")  "! Return the value of ", char (feature)
      write (unit, "(9A)")  "function ", char (prefix), &
          "get_", char (feature), " (pid)", &
          " result (", char (feature), ") bind(C)"
      write (unit, "(9A)")  "  use iso_c_binding"
      call driver%write_interfaces (unit, feature)
      write (unit, "(9A)")  "  integer(c_int), intent(in) :: pid"
      write (unit, "(9A)")  "  integer(c_int) :: ", char (feature)
      write (unit, "(9A)")  "  select case (pid)"
      do i = 1, driver%n_processes
         write (unit, "(2x,A,I0,9A)")  "case (", i, ");  ", &
             char (feature), " = ", &
             char (driver%record(i)%get_c_procname (feature)), &
             " ()"
      end do
      write (unit, "(9A)")  "  end select"
      write (unit, "(9A)")  "end function ", char (prefix), &
          "get_", char (feature)
    end subroutine write_get_int_fun
```

Write a `case` line that assigns the value of the external function to the current
return value.

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_case_int_fun (record, unit, i, feature)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      integer, intent(in) :: i
      type(string_t), intent(in) :: feature
      write (unit, "(5x,A,I0,9A)")  "case (", i, ");  ", &
          char (feature), " = ", char (record%get_c_procname (feature))
    end subroutine write_case_int_fun
```

Flavor and helicity tables

Transferring tables is more complicated. First, a two-dimensional array.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_set_int_tab1
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
       subroutine prc_set_int_tab1 (pid, tab, shape) bind(C)
         import
         integer(c_int), intent(in) :: pid
         integer(c_int), dimension(*), intent(out) :: tab
         integer(c_int), dimension(2), intent(in) :: shape
       end subroutine prc_set_int_tab1
    end interface
```

This subroutine returns a table of integers.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_set_int_sub
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_set_int_sub (driver, unit, prefix, feature)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      type(string_t), intent(in) :: feature
      integer :: i
      write (unit, "(A)")  ""
      write (unit, "(9A)")  "! Set table: ", char (feature)
      write (unit, "(9A)")  "subroutine ", char (prefix), &
           "set_", char (feature), "_ptr (pid, ", char (feature), &
           ", shape) bind(C)"
      write (unit, "(9A)")  "  use iso_c_binding"
      call driver%write_interfaces (unit, feature)
      write (unit, "(9A)")  "  integer(c_int), intent(in) :: pid"
      write (unit, "(9A)")  "  integer(c_int), dimension(*), intent(out) :: ", &
           char (feature)
      write (unit, "(9A)")  "  integer(c_int), dimension(2), intent(in) :: shape"
      write (unit, "(9A)")  "  integer, dimension(:,:), allocatable :: ", &
           char (feature), "_tmp"
      write (unit, "(9A)")  "  integer :: i, j"
      write (unit, "(9A)")  "  select case (pid)"
      do i = 1, driver%n_processes
         write (unit, "(2x,A,I0,A)")  "case (", i, ")"
         call driver%record(i)%write_int_sub_call (unit, feature)
      end do
      write (unit, "(9A)")  "  end select"
      write (unit, "(9A)")  "end subroutine ", char (prefix), &
           "set_", char (feature), "_ptr"
    end subroutine write_set_int_sub
```

The actual call depends on the type of matrix element.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: write_int_sub_call => prclib_driver_record_write_int_sub_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_int_sub_call (record, unit, feature)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      type(string_t), intent(in) :: feature
      call record%writer%write_int_sub_call (unit, record%id, feature)
```

```
        end subroutine prclib_driver_record_write_int_sub_call
```

The interface goes into the writer base type:

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
        procedure(write_feature_code), deferred :: write_int_sub_call
```

In the Fortran module case, we need an extra copy in the (academical) situation
where default integer and c_int differ. Otherwise, we just associate a Fortran
array with the C pointer and let the matrix-element subroutine fill the array.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
        procedure :: write_int_sub_call => prc_writer_f_module_write_int_sub_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
        subroutine prc_writer_f_module_write_int_sub_call (writer, unit, id, feature)
          class(prc_writer_f_module_t), intent(in) :: writer
          integer, intent(in) :: unit
          type(string_t), intent(in) :: id, feature
          write (unit, "(5x,9A)")  "allocate (",  char (feature), "_tmp ", &
              "(shape(1), shape(2)))"
          write (unit, "(5x,9A)")  "call ", &
              char (writer%get_c_procname (id, feature)), &
              " (", char (feature), "_tmp)"
          write (unit, "(5x,9A)")  "forall (i=1:shape(1), j=1:shape(2)) "
          write (unit, "(8x,9A)")  char (feature), "(i + shape(1)*(j-1)) = ", &
              char (feature), "_tmp", "(i,j)"
          write (unit, "(5x,9A)")  "end forall"
        end subroutine prc_writer_f_module_write_int_sub_call
```

In the C library case, we just transfer the C pointer to the library function.

⟨*Prclib interfaces: prc writer c lib: TBP*⟩+≡
```
        procedure :: write_int_sub_call => prc_writer_c_lib_write_int_sub_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
        subroutine prc_writer_c_lib_write_int_sub_call (writer, unit, id, feature)
          class(prc_writer_c_lib_t), intent(in) :: writer
          integer, intent(in) :: unit
          type(string_t), intent(in) :: id, feature
          write (unit, "(5x,9A)")  "call ", &
              char (writer%get_c_procname (id, feature)), " (", char (feature), ")"
        end subroutine prc_writer_c_lib_write_int_sub_call
```

Color state table

The color-state specification needs a table of integers (one array per color flow)
and a corresponding array of color-ghost flags.

⟨*Prclib interfaces: public*⟩+≡
```
        public :: prc_set_col_state
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
        abstract interface
          subroutine prc_set_col_state (pid, col_state, ghost_flag, shape) bind(C)
            import
            integer(c_int), intent(in) :: pid
```

```
          integer(c_int), dimension(*), intent(out) :: col_state
          logical(c_bool), dimension(*), intent(out) :: ghost_flag
          integer(c_int), dimension(3), intent(in) :: shape
        end subroutine prc_set_col_state
    end interface
```

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_set_col_state_sub
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_set_col_state_sub (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i
      type(string_t) :: feature
      feature = "col_state"
      write (unit, "(A)")  ""
      write (unit, "(9A)")  "! Set tables: col_state, ghost_flag"
      write (unit, "(9A)")  "subroutine ", char (prefix), &
           "set_col_state_ptr (pid, col_state, ghost_flag, shape) bind(C)"
      write (unit, "(9A)")  "  use iso_c_binding"
      call driver%write_interfaces (unit, feature)
      write (unit, "(9A)")  "  integer(c_int), intent(in) :: pid"
      write (unit, "(9A)") &
           "  integer(c_int), dimension(*), intent(out) :: col_state"
      write (unit, "(9A)") &
           "  logical(c_bool), dimension(*), intent(out) :: ghost_flag"
      write (unit, "(9A)") &
           "  integer(c_int), dimension(3), intent(in) :: shape"
      write (unit, "(9A)") &
           "  integer, dimension(:,:,:), allocatable :: col_state_tmp"
      write (unit, "(9A)") &
           "  logical, dimension(:,:), allocatable :: ghost_flag_tmp"
      write (unit, "(9A)") "  integer :: i, j, k"
      write (unit, "(A)")  "  select case (pid)"
      do i = 1, driver%n_processes
         write (unit, "(A,I0,A)")  "  case (", i, ")"
         call driver%record(i)%write_col_state_call (unit)
      end do
      write (unit, "(A)")  "  end select"
      write (unit, "(9A)")  "end subroutine ", char (prefix), &
           "set_col_state_ptr"
    end subroutine write_set_col_state_sub
```

The actual call depends on the type of matrix element.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: write_col_state_call => prclib_driver_record_write_col_state_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_col_state_call (record, unit)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      call record%writer%write_col_state_call (unit, record%id)
    end subroutine prclib_driver_record_write_col_state_call
```

The interface goes into the writer base type:

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure(write_code), deferred :: write_col_state_call
```

In the Fortran module case, we need an extra copy in the (academical) situation where default integer and `c_int` differ. Otherwise, we just associate a Fortran array with the C pointer and let the matrix-element subroutine fill the array.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
    procedure :: write_col_state_call => prc_writer_f_module_write_col_state_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_f_module_write_col_state_call (writer, unit, id)
      class(prc_writer_f_module_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
      write (unit, "(9A)")  "  allocate (col_state_tmp ", &
            "(shape(1), shape(2), shape(3)))"
      write (unit, "(5x,9A)")  "allocate (ghost_flag_tmp ", &
              "(shape(2), shape(3)))"
      write (unit, "(5x,9A)")  "call ", &
          char (writer%get_c_procname (id, var_str ("col_state"))), &
          " (col_state_tmp, ghost_flag_tmp)"
      write (unit, "(5x,9A)")  "forall (i = 1:shape(2), j = 1:shape(3))"
      write (unit, "(8x,9A)")  "forall (k = 1:shape(1))"
      write (unit, "(11x,9A)")  &
          "col_state(k + shape(1) * (i + shape(2)*(j-1) - 1)) ", &
          "= col_state_tmp(k,i,j)"
      write (unit, "(8x,9A)")  "end forall"
      write (unit, "(8x,9A)")  &
          "ghost_flag(i + shape(2)*(j-1)) = ghost_flag_tmp(i,j)"
      write (unit, "(5x,9A)")  "end forall"
    end subroutine prc_writer_f_module_write_col_state_call
```

In the C library case, we just transfer the C pointer to the library function.

⟨*Prclib interfaces: prc writer c lib: TBP*⟩+≡
```
    procedure :: write_col_state_call => prc_writer_c_lib_write_col_state_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_c_lib_write_col_state_call (writer, unit, id)
      class(prc_writer_c_lib_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
      write (unit, "(5x,9A)")  "call ", &
          char (writer%get_c_procname (id, var_str ("col_state"))), &
          " (col_state, ghost_flag)"
    end subroutine prc_writer_c_lib_write_col_state_call
```

Color factors

For the color-factor information, we return two integer arrays and a complex array.

⟨*Prclib interfaces: public*⟩+≡

```
      public :: prc_set_color_factors
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
      abstract interface
         subroutine prc_set_color_factors &
              (pid, cf_index1, cf_index2, color_factors, shape) bind(C)
           import
           integer(c_int), intent(in) :: pid
           integer(c_int), dimension(*), intent(out) :: cf_index1, cf_index2
           complex(c_default_complex), dimension(*), intent(out) :: color_factors
           integer(c_int), dimension(1), intent(in) :: shape
         end subroutine prc_set_color_factors
      end interface
```

This subroutine returns the color-flavor factor table.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
      procedure :: write_set_color_factors_sub
```

⟨*Prclib interfaces: procedures*⟩+≡
```
      subroutine write_set_color_factors_sub (driver, unit, prefix)
        class(prclib_driver_t), intent(in) :: driver
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        integer :: i
        type(string_t) :: feature
        feature = "color_factors"
        write (unit, "(A)")  ""
        write (unit, "(A)")  "! Set tables: color factors"
        write (unit, "(9A)")  "subroutine ", char (prefix), &
             "set_color_factors_ptr (pid, cf_index1, cf_index2, color_factors, ", &
             "shape) bind(C)"
        write (unit, "(A)")  "  use iso_c_binding"
        write (unit, "(A)")  "  use kinds"
        write (unit, "(A)")  "  use omega_color"
        call driver%write_interfaces (unit, feature)
        write (unit, "(A)")  "  integer(c_int), intent(in) :: pid"
        write (unit, "(A)")  "  integer(c_int), dimension(1), intent(in) :: shape"
        write (unit, "(A)")  "  integer(c_int), dimension(*), intent(out) :: &
             &cf_index1, cf_index2"
        write (unit, "(A)")  "  complex(c_default_complex), dimension(*), &
             &intent(out) :: color_factors"
        write (unit, "(A)")  "  type(omega_color_factor), dimension(:), &
             &allocatable :: cf"
        write (unit, "(A)")  "  select case (pid)"
        do i = 1, driver%n_processes
           write (unit, "(2x,A,I0,A)")  "case (", i, ")"
           call driver%record(i)%write_color_factors_call (unit)
        end do
        write (unit, "(A)")  "  end select"
        write (unit, "(A)")  "end subroutine " // char (prefix) &
             // "set_color_factors_ptr"
      end subroutine write_set_color_factors_sub
```

The actual call depends on the type of matrix element.

⟨*Prclib interfaces: prclib driver record: TBP*⟩+≡
```
    procedure :: write_color_factors_call => prclib_driver_record_write_color_factors_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_record_write_color_factors_call (record, unit)
      class(prclib_driver_record_t), intent(in) :: record
      integer, intent(in) :: unit
      call record%writer%write_color_factors_call (unit, record%id)
    end subroutine prclib_driver_record_write_color_factors_call
```

The interface goes into the writer base type:

⟨*Prclib interfaces: prc writer: TBP*⟩+≡
```
    procedure(write_code), deferred :: write_color_factors_call
```

In the Fortran module case, the matrix-element procedure fills an array of
`omega_color_factor` elements. We distribute this array among two integer
arrays and one complex-valued array, for which we have the C pointers.

⟨*Prclib interfaces: prc writer f module: TBP*⟩+≡
```
    procedure :: write_color_factors_call => prc_writer_f_module_write_color_factors_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_f_module_write_color_factors_call (writer, unit, id)
      class(prc_writer_f_module_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
      write (unit, "(5x,A)")  "allocate (cf (shape(1)))"
      write (unit, "(5x,9A)")  "call ", &
          char (writer%get_c_procname (id, var_str ("color_factors"))), " (cf)"
      write (unit, "(5x,9A)")  "cf_index1(1:shape(1)) = cf%i1"
      write (unit, "(5x,9A)")  "cf_index2(1:shape(1)) = cf%i2"
      write (unit, "(5x,9A)")  "color_factors(1:shape(1)) = cf%factor"
    end subroutine prc_writer_f_module_write_color_factors_call
```

In the C library case, we just transfer the C pointers to the library function.
There are three arrays.

⟨*Prclib interfaces: prc writer c lib: TBP*⟩+≡
```
    procedure :: write_color_factors_call => &
        prc_writer_c_lib_write_color_factors_call
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prc_writer_c_lib_write_color_factors_call (writer, unit, id)
      class(prc_writer_c_lib_t), intent(in) :: writer
      integer, intent(in) :: unit
      type(string_t), intent(in) :: id
      write (unit, "(5x,9A)")  "call ", &
          char (writer%get_c_procname (id, var_str ("color_factors"))), &
          " (cf_index1, cf_index2, color_factors)"
    end subroutine prc_writer_c_lib_write_color_factors_call
```

14.2.10 Interfaces for C-library matrix element

If the matrix element code is not provided as a Fortran module but as a C or
bind(C) Fortran library, we need explicit interfaces for the library functions.
They are not identical to the Fortran module versions. They transfer pointers
directly.

The implementation is part of the `prc_writer_c_lib` type, which serves as
base type for all C-library writers. It writes specific interfaces depending on the
feature.

We bind this as the method `write_standard_interface` instead of `write_interface`,
because we have to override the latter. Otherwise we could not call the method
because the writer type is abstract.

⟨*Prclib interfaces: prc writer c lib: TBP*⟩+≡
```
  procedure :: write_standard_interface => prc_writer_c_lib_write_interface
```

⟨*Prclib interfaces: procedures*⟩+≡
```
   subroutine prc_writer_c_lib_write_interface (writer, unit, id, feature)
     class(prc_writer_c_lib_t), intent(in) :: writer
     integer, intent(in) :: unit
     type(string_t), intent(in) :: id, feature
     select case (char (feature))
     case ("md5sum")
        write (unit, "(2x,9A)")  "interface"
        write (unit, "(5x,9A)")  "function ", &
             char (writer%get_c_procname (id, var_str ("get_md5sum"))), &
             " () result (cptr) bind(C)"
        write (unit, "(7x,9A)")  "import"
        write (unit, "(7x,9A)")  "implicit none"
        write (unit, "(7x,9A)")  "type(c_ptr) :: cptr"
        write (unit, "(5x,9A)")  "end function ", &
             char (writer%get_c_procname (id, var_str ("get_md5sum")))

 end subroutine prc_writer_c_lib_write_interface
```

14.2.11 Retrieving the tables

In the previous section we had the writer routines for procedures that return
tables, actually C pointers to tables. Here, we write convenience routines that
unpack them and move the contents to suitable Fortran arrays.

The flavor and helicity tables are two-dimensional integer arrays. We use
intermediate storage for correctly transforming C to Fortran data types.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: set_flv_state => prclib_driver_set_flv_state
    procedure :: set_hel_state => prclib_driver_set_hel_state
```
⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_set_flv_state (driver, i, flv_state)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: i
      integer, dimension(:,:), allocatable, intent(out) :: flv_state
      integer :: n_tot, n_flv
      integer(c_int) :: pid
      integer(c_int), dimension(:,:), allocatable :: c_flv_state
      pid = i
      n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
      n_flv = driver%get_n_flv (pid)
      allocate (flv_state (n_tot, n_flv))
      allocate (c_flv_state (n_tot, n_flv))
      call driver%set_flv_state_ptr &
           (pid, c_flv_state, int ([n_tot, n_flv], kind=c_int))
      flv_state = c_flv_state
    end subroutine prclib_driver_set_flv_state

    subroutine prclib_driver_set_hel_state (driver, i, hel_state)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: i
      integer, dimension(:,:), allocatable, intent(out) :: hel_state
      integer :: n_tot, n_hel
      integer(c_int) :: pid
      integer(c_int), dimension(:,:), allocatable, target :: c_hel_state
      pid = i
      n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
      n_hel = driver%get_n_hel (pid)
      allocate (hel_state (n_tot, n_hel))
      allocate (c_hel_state (n_tot, n_hel))
      call driver%set_hel_state_ptr &
           (pid, c_hel_state, int ([n_tot, n_hel], kind=c_int))
      hel_state = c_hel_state
    end subroutine prclib_driver_set_hel_state
```

The color-flow table is three-dimensional, otherwise similar. We simultaneously set the ghost-flag table, which consists of logical entries.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: set_col_state => prclib_driver_set_col_state
```
⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_set_col_state (driver, i, col_state, ghost_flag)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: i
      integer, dimension(:,:,:), allocatable, intent(out) :: col_state
      logical, dimension(:,:), allocatable, intent(out) :: ghost_flag
      integer :: n_cin, n_tot, n_col
      integer(c_int) :: pid
      integer(c_int), dimension(:,:,:), allocatable :: c_col_state
      logical(c_bool), dimension(:,:), allocatable :: c_ghost_flag
      pid = i
```

```
      n_cin = driver%get_n_cin (pid)
      n_tot = driver%get_n_in (pid) + driver%get_n_out (pid)
      n_col = driver%get_n_col (pid)
      allocate (col_state (n_cin, n_tot, n_col))
      allocate (c_col_state (n_cin, n_tot, n_col))
      allocate (ghost_flag (n_tot, n_col))
      allocate (c_ghost_flag (n_tot, n_col))
      call driver%set_col_state_ptr (pid, &
           c_col_state, c_ghost_flag, int ([n_cin, n_tot, n_col], kind=c_int))
      col_state = c_col_state
      ghost_flag = c_ghost_flag
    end subroutine prclib_driver_set_col_state
```

The color-factor table is a sparse matrix: a two-column array of indices and one array which contains the corresponding factors.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: set_color_factors => prclib_driver_set_color_factors
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_set_color_factors (driver, i, color_factors, cf_index)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: i
      complex(default), dimension(:), allocatable, intent(out) :: color_factors
      integer, dimension(:,:), allocatable, intent(out) :: cf_index
      integer :: n_cf
      integer(c_int) :: pid
      complex(c_default_complex), dimension(:), allocatable, target :: c_color_factors
      integer(c_int), dimension(:), allocatable, target :: c_cf_index1
      integer(c_int), dimension(:), allocatable, target :: c_cf_index2
      pid = i
      n_cf = driver%get_n_cf (pid)
      allocate (color_factors (n_cf))
      allocate (c_color_factors (n_cf))
      allocate (c_cf_index1 (n_cf))
      allocate (c_cf_index2 (n_cf))
      call driver%set_color_factors_ptr (pid, &
           c_cf_index1, c_cf_index2, &
           c_color_factors, int ([n_cf], kind=c_int))
      color_factors = c_color_factors
      allocate (cf_index (2, n_cf))
      cf_index(1,:) = c_cf_index1
      cf_index(2,:) = c_cf_index2
    end subroutine prclib_driver_set_color_factors
```

14.2.12   Returning a procedure pointer

The functions that directly access the matrix element, event by event, are assigned to a process-specific driver object as procedure pointers. For the `dlopen` interface, we use C function pointers. This subroutine returns such a pointer:

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prc_get_fptr
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
      subroutine prc_get_fptr (pid, fid, fptr) bind(C)
        import
        integer(c_int), intent(in) :: pid
        integer(c_int), intent(in) :: fid
        type(c_funptr), intent(out) :: fptr
      end subroutine prc_get_fptr
    end interface
```

This procedure writes the source code for the procedure pointer returning sub-routine.

All C functions that are provided by the matrix element code of a specific process are handled here. The selection consists of a double layered `select case` construct.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: write_get_fptr_sub
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine write_get_fptr_sub (driver, unit, prefix)
      class(prclib_driver_t), intent(in) :: driver
      integer, intent(in) :: unit
      type(string_t), intent(in) :: prefix
      integer :: i, j
      write (unit, "(A)")  ""
      write (unit, "(A)")  "! Return C pointer to a procedure:"
      write (unit, "(A)")  "! pid = process index;  fid = function index"
      write (unit, "(4A)")  "subroutine ", char (prefix), "get_fptr ", &
           "(pid, fid, fptr) bind(C)"
      write (unit, "(A)")  "  use iso_c_binding"
      write (unit, "(A)")  "  use kinds"
      write (unit, "(A)")  "  implicit none"
      write (unit, "(A)")  "  integer(c_int), intent(in) :: pid"
      write (unit, "(A)")  "  integer(c_int), intent(in) :: fid"
      write (unit, "(A)")  "  type(c_funptr), intent(out) :: fptr"
      do i = 1, driver%n_processes
         call driver%record(i)%write_interfaces (unit)
      end do
      write (unit, "(A)")  "  select case (pid)"
      do i = 1, driver%n_processes
         write (unit, "(2x,A,I0,A)")  "case (", i, ")"
         write (unit, "(5x,A)")  "select case (fid)"
         associate (record => driver%record(i))
           do j = 1, size (record%feature)
              write (unit, "(5x,A,I0,9A)")  "case (", j, ");  ", &
                   "fptr = c_funloc (", &
                   char (record%get_c_procname (record%feature(j))), &
                   ")"
           end do
         end associate
         write (unit, "(5x,A)")  "end select"
      end do
      write (unit, "(A)")  "  end select"
      write (unit, "(3A)")  "end subroutine ", char (prefix), "get_fptr"
```

947

```
      end subroutine write_get_fptr_sub
```

The procedures for which we want to return a pointer (the 'features' of the
matrix element code) are actually Fortran module procedures. If we want to
have a C signature, we must write wrapper functions for all of them. The
procedures, their signatures, and the appropriate writer routines are specific for
the process type.

To keep this generic, we do not provide the writer routines here, but just
the interface for a writer routine. The actual routines are stored in the process
record.

The **prefix** indicates the library, the **id** indicates the process, and **procname**
is the bare name of the procedure to be written.

⟨*Prclib interfaces: public*⟩+≡
```
    public :: write_driver_code
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
      subroutine write_driver_code (unit, prefix, id, procname)
        import
        integer, intent(in) :: unit
        type(string_t), intent(in) :: prefix
        type(string_t), intent(in) :: id
        type(string_t), intent(in) :: procname
      end subroutine write_driver_code
    end interface
```

14.2.13   Hooks

Interface for additional library unload / reload hooks (currently unused!)

⟨*Prclib interfaces: public*⟩+≡
```
    public :: prclib_unload_hook
    public :: prclib_reload_hook
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
      subroutine prclib_unload_hook (libname)
        import
        type(string_t), intent(in) :: libname
      end subroutine prclib_unload_hook

      subroutine prclib_reload_hook (libname)
        import
        type(string_t), intent(in) :: libname
      end subroutine prclib_reload_hook
    end interface
```

14.2.14   Make source, compile, link

Since we should have written a Makefile, these tasks amount to simple **make**
calls. Note that the Makefile targets depend on each other, so calling **link**
executes also the **source** and **compile** steps, when necessary.

Optionally, we can use a subdirectory. We construct a prefix for the subdirectory, and generate a shell `cd` call that moves us into the workspace.

The `prefix` version is intended to be prepended to a filename, and can be empty. The `path` version is intended to be prepended with a following slash, so the default is `.`.

⟨*Prclib interfaces: public*⟩+≡
```
public :: workspace_prefix
public :: workspace_path
```

⟨*Prclib interfaces: procedures*⟩+≡
```
function workspace_prefix (workspace) result (prefix)
  type(string_t), intent(in), optional :: workspace
  type(string_t) :: prefix
  if (present (workspace)) then
     if (workspace /= "") then
        prefix = workspace // "/"
     else
        prefix = ""
     end if
  else
     prefix = ""
  end if
end function workspace_prefix

function workspace_path (workspace) result (path)
  type(string_t), intent(in), optional :: workspace
  type(string_t) :: path
  if (present (workspace)) then
     if (workspace /= "") then
        path = workspace
     else
        path = "."
     end if
  else
     path = "."
  end if
end function workspace_path

function workspace_cmd (workspace) result (cmd)
  type(string_t), intent(in), optional :: workspace
  type(string_t) :: cmd
  if (present (workspace)) then
     if (workspace /= "") then
        cmd = "cd " // workspace // " && "
     else
        cmd = ""
     end if
  else
     cmd = ""
  end if
end function workspace_cmd
```

The first routine writes source-code files for the individual processes. First it calls the writer routines directly for each process, then it calls `make source`.

The make command may either post-process the files, or it may do the complete work, e.g., calling an external program the generates the files.

⟨Prclib interfaces: prclib driver: TBP⟩+≡
```
    procedure :: make_source => prclib_driver_make_source
```

⟨Prclib interfaces: procedures⟩+≡
```
    subroutine prclib_driver_make_source (driver, os_data, workspace)
      class(prclib_driver_t), intent(in) :: driver
      type(os_data_t), intent(in) :: os_data
      type(string_t), intent(in), optional :: workspace
      integer :: i
      do i = 1, driver%n_processes
         call driver%record(i)%write_source_code ()
      end do
      call os_system_call ( &
          workspace_cmd (workspace) &
          // "make source " // os_data%makeflags &
          // " -f " // driver%basename // ".makefile")
    end subroutine prclib_driver_make_source
```

Compile matrix element source code and the driver source code. As above, we first iterate through all processes and call `before_compile`. This is usually empty, but can execute code that depends on `make_source` already completed. Similarly, `after_compile` scans all processes again.

⟨Prclib interfaces: prclib driver: TBP⟩+≡
```
    procedure :: make_compile => prclib_driver_make_compile
```

⟨Prclib interfaces: procedures⟩+≡
```
    subroutine prclib_driver_make_compile (driver, os_data, workspace)
      class(prclib_driver_t), intent(in) :: driver
      type(os_data_t), intent(in) :: os_data
      type(string_t), intent(in), optional :: workspace
      integer :: i
      do i = 1, driver%n_processes
         call driver%record(i)%before_compile ()
      end do
      call os_system_call ( &
          workspace_cmd (workspace) &
          // "make compile " // os_data%makeflags &
          // " -f " // driver%basename // ".makefile")
      do i = 1, driver%n_processes
         call driver%record(i)%after_compile ()
      end do
    end subroutine prclib_driver_make_compile
```

Combine all matrix-element code together with the driver in a process library on disk.

⟨Prclib interfaces: prclib driver: TBP⟩+≡
```
    procedure :: make_link => prclib_driver_make_link
```

⟨Prclib interfaces: procedures⟩+≡
```
    subroutine prclib_driver_make_link (driver, os_data, workspace)
      class(prclib_driver_t), intent(in) :: driver
      type(os_data_t), intent(in) :: os_data
```

```
      type(string_t), intent(in), optional :: workspace
      integer :: i
      call os_system_call ( &
           workspace_cmd (workspace) &
           // "make link " // os_data%makeflags &
           // " -f " // driver%basename // ".makefile")
    end subroutine prclib_driver_make_link
```

14.2.15 Clean up generated files

The task of cleaning any generated files should also be deferred to Makefile
targets. Apart from removing everything, removing specific files may be useful
for partial rebuilds. (Note that removing the makefile itself can only be done
once, for obvious reasons.)

If there is no makefile, do nothing.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure :: clean_library => prclib_driver_clean_library
    procedure :: clean_objects => prclib_driver_clean_objects
    procedure :: clean_source => prclib_driver_clean_source
    procedure :: clean_driver => prclib_driver_clean_driver
    procedure :: clean_makefile => prclib_driver_clean_makefile
    procedure :: clean => prclib_driver_clean
    procedure :: distclean => prclib_driver_distclean
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_clean_library (driver, os_data, workspace)
      class(prclib_driver_t), intent(in) :: driver
      type(os_data_t), intent(in) :: os_data
      type(string_t), intent(in), optional :: workspace
      if (driver%makefile_exists ()) then
         call os_system_call ( &
           workspace_cmd (workspace) &
           // "make clean-library " // os_data%makeflags &
              // " -f " // driver%basename // ".makefile")
      end if
    end subroutine prclib_driver_clean_library

    subroutine prclib_driver_clean_objects (driver, os_data, workspace)
      class(prclib_driver_t), intent(in) :: driver
      type(os_data_t), intent(in) :: os_data
      type(string_t), intent(in), optional :: workspace
      if (driver%makefile_exists ()) then
         call os_system_call ( &
           workspace_cmd (workspace) &
           // "make clean-objects " // os_data%makeflags &
              // " -f " // driver%basename // ".makefile")
      end if
    end subroutine prclib_driver_clean_objects

    subroutine prclib_driver_clean_source (driver, os_data, workspace)
      class(prclib_driver_t), intent(in) :: driver
      type(os_data_t), intent(in) :: os_data
```

```fortran
    type(string_t), intent(in), optional :: workspace
    if (driver%makefile_exists ()) then
       call os_system_call ( &
          workspace_cmd (workspace) &

```

This Make target should remove all files that apply to a specific process. We
execute this when we want to force remaking source code. Note that source
targets need not have prerequisites, so just calling `make_source` would not do
anything if the files exist.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
        procedure :: clean_proc => prclib_driver_clean_proc
```

⟨*Prclib interfaces: procedures*⟩+≡
```
        subroutine prclib_driver_clean_proc (driver, i, os_data, workspace)
          class(prclib_driver_t), intent(in) :: driver
          integer, intent(in) :: i

```

This subroutine checks the `dlerror` content and issues a fatal error if it finds
an error there.

⟨*Prclib interfaces: prclib driver dynamic: TBP*⟩≡
```
    procedure :: check_dlerror => prclib_driver_check_dlerror
```

⟨*Prclib interfaces: procedures*⟩+≡
```
    subroutine prclib_driver_check_dlerror (driver)
      class(prclib_driver_dynamic_t), intent(in) :: driver
      if (dlaccess_has_error (driver%dlaccess)) then
         call msg_fatal (char (dlaccess_get_error (driver%dlaccess)))
      end if
    end subroutine prclib_driver_check_dlerror
```

Get the handle (C function pointer) for a given "feature" of the matrix element
code, so it can be assigned to the appropriate procedure pointer slot. In the
static case, this is a trivial pointer assignment, hard-coded into the driver type
implementation.

⟨*Prclib interfaces: prclib driver: TBP*⟩+≡
```
    procedure (prclib_driver_get_c_funptr), deferred :: get_c_funptr
```

⟨*Prclib interfaces: interfaces*⟩+≡
```
    abstract interface
       function prclib_driver_get_c_funptr (driver, feature) result (c_fptr)
         import
         class(prclib_driver_t), intent(inout) :: driver
         type(string_t), intent(in) :: feature
         type(c_funptr) :: c_fptr
       end function prclib_driver_get_c_funptr
```

```
        end interface
```

In the dynamic-library case, we call the DL interface to retrieve the C pointer
to a named procedure.

⟨*Prclib interfaces: prclib driver dynamic: TBP*⟩+≡
```
        procedure :: get_c_funptr => prclib_driver_dynamic_get_c_funptr
```

⟨*Prclib interfaces: procedures*⟩+≡
```
        function prclib_driver_dynamic_get_c_funptr (driver, feature) result (c_fptr)
          class(prclib_driver_dynamic_t), intent(inout) :: driver
          type(string_t), intent(in) :: feature
          type(c_funptr) :: c_fptr
          type(string_t) :: prefix, full_name
          prefix = lower_case (driver%basename) // "_"
          full_name = prefix // feature
          c_fptr = dlaccess_get_c_funptr (driver%dlaccess, full_name)
          call driver%check_dlerror ()
        end function prclib_driver_dynamic_get_c_funptr
```

The writer: the procedures write just comment lines. We can fix an instance
of this as a parameter (since it has no mutable content) and just reference the
fixed parameter.

NOTE: temporarily made public.

This version of test-code writer actually writes an interface and wrapper code.
The wrapped function is a no-parameter function with integer result.

The stored MD5 sum may be modified.

We will reuse this later, therefore public.

Compile test with genuine C library

Test 6: Write driver and makefile and try to compile and link the library driver.

There is a single test process with a single feature. The process code is provided as a C library of independent procedures. These procedures should match the Fortran bind(C) interface.

⟨*Prclib interfaces: execute tests*⟩+≡
```
    if (default == double .or. (CC_IS_GNU .and. CC_HAS_QUADMATH)) then
       call test (prclib_interfaces_6, "prclib_interfaces_6", &
            "compile and link (C library)", &
            u, results)
    end if
```

⟨*Prclib interfaces: test declarations*⟩+≡

```

This version of test-code writer writes interfaces for all standard features plus one specific feature. The interfaces are all bind(C), so no wrapper is needed.

The driver part is identical to the Fortran case, so we simply extend the previous **test_writer_5** type. We only have to override the Makefile writer.

⟨*Prclib interfaces: test types*⟩+≡

```
    type, extends (test_writer_5_t) :: test_writer_6_t
     contains
```

```
      procedure, nopass :: type_name => test_writer_6_type_name

 end subroutine check_file
```

14.3   Abstract process core configuration

In this module, we define abstract data types that handle the method-specific
part of defining a process (including all of its options) and accessing an external
matrix element.

There are no unit tests, these are deferred to the `process_libraries` module
below.

⟨`prc_core_def.f90`⟩≡
  ⟨*File header*⟩

  ```
  module prc_core_def
  ```

  ⟨*Use strings*⟩
  ```
    use io_units
    use diagnostics

    use process_constants
    use prclib_interfaces
  ```

  ⟨*Standard module head*⟩

  ⟨*Prc core def: public*⟩

  ⟨*Prc core def: types*⟩

  ⟨*Prc core def: interfaces*⟩

  ```
  contains
  ```

  ⟨*Prc core def: procedures*⟩

  ```
  end module prc_core_def
  ```

14.3.1   Process core definition type

For storing configuration data that depend on the specific process variant, we
introduce a polymorphic type. At this point, we just declare an abstract base
type. This allows us to defer the implementation to later modules.

There should be no components that need explicit finalization, otherwise we
would have to call a finalizer from the `process_component_def_t` wrapper.
Translate a `prc_core_def_t` to above named integers

⟨*Prc core def: public*⟩≡
  ```
    public :: prc_core_def_t
  ```

⟨*Prc core def: types*⟩≡
```
type, abstract :: prc_core_def_t
   class(prc_writer_t), allocatable :: writer
 contains
 ⟨Prc core def: process core def: TBP⟩
end type prc_core_def_t
```

Interfaces for the deferred methods.

This returns a string. No passed argument; the string is constant and depends just on the type.

⟨*Prc core def: process core def: TBP*⟩≡
```
procedure (prc_core_def_get_string), nopass, deferred :: type_string
```

⟨*Prc core def: interfaces*⟩≡
```
abstract interface
   function prc_core_def_get_string () result (string)
     import
     type(string_t) :: string
   end function prc_core_def_get_string
end interface
```

The `write` method should display the content completely.

⟨*Prc core def: process core def: TBP*⟩+≡
```
procedure (prc_core_def_write), deferred :: write
```

⟨*Prc core def: interfaces*⟩+≡
```
abstract interface
   subroutine prc_core_def_write (object, unit)
     import
     class(prc_core_def_t), intent(in) :: object
     integer, intent(in) :: unit
   end subroutine prc_core_def_write
end interface
```

The `read` method should fill the content completely.

⟨*Prc core def: process core def: TBP*⟩+≡
```
procedure (prc_core_def_read), deferred :: read
```

⟨*Prc core def: interfaces*⟩+≡
```
abstract interface
   subroutine prc_core_def_read (object, unit)
     import
     class(prc_core_def_t), intent(out) :: object
     integer, intent(in) :: unit
   end subroutine prc_core_def_read
end interface
```

This communicates a MD5 checksum to the writer inside the `core_def` object, if there is any. Usually, this checksum is not yet known at the time when the writer is initialized.

⟨*Prc core def: process core def: TBP*⟩+≡
```
procedure :: set_md5sum => prc_core_def_set_md5sum
```

⟨*Prc core def: procedures*⟩≡
```
    subroutine prc_core_def_set_md5sum (core_def, md5sum)
      class(prc_core_def_t), intent(inout) :: core_def
      character(32) :: md5sum
      if (allocated (core_def%writer))  core_def%writer%md5sum = md5sum
    end subroutine prc_core_def_set_md5sum
```

Allocate an appropriate driver object which corresponds to the chosen process
core definition.

For internal matrix element (i.e., those which do not need external code), the
driver should have access to all matrix element information from the beginning.
In short, it is the matrix-element code.

For external matrix elements, the driver will get access to the external matrix
element code.

⟨*Prc core def: process core def: TBP*⟩+≡
```
    procedure(prc_core_def_allocate_driver), deferred :: allocate_driver
```

⟨*Prc core def: interfaces*⟩+≡
```
    abstract interface
      subroutine prc_core_def_allocate_driver (object, driver, basename)
        import
        class(prc_core_def_t), intent(in) :: object
        class(prc_core_driver_t), intent(out), allocatable :: driver
        type(string_t), intent(in) :: basename
      end subroutine prc_core_def_allocate_driver
    end interface
```

This flag tells whether the particular variant needs external code. We implement
a default function which returns false. The flag depends only on the type,
therefore we implement it as `nopass`.

⟨*Prc core def: process core def: TBP*⟩+≡
```
    procedure, nopass :: needs_code => prc_core_def_needs_code
```

⟨*Prc core def: procedures*⟩+≡
```
    function prc_core_def_needs_code () result (flag)
      logical :: flag
      flag = .false.
    end function prc_core_def_needs_code
```

This subroutine allocates an array which holds the name of all features that this
process core implements. This feature applies to matrix element code that is not
coded as a Fortran module but communicates via independent library functions,
which follow the C calling conventions. The addresses of those functions are
returned as C function pointers, which can be converted into Fortran procedure
pointers. The conversion is done in code specific for the process variant; here
we just retrieve the C function pointer.

The array returned here serves the purpose of writing specific driver code.
The driver interfaces only those C functions which are supported for the given
process core.

If the process core does not require external code, this array is meaningless.

⟨*Prc core def: process core def: TBP*⟩+≡

```
    procedure(prc_core_def_get_features), nopass, deferred &
        :: get_features
```

⟨*Prc core def: interfaces*⟩+≡
```
    abstract interface
      subroutine prc_core_def_get_features (features)
        import
        type(string_t), dimension(:), allocatable, intent(out) :: features
      end subroutine prc_core_def_get_features
    end interface
```

Assign pointers to the process-specific procedures to the driver, if the process is
external.

⟨*Prc core def: process core def: TBP*⟩+≡
```
    procedure(prc_core_def_connect), deferred :: connect
```

⟨*Prc core def: interfaces*⟩+≡
```
    abstract interface
      subroutine prc_core_def_connect (def, lib_driver, i, proc_driver)
        import
        class(prc_core_def_t), intent(in) :: def
        class(prclib_driver_t), intent(in) :: lib_driver
        integer, intent(in) :: i
        class(prc_core_driver_t), intent(inout) :: proc_driver
      end subroutine prc_core_def_connect
    end interface
```

14.3.2   Process core template

We must be able to automatically allocate a process core definition object with
the appropriate type, given only the type name.

To this end, we introduce a **prc_template_t** type which is simply a wrapper
for an empty **prc_core_def_t** object. Choosing one of the templates from an
array, we can allocate the target object.

⟨*Prc core def: public*⟩+≡
```
    public :: prc_template_t
```

⟨*Prc core def: types*⟩+≡
```
    type :: prc_template_t
      class(prc_core_def_t), allocatable :: core_def
    end type prc_template_t
```

The allocation routine. We use the `source` option of the `allocate` statement.
The `mold` option would probably more appropriate, but is a F2008 feature.

⟨*Prc core def: public*⟩+≡
```
    public :: allocate_core_def
```

⟨*Prc core def: procedures*⟩+≡
```
    subroutine allocate_core_def (template, name, core_def)
      type(prc_template_t), dimension(:), intent(in) :: template
      type(string_t), intent(in) :: name
      class(prc_core_def_t), allocatable :: core_def
```

```
         integer :: i
         do i = 1, size (template)
            if (template(i)%core_def%type_string () == name) then
               allocate (core_def, source = template(i)%core_def)
               return
            end if
         end do
      end subroutine allocate_core_def
```

14.3.3 Process driver

For each process component, we implement a driver object which holds the calls
to the matrix element and various auxiliary routines as procedure pointers. Any
actual calculation will use this object to communicate with the process.

Depending on the type of process (as described by a corresponding prc_core_def
object), the procedure pointers may refer to external or internal code, and there
may be additional procedures for certain types. The base type defined here is
abstract.

⟨*Prc core def: public*⟩+≡
```
      public :: prc_core_driver_t
```

⟨*Prc core def: types*⟩+≡
```
      type, abstract :: prc_core_driver_t
       contains
       ⟨Prc core def: process driver: TBP⟩
      end type prc_core_driver_t
```

This returns the process type. No reference to contents.

⟨*Prc core def: process driver: TBP*⟩≡
```
      procedure(prc_core_driver_type_name), nopass, deferred :: type_name
```

⟨*Prc core def: interfaces*⟩+≡
```
      abstract interface
        function prc_core_driver_type_name () result (type)
          import
          type(string_t) :: type
        end function prc_core_driver_type_name
      end interface
```

14.3.4 Process driver for intrinsic process

This is an abstract extension for the driver type. It has one additional method,
namely a subroutine that fills the record of constant process data. For an
external process, this task is performed by the external library driver instead.

⟨*Prc core def: public*⟩+≡
```
      public :: process_driver_internal_t
```

⟨*Prc core def: types*⟩+≡
```
    type, extends (prc_core_driver_t), abstract :: process_driver_internal_t
     contains
     ⟨Prc core def: process driver internal: TBP⟩
    end type process_driver_internal_t
```

⟨*Prc core def: process driver internal: TBP*⟩≡
```
    procedure(process_driver_fill_constants), deferred :: fill_constants
```

⟨*Prc core def: interfaces*⟩+≡
```
    abstract interface
       subroutine process_driver_fill_constants (driver, data)
         import
         class(process_driver_internal_t), intent(in) :: driver
         type(process_constants_t), intent(out) :: data
       end subroutine process_driver_fill_constants
    end interface
```

14.4   Process library access

Processes (the code and data that are necessary for evaluating matrix elements of a particular process or process component) are organized in process libraries. In full form, process libraries contain generated and dynamically compiled and linked code, so they are actual libraries on the OS level. Alternatively, there may be simple processes that can be generated without referring to external libraries, and external libraries that are just linked in.

This module interfaces the OS to create, build, and use process libraries.

We work with two related data structures. There is the list of process configurations that stores the user input and data derived from it. A given process configuration list is scanned for creating a process library, which consists of both data and code. The creation step involves calling external programs and incorporating external code.

For the subsequent integration and event generation steps, we read the process library. We also support partial (re)creation of the process library. To this end, we should be able to reconstruct the configuration data records from the process library.

⟨process_libraries.f90⟩≡
  ⟨*File header*⟩

```
  module process_libraries

    use, intrinsic :: iso_c_binding !NODEP!
```

  ⟨*Use strings*⟩
```
    use io_units
    use diagnostics
    use md5
    use physics_defs
    use os_interface
    use model_data
```

```
    use particle_specifiers
    use process_constants
    use prclib_interfaces
    use prc_core_def
```

⟨*Standard module head*⟩

⟨*Process libraries: public*⟩

⟨*Process libraries: parameters*⟩

⟨*Process libraries: types*⟩

```
contains
```

⟨*Process libraries: procedures*⟩

```
end module process_libraries
```

14.4.1   Auxiliary stuff

Here is a small subroutine that strips the left-hand side and the equals sign off an equation.

⟨*Process libraries: public*⟩≡
```
    public :: strip_equation_lhs
```

⟨*Process libraries: procedures*⟩≡
```
    subroutine strip_equation_lhs (buffer)
      character(*), intent(inout) :: buffer
      type(string_t) :: string, prefix
      string = buffer
      call split (string, prefix, "=")
      buffer = string
    end subroutine strip_equation_lhs
```

14.4.2   Process definition objects

We collect process configuration data in a derived type, `process_def_t`. A process can be a collection of several components which are treated as a single entity for the purpose of observables and event generation. Multiple process components may initially be defined by the user. The system may add additional components, e.g., subtraction terms. The common data type is `process_component_def_t`. Within each component, there are several universal data items, and a part which depend on the particular process variant. The latter is covered by an abstract type `prc_core_def_t` and its extensions.

Wrapper for components

We define a wrapper type for the configuration of individual components.

The string `basename` is used for building file, module, and function names for the current process component. Initially, it will be built from the corresponding process basename by appending an alphanumeric suffix.

The logical `initial` tells whether this is a user-defined (true) or system-generated (false) configuration.

The numbers `n_in`, `n_out`, and `n_tot` denote the incoming, outgoing and total number of particles (partons) participating in the process component, respectively. These are the nominal particles, as input by the user (recombination may change the particle content, for the output events).

The string arrays `prt_in` and `prt_out` hold the particle specifications as provided by the user. For a system-generated process component, they remain deallocated.

The `method` string is used to determine the type of process matrix element and how it is obtained.

The `description` string collects the information about particle content and method in a single human-readable string.

The pointer object `core_def` is allocated according to the actual process variant, which depends on the method. The subobject holds any additional configuration data that is relevant for the process component.

We assume that no finalizer is needed.

⟨*Process libraries: public*⟩+≡
```
    public :: process_component_def_t
```

⟨*Process libraries: types*⟩≡
```
    type :: process_component_def_t
      private
      type(string_t) :: basename
      logical :: initial = .false.
      integer :: n_in = 0
      integer :: n_out = 0
      integer :: n_tot = 0
      type(prt_spec_t), dimension(:), allocatable :: prt_in
      type(prt_spec_t), dimension(:), allocatable :: prt_out
      type(string_t) :: method
      type(string_t) :: description

   end if
 end subroutine process_component_def_show
```

Compute the MD5 sum of a process component. We reset the stored MD5 sum to the empty string (so a previous value is not included in the calculation), the write a temporary file and calculate the MD5 sum of that file.

This implies that all data that are displayed by the `write` method become part of the MD5 sum calculation.

The `model` is not part of the object, but must be included in the MD5 sum. Otherwise, modifying the model and nothing else would not trigger remaking the process-component source. Note that the model parameters may change later and therefore are not incorporated.

After the MD5 sum of the component has been computed, we communicate it to the `writer` subobject of the specific `core_def` component. Although these types are abstract, the MD5-related features are valid for the abstract types.

⟨*Process libraries: process component def: TBP*⟩+≡
```

     close (u)
     if (allocated (component%core_def)) then
        call component%core_def%set_md5sum (component%md5sum)
     end if
   end subroutine process_component_def_compute_md5sum
```

⟨*Process libraries: process component def: TBP*⟩+≡
```
    procedure :: get_def_type_string => process_component_def_get_def_type_string
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_component_def_get_def_type_string (component) result (type_string)
      type(string_t) :: type_string
      class(process_component_def_t), intent(in) :: component
      type_string = component%core_def%type_string ()
    end function process_component_def_get_def_type_string
```

Allocate the process driver (with a suitable type) for a process component. For internal processes, we may set all data already at this stage.

⟨*Process libraries: process component def: TBP*⟩+≡
```
    procedure :: allocate_driver => process_component_def_allocate_driver
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_component_def_allocate_driver (component, driver)
      class(process_component_def_t), intent(in) :: component
      class(prc_core_driver_t), intent(out), allocatable :: driver
      if (allocated (component%core_def)) then
         call component%core_def%allocate_driver (driver, component%basename)
      end if
    end subroutine process_component_def_allocate_driver
```

Tell whether the process core needs external code.

⟨*Process libraries: process component def: TBP*⟩+≡
```
    procedure :: needs_code => process_component_def_needs_code
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_component_def_needs_code (component) result (flag)
      class(process_component_def_t), intent(in) :: component
      logical :: flag
      flag = component%core_def%needs_code ()
    end function process_component_def_needs_code
```

If there is external code, the core_def subobject should provide a writer object. This method returns a pointer to the writer.

⟨*Process libraries: process component def: TBP*⟩+≡
```
    procedure :: get_writer_ptr => process_component_def_get_writer_ptr
```

⟨*Process libraries: procedures*⟩+≡
```

Process definition

The process component definitions are collected in a common process definition object.

The id is the ID string that the user has provided for identifying this process. It must be a string that is allowed as part of a Fortran variable name, since it may be used for generating code.

The number n_in is 1 or 2 for a decay or scattering process, respectively. This must be identical to n_in for all components.

The initial and extra component definitions (see above) are allocated as the initial and extra arrays, respectively. The latter are determined from the former.

The md5sum is used to verify the integrity of the configuration.

⟨*Process libraries: public*⟩+≡
```
    public :: process_def_t
```

⟨Process libraries: types⟩+≡
```
type :: process_def_t

        end do
     end if
   end subroutine process_def_show
```

Initialize an entry (initialize the process definition inside). We allocate the 'initial' set of components. Extra components remain unallocated.

The model should be present as a pointer. This allows us to retrieve the model's MD5 sum. However, for various tests it is sufficient to have the name.

We create the basenames for the process components by appending a suffix which we increment for each component.

      type(string_t), intent(in) :: model_name
      def%model_name = model_name
    end subroutine process_def_set_model_name
```

Initialize an initial component. The particle content must be specified. The process core block is not (yet) allocated.

We assume that the particle arrays match the n_in and n_out values in size. The model is referred to by name; it is identified as an existing model later. The index i must refer to an existing element of the component array.

Data specific for the process core of a component are imported as the core_def argument. We should allocate an object of class prc_core_def_t with the appropriate specific type, fill it, and transfer it to the process component definition here. The allocation is moved, so the original allocated object is returned empty.

```

This query tells whether a specific process component relies on external code.
This includes all traditional WHIZARD matrix elements which rely on O'MEGA
for code generation. Other process components (trivial decays, subtraction
terms) do not require external code.

NOTE: Implemented only for initial component.

The query is passed to the process component.

```

Process definition list

A list of process definitions is the starting point for creating a process library. The list is built when reading the user input. When reading an existing process library, the list is used for cross-checking and updating the configuration.

We need a type for the list entry. The simplest way is to extend the process definition type, so all methods apply to the process definition directly.

⟨*Process libraries: public*⟩+≡
```
    public :: process_def_entry_t
```

⟨*Process libraries: types*⟩+≡
```
    type, extends (process_def_t) :: process_def_entry_t
       private
       type(process_def_entry_t), pointer :: next => null ()
    end type process_def_entry_t
```

This is the type for the list itself.

⟨*Process libraries: public*⟩+≡
```
    public :: process_def_list_t
```

⟨*Process libraries: types*⟩+≡
```
type :: process_def_list_t
  private
  type(process_def_entry_t), pointer :: first => null ()
  type(process_def_entry_t), pointer :: last => null ()
 contains
 ⟨Process libraries: process def list: TBP⟩
end type process_def_list_t
```

The deallocates the list iteratively. We assume that the list entries do not need finalization themselves.

⟨*Process libraries: process def list: TBP*⟩≡
```
procedure :: final => process_def_list_final
```

⟨*Process libraries: procedures*⟩+≡
```
subroutine process_def_list_final (list)
  class(process_def_list_t), intent(inout) :: list
  type(process_def_entry_t), pointer :: current
  nullify (list%last)
  do while (associated (list%first))
     current => list%first
     list%first => current%next
     deallocate (current)
  end do
end subroutine process_def_list_final
```

Write the complete list.

⟨*Process libraries: process def list: TBP*⟩+≡
```
procedure :: write => process_def_list_write
```

⟨*Process libraries: procedures*⟩+≡
```
subroutine process_def_list_write (object, unit, libpath)
  class(process_def_list_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: libpath
  type(process_def_entry_t), pointer :: entry
  integer :: i, u
  u = given_output_unit (unit)
  if (associated (object%first)) then
     i = 1
     entry => object%first
     do while (associated (entry))
        write (u, "(1x,A,I0,A)")  "Process #", i, ":"
        call entry%write (u)
        i = i + 1
        entry => entry%next
        if (associated (entry))  write (u, *)
     end do
  else
     write (u, "(1x,A)")  "Process definition list: [empty]"
  end if
end subroutine process_def_list_write
```

1016

Short account.

⟨Process libraries: process def list: TBP⟩+≡

```
    procedure :: show => process_def_list_show
```

⟨Process libraries: procedures⟩+≡

```
    subroutine process_def_list_show (object, unit)
      class(process_def_list_t), intent(in) :: object
      integer, intent(in), optional :: unit
      type(process_def_entry_t), pointer :: entry
      integer :: u
      u = given_output_unit (unit)
      if (associated (object%first)) then
         write (u, "(2x,A)")  "Processes:"
         entry => object%first
         do while (associated (entry))
            call entry%show (u)
            entry => entry%next
         end do
      else
         write (u, "(2x,A)")  "Processes: [empty]"
      end if
    end subroutine process_def_list_show
```

Read the complete list. We need an array of templates for the component sub-objects of abstract `prc_core_t` type, to allocate them with the correct specific type.

NOTE: Error handling is missing. Reading will just be aborted on error, or an I/O error occurs.

⟨Process libraries: process def list: TBP⟩+≡

```
    procedure :: read => process_def_list_read
```

⟨Process libraries: procedures⟩+≡

```
    subroutine process_def_list_read (object, unit, core_def_templates)
      class(process_def_list_t), intent(out) :: object
      integer, intent(in) :: unit
      type(prc_template_t), dimension(:), intent(in) :: core_def_templates
      type(process_def_entry_t), pointer :: entry
      character(80) :: buffer, ref
      integer :: i
      read (unit, "(A)")  buffer
      write (ref, "(1x,A)")  "Process definition list: [empty]"
      if (buffer == ref)  return          ! OK: empty library
      backspace (unit)
      READ_ENTRIES: do i = 1, huge (0)
         if (i > 1) read (unit, *, end=1)
         read (unit, "(A)")  buffer

         write (ref, "(1x,A,I0,A)")  "Process #", i, ":"
         if (buffer /= ref)  return      ! Wrong process header: done.
         allocate (entry)
         call entry%read (unit, core_def_templates)
         call object%append (entry)
      end do READ_ENTRIES
  1   continue                           ! EOF: done
```

```
      end subroutine process_def_list_read
```

Append an entry to the list. The entry should be allocated as a pointer, and the pointer allocation is transferred. The original pointer is returned null.

⟨*Process libraries: process def list: TBP*⟩+≡
```
    procedure :: append => process_def_list_append
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_def_list_append (list, entry)
      class(process_def_list_t), intent(inout) :: list
      type(process_def_entry_t), intent(inout), pointer :: entry
      if (list%contains (entry%id)) then
         call msg_fatal ("Recording process: '" // char (entry%id) &
              // "' has already been defined")
      end if
      if (associated (list%first)) then
         list%last%next => entry
      else
         list%first => entry
      end if
      list%last => entry
      entry => null ()
    end subroutine process_def_list_append
```

Probe the process definition list

Return the number of processes supported by the library.

⟨*Process libraries: process def list: TBP*⟩+≡
```
    procedure :: get_n_processes => process_def_list_get_n_processes
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_def_list_get_n_processes (list) result (n)
      integer :: n
      class(process_def_list_t), intent(in) :: list
      type(process_def_entry_t), pointer :: current
      n = 0
      current => list%first
      do while (associated (current))
         n = n + 1
         current => current%next
      end do
    end function process_def_list_get_n_processes
```

Allocate an array with the process IDs supported by the library.

⟨*Process libraries: process def list: TBP*⟩+≡
```
    procedure :: get_process_id_list => process_def_list_get_process_id_list
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_def_list_get_process_id_list (list, id)
      class(process_def_list_t), intent(in) :: list
      type(string_t), dimension(:), allocatable, intent(out) :: id
      type(process_def_entry_t), pointer :: current
```

```
      integer :: i
      allocate (id (list%get_n_processes ()))
      i = 0
      current => list%first
      do while (associated (current))
         i = i + 1
         id(i) = current%id
         current => current%next
      end do
   end subroutine process_def_list_get_process_id_list
```

Return just the processes which require resonant subprocesses.

⟨*Process libraries: process def list: TBP*⟩+≡
```
   procedure :: get_process_id_req_resonant => &
       process_def_list_get_process_id_req_resonant
```

⟨*Process libraries: procedures*⟩+≡
```
   subroutine process_def_list_get_process_id_req_resonant (list, id)
     class(process_def_list_t), intent(in) :: list
     type(string_t), dimension(:), allocatable, intent(out) :: id
     type(process_def_entry_t), pointer :: current
     integer :: i
     allocate (id (list%get_n_processes ()))
     i = 0
     current => list%first
     do while (associated (current))
        if (current%requires_resonances) then
           i = i + 1
           id(i) = current%id
        end if
        current => current%next
     end do
     id = id(1:i)
   end subroutine process_def_list_get_process_id_req_resonant
```

Return a pointer to a particular process entry.

⟨*Process libraries: process def list: TBP*⟩+≡
```
   procedure :: get_process_def_ptr => process_def_list_get_process_def_ptr
```

⟨*Process libraries: procedures*⟩+≡
```
   function process_def_list_get_process_def_ptr (list, id) result (entry)
     type(process_def_entry_t), pointer :: entry
     class(process_def_list_t), intent(in) :: list
     type(string_t), intent(in) :: id
     type(process_def_entry_t), pointer :: current
     current => list%first
     do while (associated (current))
        if (id == current%id)  exit
        current => current%next
     end do
     entry => current
   end function process_def_list_get_process_def_ptr
```

Return true if a given process is in the library.

⟨Process libraries: process def list: TBP⟩+≡
```
    procedure :: contains => process_def_list_contains
```

⟨Process libraries: procedures⟩+≡
```
    function process_def_list_contains (list, id) result (flag)
      logical :: flag
      class(process_def_list_t), intent(in) :: list
      type(string_t), intent(in) :: id
      type(process_def_entry_t), pointer :: current
      current => list%get_process_def_ptr (id)
      flag = associated (current)
    end function process_def_list_contains
```

Return the index of the entry that corresponds to a given process.

⟨Process libraries: process def list: TBP⟩+≡
```
    procedure :: get_entry_index => process_def_list_get_entry_index
```

⟨Process libraries: procedures⟩+≡
```
    function process_def_list_get_entry_index (list, id) result (n)
      integer :: n
      class(process_def_list_t), intent(in) :: list
      type(string_t), intent(in) :: id
      type(process_def_entry_t), pointer :: current
      n = 0
      current => list%first
      do while (associated (current))
         n = n + 1
         if (id == current%id) then
            return
         end if
         current => current%next
      end do
      n = 0
    end function process_def_list_get_entry_index
```

Return the numerical ID for a process.

⟨Process libraries: process def list: TBP⟩+≡
```
    procedure :: get_num_id => process_def_list_get_num_id
```

⟨Process libraries: procedures⟩+≡
```
    function process_def_list_get_num_id (list, id) result (num_id)
      integer :: num_id
      class(process_def_list_t), intent(in) :: list
      type(string_t), intent(in) :: id
      type(process_def_entry_t), pointer :: current
      current => list%get_process_def_ptr (id)
      if (associated (current)) then
         num_id = current%num_id
      else
         num_id = 0
      end if
    end function process_def_list_get_num_id
```

1020

Return the model name for a given process in the library.

⟨*Process libraries: process def list: TBP*⟩+≡
```
    procedure :: get_model_name => process_def_list_get_model_name
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_def_list_get_model_name (list, id) result (model_name)
      type(string_t) :: model_name
      class(process_def_list_t), intent(in) :: list
      type(string_t), intent(in) :: id
      type(process_def_entry_t), pointer :: current
      current => list%get_process_def_ptr (id)
      if (associated (current)) then
         model_name = current%model_name
      else
         model_name = ""
      end if
    end function process_def_list_get_model_name
```

Return the number of incoming particles of a given process in the library. This
tells us whether the process is a decay or a scattering.

⟨*Process libraries: process def list: TBP*⟩+≡
```
    procedure :: get_n_in => process_def_list_get_n_in
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_def_list_get_n_in (list, id) result (n)
      integer :: n
      class(process_def_list_t), intent(in) :: list
      type(string_t), intent(in) :: id
      type(process_def_entry_t), pointer :: current
      current => list%get_process_def_ptr (id)
      if (associated (current)) then
         n = current%n_in
      else
         n = 0
      end if
    end function process_def_list_get_n_in
```

Return the incoming particle pdg codesnumber of incoming particles of a given
process in the library. If there is a PDG array, return only the first code for
each beam. This serves as a quick way for (re)constructing beam properties.

⟨*Process libraries: process def list: TBP*⟩+≡
```
    procedure :: get_pdg_in_1 => process_def_list_get_pdg_in_1
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_def_list_get_pdg_in_1 (list, id, pdg)
      class(process_def_list_t), intent(in) :: list
      type(string_t), intent(in) :: id
      integer, dimension(:), intent(out) :: pdg
      type(process_def_entry_t), pointer :: current
      current => list%get_process_def_ptr (id)
      if (associated (current)) then
         call current%get_pdg_in_1 (pdg)
      else
         pdg = 0
```

```
      end if
    end subroutine process_def_list_get_pdg_in_1
```

Return the list of component IDs of a given process in the library.

⟨*Process libraries: process def list: TBP*⟩+≡
```
    procedure :: get_component_list => process_def_list_get_component_list
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_def_list_get_component_list (list, id, cid)
      class(process_def_list_t), intent(in) :: list
      type(string_t), intent(in) :: id
      type(string_t), dimension(:), allocatable, intent(out) :: cid
      type(process_def_entry_t), pointer :: current
      integer :: i, n
      current => list%get_process_def_ptr (id)
      if (associated (current)) then
        allocate (cid (current%n_initial + current%n_extra))
        do i = 1, current%n_initial
           cid(i) = current%initial(i)%basename
        end do
        n = current%n_initial
        do i = 1, current%n_extra
           cid(n + i) = current%extra(i)%basename
        end do
      end if
    end subroutine process_def_list_get_component_list
```

Return the list of component description strings for a given process in the library.

⟨*Process libraries: process def list: TBP*⟩+≡
```
    procedure :: get_component_description_list => &
        process_def_list_get_component_description_list
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_def_list_get_component_description_list &
        (list, id, description)
      class(process_def_list_t), intent(in) :: list
      type(string_t), intent(in) :: id
      type(string_t), dimension(:), allocatable, intent(out) :: description
      type(process_def_entry_t), pointer :: current
      integer :: i, n
      current => list%get_process_def_ptr (id)
      if (associated (current)) then
        allocate (description (current%n_initial + current%n_extra))
        do i = 1, current%n_initial
           description(i) = current%initial(i)%description
        end do
        n = current%n_initial
        do i = 1, current%n_extra
           description(n + i) = current%extra(i)%description
        end do
      end if
    end subroutine process_def_list_get_component_description_list
```

Return whether the entry requires construction of a resonanct subprocess set.

⟨*Process libraries: process def list: TBP*⟩+≡
```
procedure :: req_resonant => process_def_list_req_resonant
```

⟨*Process libraries: procedures*⟩+≡
```
function process_def_list_req_resonant (list, id) result (flag)
  class(process_def_list_t), intent(in) :: list
  type(string_t), intent(in) :: id
  logical :: flag
  type(process_def_entry_t), pointer :: current
  current => list%get_process_def_ptr (id)
  if (associated (current)) then
     flag = current%requires_resonances
  else
     flag = .false.
  end if
end function process_def_list_req_resonant
```

14.4.3   Process library

The process library object is the interface between the process definition data, as provided by the user, generated or linked process code on file, and the process run data that reference the process code.

Process library entry

For each process component that is part of the library, there is a separate library entry (process_library_entry_t. The library entry connects a process definition with the specific code (if any) in the compiled driver library.

The status indicates how far the process has been processed by the system (definition, code generation, compilation, linking). A process with status STAT_LOADED is accessible for computing matrix elements.

The def pointer identifies the corresponding process definition. The process component within that definition is identified by the i_component index.

The i_external index refers to the compiled library driver. If it is zero, there is no associated matrix-element code.

The driver component holds the pointers to the matrix-element specific functions, in particular the matrix element function itself.

⟨*Process libraries: types*⟩+≡
```
type :: process_library_entry_t
  private
  integer :: status = STAT_UNKNOWN
  type(process_def_t), pointer :: def => null ()
  integer :: i_component = 0
  integer :: i_external = 0
  class(prc_core_driver_t), allocatable :: driver
 contains
 ⟨Process libraries: process library entry: TBP⟩
end type process_library_entry_t
```

Here are the available status codes. An entry starts with UNKNOWN status. Once the association with a valid process definition is established, the status becomes CONFIGURED. If matrix element source code is to be generated by the system or provided from elsewhere, CODE_GENERATED indicates that this is done. The COMPILED status is next, it also applies to processes which are accessed as pre-compiled binaries. Finally, the library is linked and process pointers are set; this is marked as LOADED.

For a process library, the initial status is OPEN, since process definitions may be added. After configuration, the process content is fixed and the status becomes CONFIGURED. The further states are as above, always referring to the lowest status among the process entries.

⟨*Process libraries: parameters*⟩≡
```
integer, parameter, public :: STAT_UNKNOWN = 0
integer, parameter, public :: STAT_OPEN = 1
integer, parameter, public :: STAT_CONFIGURED = 2
integer, parameter, public :: STAT_SOURCE = 3
integer, parameter, public :: STAT_COMPILED = 4
integer, parameter, public :: STAT_LINKED = 5
integer, parameter, public :: STAT_ACTIVE = 6

integer, parameter, public :: ASSOCIATED_BORN = 1
integer, parameter, public :: ASSOCIATED_REAL = 2
integer, parameter, public :: ASSOCIATED_VIRT = 3
integer, parameter, public :: ASSOCIATED_SUB = 4
integer, parameter, public :: ASSOCIATED_PDF = 5
integer, parameter, public :: ASSOCIATED_REAL_SING = 6
integer, parameter, public :: ASSOCIATED_REAL_FIN = 7
integer, parameter, public :: N_ASSOCIATED_COMPONENTS = 7
```

These are the associated code letters, for output:

⟨*Process libraries: parameters*⟩+≡
```
character, dimension(0:6), parameter :: STATUS_LETTER = &
     ["?", "o", "f", "s", "c", "l", "a"]
```

This produces a condensed account of the library entry. The status is indicated by a letter in brackets, then the ID and component index of the associated process definition, finally the library index, if available.

⟨*Process libraries: process library entry: TBP*⟩≡
```
procedure :: to_string => process_library_entry_to_string
```

⟨*Process libraries: procedures*⟩+≡
```
function process_library_entry_to_string (object) result (string)
  type(string_t) :: string
  class(process_library_entry_t), intent(in) :: object
  character(32) :: buffer
  string = "[" // STATUS_LETTER(object%status) // "]"
  select case (object%status)
  case (STAT_UNKNOWN)
  case default
     if (associated (object%def)) then
        write (buffer, "(I0)")  object%i_component
        string = string // " " // object%def%id // "." // trim (buffer)
```

1024

```
            end if
            if (object%i_external /= 0) then
               write (buffer, "(I0)")  object%i_external
               string = string // " = ext:" // trim (buffer)
            else
               string = string // " = int"
            end if
            if (allocated (object%driver)) then
               string = string // " (" // object%driver%type_name () // ")"
            end if
         end select
      end function process_library_entry_to_string
```

Initialize with data. Used for the unit tests.

⟨*Process libraries: process library entry: TBP*⟩+≡
```
      procedure :: init => process_library_entry_init
```

⟨*Process libraries: procedures*⟩+≡
```
      subroutine process_library_entry_init (object, &
           status, def, i_component, i_external, driver_template)
        class(process_library_entry_t), intent(out) :: object
        integer, intent(in) :: status
        type(process_def_t), target, intent(in) :: def
        integer, intent(in) :: i_component
        integer, intent(in) :: i_external
        class(prc_core_driver_t), intent(inout), allocatable, optional &
             :: driver_template
        object%status = status
        object%def => def
        object%i_component = i_component
        object%i_external = i_external
        if (present (driver_template)) then
           call move_alloc (driver_template, object%driver)
        end if
      end subroutine process_library_entry_init
```

Assign pointers for all process-specific features. We have to combine the method from the **core_def** specification, the assigned pointers within the library driver, the index within that driver, and the process driver which should receive the links.

⟨*Process libraries: process library entry: TBP*⟩+≡
```
      procedure :: connect => process_library_entry_connect
```

⟨*Process libraries: procedures*⟩+≡
```
      subroutine process_library_entry_connect (entry, lib_driver, i)
        class(process_library_entry_t), intent(inout) :: entry
        class(prclib_driver_t), intent(in) :: lib_driver
        integer, intent(in) :: i
        call entry%def%initial(entry%i_component)%connect &
             (lib_driver, i, entry%driver)
      end subroutine process_library_entry_connect
```

The process library object

The `process_library_t` type is an extension of the `process_def_list_t` type. Thus, it automatically contains the process definition list.

The `basename` identifies the library generically.

The `external` flag is true if any process within the library needs external code, so the library must correspond to an actual code library (statically or dynamically linked).

The `entry` array contains all process components that can be handled by this library. Each entry refers to the process (component) definition and to the associated external matrix element code, if there is any.

The `driver` object is needed only if `external` is true. This object handles all interactions with external matrix-element code.

The `md5sum` summarizes the complete `process_def_list_t` base object. It can be used to check if the library configuration has changed.

⟨*Process libraries: public*⟩+≡
```
    public :: process_library_t
```

⟨*Process libraries: types*⟩+≡
```
    type, extends (process_def_list_t) :: process_library_t
      private
      type(string_t) :: basename
      integer :: n_entries = 0
      logical :: external = .false.
      integer :: status = STAT_UNKNOWN
      logical :: static = .false.
      logical :: driver_exists = .false.
      logical :: makefile_exists = .false.
      integer :: update_counter = 0
      type(process_library_entry_t), dimension(:), allocatable :: entry
      class(prclib_driver_t), allocatable :: driver
      character(32) :: md5sum = ""
    contains
    ⟨Process libraries: process library: TBP⟩
    end type process_library_t
```

For the output, we write first the metadata and the DL access record, then the library entries in short form, and finally the process definition list which is the base object.

Don't write the MD5 sum since this is used to generate it.

⟨*Process libraries: process library: TBP*⟩≡
```
    procedure :: write => process_library_write
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_write (object, unit, libpath)
      class(process_library_t), intent(in) :: object
      integer, intent(in), optional :: unit

      call msg_message ("Process library '" // char (basename) &
           // "': initialized")
    end subroutine process_library_init
```

This alternative initializer declares the library as static. We should now add
process definitions to the library, but all external process code exists already.
We need the driver object, and we should check the defined processes against
the stored ones.

⟨*Process libraries: process library: TBP*⟩+≡
```

      lib%status = STAT_OPEN
      lib%static = .true.
      call msg_message ("Static process library '" // char (basename) &
           // "': initialized")
    end subroutine process_library_init_static
```

The `configure` procedure scans the allocated entries in the process definition
list. The configuration proceeds in three passes.

In the first pass, we scan the process definition list and count the number of
process components and the number of components which need external code.
This is used to allocate the `entry` array.

In the second pass, we initialize the `entry` elements which connect process
definitions, process driver objects, and external code.

In the third pass, we initialize the library driver object, allocating an entry
for each external matrix element.

NOTE: Currently we handle only `initial` process components; `extra` com-
ponents are ignored.

```

Basic setup: allocate the `entry` array.

⟨*Process libraries: process library: TBP*⟩+≡
```
     procedure :: allocate_entries => process_library_allocate_entries
```

⟨*Process libraries: procedures*⟩+≡
```
     subroutine process_library_allocate_entries (lib, n_entries)
       class(process_library_t), intent(inout) :: lib
       integer, intent(in) :: n_entries
       lib%n_entries = n_entries
       allocate (lib%entry (n_entries))
     end subroutine process_library_allocate_entries
```

Initialize an entry with data (used by unit tests).

⟨*Process libraries: process library: TBP*⟩+≡
```
     procedure :: init_entry => process_library_init_entry
```

⟨*Process libraries: procedures*⟩+≡
```
     subroutine process_library_init_entry (lib, i, &
          status, def, i_component, i_external, driver_template)
       class(process_library_t), intent(inout) :: lib
       integer, intent(in) :: i
       integer, intent(in) :: status
       type(process_def_t), target, intent(in) :: def
       integer, intent(in) :: i_component
       integer, intent(in) :: i_external
       class(prc_core_driver_t), intent(inout), allocatable, optional &
            :: driver_template
       call lib%entry(i)%init (status, def, i_component, i_external, &
            driver_template)
     end subroutine process_library_init_entry
```

Compute the MD5 sum. We concatenate the individual MD5 sums of all processes (which, in turn, are derived from the MD5 sums of their components) and compute the MD5 sum of that.

This should be executed *after* configuration, where the driver was initialized, since otherwise the MD5 sum stored in the driver would be overwritten.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: compute_md5sum => process_library_compute_md5sum
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_compute_md5sum (lib, model)
      class(process_library_t), intent(inout) :: lib
      class(model_data_t), intent(in), optional, target :: model
      type(process_def_entry_t), pointer :: def_entry
      type(string_t) :: buffer
      buffer = lib%basename
      def_entry => lib%first
      do while (associated (def_entry))
         call def_entry%compute_md5sum (model)
         buffer = buffer // def_entry%md5sum
         def_entry => def_entry%next
      end do
      lib%md5sum = md5sum (char (buffer))
      call lib%driver%set_md5sum (lib%md5sum)
    end subroutine process_library_compute_md5sum
```

Write an appropriate makefile, if there are external processes. Unless `force` is in effect, first check if there is already a makefile with the correct MD5 sum. If yes, do nothing.

The `workspace` optional argument puts any library code in a subdirectory.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: write_makefile => process_library_write_makefile
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_write_makefile &
        (lib, os_data, force, verbose, testflag, workspace)
      class(process_library_t), intent(inout) :: lib
      type(os_data_t), intent(in) :: os_data
      logical, intent(in) :: force, verbose
      logical, intent(in), optional :: testflag
      type(string_t), intent(in), optional :: workspace
      character(32) :: md5sum_file
      logical :: generate
      integer :: unit
      if (lib%external .and. .not. lib%static) then
         generate = .true.
         if (.not. force) then
            md5sum_file = lib%driver%get_md5sum_makefile (workspace)
            if (lib%md5sum == md5sum_file) then
               call msg_message ("Process library '" // char (lib%basename) &
                    // "': keeping makefile")
               generate = .false.
            end if
         end if
         if (generate) then
            call msg_message ("Process library '" // char (lib%basename) &
                 // "': writing makefile")
            unit = free_unit ()
```

```
        open (unit, &
             file = char (workspace_prefix (workspace) &
             &              // lib%driver%basename // ".makefile"), &
             status="replace", action="write")
        call lib%driver%generate_makefile (unit, os_data, verbose, testflag)
        close (unit)
      end if
      lib%makefile_exists = .true.
    end if
  end subroutine process_library_write_makefile
```

Write the driver source code for the library to file, if there are external processes.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: write_driver => process_library_write_driver
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_write_driver (lib, force, workspace)
      class(process_library_t), intent(inout) :: lib
      logical, intent(in) :: force
      type(string_t), intent(in), optional :: workspace
      character(32) :: md5sum_file
      logical :: generate
      integer :: unit
      if (lib%external .and. .not. lib%static) then
         generate = .true.
         if (.not. force) then
            md5sum_file = lib%driver%get_md5sum_driver (workspace)
            if (lib%md5sum == md5sum_file) then
               call msg_message ("Process library '" // char (lib%basename) &
                    // "': keeping driver")
               generate = .false.
            end if
         end if
         if (generate) then
            call msg_message ("Process library '" // char (lib%basename) &
                 // "': writing driver")
            unit = free_unit ()
            open (unit, &
                 file = char (workspace_prefix (workspace) &
                 &              // lib%driver%basename // ".f90"), &
                 status="replace", action="write")
            call lib%driver%generate_driver_code (unit)
            close (unit)
         end if
         lib%driver_exists = .true.
      end if
    end subroutine process_library_write_driver
```

Update the compilation status of an external library.

Strictly speaking, this is not necessary for a one-time run, since the individual library methods will update the status themselves. However, it allows us to identify compilation steps that we can skip because the file exists or is already loaded, for the whole library or for particular entries.

Independently, the building process is controlled by a makefile. Thus, previous files are reused if they are not modified by the current compilation.

1. If it is not already loaded, attempt to load the library. If successful, check the overall MD5 sum. If it matches, just keep it loaded and mark as ACTIVE. If not, check the MD5 sum for all linked process components. Where it matches, mark the entry as COMPILED. Then, unload the library and mark as CONFIGURED.

   Thus, we can identify compiled files for all matrix elements which are accessible via the previous compiled library, even if it is no longer up to date.

2. If the library is now in CONFIGURED state, look for valid source files. Each entry that is just in CONFIGURED state will advance to SOURCE if the MD5 sum matches. Finally, advance the whole library to SOURCE if all entries are at least in this condition.

⟨*Process libraries: process library: TBP*⟩+≡

            end if
         end if
      end select
   end if
 end subroutine process_library_update_status
```

This procedure triggers code generation for all processes where this is possible.

We generate code only for external processes of status STAT_CONFIGURED, which then advance to STAT_SOURCE. If, for a particular process, the status is already advanced, we do not remove previous files, so make will consider them as up to date if they exist. Otherwise, we remove those files to force a fresh make.

Finally, if any source code has been generated, we need a driver file.

                  if (i_external /= 0 &
                       .and. lib%entry(i)%status == STAT_CONFIGURED) then
                     call lib%driver%clean_proc &
                          (i_external, os_data, workspace)
                  end if
                end associate
                if (signal_is_pending ())  return
             end do
             call lib%driver%make_source (os_data, workspace)
             end if
             lib%status = STAT_SOURCE
             where (lib%entry%i_external /= 0 &
                  .and. lib%entry%status == STAT_CONFIGURED)
                lib%entry%status = STAT_SOURCE
             end where
             lib%status = STAT_SOURCE
          end select
       end if
    end subroutine process_library_make_source
```

Compile the generated code and update the status codes. Try to make the
sources first, just in case. This includes compiling possible LATEXFeynman dia-
gram files.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: make_compile => process_library_make_compile
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_make_compile &
         (lib, os_data, keep_old_source, workspace)
      class(process_library_t), intent(inout) :: lib
      type(os_data_t), intent(in) :: os_data
      logical, intent(in), optional :: keep_old_source
      type(string_t), intent(in), optional :: workspace
      if (lib%external .and. .not. lib%static) then
          select case (lib%status)
          case (STAT_CONFIGURED)
             call lib%make_source (os_data, keep_old_source, workspace)
          end select
          if (signal_is_pending ())  return
          select case (lib%status)
          case (STAT_SOURCE)
```

```
               call msg_message ("Process library '" // char (lib%basename) &
                    // "': compiling sources")
               call lib%driver%make_compile (os_data, workspace)
               where (lib%entry%i_external /= 0 &
                      .and. lib%entry%status == STAT_SOURCE)
                  lib%entry%status = STAT_COMPILED
               end where
               lib%status = STAT_COMPILED
            end select
         end if
     end subroutine process_library_make_compile
```

Link the process library. Try to compile first, just in case.

⟨*Process libraries: process library: TBP*⟩+≡
```
     procedure :: make_link => process_library_make_link
```

⟨*Process libraries: procedures*⟩+≡
```
     subroutine process_library_make_link &
         (lib, os_data, keep_old_source, workspace)
       class(process_library_t), intent(inout) :: lib
       type(os_data_t), intent(in) :: os_data
       logical, intent(in), optional :: keep_old_source
       type(string_t), intent(in), optional :: workspace
       if (lib%external .and. .not. lib%static) then
          select case (lib%status)
          case (STAT_CONFIGURED:STAT_SOURCE)
             call lib%make_compile (os_data, keep_old_source, workspace)
          end select
          if (signal_is_pending ())  return
          select case (lib%status)
          case (STAT_COMPILED)
             call msg_message ("Process library '" // char (lib%basename) &
                  // "': linking")
             call lib%driver%make_link (os_data, workspace)
             lib%entry%status = STAT_LINKED
             lib%status = STAT_LINKED
          end select
       end if
     end subroutine process_library_make_link
```

Load the process library, i.e., assign pointers to the library functions.

⟨*Process libraries: process library: TBP*⟩+≡
```
     procedure :: load => process_library_load
```

⟨*Process libraries: procedures*⟩+≡
```
     subroutine process_library_load (lib, os_data, keep_old_source, workspace)
       class(process_library_t), intent(inout) :: lib
       type(os_data_t), intent(in) :: os_data
       logical, intent(in), optional :: keep_old_source
       type(string_t), intent(in), optional :: workspace
       select case (lib%status)
       case (STAT_CONFIGURED:STAT_COMPILED)
          call lib%make_link (os_data, keep_old_source, workspace)
       end select
```

```
      if (signal_is_pending ())  return
      select case (lib%status)
      case (STAT_LINKED)
         if (lib%external) then
            call msg_message ("Process library '" // char (lib%basename) &
                 // "': loading")
            call lib%driver%load (os_data, workspace=workspace)
            call lib%load_entries ()
         end if
         lib%entry%status = STAT_ACTIVE
         lib%status = STAT_ACTIVE
      end select
   end subroutine process_library_load
```

This is the actual loading part for the process methods.

⟨*Process libraries: process library: TBP*⟩+≡
```
   procedure :: load_entries => process_library_load_entries
```

⟨*Process libraries: procedures*⟩+≡
```
   subroutine process_library_load_entries (lib)
     class(process_library_t), intent(inout) :: lib
     integer :: i
     do i = 1, size (lib%entry)
        associate (entry => lib%entry(i))
          if (entry%i_external /= 0) then
             call entry%connect (lib%driver, entry%i_external)
          end if
        end associate
     end do
   end subroutine process_library_load_entries
```

Unload the library, if possible. This reverts the status to "linked".

⟨*Process libraries: process library: TBP*⟩+≡
```
   procedure :: unload => process_library_unload
```

⟨*Process libraries: procedures*⟩+≡
```
   subroutine process_library_unload (lib)
     class(process_library_t), intent(inout) :: lib
     select case (lib%status)
     case (STAT_ACTIVE)
        if (lib%external) then
           call msg_message ("Process library '" // char (lib%basename) &
                // "': unloading")
           call lib%driver%unload ()
        end if
        lib%entry%status = STAT_LINKED
        lib%status = STAT_LINKED
     end select
   end subroutine process_library_unload
```

Unload, clean all generated files and revert the library status. If `distclean` is
set, also remove the makefile and the driver source.

⟨*Process libraries: process library: TBP*⟩+≡
```
   procedure :: clean => process_library_clean
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_clean (lib, os_data, distclean, workspace)
      class(process_library_t), intent(inout) :: lib
      type(os_data_t), intent(in) :: os_data
      logical, intent(in) :: distclean
      type(string_t), intent(in), optional :: workspace
      call lib%unload ()
      if (lib%external .and. .not. lib%static) then
         call msg_message ("Process library '" // char (lib%basename) &
              // "': removing old files")
         if (distclean) then
            call lib%driver%distclean (os_data, workspace)
         else
            call lib%driver%clean (os_data, workspace)
         end if
      end if
      where (lib%entry%i_external /= 0)
         lib%entry%status = STAT_CONFIGURED
      elsewhere
         lib%entry%status = STAT_LINKED
      end where
      if (lib%external) then
         lib%status = STAT_CONFIGURED
      else
         lib%status = STAT_LINKED
      end if
    end subroutine process_library_clean
```

Unload and revert the library status to INITIAL. This allows for appending new processes. No files are deleted.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: open => process_library_open
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_open (lib)
      class(process_library_t), intent(inout) :: lib
      select case (lib%status)
      case (STAT_OPEN)
      case default
         call lib%unload ()
         if (.not. lib%static) then
            lib%entry%status = STAT_OPEN
            lib%status = STAT_OPEN
            if (lib%external)  lib%update_counter = lib%update_counter + 1
            call msg_message ("Process library '" // char (lib%basename) &
                 // "': open")
         else
            call msg_error ("Static process library '" // char (lib%basename) &
                 // "': processes can't be appended")
         end if
      end select
    end subroutine process_library_open
```

14.4.4 Use the library

Return the base name of the library

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: get_name => process_library_get_name
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_library_get_name (lib) result (name)
      class(process_library_t), intent(in) :: lib
      type(string_t) :: name
      name = lib%basename
    end function process_library_get_name
```

Once activated, we view the process library object as an interface for accessing the matrix elements.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: is_active => process_library_is_active
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_library_is_active (lib) result (flag)
      logical :: flag
      class(process_library_t), intent(in) :: lib
      flag = lib%status == STAT_ACTIVE
    end function process_library_is_active
```

Return the current status code of the library. If an index is provided, return the status of that entry.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: get_status => process_library_get_status
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_library_get_status (lib, i) result (status)
      class(process_library_t), intent(in) :: lib
      integer, intent(in), optional :: i
      integer :: status
      if (present (i)) then
         status = lib%entry(i)%status
      else
         status = lib%status
      end if
    end function process_library_get_status
```

Return the update counter. Since this is incremented each time the library is re-opened, we can use this to check if existing pointers to matrix element code are still valid.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: get_update_counter => process_library_get_update_counter
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_library_get_update_counter (lib) result (counter)
      class(process_library_t), intent(in) :: lib
      integer :: counter
      counter = lib%update_counter
    end function process_library_get_update_counter
```

Manually set the current status code of the library. If the optional flag is set,
set also the entry status codes. This is used for unit tests.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: set_status => process_library_set_status
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_set_status (lib, status, entries)
      class(process_library_t), intent(inout) :: lib
      integer, intent(in) :: status
      logical, intent(in), optional :: entries
      lib%status = status
      if (present (entries)) then
         if (entries)  lib%entry%status = status
      end if
    end subroutine process_library_set_status
```

Return the load status of the associated driver.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: is_loaded => process_library_is_loaded
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_library_is_loaded (lib) result (flag)
      class(process_library_t), intent(in) :: lib
      logical :: flag
      flag = lib%driver%loaded
    end function process_library_is_loaded
```

Retrieve constants using the process library driver. We assume that the process
code has been loaded, if external.

⟨*Process libraries: process library entry: TBP*⟩+≡
```
    procedure :: fill_constants => process_library_entry_fill_constants
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_entry_fill_constants (entry, driver, data)
      class(process_library_entry_t), intent(in) :: entry
      class(prclib_driver_t), intent(in) :: driver
      type(process_constants_t), intent(out) :: data
      integer :: i
      if (entry%i_external /= 0) then
         i = entry%i_external
         data%id          = driver%get_process_id (i)
         data%model_name = driver%get_model_name (i)
         data%md5sum     = driver%get_md5sum (i)
         data%openmp_supported = driver%get_openmp_status (i)
         data%n_in  = driver%get_n_in  (i)
         data%n_out = driver%get_n_out (i)
         data%n_flv = driver%get_n_flv (i)
         data%n_hel = driver%get_n_hel (i)
         data%n_col = driver%get_n_col (i)
         data%n_cin = driver%get_n_cin (i)
         data%n_cf  = driver%get_n_cf  (i)
         call driver%set_flv_state (i, data%flv_state)
         call driver%set_hel_state (i, data%hel_state)
         call driver%set_col_state (i, data%col_state, data%ghost_flag)
```

```
        call driver%set_color_factors (i, data%color_factors, data%cf_index)
    else
        select type (proc_driver => entry%driver)
        class is (process_driver_internal_t)
            call proc_driver%fill_constants (data)
        end select
    end if
end subroutine process_library_entry_fill_constants
```

Retrieve the constants for a process

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: fill_constants => process_library_fill_constants
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_fill_constants (lib, id, i_component, data)
      class(process_library_t), intent(in) :: lib
      type(string_t), intent(in) :: id
      integer, intent(in) :: i_component
      type(process_constants_t), intent(out) :: data
      integer :: i
      do i = 1, size (lib%entry)
         associate (entry => lib%entry(i))
            if (entry%def%id == id .and. entry%i_component == i_component) then
               call entry%fill_constants (lib%driver, data)
               return
            end if
         end associate
      end do
    end subroutine process_library_fill_constants
```

Retrieve the constants and a connected driver for a process, identified by a process ID and a subprocess index. We scan the process entries until we have found a match.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: connect_process => process_library_connect_process
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_connect_process &
        (lib, id, i_component, data, proc_driver)
      class(process_library_t), intent(in) :: lib
      type(string_t), intent(in) :: id
      integer, intent(in) :: i_component
      type(process_constants_t), intent(out) :: data
      class(prc_core_driver_t), allocatable, intent(out) :: proc_driver
      integer :: i
      do i = 1, size (lib%entry)
         associate (entry => lib%entry(i))
            if (entry%def%id == id .and. entry%i_component == i_component) then
               call entry%fill_constants (lib%driver, data)
               allocate (proc_driver, source = entry%driver)
               return
            end if
         end associate
      end do
```

```
      call msg_fatal ("Process library '" // char (lib%basename) &
               // "': process '" // char (id) // "' not found")
  end subroutine process_library_connect_process
```

Shortcut for use in unit tests: fetch the MD5sum from a specific library entry
and inject it into the writer of a specific record.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: test_transfer_md5sum => process_library_test_transfer_md5sum
```

⟨*Process libraries: procedures*⟩+≡
```
    subroutine process_library_test_transfer_md5sum (lib, r, e, c)
      class(process_library_t), intent(inout) :: lib
      integer, intent(in) :: r, e, c
      associate (writer => lib%driver%record(r)%writer)
         writer%md5sum = lib%entry(e)%def%get_md5sum (c)
      end associate
    end subroutine process_library_test_transfer_md5sum
```

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: get_nlo_type => process_library_get_nlo_type
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_library_get_nlo_type (lib, id, i_component) result (nlo_type)
      integer :: nlo_type
      class(process_library_t), intent(in) :: lib
      type(string_t), intent(in) :: id
      integer, intent(in) :: i_component
      integer :: i
      do i = 1, size (lib%entry)
         if (lib%entry(i)%def%id == id .and. lib%entry(i)%i_component == i_component) then
            nlo_type = lib%entry(i)%def%get_nlo_type (i_component)
            exit
         end if
      end do
    end function process_library_get_nlo_type
```

14.4.5 Collect model-specific libraries

This returns appropriate linker flags for the model parameter libraries that are
used by the generated matrix element. At the end, the main libwhizard is
appended (again), because functions from that may be reqired.

Extra models in the local user space need to be treated individually.

⟨*Process libraries: process library: TBP*⟩+≡
```
    procedure :: get_modellibs_ldflags => process_library_get_modellibs_ldflags
```

⟨*Process libraries: procedures*⟩+≡
```
    function process_library_get_modellibs_ldflags (prc_lib, os_data) result (flags)
      class(process_library_t), intent(in) :: prc_lib
      type(os_data_t), intent(in) :: os_data
      type(string_t) :: flags
      type(string_t), dimension(:), allocatable :: models
      type(string_t) :: modelname, modellib, modellib_full
```

```
      logical :: exist
      integer :: i, j, mi
      flags = " -lomega"
      if ((.not. os_data%use_testfiles) .and. &
               os_dir_exist (os_data%whizard_models_libpath_local)) &
                 flags = flags // " -L" // os_data%whizard_models_libpath_local
      flags = flags // " -L" // os_data%whizard_models_libpath
      allocate (models(prc_lib%n_entries + 1))
      models = ""
      mi = 1
      if (allocated (prc_lib%entry)) then
         SCAN: do i = 1, prc_lib%n_entries
            if (associated (prc_lib%entry(i)%def)) then
               if (prc_lib%entry(i)%def%model_name /= "") then
                  modelname = prc_lib%entry(i)%def%model_name
               else
                  cycle SCAN
               end if
            else
               cycle SCAN
            end if
            do j = 1, mi
               if (models(mi) == modelname) cycle SCAN
            end do
            models(mi) = modelname
            mi = mi + 1
            if (os_data%use_libtool) then
               modellib = "libparameters_" // modelname // ".la"
            else
               modellib = "libparameters_" // modelname // ".a"
            end if
            exist = .false.
            if (.not. os_data%use_testfiles) then
               modellib_full = os_data%whizard_models_libpath_local &
                     // "/" // modellib
               inquire (file=char (modellib_full), exist=exist)
            end if

    end subroutine process_libraries_test
```

1045

Empty process list

Test 1: Write an empty process list.

⟨*Process libraries: execute tests*⟩≡
```
    call test (process_libraries_1, "process_libraries_1", &
        "empty process list", &
        u, results)
```

⟨*Process libraries: test declarations*⟩≡
```
    public :: process_libraries_1
```

⟨*Process libraries: tests*⟩≡
```
    subroutine process_libraries_1 (u)
      integer, intent(in) :: u
      type(process_def_list_t) :: process_def_list

      write (u, "(A)")  "* Test output: process_libraries_1"
      write (u, "(A)")  "*   Purpose: Display an empty process definition list"
      write (u, "(A)")

      call process_def_list%write (u)

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: process_libraries_1"
    end subroutine process_libraries_1
```

Process definition list

Test 2: Process definition list with processes and components. Construct the list, write to file, read it in again, and display. Finalize and delete the list after use.

We define a trivial 'test' type for the process variant. The test type contains just one (meaningless) data item, which is an integer.

⟨*Process libraries: test types*⟩≡
```
    type, extends (prc_core_def_t) :: prcdef_2_t
       integer :: data = 0
       logical :: file = .false.
     contains
     ⟨Process libraries: prcdef 2: TBP⟩
    end type prcdef_2_t
```

The process variant is named 'test'.

⟨*Process libraries: prcdef 2: TBP*⟩≡
```
    procedure, nopass :: type_string => prcdef_2_type_string
```

⟨*Process libraries: test auxiliary*⟩≡
```
    function prcdef_2_type_string () result (string)
      type(string_t) :: string
      string = "test"
    end function prcdef_2_type_string
```

1046

Write the contents (the integer value).

⟨*Process libraries: prcdef 2: TBP*⟩+≡
```
    procedure :: write => prcdef_2_write
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prcdef_2_write (object, unit)
      class(prcdef_2_t), intent(in) :: object
      integer, intent(in) :: unit
      write (unit, "(3x,A,I0)")  "Test data          = ", object%data
    end subroutine prcdef_2_write
```

Recover the integer value.

⟨*Process libraries: prcdef 2: TBP*⟩+≡
```
    procedure :: read => prcdef_2_read
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prcdef_2_read (object, unit)
      class(prcdef_2_t), intent(out) :: object
      integer, intent(in) :: unit
      character(80) :: buffer
      read (unit, "(A)")  buffer
      call strip_equation_lhs (buffer)
      read (buffer, *)  object%data
    end subroutine prcdef_2_read
```

No external procedures.

⟨*Process libraries: prcdef 2: TBP*⟩+≡
```
    procedure, nopass :: get_features => prcdef_2_get_features
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prcdef_2_get_features (features)
      type(string_t), dimension(:), allocatable, intent(out) :: features
      allocate (features (0))
    end subroutine prcdef_2_get_features
```

No code generated.

⟨*Process libraries: prcdef 2: TBP*⟩+≡
```
    procedure :: generate_code => prcdef_2_generate_code
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prcdef_2_generate_code (object, &
        basename, model_name, prt_in, prt_out)
      class(prcdef_2_t), intent(in) :: object
      type(string_t), intent(in) :: basename
      type(string_t), intent(in) :: model_name
      type(string_t), dimension(:), intent(in) :: prt_in
      type(string_t), dimension(:), intent(in) :: prt_out
    end subroutine prcdef_2_generate_code
```

Allocate the driver with the appropriate type.

⟨*Process libraries: prcdef 2: TBP*⟩+≡
```
    procedure :: allocate_driver => prcdef_2_allocate_driver
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prcdef_2_allocate_driver (object, driver, basename)
      class(prcdef_2_t), intent(in) :: object
      class(prc_core_driver_t), intent(out), allocatable :: driver
      type(string_t), intent(in) :: basename
      allocate (prctest_2_t :: driver)
    end subroutine prcdef_2_allocate_driver
```

Nothing to connect.
⟨*Process libraries: prcdef 2: TBP*⟩+≡
```
    procedure :: connect => prcdef_2_connect
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prcdef_2_connect (def, lib_driver, i, proc_driver)
      class(prcdef_2_t), intent(in) :: def
      class(prclib_driver_t), intent(in) :: lib_driver
      integer, intent(in) :: i
      class(prc_core_driver_t), intent(inout) :: proc_driver
    end subroutine prcdef_2_connect
```

The associated driver type.
⟨*Process libraries: test types*⟩+≡
```
    type, extends (process_driver_internal_t) :: prctest_2_t
     contains
     ⟨Process libraries: prctest 2: TBP⟩
    end type prctest_2_t
```

Return the type name.
⟨*Process libraries: prctest 2: TBP*⟩≡
```
    procedure, nopass :: type_name => prctest_2_type_name
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    function prctest_2_type_name () result (type)
      type(string_t) :: type
      type = "test"
    end function prctest_2_type_name
```

This should fill constant process data. We do not check those here, however, therefore nothing done.
⟨*Process libraries: prctest 2: TBP*⟩+≡
```
    procedure :: fill_constants => prctest_2_fill_constants
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prctest_2_fill_constants (driver, data)
      class(prctest_2_t), intent(in) :: driver
      type(process_constants_t), intent(out) :: data
    end subroutine prctest_2_fill_constants
```

Here is the actual test.

For reading, we need a list of templates, i.e., an array containing allocated objects for all available process variants. This is the purpose of `process_core_templates`. Here, we have only a single template for the 'test' variant.
⟨*Process libraries: execute tests*⟩+≡

1048

```
      call test (process_libraries_2, "process_libraries_2", &
           "process definition list", &
           u, results)

  end subroutine process_libraries_4
```

Build workflow for test matrix element

Test 5: We write source code for a dummy process.

We define another trivial type for the process variant. The test type contains just no variable data, but produces code on file.

⟨*Process libraries: test types*⟩+≡
```
    type, extends (prc_core_def_t) :: prcdef_5_t
     contains
     ⟨Process libraries: prcdef 5: TBP⟩
    end type prcdef_5_t
```

The process variant is named `test_file`.

⟨*Process libraries: prcdef 5: TBP*⟩≡
```
    procedure, nopass :: type_string => prcdef_5_type_string
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    function prcdef_5_type_string () result (string)
      type(string_t) :: string
      string = "test_file"
    end function prcdef_5_type_string
```

We reuse the writer `test_writer_4` from the previous module.

⟨*Process libraries: prcdef 5: TBP*⟩+≡
```
    procedure :: init => prcdef_5_init
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prcdef_5_init (object)
      class(prcdef_5_t), intent(out) :: object
      allocate (test_writer_4_t :: object%writer)
    end subroutine prcdef_5_init
```

Nothing to write.

⟨*Process libraries: prcdef 5: TBP*⟩+≡
```

```

Build and load library with test matrix element

Test 6: We write source code for a dummy process.

This process variant is identical to the previous case, but it supports a driver for the test procedure 'proc1'.

⟨*Process libraries: test types*⟩+≡
```
type, extends (prc_core_def_t) :: prcdef_6_t
 contains
 ⟨Process libraries: prcdef 6: TBP⟩
end type prcdef_6_t
```

The process variant is named `test_file`.

⟨*Process libraries: prcdef 6: TBP*⟩≡
```
procedure, nopass :: type_string => prcdef_6_type_string
```

⟨*Process libraries: test auxiliary*⟩+≡
```
function prcdef_6_type_string () result (string)
  type(string_t) :: string
  string = "test_file"
end function prcdef_6_type_string
```

We reuse the writer `test_writer_4` from the previous module.

⟨*Process libraries: prcdef 6: TBP*⟩+≡
```
procedure :: init => prcdef_6_init
```

⟨*Process libraries: test auxiliary*⟩+≡
```
subroutine prcdef_6_init (object)
  class(prcdef_6_t), intent(out) :: object
  allocate (test_writer_4_t :: object%writer)
  call object%writer%init_test ()
end subroutine prcdef_6_init
```

Nothing to write.

⟨*Process libraries: prcdef 6: TBP*⟩+≡
```
procedure :: write => prcdef_6_write
```

⟨*Process libraries: test auxiliary*⟩+≡
```
subroutine prcdef_6_write (object, unit)
  class(prcdef_6_t), intent(in) :: object
  integer, intent(in) :: unit
end subroutine prcdef_6_write
```

Nothing to read.

⟨*Process libraries: prcdef 6: TBP*⟩+≡
```
procedure :: read => prcdef_6_read
```

⟨*Process libraries: test auxiliary*⟩+≡
```
subroutine prcdef_6_read (object, unit)
  class(prcdef_6_t), intent(out) :: object
  integer, intent(in) :: unit
end subroutine prcdef_6_read
```

Allocate the driver with the appropriate type.

⟨*Process libraries: prcdef 6: TBP*⟩+≡
```
    procedure :: allocate_driver => prcdef_6_allocate_driver
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prcdef_6_allocate_driver (object, driver, basename)
      class(prcdef_6_t), intent(in) :: object
      class(prc_core_driver_t), intent(out), allocatable :: driver
      type(string_t), intent(in) :: basename
      allocate (prctest_6_t :: driver)
    end subroutine prcdef_6_allocate_driver
```

This time we need code:

⟨*Process libraries: prcdef 6: TBP*⟩+≡
```
    procedure, nopass :: needs_code => prcdef_6_needs_code
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    function prcdef_6_needs_code () result (flag)
      logical :: flag
      flag = .true.
    end function prcdef_6_needs_code
```

For the test case, we implement a single feature `proc1`.

⟨*Process libraries: prcdef 6: TBP*⟩+≡
```
    procedure, nopass :: get_features => prcdef_6_get_features
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prcdef_6_get_features (features)
      type(string_t), dimension(:), allocatable, intent(out) :: features
      allocate (features (1))
      features = [ var_str ("proc1") ]
    end subroutine prcdef_6_get_features
```

The interface of the only specific feature.

⟨*Process libraries: test types*⟩+≡
```
    abstract interface
       subroutine proc1_t (n) bind(C)
         import
         integer(c_int), intent(out) :: n
       end subroutine proc1_t
    end interface
```

Connect the feature `proc1` with the process driver.

⟨*Process libraries: prcdef 6: TBP*⟩+≡
```
    procedure :: connect => prcdef_6_connect
```

⟨*Process libraries: test auxiliary*⟩+≡
```
    subroutine prcdef_6_connect (def, lib_driver, i, proc_driver)
      class(prcdef_6_t), intent(in) :: def
      class(prclib_driver_t), intent(in) :: lib_driver
      integer, intent(in) :: i
      class(prc_core_driver_t), intent(inout) :: proc_driver
      integer(c_int) :: pid, fid
```

```
      type(c_funptr) :: fptr
      select type (proc_driver)
      type is  (prctest_6_t)
         pid = i
         fid = 1
         call lib_driver%get_fptr (pid, fid, fptr)
         call c_f_procpointer (fptr, proc_driver%proc1)
      end select
    end subroutine prcdef_6_connect
```

The driver type.

⟨*Process libraries: test types*⟩+≡
```
    type, extends (prc_core_driver_t) :: prctest_6_t
      procedure(proc1_t), nopass, pointer :: proc1 => null ()
     contains
     ⟨Process libraries: prctest 6: TBP⟩
    end type prctest_6_t
```

Return the type name.

⟨*Process libraries: prctest 6: TBP*⟩≡

14.5   Process Library Stacks

For storing and handling multiple libraries, we define process library stacks.
These are ordinary stacks where new entries are pushed onto the top.

⟨prclib_stacks.f90⟩≡
  ⟨*File header*⟩

  module prclib_stacks

  ⟨*Use strings*⟩
    use io_units
    use format_utils, only: write_separator
    use process_libraries

  ⟨*Standard module head*⟩

  ⟨*Prclib stacks: public*⟩

  ⟨*Prclib stacks: types*⟩

  contains

  ⟨*Prclib stacks: procedures*⟩

  end module prclib_stacks

14.5.1 The stack entry type

A stack entry is a process library object, augmented by a pointer to the next entry. We do not need specific methods, all relevant methods are inherited.

On higher level, process libraries should be prepared as process entry objects.

⟨Prclib stacks: public⟩≡
```
public :: prclib_entry_t
```

⟨Prclib stacks: types⟩≡
```
type, extends (process_library_t) :: prclib_entry_t
   type(prclib_entry_t), pointer :: next => null ()
end type prclib_entry_t
```

14.5.2 The prclib stack type

For easy conversion and lookup it is useful to store the filling number in the object. The content is stored as a linked list.

⟨Prclib stacks: public⟩+≡
```
public :: prclib_stack_t
```

⟨Prclib stacks: types⟩+≡
```
type :: prclib_stack_t
   integer :: n = 0
   type(prclib_entry_t), pointer :: first => null ()
 contains
 ⟨Prclib stacks: prclib stack: TBP⟩
end type prclib_stack_t
```

Finalizer. Iteratively deallocate the stack entries. The resulting empty stack can be immediately recycled, if necessary.

⟨Prclib stacks: prclib stack: TBP⟩≡
```
procedure :: final => prclib_stack_final
```

⟨Prclib stacks: procedures⟩≡
```
subroutine prclib_stack_final (object)
  class(prclib_stack_t), intent(inout) :: object
  type(prclib_entry_t), pointer :: lib
  do while (associated (object%first))
     lib => object%first
     object%first => lib%next
     call lib%final ()
     deallocate (lib)
  end do
  object%n = 0
end subroutine prclib_stack_final
```

Output. The entries on the stack will be ordered LIFO, i.e., backwards.

⟨Prclib stacks: prclib stack: TBP⟩+≡
```
procedure :: write => prclib_stack_write
```

⟨*Prclib stacks: procedures*⟩+≡
```
subroutine prclib_stack_write (object, unit, libpath)
  class(prclib_stack_t), intent(in) :: object
  integer, intent(in), optional :: unit
  logical, intent(in), optional :: libpath
  type(prclib_entry_t), pointer :: lib
  integer :: u
  u = given_output_unit (unit)
  call write_separator (u, 2)
  select case (object%n)
  case (0)
     write (u, "(1x,A)")  "Process library stack: [empty]"
  case default
     write (u, "(1x,A)")  "Process library stack:"
     lib => object%first
     do while (associated (lib))
        call write_separator (u)
        call lib%write (u, libpath)
        lib => lib%next
     end do
  end select
  call write_separator (u, 2)
end subroutine prclib_stack_write
```

14.5.3   Operating on Stacks

We take a library entry pointer and push it onto the stack. The previous pointer
is nullified. Subsequently, the library entry is 'owned' by the stack and will be
finalized when the stack is deleted.

⟨*Prclib stacks: prclib stack: TBP*⟩+≡
```
procedure :: push => prclib_stack_push
```

⟨*Prclib stacks: procedures*⟩+≡
```
subroutine prclib_stack_push (stack, lib)
  class(prclib_stack_t), intent(inout) :: stack
  type(prclib_entry_t), intent(inout), pointer :: lib
  lib%next => stack%first
  stack%first => lib
  lib => null ()
  stack%n = stack%n + 1
end subroutine prclib_stack_push
```

14.5.4   Accessing Contents

Return a pointer to the topmost stack element. The result type is just the
bare process_library_t. There is no target attribute required since the stack
elements are allocated via pointers.

⟨*Prclib stacks: prclib stack: TBP*⟩+≡
```
procedure :: get_first_ptr => prclib_stack_get_first_ptr
```

⟨*Prclib stacks: procedures*⟩+≡
```
    function prclib_stack_get_first_ptr (stack) result (ptr)
      class(prclib_stack_t), intent(in) :: stack
      type(process_library_t), pointer :: ptr
      if (associated (stack%first)) then
         ptr => stack%first%process_library_t
      else
         ptr => null ()
      end if
    end function prclib_stack_get_first_ptr
```

Return a complete list of the libraries (names) in the stack. The list is in the order in which the elements got pushed onto the stack, so the 'first' entry is listed last.

⟨*Prclib stacks: prclib stack: TBP*⟩+≡
```
    procedure :: get_names => prclib_stack_get_names
```

⟨*Prclib stacks: procedures*⟩+≡
```
    subroutine prclib_stack_get_names (stack, libname)
      class(prclib_stack_t), intent(in) :: stack
      type(string_t), dimension(:), allocatable, intent(out) :: libname
      type(prclib_entry_t), pointer :: lib
      integer :: i
      allocate (libname (stack%n))
      i = stack%n
      lib => stack%first
      do while (associated (lib))
         libname(i) = lib%get_name ()
         i = i - 1
         lib => lib%next
      end do
    end subroutine prclib_stack_get_names
```

Return a pointer to the library with given name.

⟨*Prclib stacks: prclib stack: TBP*⟩+≡
```
    procedure :: get_library_ptr => prclib_stack_get_library_ptr
```

⟨*Prclib stacks: procedures*⟩+≡
```
    function prclib_stack_get_library_ptr (stack, libname) result (ptr)
      class(prclib_stack_t), intent(in) :: stack
      type(string_t), intent(in) :: libname
      type(process_library_t), pointer :: ptr
      type(prclib_entry_t), pointer :: current
      current => stack%first
      do while (associated (current))
         if (current%get_name () == libname) then
            ptr => current%process_library_t
            return
         end if
         current => current%next
      end do
      ptr => null ()
    end function prclib_stack_get_library_ptr
```

14.5.5 Unit tests

Test module, followed by the corresponding implementation module.

⟨prclib_stacks_ut.f90⟩≡
  ⟨*File header*⟩

```
  module prclib_stacks_ut
    use unit_tests
    use prclib_stacks_uti
```

  ⟨*Standard module head*⟩

  ⟨*Prclib stacks: public test*⟩

```
  contains
```

  ⟨*Prclib stacks: test driver*⟩

```
  end module prclib_stacks_ut
```

⟨prclib_stacks_uti.f90⟩≡
  ⟨*File header*⟩

```
  module prclib_stacks_uti
```

  ⟨*Use strings*⟩

```
    use prclib_stacks
```

  ⟨*Standard module head*⟩

  ⟨*Prclib stacks: test declarations*⟩

```
  contains
```

  ⟨*Prclib stacks: tests*⟩

```
  end module prclib_stacks_uti
```

API: driver for the unit tests below.

⟨*Prclib stacks: public test*⟩≡
```
    public :: prclib_stacks_test
```

⟨*Prclib stacks: test driver*⟩≡
```
    subroutine prclib_stacks_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
    ⟨Prclib stacks: execute tests⟩
    end subroutine prclib_stacks_test
```

Write an empty process library stack

The most trivial test is to write an uninitialized process library stack.

⟨*Prclib stacks: execute tests*⟩≡

```
    call test (prclib_stacks_1, "prclib_stacks_1", &
        "write an empty process library stack", &
        u, results)
```

⟨*Prclib stacks: test declarations*⟩≡
```
    public :: prclib_stacks_1
```

⟨*Prclib stacks: tests*⟩≡
```
    subroutine prclib_stacks_1 (u)
      integer, intent(in) :: u
      type(prclib_stack_t) :: stack

      write (u, "(A)")  "* Test output: prclib_stacks_1"
      write (u, "(A)")  "*   Purpose: display an empty process library stack"
      write (u, "(A)")

      call stack%write (u)

      write (u, "(A)")
      write (u, "(A)")  "* Test output end: prclib_stacks_1"

    end subroutine prclib_stacks_1
```

Fill a process library stack

Fill a process library stack with two (identical) processes.

⟨*Prclib stacks: execute tests*⟩+≡
```
    call test (prclib_stacks_2, "prclib_stacks_2", &
        "fill a process library stack", &
        u, results)
```

⟨*Prclib stacks: test declarations*⟩+≡
```
    public :: prclib_stacks_2
```

⟨*Prclib stacks: tests*⟩+≡
```
    subroutine prclib_stacks_2 (u)
      integer, intent(in) :: u
      type(prclib_stack_t) :: stack
      type(prclib_entry_t), pointer :: lib

      write (u, "(A)")  "* Test output: prclib_stacks_2"
      write (u, "(A)")  "*   Purpose: fill a process library stack"
      write (u, "(A)")

      write (u, "(A)")  "* Initialize two (empty) libraries &
          &and push them on the stack"
      write (u, "(A)")

      allocate (lib)
      call lib%init (var_str ("lib1"))
      call stack%push (lib)

      allocate (lib)
      call lib%init (var_str ("lib2"))
      call stack%push (lib)
```

```
    call stack%write (u)

    write (u, "(A)")
    write (u, "(A)")  "* Cleanup"

    call stack%final ()

    write (u, "(A)")
    write (u, "(A)")  "* Test output end: prclib_stacks_2"

  end subroutine prclib_stacks_2
```

14.6   Trivial matrix element for tests

For the purpose of testing the workflow, we implement here two matrix elements
with the simplest possible structure.

This matrix element generator can only generate a single scattering process
and a single decay process. The scattering process is a quartic interaction of
a massless, neutral and colorless scalar **s** with unit coupling results in a trivial
$2 \rightarrow 2$ scattering process. The matrix element is implemented internally, so we
do not need the machinery of external process libraries. The decay process is a
decay of **s** into a pair of colored fermions **f**.

⟨prc_test.f90⟩≡
  ⟨*File header*⟩

```
  module prc_test

    use, intrinsic :: iso_c_binding !NODEP!
```

  ⟨*Use kinds*⟩
  ⟨*Use strings*⟩
```
    use os_interface
    use process_constants
    use prclib_interfaces
    use prc_core_def
    use particle_specifiers, only: new_prt_spec
    use process_libraries
```

  ⟨*Standard module head*⟩

  ⟨*Test ME: public*⟩

  ⟨*Test ME: types*⟩

```
  contains
```

  ⟨*Test ME: procedures*⟩

```
  end module prc_test
```

14.6.1 Process definition

For the process definition we implement an extension of the `prc_core_def_t` abstract type.

⟨*Test ME: public*⟩≡
```
public :: prc_test_def_t
```

⟨*Test ME: types*⟩≡
```
type, extends (prc_core_def_t) :: prc_test_def_t
  type(string_t) :: model_name
  type(string_t), dimension(:), allocatable :: prt_in
  type(string_t), dimension(:), allocatable :: prt_out
 contains
 ⟨Test ME: test me def: TBP⟩
end type prc_test_def_t
```

⟨*Test ME: test me def: TBP*⟩≡
```
procedure, nopass :: type_string => prc_test_def_type_string
```

⟨*Test ME: procedures*⟩≡
```
function prc_test_def_type_string () result (string)
  type(string_t) :: string
  string = "test_me"
end function prc_test_def_type_string
```

There is no 'feature' here since there is no external code.

⟨*Test ME: test me def: TBP*⟩+≡
```
procedure, nopass :: get_features => prc_test_def_get_features
```

⟨*Test ME: procedures*⟩+≡
```
subroutine prc_test_def_get_features (features)
  type(string_t), dimension(:), allocatable, intent(out) :: features
  allocate (features (0))
end subroutine prc_test_def_get_features
```

Initialization: set some data (not really useful).

⟨*Test ME: test me def: TBP*⟩+≡
```
procedure :: init => prc_test_def_init
```

⟨*Test ME: procedures*⟩+≡
```
subroutine prc_test_def_init (object, model_name, prt_in, prt_out)
  class(prc_test_def_t), intent(out) :: object
  type(string_t), intent(in) :: model_name
  type(string_t), dimension(:), intent(in) :: prt_in
  type(string_t), dimension(:), intent(in) :: prt_out
  object%model_name = model_name
  allocate (object%prt_in (size (prt_in)))
  object%prt_in = prt_in
  allocate (object%prt_out (size (prt_out)))
  object%prt_out = prt_out
end subroutine prc_test_def_init
```

Write/read process- and method-specific data. (No-op)

⟨*Test ME: test me def: TBP*⟩+≡
```
procedure :: write => prc_test_def_write
```

⟨*Test ME: procedures*⟩+≡

```
subroutine prc_test_def_write (object, unit)
  class(prc_test_def_t), intent(in) :: object
  integer, intent(in) :: unit
end subroutine prc_test_def_write
```

⟨*Test ME: test me def: TBP*⟩+≡

```
procedure :: read => prc_test_def_read
```

⟨*Test ME: procedures*⟩+≡

```
subroutine prc_test_def_read (object, unit)
  class(prc_test_def_t), intent(out) :: object
  integer, intent(in) :: unit
end subroutine prc_test_def_read
```

Allocate the driver for test ME matrix elements. We get the actual component ID (basename), and we can transfer all process-specific data from the process definition.

⟨*Test ME: test me def: TBP*⟩+≡

```
procedure :: allocate_driver => prc_test_def_allocate_driver
```

⟨*Test ME: procedures*⟩+≡

```
subroutine prc_test_def_allocate_driver (object, driver, basename)
  class(prc_test_def_t), intent(in) :: object
  class(prc_core_driver_t), intent(out), allocatable :: driver
  type(string_t), intent(in) :: basename
  allocate (prc_test_t :: driver)
  select type (driver)
  type is (prc_test_t)
     driver%id = basename
     driver%model_name = object%model_name
     select case (size (object%prt_in))
     case (1);  driver%scattering = .false.
     case (2);  driver%scattering = .true.
     end select
  end select
end subroutine prc_test_def_allocate_driver
```

Nothing to connect. This subroutine will not be called.

⟨*Test ME: test me def: TBP*⟩+≡

```
procedure :: connect => prc_test_def_connect
```

⟨*Test ME: procedures*⟩+≡

```
subroutine prc_test_def_connect (def, lib_driver, i, proc_driver)
  class(prc_test_def_t), intent(in) :: def
  class(prclib_driver_t), intent(in) :: lib_driver
  integer, intent(in) :: i
  class(prc_core_driver_t), intent(inout) :: proc_driver
end subroutine prc_test_def_connect
```

14.6.2 Driver

⟨*Test ME: public*⟩+≡
```
    public :: prc_test_t
```

⟨*Test ME: types*⟩+≡
```
    type, extends (process_driver_internal_t) :: prc_test_t
      type(string_t) :: id
      type(string_t) :: model_name
      logical :: scattering = .true.
     contains
     ⟨Test ME: test me driver: TBP⟩
    end type prc_test_t
```

In contrast to generic matrix-element implementations, we can hard-wire the amplitude method as a type-bound procedure.

⟨*Test ME: test me driver: TBP*⟩≡
```
    procedure, nopass :: get_amplitude => prc_test_get_amplitude
```

⟨*Test ME: procedures*⟩+≡
```
    function prc_test_get_amplitude (p) result (amp)
      complex(default) :: amp
      real(default), dimension(:,:), intent(in) :: p
      amp = 1
    end function prc_test_get_amplitude
```

The reported type is the same as for the `prc_test_def_t` type.

⟨*Test ME: test me driver: TBP*⟩+≡
```
    procedure, nopass :: type_name => prc_test_type_name
```

⟨*Test ME: procedures*⟩+≡
```
    function prc_test_type_name () result (string)
      type(string_t) :: string
      string = "test_me"
    end function prc_test_type_name
```

Fill process constants.

         end if
      end subroutine prc_test_fill_constants
```

14.6.3   Shortcut

Since this module is there for testing purposes, we set up a subroutine that does
all the work at once: create a library with the two processes (scattering and
decay), configure and load, and set up the driver.

⟨*Test ME: public*⟩+≡
```
    public :: prc_test_create_library
```

⟨*Test ME: procedures*⟩+≡
```
    subroutine prc_test_create_library &
         (libname, lib, scattering, decay, procname1, procname2)
      type(string_t), intent(in) :: libname
      type(process_library_t), intent(out) :: lib
      logical, intent(in), optional :: scattering, decay
      type(string_t), intent(in), optional :: procname1, procname2
      type(string_t) :: model_name, procname
      type(string_t), dimension(:), allocatable :: prt_in, prt_out
```

```
class(prc_core_def_t), allocatable :: def
type(process_def_entry_t), pointer :: entry
type(os_data_t) :: os_data
logical :: sca, dec
sca = .true.;   if (present (scattering))  sca = scattering
dec = .false.;  if (present (decay))       dec = decay

call os_data%init ()
call lib%init (libname)
model_name = "Test"

if (sca) then
   if (present (procname1)) then
      procname = procname1
   else
      procname = libname
   end if
   allocate (prt_in (2), prt_out (2))
   prt_in  = [var_str ("s"), var_str ("s")]
   prt_out = [var_str ("s"), var_str ("s")]
   allocate (prc_test_def_t :: def)
   select type (def)
   type is (prc_test_def_t)
      call def%init (model_name, prt_in, prt_out)
   end select
   allocate (entry)
   call entry%init (procname, model_name = model_name, &
        n_in = 2, n_components = 1)
   call entry%import_component (1, n_out = size (prt_out), &
        prt_in  = new_prt_spec (prt_in), &
        prt_out = new_prt_spec (prt_out), &
        method  = var_str ("test_me"), &
        variant = def)
   call lib%append (entry)
end if

if (dec) then
   if (present (procname2)) then
      procname = procname2
   else
      procname = libname
   end if
   if (allocated (prt_in))  deallocate (prt_in, prt_out)
   allocate (prt_in (1), prt_out (2))
   prt_in  = [var_str ("s")]
   prt_out = [var_str ("f"), var_str ("fbar")]
   allocate (prc_test_def_t :: def)
   select type (def)
   type is (prc_test_def_t)
      call def%init (model_name, prt_in, prt_out)
   end select
   allocate (entry)
   call entry%init (procname, model_name = model_name, &
        n_in = 1, n_components = 1)
```

```
            call entry%import_component (1, n_out = size (prt_out), &
                 prt_in  = new_prt_spec (prt_in), &
                 prt_out = new_prt_spec (prt_out), &
                 method  = var_str ("test_decay"), &
                 variant = def)
         call lib%append (entry)
      end if

      call lib%configure (os_data)
      call lib%load (os_data)
   end subroutine prc_test_create_library
```

    ⟨Test ME: execute tests⟩
    end subroutine prc_test_test
```

Generate and load the scattering process

The process is $ss \rightarrow ss$, where s is a trivial scalar particle, for vanishing mass and unit coupling. We initialize the process, build the library, and compute the particular matrix element for momenta of unit energy and right-angle scattering. (The scattering is independent of angle.) The matrix element is equal to unity.

⟨*Test ME: execute tests*⟩≡

Chapter 15

Particles

This chapter collects modules that implement particle objects, for use in event records.

While within interactions, all correlations are manifest, a particle array is derived by selecting a particular quantum number set. This involves tracing over all other particles, as far as polarization is concerned. Thus, a particle has definite flavor, color, and a single-particle density matrix for polarization.

su_algebra We make use of $su(N)$ generators as the basis for representing polarization matrices. This module defines the basis and provides the necessary transformation routines.

bloch_vectors This defines polarization objects in Bloch representation. The object describes the spin density matrix of a particle, currently restricted to spin $0\ldots2$.

polarizations This extends the basic polarization object such that it supports properties of physical particles and appropriate constructors.

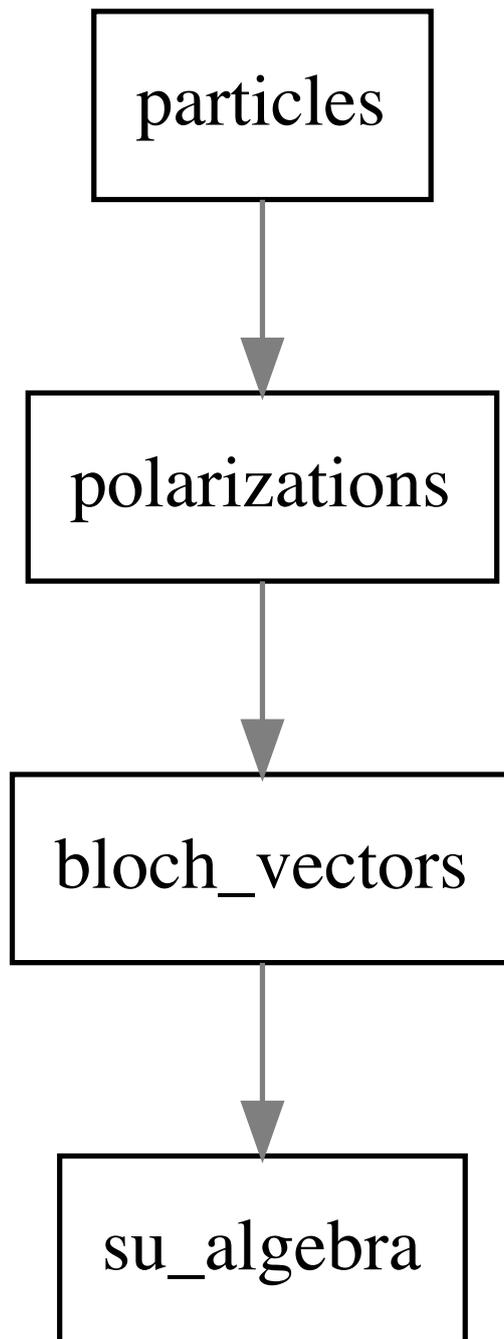
particles Particle objects and particle lists, as the base of event records.


Figure 15.1: Module dependencies in `src/particles`.

15.1 $su(N)$ Algebra

We need a specific choice of basis for a well-defined component representation. The matrix elements of T^a are ordered as $m = \ell, \ell - 1, \ldots - \ell$, i.e., from highest down to lowest weight, for both row and column.

We list first the generators of the $su(2)$ subalgebras which leave $|m|$ invariant ($|m| \neq 0$):

$$T^{b+1,b+2,b+3} \equiv \sigma^{1,2,3} \tag{15.1}$$

acting on the respective subspace $|m| = \ell, \ell - 1, \ldots$ for $b = 0, 1, \ldots$. This defines generators T^a for $a = 1, \ldots 3N/2$ $(\ldots 3(N-1)/2)$ for N even (odd), respectively.

The following generators successively extend this to $su(4)$, $su(6)$, ... until $su(N)$ by adding first the missing off-diagonal and then diagonal generators. The phase conventions are analogous.

(It should be possible to code these conventions for generic spin, but in the current implementation we restrict ourselves to $s \leq 2$, i.e., $N \leq 5$.)

  ⟨*su algebra: procedures*⟩

```
  end module su_algebra
```

15.1.1 $su(N)$ fundamental representation

The dimension of the basis for a given spin type. consecutively, starting at `SCALAR=1`.

⟨*su algebra: public*⟩≡
```
    public :: algebra_dimension
```
⟨*su algebra: procedures*⟩≡
```
    function algebra_dimension (s) result (n)
      integer :: n
      integer, intent(in) :: s
      n = fundamental_dimension (s) ** 2 - 1
    end function algebra_dimension
```

The dimension of the fundamental (defining) representation that we use. This implementation assumes that the spin type is numerically equal to the fundamental dimension.

⟨*su algebra: public*⟩+≡
```
    public :: fundamental_dimension
```

⟨*su algebra: procedures*⟩+≡

```
    function fundamental_dimension (s) result (d)
      integer :: d
      integer, intent(in) :: s
      d = s
    end function fundamental_dimension
```

15.1.2 Mapping between helicity and matrix index

Return the helicity that corresponds to a particular entry in the polarization matrix representation. Helicities are counted downwards, in integers, and zero helicity is included (omitted) for odd (even) spin, respectively.

⟨*su algebra: public*⟩+≡

```
    public :: helicity_value
```

⟨*su algebra: procedures*⟩+≡

```
    function helicity_value (s, i) result (h)
      integer :: h
      integer, intent(in) :: s, i
      integer, dimension(1), parameter :: hh1 = [0]
      integer, dimension(2), parameter :: hh2 = [1, -1]
      integer, dimension(3), parameter :: hh3 = [1,  0, -1]
      integer, dimension(4), parameter :: hh4 = [2,  1, -1, -2]
      integer, dimension(5), parameter :: hh5 = [2,  1,  0, -1, -2]
      h = 0
      select case (s)
      case (SCALAR)
         select case (i)
         case (1:1);  h = hh1(i)
         end select
      case (SPINOR)
         select case (i)
         case (1:2);  h = hh2(i)
         end select
      case (VECTOR)
         select case (i)
         case (1:3);  h = hh3(i)
         end select
      case (VECTORSPINOR)
         select case (i)
         case (1:4);  h = hh4(i)
         end select
      case (TENSOR)
         select case (i)
         case (1:5);  h = hh5(i)
         end select
      end select
    end function helicity_value
```

Inverse: return the index that corresponds to a certain helicity value in the chosen representation.

⟨*su algebra: public*⟩+≡

```
      public :: helicity_index
```

⟨*su algebra: procedures*⟩+≡
```
    function helicity_index (s, h) result (i)

      case (VECTORSPINOR)
         i = hi4(h)
      case (TENSOR)
         i = hi5(h)
      end select
    end function helicity_index
```

15.1.3 Generator Basis: Cartan Generators

For each supported spin type, we return specific properties of the set of generators via inquiry functions. This is equivalent to using explicit representations of the generators.

For easy access, the properties are hard-coded and selected via case expressions.

Return true if the generator #i is in the Cartan subalgebra, i.e., a diagonal matrix for spin type s.

⟨*su algebra: public*⟩+≡
```
    public :: is_cartan_generator
```

⟨*su algebra: procedures*⟩+≡
```
    elemental function is_cartan_generator (s, i) result (cartan)
      logical :: cartan
      integer, intent(in) :: s, i
      select case (s)
      case (SCALAR)
      case (SPINOR)
         select case (i)
         case (3);  cartan = .true.
         case default
            cartan = .false.
         end select
      case (VECTOR)
         select case (i)
         case (3,8);  cartan = .true.
         case default
```

```
            cartan = .false.
         end select
      case (VECTORSPINOR)
         select case (i)
         case (3,6,15);  cartan = .true.
         case default
            cartan = .false.
         end select
      case (TENSOR)
         select case (i)
         case (3,6,15,24);  cartan = .true.
         case default
            cartan = .false.
         end select
      case default
         cartan = .false.
      end select
   end function is_cartan_generator
```

Return the index of Cartan generator #k in the chosen representation. This has to conform to `cartan` above.

⟨*su algebra: public*⟩+≡
```
   public :: cartan_index
```

⟨*su algebra: procedures*⟩+≡
```
   elemental function cartan_index (s, k) result (ci)
      integer :: ci
      integer, intent(in) :: s, k
      integer, dimension(1), parameter :: ci2 = [3]
      integer, dimension(2), parameter :: ci3 = [3,8]
      integer, dimension(3), parameter :: ci4 = [3,6,15]
      integer, dimension(4), parameter :: ci5 = [3,6,15,24]
      select case (s)
      case (SPINOR)
         ci = ci2(k)
      case (VECTOR)
         ci = ci3(k)
      case (VECTORSPINOR)
         ci = ci4(k)
      case (TENSOR)
         ci = ci5(k)
      case default
         ci = 0
      end select
   end function cartan_index
```

The element #k of the result vector `a` is equal to the (h, h) diagonal entry of the generator matrix T^k. That is, evaluating this for all allowed values of `h`, we recover the set of Cartan generator matrices.

⟨*su algebra: public*⟩+≡

         end select
      end select
   end function cartan_element
```

Given an array of diagonal matrix elements `rd` of a generator, compute the array `a` of basis coefficients. The array must be ordered as defined by `helicity_value`, i.e., highest weight first. The calculation is organized such that the trace of the generator, i.e., the sum of `rd` values, drops out. The result array `a` has coefficients for all basis generators, but only Cartan generators can get a nonzero coefficient.

⟨*su algebra: public*⟩+≡
```
   public :: cartan_coeff
```

⟨*su algebra: procedures*⟩+≡
```
   function cartan_coeff (s, rd) result (a)
     real(default), dimension(:), allocatable :: a

        a(24) = (rd(1) + rd(2) - 4 * rd(3) + rd(4) + rd(5)) / sqrt10
     end select
   end function cartan_coeff
```

15.1.4 Roots (Off-Diagonal Generators)

Return the appropriate generator index for a given off-diagonal helicity combination. We require $h_1 > h_2$. We return the index of the appropriate real-valued generator if `r` is true, else the complex-valued one.

This is separate from the `cartan_coeff` function above. The reason is that the off-diagonal generators have only a single nonzero matrix element, so there is a one-to-one correspondence of helicity and index.

⟨*su algebra: public*⟩+≡
```
public :: root_index
```

⟨*su algebra: procedures*⟩+≡
```
function root_index (s, h1, h2, r) result (ai)
  integer :: ai
  integer, intent(in) :: s, h1, h2
  logical :: r
  ai = 0
  select case (s)
  case (SCALAR)
  case (SPINOR)

15.2 Bloch Representation

Particle polarization is determined by a particular quantum state which has just helicity information. Physically, this is the spin density matrix ρ, where we do not restrict ourselves to pure states.

We adopt the phase convention for a spin-1/2 particle that

$$\rho = \tfrac{1}{2}(1 + \vec{\alpha} \cdot \vec{\sigma}) \tag{15.2}$$

with the polarization axis $\vec{\alpha}$. For a particle with arbitrary spin s, and thus $N = 2s + 1$ spin states, we extend the above definition to generalized Bloch form

$$\rho = \frac{1}{N} \left(1 + \sqrt{2N(N-1)} \alpha^a T^a \right) \tag{15.3}$$

where the T^a ($a = 1, \ldots N^2 - 1$) are a basis of $su(N)$ algebra generators. These $N \times N$ matrices are hermitean, traceless, and orthogonal via

$$\mathrm{Tr}\, T^a T^b = \frac{1}{2} \delta^{ab} \tag{15.4}$$

In the spin-1/2 case, this reduces to the above (standard Bloch) representation since $T^a = \sigma^a/2$, $a = 1, 2, 3$. For the spin-1 case, we could use $T^a = \lambda^a/2$ with the Gell-Mann matrices,

$$\rho = \frac{1}{3} \left(1 + \sqrt{3} \alpha^a \lambda^a \right), \tag{15.5}$$

The normalization is chosen that $|alpha| \leq 1$ for allowed density matrix, where $|\alpha| = 1$ is a necessary, but not sufficient, condition for a pure state.

We need a specific choice of basis for a well-defined component representation. The matrix elements of T^a are ordered as $m = \ell, \ell - 1, \ldots - \ell$, i.e., from highest down to lowest weight, for both row and column.

We list first the generators of the $su(2)$ subalgebras which leave $|m|$ invariant ($|m| \neq 0$):

$$T^{b+1,b+2,b+3} \equiv \sigma^{1,2,3} \tag{15.6}$$

acting on the respective subspace $|m| = \ell, \ell - 1, \ldots$ for $b = 0, 1, \ldots$. This defines generators T^a for $a = 1, \ldots 3N/2$ ($\ldots 3(N-1)/2$) for N even (odd), respectively.

The following generators successively extend this to $su(4)$, $su(6)$, $\ldots$ until $su(N)$ by adding first the missing off-diagonal and then diagonal generators. The phase conventions are analogous.

(It should be possible to code these conventions for generic spin, but in the current implementation we restrict ourselves to $s \leq 2$, i.e., $N \leq 5$.)

Particle polarization is determined by a particular quantum state which has just helicity information. Physically, this is the spin density matrix ρ, where we do not restrict ourselves to pure states.

We adopt the phase convention for a spin-1/2 particle that

$$\rho = \tfrac{1}{2}(1 + \vec{\alpha} \cdot \vec{\sigma}) \tag{15.7}$$

with the polarization axis $\vec{\alpha}$. For a particle with arbitrary spin s, and thus $N = 2s + 1$ spin states, we extend the above definition to generalized Bloch form

$$\rho = \frac{1}{N} \left(1 + \sqrt{2N(N-1)} \alpha^a T^a \right) \tag{15.8}$$

where the T^a ($a = 1, \ldots N^2 - 1$) are a basis of $su(N)$ algebra generators. These $N \times N$ matrices are hermitean, traceless, and orthogonal via

$$\operatorname{Tr} T^a T^b = \frac{1}{2} \delta^{ab} \tag{15.9}$$

In the spin-1/2 case, this reduces to the above (standard Bloch) representation since $T^a = \sigma^a / 2$, $a = 1, 2, 3$. For the spin-1 case, we could use $T^a = \lambda^a / 2$ with the Gell-Mann matrices,

$$\rho = \frac{1}{3} \left(1 + \sqrt{3} \alpha^a \lambda^a \right), \tag{15.10}$$

The normalization is chosen that $|alpha| \leq 1$ for allowed density matrix, where $|\alpha| = 1$ is a necessary, but not sufficient, condition for a pure state.

```

15.2.1 Preliminaries

The normalization factor $\sqrt{2N(N-1)}/N$ that enters the Bloch representation.

⟨*Bloch vectors: procedures*⟩≡
```
    function bloch_factor (s) result (f)
      real(default) :: f
      integer, intent(in) :: s
      select case (s)
      case (SCALAR)
         f = 0
      case (SPINOR)
         f = 1
      case (VECTOR)
         f = 2 * sqrt (3._default) / 3
      case (VECTORSPINOR)
         f = 2 * sqrt (6._default) / 4
      case (TENSOR)
         f = 2 * sqrt (10._default) / 5
```

```
      case default
         f = 0
      end select
   end function bloch_factor
```

15.2.2   The basic polarization type

The basic polarization object holds just the entries of the Bloch vector as an allocatable array.

Bloch is active whenever the coefficient array is allocated. For convenience, we store the spin type $(2s)$ and the multiplicity (N) together with the coefficient array (α). We have to allow for the massless case where s is arbitrary > 0 but $N = 2$, and furthermore the chiral massless case where $N = 1$. In the latter case, the array remains deallocated but the chirality is set to ± 1.

In the Bloch vector implementation, we do not distinguish between particle and antiparticle. If the distinction applies, it must be made by the caller when transforming between density matrix and Bloch vector.

⟨*Bloch vectors: public*⟩≡
```
   public :: bloch_vector_t
```

⟨*Bloch vectors: types*⟩≡
```
   type :: bloch_vector_t
     private
     integer :: spin_type = UNKNOWN
     real(default), dimension(:), allocatable :: a
   contains
   ⟨Bloch vectors: bloch vector: TBP⟩
 end type bloch_vector_t
```

15.2.3   Direct Access

This basic initializer just sets the spin type, leaving the Bloch vector unallocated. The object therefore does not support nonzero polarization.

⟨*Bloch vectors: bloch vector: TBP*⟩≡
```
   procedure :: init_unpolarized => bloch_vector_init_unpolarized
```

⟨*Bloch vectors: procedures*⟩+≡
```
   subroutine bloch_vector_init_unpolarized (pol, spin_type)
     class(bloch_vector_t), intent(out) :: pol
     integer, intent(in) :: spin_type
     pol%spin_type = spin_type
   end subroutine bloch_vector_init_unpolarized
```

The standard initializer allocates the Bloch vector and initializes with zeros, so we can define a polarization later. We make sure that this works only for the supported spin type. Initializing with UNKNOWN spin type resets the Bloch vector to undefined, i.e., unpolarized state.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
   generic :: init => bloch_vector_init
   procedure, private :: bloch_vector_init
```

⟨*Bloch vectors: procedures*⟩+≡
```
    subroutine bloch_vector_init (pol, spin_type)
      class(bloch_vector_t), intent(out) :: pol
      integer, intent(in) :: spin_type
      pol%spin_type = spin_type
      select case (spin_type)
      case (SCALAR,SPINOR,VECTOR,VECTORSPINOR,TENSOR)
         allocate (pol%a (algebra_dimension (spin_type)), source = 0._default)
      end select
    end subroutine bloch_vector_init
```

Fill the Bloch vector from an array, no change of normalization. No initialization and no check, we assume that the shapes do match.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
    procedure :: from_array => bloch_vector_from_array
```

⟨*Bloch vectors: procedures*⟩+≡
```
    subroutine bloch_vector_from_array (pol, a)
      class(bloch_vector_t), intent(inout) :: pol
      real(default), dimension(:), allocatable, intent(in) :: a
      pol%a(:) = a
    end subroutine bloch_vector_from_array
```

Transform to an array of reals, i.e., extract the Bloch vector as-is.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
    procedure :: to_array => bloch_vector_to_array
```

⟨*Bloch vectors: procedures*⟩+≡
```
    subroutine bloch_vector_to_array (pol, a)
      class(bloch_vector_t), intent(in) :: pol
      real(default), dimension(:), allocatable, intent(out) :: a
      if (pol%is_defined ())  allocate (a (size (pol%a)), source = pol%a)
    end subroutine bloch_vector_to_array
```

15.2.4 Raw I/O

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
    procedure :: write_raw => bloch_vector_write_raw
    procedure :: read_raw => bloch_vector_read_raw
```

⟨*Bloch vectors: procedures*⟩+≡
```
    subroutine bloch_vector_write_raw (pol, u)
      class(bloch_vector_t), intent(in) :: pol
      integer, intent(in) :: u
      write (u) pol%spin_type
      write (u) allocated (pol%a)
      if (allocated (pol%a)) then
         write (u) pol%a
      end if
    end subroutine bloch_vector_write_raw

    subroutine bloch_vector_read_raw (pol, u, iostat)
      class(bloch_vector_t), intent(out) :: pol
```

```
      integer, intent(in) :: u
      integer, intent(out) :: iostat
      integer :: s
      logical :: polarized
      read (u, iostat=iostat) s
      read (u, iostat=iostat) polarized
      if (iostat /= 0)  return
      if (polarized) then
         call pol%init (s)
         read (u, iostat=iostat) pol%a
      else
         call pol%init_unpolarized (s)
      end if
   end subroutine bloch_vector_read_raw
```

15.2.5   Properties

Re-export algebra functions that depend on the spin type. These functions do not depend on the Bloch vector being allocated.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡

```
    procedure :: get_n_states
    procedure :: get_length
    procedure :: hel_index => bv_helicity_index
    procedure :: hel_value => bv_helicity_value
    procedure :: bloch_factor => bv_factor
```

⟨*Bloch vectors: procedures*⟩+≡

```
    function get_n_states (pol) result (n)
      class(bloch_vector_t), intent(in) :: pol
      integer :: n
      n = fundamental_dimension (pol%spin_type)
    end function get_n_states

    function get_length (pol) result (n)
      class(bloch_vector_t), intent(in) :: pol
      integer :: n
      n = algebra_dimension (pol%spin_type)
    end function get_length

    function bv_helicity_index (pol, h) result (i)
      class(bloch_vector_t), intent(in) :: pol
      integer, intent(in) :: h
      integer :: i
      i = helicity_index (pol%spin_type, h)
    end function bv_helicity_index

    function bv_helicity_value (pol, i) result (h)
      class(bloch_vector_t), intent(in) :: pol
      integer, intent(in) :: i
      integer :: h
      h = helicity_value (pol%spin_type, i)
    end function bv_helicity_value
```

```
function bv_factor (pol) result (f)
  class(bloch_vector_t), intent(in) :: pol
  real(default) :: f
  f = bloch_factor (pol%spin_type)
end function bv_factor
```

If the Bloch vector object is defined, the spin type is anything else but `UNKNOWN`. This allows us the provide the representation-specific functions above.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
procedure :: is_defined => bloch_vector_is_defined
```

⟨*Bloch vectors: procedures*⟩+≡
```
function bloch_vector_is_defined (pol) result (flag)
  class(bloch_vector_t), intent(in) :: pol
  logical :: flag
  flag = pol%spin_type /= UNKNOWN
end function bloch_vector_is_defined
```

If the Bloch vector object is (technically) polarized, it is defined, and the vector coefficient array has been allocated. However, the vector value may be zero.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
procedure :: is_polarized => bloch_vector_is_polarized
```

⟨*Bloch vectors: procedures*⟩+≡
```
function bloch_vector_is_polarized (pol) result (flag)
  class(bloch_vector_t), intent(in) :: pol
  logical :: flag
  flag = allocated (pol%a)
end function bloch_vector_is_polarized
```

Return true if the polarization is diagonal, i.e., all entries in the density matrix are on the diagonal. This is equivalent to requiring that only Cartan generator coefficients are nonzero in the Bloch vector.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
procedure :: is_diagonal => bloch_vector_is_diagonal
```

⟨*Bloch vectors: procedures*⟩+≡
```
function bloch_vector_is_diagonal (pol) result (diagonal)
  class(bloch_vector_t), intent(in) :: pol
  logical :: diagonal
  integer :: s, i
  s = pol%spin_type
  diagonal = .true.
  if (pol%is_polarized ()) then
     do i = 1, size (pol%a)
        if (is_cartan_generator (s, i))  cycle
        if (pol%a(i) /= 0) then
           diagonal = .false.
           return
        end if
     end do
  end if
end function bloch_vector_is_diagonal
```

Return the Euclidean norm of the Bloch vector. This is equal to the Killing form value of the corresponding algebra generator. We assume that the polarization object has been initialized.

For a pure state, the norm is unity. All other allowed states have a norm less than unity. (For $s \geq 1$, this is a necessary but not sufficient condition.)

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
    procedure :: get_norm => bloch_vector_get_norm
```

⟨*Bloch vectors: procedures*⟩+≡
```
    function bloch_vector_get_norm (pol) result (norm)
      class(bloch_vector_t), intent(in) :: pol
      real(default) :: norm
      select case (pol%spin_type)
      case (SPINOR,VECTOR,VECTORSPINOR,TENSOR)
         norm = sqrt (dot_product (pol%a, pol%a))
      case default
         norm = 1
      end select
    end function bloch_vector_get_norm
```

15.2.6 Diagonal density matrix

This initializer takes a diagonal density matrix, represented by a real-valued array. We assume that the trace is unity, and that the array has the correct shape for the given spin_type.

The bloch_factor renormalization is necessary such that a pure state maps to a Bloch vector with unit norm.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
    generic :: init => bloch_vector_init_diagonal
    procedure, private :: bloch_vector_init_diagonal
```

⟨*Bloch vectors: procedures*⟩+≡
```
    subroutine bloch_vector_init_diagonal (pol, spin_type, rd)
      class(bloch_vector_t), intent(out) :: pol
      integer, intent(in) :: spin_type
      real(default), dimension(:), intent(in) :: rd
      call pol%init (spin_type)
      call pol%set (rd)
    end subroutine bloch_vector_init_diagonal
```

Set a Bloch vector, given a diagonal density matrix as a real array. The Bloch vector must be initialized with correct characteristics.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
    generic :: set => bloch_vector_set_diagonal
    procedure, private :: bloch_vector_set_diagonal
```

⟨*Bloch vectors: procedures*⟩+≡
```
    subroutine bloch_vector_set_diagonal (pol, rd)
      class(bloch_vector_t), intent(inout) :: pol
      real(default), dimension(:), intent(in) :: rd
      integer :: s
      s = pol%spin_type
```

```
      select case (s)
      case (SCALAR,SPINOR,VECTOR,VECTORSPINOR,TENSOR)
         pol%a(:) = cartan_coeff (s, rd) / bloch_factor (s)
      end select
    end subroutine bloch_vector_set_diagonal
```

15.2.7   Massless density matrix

This is a specific variant which initializes an equipartition for the maximum
helicity, corresponding to an unpolarized massless particle.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
    procedure :: init_max_weight => bloch_vector_init_max_weight
```

⟨*Bloch vectors: procedures*⟩+≡
```
    subroutine bloch_vector_init_max_weight (pol, spin_type)
      class(bloch_vector_t), intent(out) :: pol
      integer, intent(in) :: spin_type
      call pol%init (spin_type)
      select case (spin_type)
      case (VECTOR)
        call pol%set ([0.5_default, 0._default, 0.5_default])
      case (VECTORSPINOR)
        call pol%set ([0.5_default, 0._default, 0._default, 0.5_default])
      case (TENSOR)
        call pol%set ([0.5_default, 0._default, 0._default, 0._default, 0.5_default])
      end select
    end subroutine bloch_vector_init_max_weight
```

Initialize the maximum-weight submatrix with a three-component Bloch vector.
This is not as trivial as it seems because we need the above initialization for the
generalized Bloch in order to remove the lower weights from the density matrix.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
    procedure :: init_vector => bloch_vector_init_vector
    procedure :: to_vector => bloch_vector_to_vector
```

⟨*Bloch vectors: procedures*⟩+≡
```
    subroutine bloch_vector_init_vector (pol, s, a)
      class(bloch_vector_t), intent(out) :: pol
      integer, intent(in) :: s
      real(default), dimension(3), intent(in) :: a
      call pol%init_max_weight (s)
      select case (s)
      case (SPINOR, VECTOR, VECTORSPINOR, TENSOR)
        pol%a(1:3) = a / bloch_factor (s)
      end select
    end subroutine bloch_vector_init_vector

    subroutine bloch_vector_to_vector (pol, a)
      class(bloch_vector_t), intent(in) :: pol
      real(default), dimension(3), intent(out) :: a
      integer :: s
      s = pol%spin_type
```

1113

```
      select case (s)
      case (SPINOR, VECTOR, VECTORSPINOR, TENSOR)
         a = pol%a(1:3) * bloch_factor (s)
      case default
         a = 0
      end select
   end subroutine bloch_vector_to_vector
```

15.2.8 Arbitrary density matrix

Initialize the Bloch vector from a density matrix. We assume that the density is valid. In particular, the shape should match, the matrix should be hermitian, and the trace should be unity.

We first fill the diagonal, then add the off-diagonal parts.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡

```
   generic :: init => bloch_vector_init_matrix
   procedure, private :: bloch_vector_init_matrix
```

⟨*Bloch vectors: procedures*⟩+≡

```
   subroutine bloch_vector_init_matrix (pol, spin_type, r)
     class(bloch_vector_t), intent(out) :: pol
     integer, intent(in) :: spin_type
     complex(default), dimension(:,:), intent(in) :: r
     select case (spin_type)
     case (SCALAR,SPINOR,VECTOR,VECTORSPINOR,TENSOR)
        call pol%init (spin_type)
        call pol%set (r)
     case default
        call pol%init (UNKNOWN)
     end select
   end subroutine bloch_vector_init_matrix
```

Set a Bloch vector, given an arbitrary density matrix as a real array. The Bloch vector must be initialized with correct characteristics.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡

```
   generic :: set => bloch_vector_set_matrix
   procedure, private :: bloch_vector_set_matrix
```

⟨*Bloch vectors: procedures*⟩+≡

```
   subroutine bloch_vector_set_matrix (pol, r)
     class(bloch_vector_t), intent(inout) :: pol
     complex(default), dimension(:,:), intent(in) :: r
     real(default), dimension(:), allocatable :: rd
     integer :: s, d, i, j, h1, h2, ir, ii
     s = pol%spin_type
     select case (s)
     case (SCALAR,SPINOR,VECTOR,VECTORSPINOR,TENSOR)
        d = fundamental_dimension (s)
        allocate (rd (d))
        do i = 1, d
           rd(i) = r(i,i)
        end do
```

```
      call pol%set (rd)
      do i = 1, d
         h1 = helicity_value (s, i)
         do j = i+1, d
            h2 = helicity_value (s, j)
            ir = root_index (s, h1, h2, .true.)
            ii = root_index (s, h1, h2, .false.)
            pol%a(ir) = real (r(j,i) + r(i,j)) / bloch_factor (s)
            pol%a(ii) = aimag (r(j,i) - r(i,j)) / bloch_factor (s)
         end do
      end do
   end select
 end subroutine bloch_vector_set_matrix
```

Allocate and fill the density matrix `r` (with the index ordering as defined in `su_algebra`) that corresponds to a given Bloch vector.

If the optional `only_max_weight` is set, the resulting matrix has entries only for $\pm h_{\max}$, as appropriate for a massless particle (for spin ≥ 1). Note that we always add the unit matrix, as this is part of the Bloch-vector definition.

⟨*Bloch vectors: bloch vector: TBP*⟩+≡
```
   procedure :: to_matrix => bloch_vector_to_matrix
```

⟨*Bloch vectors: procedures*⟩+≡
```
   subroutine bloch_vector_to_matrix (pol, r, only_max_weight)
     class(bloch_vector_t), intent(in) :: pol
     complex(default), dimension(:,:), intent(out), allocatable :: r
     logical, intent(in), optional :: only_max_weight
     integer :: d, s, h0, ng, ai, h, h1, h2, i, j
     logical :: is_real, only_max
     complex(default) :: val
     if (.not. pol%is_polarized ())  return
     s = pol%spin_type
     only_max = .false.
     select case (s)
     case (VECTOR, VECTORSPINOR, TENSOR)
        if (present (only_max_weight))  only_max = only_max_weight
     end select
     if (only_max) then
        ng = 2
        h0 = helicity_value (s, 1)
     else
        ng = algebra_dimension (s)
        h0 = 0
     end if
     d = fundamental_dimension (s)
     allocate (r (d, d), source = (0._default, 0._default))
     do i = 1, d
        h = helicity_value (s, i)
        if (abs (h) < h0)  cycle
        r(i,i) = 1._default / d &
              + dot_product (cartan_element (s, h), pol%a) * bloch_factor (s)
     end do
     do ai = 1, ng
        if (is_cartan_generator (s, ai))  cycle
```

```
        call root_helicity (s, ai, h1, h2, is_real)
        i = helicity_index (s, h1)
        j = helicity_index (s, h2)
        if (is_real) then
           val = cmplx (pol%a(ai) / 2 * bloch_factor (s), 0._default, &
               kind=default)
           r(i,j) = r(i,j) + val
           r(j,i) = r(j,i) + val
        else
           val = cmplx (0._default, pol%a(ai) / 2 * bloch_factor (s), &
               kind=default)
           r(i,j) = r(i,j) - val
           r(j,i) = r(j,i) + val
        end if
     end do
   end subroutine bloch_vector_to_matrix
```

15.2.9 Unit tests

Test module, followed by the corresponding implementation module.

⟨bloch_vectors_ut.f90⟩≡
  ⟨*File header*⟩

```
  module bloch_vectors_ut

1116

⟨*Bloch vectors: tests*⟩

```
  end module bloch_vectors_uti
```

API: driver for the unit tests below.

⟨*Bloch vectors: public test*⟩≡
```
    public :: bloch_vectors_test
```

⟨*Bloch vectors: test driver*⟩≡
```
    subroutine bloch_vectors_test (u, results)
      integer, intent(in) :: u
      type(test_results_t), intent(inout) :: results
    ⟨Bloch vectors: execute tests⟩
    end subroutine bloch_vectors_test
```

Initialization

Initialize the Bloch vector for any spin type. First as unpolarized (no array), then as polarized but with zero polarization.

⟨*Bloch vectors: execute tests*⟩≡
```
    call test (bloch_vectors_1, "bloch_vectors_1", &
         "initialization", &
         u, results)
```

⟨*Bloch vectors: test declarations*⟩≡
```
    public :: bloch_vectors_1
```

⟨*Bloch vectors: tests*⟩≡
```
    subroutine bloch_vectors_1 (u)
      integer, intent(in) :: u

      write (u, "(A)")  "* Test output: bloch_vectors_1"
      write (u, "(A)")  "*   Purpose: test Bloch-vector &
          &polarization implementation"
      write (u, "(A)")

      write (u, "(A)")  "* Initialization (unpolarized)"

      write (u, "(A)")
      write (u, "(A)")  "* unknown"
      call bloch_init (UNKNOWN)

      write (u, "(A)")
      write (u, "(A)")  "* s = 0"
      call bloch_init (SCALAR)

      write (u, "(A)")
      write (u, "(A)")  "* s = 1/2"
      call bloch_init (SPINOR)

      write (u, "(A)")
      write (u, "(A)")  "* s = 1"
```

```
      call bloch_init (VECTOR)

      write (u, "(A)")
      write (u, "(A)")   "* s = 3/2"
      call bloch_init (VECTORSPINOR)

      write (u, "(A)")
